# ACKNOWLEDGEMENTS

Ecoscape would like to thank the following Fortescue personnel for their assistance with the project:

- Matt Dowling for coordinating the field surveys, data provision and project managing
- Mike Bromell for providing orientation and required training
- Nyidinghu camp for accommodating the teams during the field survey.

# SUMMARY

To support the expansion of its operations, Fortescue Metals Group Limited (Fortescue) is proposing the development of an ore transport corridor in the project area known as Nyidinghu, in the Pilbara region of Western Australia. Fortescue commissioned Ecoscape to conduct a Detailed flora and vegetation survey along the proposed transport corridor options as well as an area to the south known as 'Billiards North'.

The survey area occupied 31,919.08 ha, the majority has been subject to previous flora and vegetation surveys. The findings of previous flora surveys were consolidated and incorporated into the results where possible. The field surveys were undertaken during two phases early May and late July 2021.

The desktop assessment identified the following significant aspects:

- the survey area intersects with mapped occurrences of four Priority Ecological Communities (PECs):
  - *Brockman Iron cracking clay communities of the Hamersley Range*
  - *Fortescue Marsh (Martuyitha) (Marsh Land System)*
  - *Four plant assemblages of the Wona Land System*
  - *Vegetation of sand dunes of the Hamersley Range/Fortescue Valley*.
- the combined database searches identified 73 conservation-listed flora that have been recorded from within 50 km of the survey area, consisting of one Threatened Flora (TF), 11 Priority 1, 11 Priority 2, 32 Priority 3 and nine Priority 4. Of these, 10 were identified as being known from within the survey area and a further 12 as Likely to occur within the survey area.
- the literature review identified numerous previous surveys that have been undertaken for Fortescue and others in close proximity to the survey area, including several that intersect with it.

There have been 268 floristic quadrats established within the survey area (including previous surveys) of which 147 were either established or rescored during 2021. A total of 607 vascular flora taxa have been recorded from the survey area including:

- one TF species, *Seringia exastia*
- 12 Priority Flora species:
  - one Priority 1*: Tecticornia* sp. Christmas Creek (K.A. Shepherd & T. Colmer et al. KS 1063)
  - one Priority 2: *Euphorbia inappendiculata* var. *queenslandica* (P2)
  - seven Priority 3: *Atriplex flabelliformis, Dolichocarpa* sp. Hamersley Station (A.A. Mitchell PRP 1479), *Dysphania congestiflora, Eragrostis* sp. Erect spikelets (P.K. Latz 2122), *Eremophila spongiocarpa, Stackhousia clementii, Swainsona thompsoniana*
  - three Priority 4: *Eremophila youngii* subsp. *lepidota, Goodenia nuda, Lepidium catapycnon*
- 18 introduced flora (weeds).

Twenty-nine vegetation types were recorded from the survey area associated with landform types including plains, valley floors, cracking clay, sand dunes hills and drainage lines. The following vegetation types considered as having some significance or potentially significance were recorded:

- **Eb,** representative of the *Brockman Iron cracking clay communities of the Hamersley Range* PEC
- **Ti,** representative of the *Fortescue Marsh (Marsh Land System)* PEC
- **Nd**, representative of the *Four plant assemblages of the Wona Land System* PEC
- **AdTb**, representative of the *Vegetation of sand dunes of the Hamersley Range/Fortescue Valley* PEC
- **EvAcCc** and **EvApTe**, representative of potential Groundwater Dependent Vegetation
- **AaAsCc**, **AaEfEp** and **AaSaEp** as representative of sheetflow dependent vegetation.

The vegetation condition within the survey area ranged from Degraded to Excellent, with the Very Good category having the highest proportion. The main factors affecting vegetation condition were grazing by cattle, weed infestation (particularly **Cenchrus ciliaris*) and existing infrastructure.

