## 1 INTRODUCTION

IB Operations Pty Ltd (IBO) is developing the North Star Magnetite Project (the Project), on behalf of the joint venture partners FMG Iron Bridge (Aust) Pty Ltd (FMGIB) and Formosa Steel IB Pty Ltd (Formosa). The Project is located approximately 110 km south of Port Hedland in the Pilbara region of Western Australia.

The objective of the survey was to conduct a regional survey for the Priority 1 *Pityrodia* sp. Marble Bar (G. Woodman & D. Coultas GWDC Opp 4) consistent with the *Pityrodia* sp. Marble Bar Regional Survey Plan (NS-PL-EN-0006) required to satisfy Condition 7 of EPA Report 1514.

Previous flora and vegetation assessments in the North Star area have recorded an estimated 2,039 *Pityrodia* sp. Marble Bar individuals. Previous studies that have recorded *Pityrodia* sp. Marble Bar include:

- Supplementary botanical surveys, rare flora searches, assessment of vegetation condition and identification of groundwater dependent ecosystems for the Sulphur Springs Project (Trudgen 2007, cited in Mattiske 2007);
- North Star Flora and Vegetation Assessment (*ecologia* 2012a);
- *Pityrodia* sp. Marble Bar Targeted Survey (*ecologia* 2012b);
- Abydos Direct Shipping Ore Project Flora and Vegetation Studies (Woodman 2012);
- Abydos Direct Shipping Ore Project Stage 2 Flora and Vegetation Studies (Woodman 2013); and
- North Star Slurry and Infrastructure Corridors Conservation Significant Flora and Vegetation Assessment (*ecologia* 2015).

The *Pityrodia* sp. Marble Bar Regional Survey Plan (NS-PL-EN-0006) included a probabilistic species distribution model which was used to identify areas of potentially suitable habitat for *Pityrodia* sp. Marble Bar. FMGIB requested *ecologia* to conduct a *Pityrodia* sp. Marble Bar regional survey of those areas identified as targets for survey according to the *Pityrodia* sp. Marble Bar Regional Survey Plan (NS-PL-EN-0006).

## 2 METHODS

Two field botanists surveyed 144 *Pityrodia* sp. Marble Bar Regional Survey targets from 16 to 27 September 2015 (Principal Ecologist Matthew Macdonald and Botanist John Grantham). This includes 62 of the 96 higher priority targets (41 targets surveyed from the helicopter, 24 on foot or from the vehicle) identified in the *Pityrodia* sp. Marble Bar Regional Survey Plan (Table 2.1, Table 2.2, Figure 2.1, to Figure 2.6). An additional 11 higher priority targets have been surveyed during previous flora and vegetation assessments (nine from *ecologia* 2012b, one from *ecologia* 2012a, and one from Woodman 2012). Of the 144 lower priority targets identified in the *Pityrodia* sp. Marble Bar Regional Survey Plan, 79 (Table 2.1, Table 2.2, Figure 2.1, Figure 2.2 and Figure 2.3) were surveyed during this regional survey (51 targets surveyed from the helicopter, 28 on foot or from vehicle). An additional 11 targets have previously been surveyed (eight from *ecologia* 2012b, one from *ecologia* 2012a, one from Trudgen 2007 and one from Woodman 2012/2013).

A helicopter was utilised on 18 and 20 September to efficiently survey the more distant and remote targets (Figure 2.1, Figure 2.2 and Figure 2.3). Vehicle access was constrained to the north of Glacier Valley by the closure of the vehicle track by Atlas Iron due to ongoing mining activities associated with the Abydos project.

Where *Pityrodia* sp. Marble Bar targets could be satisfactorily viewed with binoculars from a distance, this was considered sufficient to determine if more intensive ground-searching was justified. Where higher priority targets were not considered safe to survey (due to distance from known access tracks), lower priority areas were surveyed where accessible instead. Target areas tended to be associated with steep terrain, and areas were avoided where ground conditions were considered unsafe for approach on foot. Some *Pityrodia* sp. Marble Bar locations are approximate due to unsafe terrain. Where *Pityrodia* sp. Marble Bar populations were encountered outside target areas, they were recorded and these areas surveyed opportunistically.

Conditions were favourable for identifying *Pityrodia* sp. Marble Bar from a distance, with approximately 90% of individuals recorded in reproductive condition (generally late flower/early fruit). Fruit are expected to ripen within weeks of completion of field work. Care was taken to avoid double-counting previous records by carrying a hand-held GPS at all times while in the field and avoiding areas with previous records, or accounting for all previously recorded individuals in an area prior to recording additional locations.

### 3 RESULTS

#### 3.1 PITYRODIA SP. MARBLE BAR RECORDS

In total 2,114 new locations of *Pityrodia* sp. Marble Bar were recorded, representing 7,473 previously unrecorded mature individuals, with an additional 269 juveniles and 45 seedlings recorded. Of the 7,473 newly recorded mature individuals 5,425 (72.6%) were at the immature fruit developmental stage; 369 (4.9%) were recorded with flowers and immature fruit; 196 (2.6%) were in flower only. Not all individuals were scored for developmental stage, such as those recorded from helicopter. New *Pityrodia* sp. Marble Bar records are provided in Appendix A. All *Pityrodia* sp. Marble Bar records from this and previous surveys are shown in Figure 3.6.