# 1 INTRODUCTION

## 1.1 BACKGROUND

Fortescue Metals Group Ltd (Fortescue) is an integrated iron-ore business with mine, rail and port operations across the Pilbara region of Western Australia. To support the expansion of its operations, Fortescue is proposing the development of an ore transport corridor in the project area known as Nyidinghu. Approval of this development requires an investigation of the area's environmental values and Fortescue has commissioned Ecoscape to conduct a Detailed flora and vegetation survey along the proposed transport corridor options as well as an area to the south known as 'Billiards North'. The purpose of the survey is to identify and map vegetation and conservation-listed flora and communities within the survey area.

## 1.2 SURVEY AREA

The survey area, comprising the Transport Corridor and Billiards North survey areas, is located within the Shire of East Pilbara in the Pilbara region, approximately 1,070 km north of Perth (**Figure 1**). The Transport Corridor survey area occupies 30,262.47 ha and the Billiards North survey area is 1,656.61 ha, totalling 31,919.08 ha. The survey areas extend into the Chichester Range in the north and the Hamersley Range in the south, and partially intersect the western edge of the Fortescue Marsh.

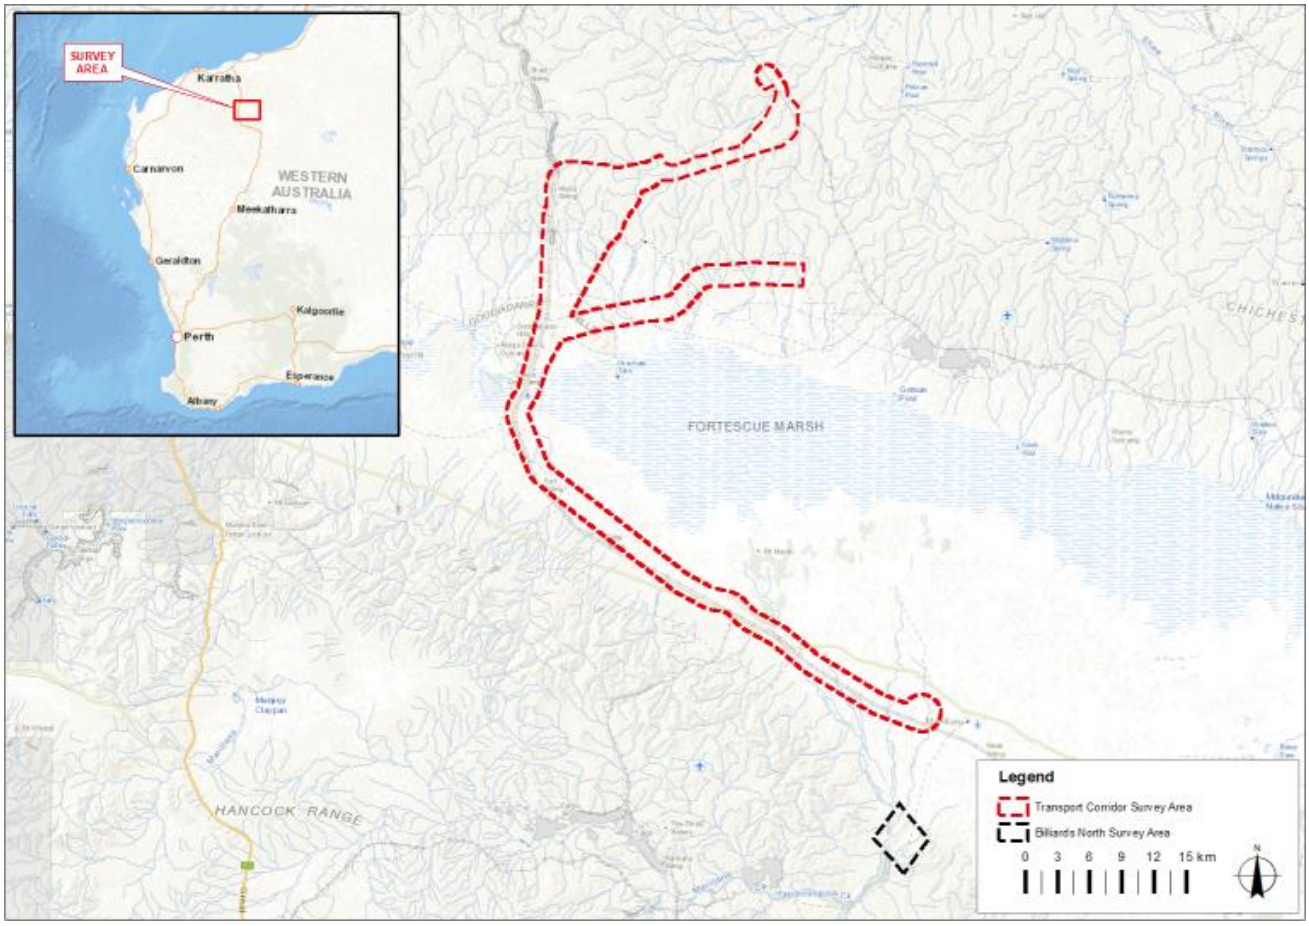

**Figure 1: Survey area location**

## 1.3 SURVEY REQUIREMENTS

The survey was conducted as a two-phase Detailed flora and vegetation assessment.

The requirements of the survey were to:

- identify and map vegetation within the survey boundary
- conduct targeted searches for conservation-listed flora and communities
- adhere to the requirements for environmental survey outlined in the EPA (2016) *Technical Guidance – Flora and Vegetation Surveys for Environmental Impact Assessment* (Flora and Vegetation Technical Guidance) and Fortescue's Flora and Vegetation Survey Guidelines (100-GU-EN-0005).

## 1.4 COMPLIANCE

This environmental assessment was conducted in accordance with Commonwealth and State legislation and guidelines:

- Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act)
- Western Australian *Environmental Protection Act 1986* (EP Act)
- Western Australian *Environmental Protection Amendment Act 2020*
- Western Australian *Biodiversity Conservation Act 2016* (BC Act)
- Western Australian *Biodiversity Conservation Regulations 2018*
- Department of Environment, Water, Heritage and the Arts (DEWHA 2009) *Matters of National Environmental Significance. Significant impact guidelines 1.1 - Environment Protection and Biodiversity Conservation Act 1999.*

Summaries of the main Acts under which this assessment was conducted, and related criteria and definitions, are available in **Appendix One**.

As well as those listed above, the assessment complied with EPA requirements for environmental survey and reporting in Western Australia, as outlined in:

- EPA (2016) *Technical Guidance – Flora and Vegetation Surveys for Environmental Impact Assessment*, known herein as the Flora and Vegetation Technical Guidance
- EPA (2020) *Statement of Environmental Principles, Factors and Objectives*.

Fortescue's internal management Guidelines and Procedures were also compiled with as required, primarily *Flora and Vegetation Assessment Guidelines* (100-GU-EN-005) (Fortescue 2014).

# 2 DESKTOP ASSESSMENT

## 2.1 PHYSICAL ENVIRONMENT

### 2.1.1 CLIMATE

The survey area is located within the Pilbara region, which includes two broad climatic zones. Coastal areas, as well as some higher rainfall inland areas, have a semi-desert tropical climate which experience 9-11 months of dry weather, with hot humid summers and warm winters. Inland areas have a dry desert climate, typically with higher temperatures and lower rainfall and often experience up to 12 months of dry weather, with hot dry summers and mild winters (Leighton 2004). The survey area is within the dry inland area.

According to the Köppen-Geiger climate classification, the survey area has a hot arid desert climate (Class BWh) (Peel, Finlayson & McMahon 2007). This classification is considered to represent a desert climate where annual rainfall is generally less than 200 mm or the region loses more water via evapotranspiration than it receives as rain, generally a result of hot, sunny weather without significant cloud. The mean average temperature exceeds 18°C, and summer temperatures are frequently over 40°C.

The closest Bureau of Meteorology (BoM) station with long term records for rainfall is Bonney Downs (BoM 2021 station no. 4006, operating since 1907) located approximately 70 km to the east of the survey area. The mean annual rainfall is 325.3 mm, with 60% falling from January to March (**Figure 2**). Rainfall in the 4 months preceding the field survey was approximately average with the most substantial rainfall events occurring during February. Data available from Cloudbreak BoM station (12 km from the survey area, short term records only) indicates that rainfall during April 2021 (60.6 mm) was substantially higher that than that recorded at Bonney Downs (38.1 mm). This suggests that seasonal conditions within the survey area may have been better than BoM data indicates.