Based on all known records of *Pityrodia* sp. Marble Bar, there is an estimated 9,848 individuals (including 269 juveniles and 45 seedlings) recorded. The records have been assembled into 67 “populations” (Table 3.1, Figure 3.5) which are separated by at least 500 m, according to DPaW guidelines (DEC 2010). This includes records from the current survey, the records from previous surveys incorporated into the *Pityrodia* sp. Marble Bar Regional Survey Plan (NS-PL-EN-0006), and records obtained since the development of the Survey Plan including:

- Four records from the 2015 North Star Conservation Significant Fauna Monitoring (Ecoscape 2015); and
- Two records from the North Star Slurry and Infrastructure Corridors Conservation Significant Flora and Vegetation Assessment (*ecologia* 2015).

The single largest population (Population 6) includes an estimated 3,048 individuals, approximately 30% of the number of *Pityrodia* sp. Marble Bar individuals recorded. Population 8 is the second largest population, with an estimated 1,222 individuals. Six populations are represented by a single individual, an additional two populations represented by two individuals, and four populations represented by three individuals.

The records obtained from helicopter searches (which represent populations 52 to 67) are necessarily less precise than those obtained on foot and the accuracy ( $\pm 100$  m) of these records should be considered when revisiting these sites, with a view to obtaining more precise location and count data for these populations in the future.

A substantial extension to the extent of occurrence was recorded with new *Pityrodia* sp. Marble Bar records approximately 6 km east of previous most easterly record, towards the Shaw River. The extent of occurrence is defined for use in the determination of species conservation status (IUCN 2014). Based on the additional locations recorded since the development of the *Pityrodia* sp. Marble Bar Regional Survey Plan (NS-PL-EN-0006), the known extent of occurrence for *Pityrodia* sp. Marble has increased from 338.6 km<sup>2</sup> to 422.4 km<sup>2</sup>.

The records of *Pityrodia* sp. Marble Bar are found overwhelmingly within the Capricorn land system, with only six records (from all surveys) recorded in any other land system (these six records are all within the Rocklea land system).

### 3.2 FIELD OBSERVATIONS

Most mature plants were in late flower/early fruit at the time of survey, with most flowers withered and green immature fruit developing within the corolla and obscured by the persistent sepals (Figure 3.1). Two colour forms of mature individuals were noticed at some locations, a “green” (less frequent) form and a “grey” (more common) form (Figure 3.1, Figure 3.5). “Grey” form individuals appear to have an indumentum almost entirely of white hairs, whereas the stem and leaf of “green” form individuals have yellow hairs and sepal hairs are pink. The inflorescence structure may also be more open in “green” form plants, with possibly a later, albeit overlapping flowering period.

Plants in areas which had apparently been burnt within the past year had resprouted and were flowering/fruitletting prolifically (Figure 3.2). The juveniles and seedlings were recorded almost exclusively in areas recently (<1 year) burnt (Figure 3.3). Some individual plants which have apparently established since the recent fire appear to have flowered within one year of germination.

Two potential insect pollinators were observed on flowering *Pityrodia* sp. Marble Bar. The most prevalent was an unidentified jewel beetle (Figure 3.4), but feral honey bees (*Apis mellifera*) were also observed visiting some flowering *Pityrodia* sp. Marble Bar plants.

## 4 DISCUSSION AND CONCLUSIONS

During the *Pityrodia* sp. Marble Bar regional survey 2,114 new locations of *Pityrodia* sp. Marble Bar were recorded, representing 7,473 previously unrecorded mature individuals, with an additional 269 juveniles and 45 seedlings recorded. Therefore, based on all known records of *Pityrodia* sp. Marble Bar, there is an estimated 9,848 individuals recorded (including 9,534 mature individuals, 269 juveniles and 45 seedlings). The records include the 2,039 reported in the *Pityrodia* sp. Marble Bar Regional Survey Plan (NS-PL-EN-0006), 7,787 from this survey and 22 from other surveys since the development of the *Pityrodia* sp. Marble Bar Regional Survey Plan (NS-PL-EN-0006). All records have been assembled into 67 “populations” which are separated by at least 500 m, according to DPaW guidelines (DEC 2010). The single largest population (Population 6) includes an estimated 3,048 individuals, approximately 31% of the number of *Pityrodia* sp. Marble Bar individuals known.

A substantial extension to the extent of occurrence was recorded with new *Pityrodia* sp. Marble Bar records approximately 6 km east of previous most easterly record, towards the Shaw River. Since the development of the *Pityrodia* sp. Marble Bar Regional Survey Plan (NS-PL-EN-0006), the extent of occurrence for *Pityrodia* sp. Marble Bar has increased from 338.6 km<sup>2</sup> to 422.4 km<sup>2</sup>.

Records of *Pityrodia* sp. Marble Bar are found overwhelmingly within the Capricorn land system, with only six records (from all surveys) recorded in any other land system (these six records are all within the Rocklea land system). The results of this regional survey are not exhaustive, and additional *Pityrodia* sp. Marble Bar individuals are likely to be recorded in and around known records, particularly in areas around Populations 6, 30 and 51, and between Populations 40 and 43. Populations surveyed from the helicopter (Populations 52 to 67) are also likely to yield higher abundance estimates if surveyed on ground, however remoteness and difficult terrain may limit the feasibility of accessing some of these areas. Therefore the total population of *Pityrodia* sp. Marble Bar is likely to be larger than that estimated, however large increases in the extent of occurrence from additional survey effort are considered less likely.

Several potentially important ecological observations were also made during the survey, including observations of potential pollinators (jewel beetles and feral honey bees) visiting *Pityrodia* sp. Marble Bar flowers. *Pityrodia* sp. Marble Bar individuals resprouting after fire, with prolific flowering/fruitleting following fire and evidence of recruitment observed only in areas recently burnt. Some individuals which appeared to be less than one year old were also observed flowering. Therefore an increase in fire frequency is not expected to be detrimental to the *Pityrodia* sp. Marble Bar population.