The closes BoM station with long term records for temperature is Newman Aero (BoM 2021 station no. 7176, operating since 1971) located approximately 140 km to the south-east of the survey area. December is the hottest month with a mean maximum temperature of 39.2°C and minimum of 24.1°C. June is the coldest month with a mean maximum of 23.1°C and minimum of 7.5°C.

**Figure 2** shows the average rainfall and temperatures for Bonney Downs (BoM 2021 station no. 4006, operating since 1907), with rainfall for the six months preceding the field survey.

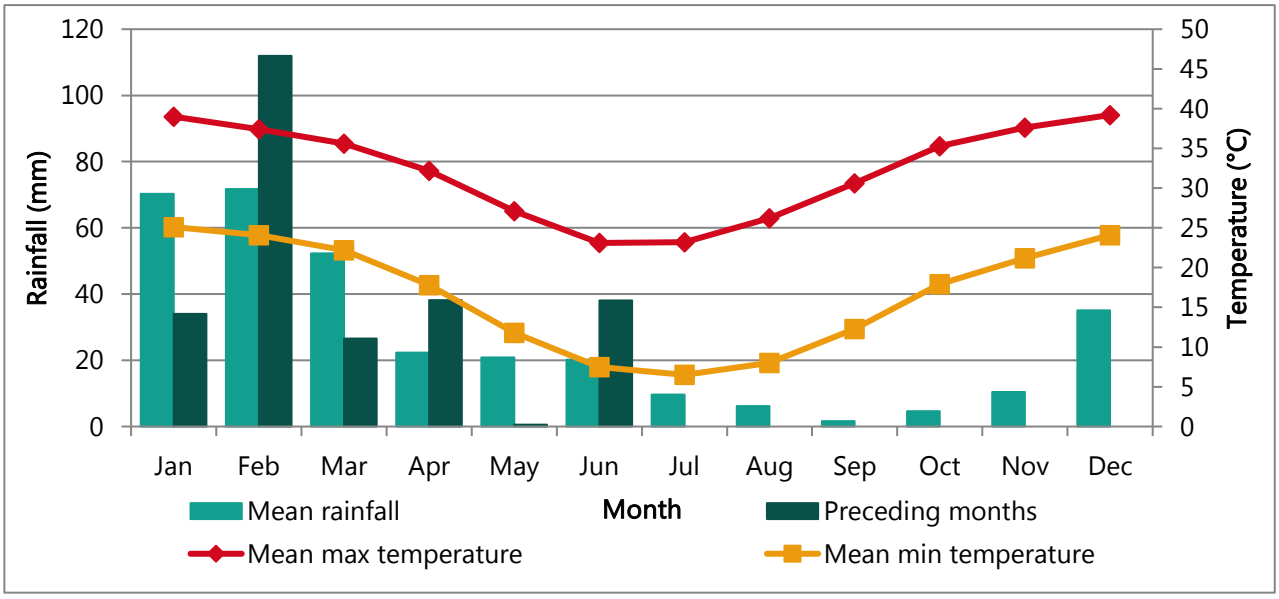

**Figure 2: Rainfall and temperature data for the survey area Bonney Downs (BoM 2021a)**

### 2.1.2 LAND SYSTEMS

According to the Department of Primary Industries and Rural Development (DPIRD 2020) soil landscape mapping, the following land systems intersect the survey area (**Table 2** and **Map 1**).

**Table 2: Land systems (DPIRD 2020)**

| Mapping unit | Land system | Description | Extent (ha) | % |
|---|---|---|---|---|
| 282Cp | Capricorn System | Rugged sandstone hills, ridges, stony footslopes and interfluves supporting low acacia shrublands or hard spinifex grasslands with scattered shrubs. | 260.82 | 0.86 |
| 282Mk | McKay System | Hills, ridges, plateaux remnants and breakaways of meta sedimentary and sedimentary rocks supporting hard spinifex grasslands with acacias and occasional eucalypts. | 3,950.99 | 13.07 |
| 282Ne | Newman System | Rugged jaspilite plateaux, ridges and mountains supporting hard spinifex grasslands. | 3,649.59 | 12.07 |
| 282Rk | Rocklea System | Basalt hills, plateaux, lower slopes and minor stony plains supporting hard spinifex and occasionally soft spinifex grasslands with scattered shrubs. | 1,081.65 | 3.58 |
| 282Wo | Wona System | Basalt upland gilgai plains supporting Roebourne Plains grass and Mitchell grass tussock grasslands, minor hard spinifex grasslands or annual grasslands/herbfields. | 225.44 | 0.75 |
| 283Mc | Macroy System | Stony plains and occasional tor fields based on granite supporting hard and soft spinifex shrubby grasslands. | 307.60 | 1.02 |
| 283Rk | Rocklea System | Basalt hills, plateaux, lower slopes and minor stony plains supporting hard spinifex and occasionally soft spinifex grasslands with scattered shrubs. | 15.55 | 0.05 |
| 283Ro | Robe System | Low plateaux, mesas and buttes of limonite supporting soft spinifex and occasionally hard spinifex grasslands. | 139.84 | 0.46 |
| 284Ad | Adrian System | Stony plains and low silcrete hills supporting hard spinifex grasslands. | 1,380.22 | 4.56 |
| 284Bg | Boolgeeda System | Stony lower slopes and plains below hill systems supporting hard and soft spinifex grasslands or mulga shrublands. | 1,441.30 | 4.77 |
| 284Ca | Calcrete System | Low calcrete platforms and plains supporting shrubby hard spinifex grasslands. | 343.94 | 1.14 |
| 284Ch | Christmas System | Stony alluvial plains supporting snakewood and mulga shrublands with sparse tussock grasses. | 4,866.77 | 16.09 |
| 284Co | Coolibah System | Flood plains with weakly gilgaied clay soils supporting coolibah woodlands with tussock grass understorey. | 15.662 | 0.05 |
| 284Cw | Cowra System | Plains fringing the Marsh land system and supporting snakewood and mulga shrublands with some halophytic undershrubs. | 847.75 | 2.80 |
| 284Dv | Divide System | Gently undulating sandplains with minor dunes, supporting hard spinifex hummock grasslands with numerous shrubs. | 1,626.99 | 5.38 |
| 284Fa | Fan System | Washplains and gilgai plains supporting groved mulga tall shrublands and minor tussock grasslands. | 1,349.26 | 4.46 |
| 284Ft | Fortescue System | Alluvial plains and flood plains supporting patchy grassy eucalypt and acacia woodlands and shrublands and tussock grasslands. | 1,910.78 | 6.32 |
| 284Jm | Jamindie System | Stony hardpan plains and rises supporting groved mulga shrublands, occasionally with spinifex understorey. | 5,449.40 | 18.02 |
| 284Ms | Marsh System | Lakebeds and flood plains subject to regular inundation, supporting samphire shrublands, salt water couch grasslands and chenopod shrublands. | 612.05 | 2.02 |
| 284Ur | Urandy System | Stony plains, alluvial plains and drainage lines supporting shrubby soft spinifex grasslands. | 763.20 | 2.52 |

### 2.1.1 GEOLOGY

The survey area is associated with the Roy Hill (SF50-12) map sheet of the 1:250 000 Geological Map of Western Australia (DMIRS 2020). According to this mapping, the survey areas intersect 20 geological units (**Table 3**, **Map 2**).

**Table 3: Geology of the survey area**

| Code | Description | Area (ha) | % |
|---|---|---|---|
| **AFj** | Pelite, chert and thin-bedded metasandstone; intruded by metadolerite sills in the Hamersley Range | 1823.52 | 5.71% |
| **AFjo** | Metamorphosed quartzitic sandstone, pelite and chert (locally stromatolitic) | 568.14 | 1.78% |
| **AFm** | Amygdaloidal metabasaltic flora and breccia | 1501.07 | 4.70% |
| **AFmk** | Metamorphosed volcanic sandstone, pelite, chert and metadolomite; local accretionary lapilli and stromatolites | 210.88 | 0.66% |
| **AFt** | Metamorphosed mafic to intermediate volcanic sandstone, pelite, metabasaltic flows and breccia, chert and metadolerite; local accretionary lapilla and stromatolites | 191.74 | 0.60% |
| **AFtc** | Metamorphosed stromatolitic limestone and dolomite, pelite and volcanic sandstone | 206.77 | 0.65% |
| **AgSm** | Metamorphosed biotite monzogranite and minor granodiorite; weakly to strongly foliated; local metabasalt and metadolerite xenoliths intruded by a network of metamorphosed muscovite pegmatite veins | 332.61 | 1.04% |
| **AHm** | Chert, banded iron-formation and pelite | 2191.56 | 6.87% |
| **Czc** | Colluvium – partly consolidated quartz and rock fragments in silt and sand matrix; old valley-fill deposits | 476.97 | 1.49% |
| **Czk** | Calcrete – sheet carbonate; found along major drainage lines | 138.37 | 0.43% |
| **Czp** | Robe pisolite: pisolitic limonite deposits developed along river channels | 113.47 | 0.36% |
| **Czr** | Hematite-geothite deposits on banded iron-formation and adjacent scree deposits | 762.56 | 2.39% |
| **Czz** | Brecciated siliceous caprock over dolomitic rock; angular chert fragments in a chert matrix; overlies Wittenoom Formation | 854.33 | 2.68% |
| **PLHb** | Brockman Iron Formation" banded iron-formation, chert and pelite | 489.99 | 1.54% |
| **PLHj** | Weeli Wolli Formation: banded iron-formation (commonly jaspilitic), pelite and numerous metadolerite sills | 45.66 | 0.14% |
| **Qa** | Alluvium – unconsolidated silt, sand and gravel; in drainage channels and on adjacent floodplains | 4391.04 | 13.76% |
| **Qc** | Colluvium – unconsolidated quartz and rock fragments in soil; locally derived soil and scree and talus deposits | 1621.20 | 5.08% |
| **Ql** | Lacustrine deposits – clay and silt; claypan (predominantly fresh water) deposits | 171.46 | 0.54% |
| **Qs** | Eolian deposit – sand; in sheets and longitudinal dunes | 1772.80 | 5.55% |
| **Qw** | Alluvium and colluvium – red brown sandy and clayey soil; on low slopes and sheetwash areas | 14054.37 | 44.03% |

### 2.1.2 WETLANDS AND DRAINAGE

The survey area is in the Fortescue and Upper Fortescue River catchments (DWER 2018) and intersects the Fortescue Marsh and several non-perennial/intermittent drainage lines including Weeli Wolli creek.

The central portion of the survey area includes part of the Fortescue Marsh. The hydrology of the Marsh is described in some detail in Markey (2016). In summary, the Upper Fortescue River catchment terminates in the Fortescue Marsh, which has little surface connection to the Lower Fortescue River catchment west of the Goodiadarrie Hills. These hills form a barrier between the two sub-catchments such that they are only rarely connected following large flood events. The Marsh is fed by direct rainfall, surface runoff and groundwater sources, however, except for some permanent pools east of the study area, is only filled during years of extreme rainfall. The Fortescue Marsh wetland is considered to be saline, with surface waters becoming more saline over time due to the high evaporation rate.

The Fortescue Marsh is listed in the Directory of Important Wetlands of Australia as a *Wetland of National Significance* (Australian Government & Department of Agriculture Water and the Environment [DAWE] 2010) as it satisfies the following criteria for inclusion:

1. It is a good example of a wetland type occurring within a biogeographic region in Australia.
2. It is a wetland which plays an important ecological or hydrological role in the natural functioning of a major wetland system/complex.
3. It is a wetland which is important as the habitat for animal taxa at a vulnerable stage in their life cycles, or provides a refuge when adverse conditions such as drought prevail.
4. The wetland is of outstanding historical or cultural significance.

### 2.1.3 GROUNDWATER DEPENDENT ECOSYSTEMS

The Groundwater Dependent Ecosystems Atlas (BoM 2021b) indicates that the survey area is considered as having a high potential for terrestrial GDEs to occur where it intersects the Fortescue Marsh, with an IDE likelihood of 10 (high).

### 2.1.4 ENVIRONMENTALLY SENSITIVE AREAS

There are a number of areas around Western Australia identified as being of environmental significance within which the exemptions to the Native Vegetation Clearing Regulations do not apply. These are referred to as Environmentally Sensitive Areas (ESAs), and are declared under section 51B of EP Act and described in the *Environmental Protection (Environmentally Sensitive Areas) Notice*.

The survey area intersects one ESA, corresponding with the Fortescue Marsh (Landgate 2021). The next closest ESA is Karijini National Park, located approximately 30 km west of the survey area.

### 2.1.5 CONSERVATION LANDS

The National Reserve System is a network of protected areas managed for conservation under international guidelines. The objective of placing areas of bushland into the Conservation Estate is to achieve and maintain a comprehensive, adequate and representative reserve system for Western Australia. The Conservation and Parks Commission is the vesting body for conservation lands, forest and marine reserves that are managed by DBCA.

The survey area does not intersect with any conservation estate, i.e. it does not correspond with any Nature Reserves, National Parks or other areas vested for conservation. The nearest conservation estate is Karijini National Park, located approximately 30 km west of the survey area and Mungaroona Nature Reserve, located approximately 70 km north of the survey area.

A section of the survey area corresponds with DBCA Lands of Interest, part of a 2015 excision from Marillana Station that is proposed for conservation. The total area that intersects the survey area is 4,367.07 ha (**Map 4**).

### 2.1.6 LAND USE HISTORY

Dominant land uses in the survey area and surrounding areas include grazing, native pastures, Conservation and Aboriginal Reserves and mining leases. The survey area is intersected by pastoral station and exploration infrastructure and tracks.

## 2.2 BIOLOGICAL ENVIRONMENT

### 2.2.1 BIOGEOGRAPHIC REGION

Biogeographic regions are delineated on the basis of similar climate, geology, landforms, vegetation and fauna and are defined in the Interim Biogeographical Regionalisation for Australia (IBRA) (Department of Agriculture Water and the Environment 2020).

The survey area is located in the Pilbara IBRA region in the Chichester (PIL1) and Fortescue (PIL2) subregions, described as follows.

The Chichester subregion, as described by Kendrick & McKenzie (2001) is:

> *The Chichester subregion (PIL 1) comprises the northern section of the Pilbara Craton. Undulating Archaean granite and basalt plains include significant areas of basaltic ranges. Plains support a shrub steppe characterised by Acacia inaequilatera over Triodia wiseana (formerly Triodia pungens) hummock grasslands, while Eucalyptus leucophloia tree steppes occur on ranges. The climate is Semi-desert-tropical and receives 300 mm of rainfall annually. Drainage occurs to the north via numerous rivers (e.g. De Grey, Oakover, Nullagine, Shaw, Yule, Sherlock). Subregional area is 9,044,560 ha.*

The Fortescue subregion, as described by Kendrick (2001) is:

> *Alluvial plains and river frontage. Extensive salt marsh, mulga-bunch grass, and short grass communities on alluvial plains in the east. Deeply incised gorge systems in the western (lower) part of the drainage. River gum woodlands fringe the drainage lines. Northern limit of Mulga (Acacia aneura). An extensive calcrete aquifer (originating within a palaeo-drainage valley) feeds numerous permanent springs in the central Fortescue, supporting large permanent wetlands with extensive stands of river gum and cadjeput Melaleuca woodlands. Climatic conditions are semi desert tropical, with average rainfall of 300 mm, falling mainly in summer cyclonic events. Drainage occurs to the north-west. Subregional area is 2,041,914 ha.*

### 2.2.2 PRE-EUROPEAN VEGETATION

During the 1970s, John Beard and associates conducted a systematic survey of native vegetation, describing the vegetation systems in Western Australia at a scale of 1:250 000 in the south-west and at a scale of 1:1,000,000 in less developed areas.

Beard's vegetation maps attempted to depict the native vegetation as it was presumed to be at the time of settlement and is known as the pre-European vegetation type and extent. Beard's vegetation maps have since been developed in digital form by Shepherd, Beeston & Hopkins (2002) and updated by DPIRD (2019). Extents are updated every two years by DBCA (2019a). This mapping indicates that the survey area intersects eight pre-European vegetation units:

- Association 29 described as: Sparse low woodland; mulga, discontinuous in scattered groups
- Association 93 described as: Hummock grasslands, shrub steppe; kanji over soft spinifex
- Association 111 described as: Hummock grasslands, shrub steppe; *Eucalyptus gamophylla* over hard spinifex
- Association 157 described as: Hummock grasslands, grass steppe; hard spinifex, *Triodia wiseana*
- Association 173 described as: Hummock grasslands, shrub steppe; kanji over soft spinifex & *Triodia wiseana* on basalt
- Association 175 described as: Short bunch grassland - savanna/grass plain (Pilbara)
- Association 562 described as: Mosaic: Low woodland; mulga in valleys / Hummock grasslands, open low tree-steppe; snappy gum over *Triodia wiseana*
- Association 676 described as: Succulent steppe; samphire.

The pre-European vegetation associations identified from the survey area (DPIRD 2019) and their pre-European and current extents are listed in **Table 4** (DBCA 2019a) and shown on **Map 3**.

**Table 4: Pre-European vegetation association representation (DBCA 2019a)**

| Region | Vegetation association | Original extent (ha) | Current extent (ha) | % remaining |
|---|---|---|---|---|
| Western Australia | 29 | 7,903,991.45 | 7,898,973.24 | 99.94 |
| | 93 | 3,044,309.52 | 3,040,640.98 | 99.88 |
| | 111 | 762,963.55 | 762,326.22 | 99.92 |
| | 157 | 502,728.56 | 499,311.84 | 99.32 |
| | 173 | 1,753,104.09 | 1,748,260.83 | 99.72 |
| | 175 | 526,957.95 | 524,640.18 | 99.56 |
| | 562 | 103,606.82 | 103,606.82 | 100.00 |
| | 676 | 2,063,413.95 | 1,963,881.55 | 95.18 |
| IBRA biogeographic region (Pilbara) | 29 | 1,133,219.76 | 1,131,712.01 | 99.87 |
| | 93 | 3,042,114.27 | 3,038,471.67 | 99.88 |
| | 111 | 550,286.99 | 550,232.45 | 99.99 |

| | 562 | 38,534.42 | 38,534.42 | 100.00 |
| | 676 | 65,526.68 | 65,518.78 | 99.99 |

### 2.2.1 PREVIOUS VEGETATION MAPPING

Previous vegetation mapping is available for numerous surveys as listed in **Section 2.3** with codes and descriptions available for the majority of these surveys. The previous mapping covers a large proportion of the survey area (82.3%). The following vegetation types have been described within the survey area from the combined previous surveys outlined in **Section 2.3**:

- AaAbTe: *Acacia aneura* mid open woodland with occasional *Acacia rhodophloia x sibirica* and *Eucalyptus leucophloia* subsp. *leucophloia* over *Acacia bivenosa, Eremophila forrestii* and *Eremophila cuneifolia* mid shrubland over *Triodia epactia* low open hummock grassland
- AaAsCc: *Acacia aneura* and *Acacia pruinocarpa* woodland over *Acacia synchronicia* shrubland over **Cenchrus ciliaris* and **Cenchrus setiger* tussock grassland
- AaAsCc: *Acacia aptaneura* low woodland over *Acacia synchronicia, A. tetragonophylla* and *Senna artemisioides* subsp*. oligophylla* mid sparse shrubland over **Cenchrus ciliaris* mid closed tussock grassland
- AaAsEs: *Acacia aneura* low to mid open woodland over *Acacia synchronicia* tall shrubland to open shrubland over *Eragrostis setifolia* low sparse grassland
- AaAsTp: *Acacia aneura, Acacia aptaneura* and *Acacia pruinocarpa* low woodland to open woodland over *Acacia synchronicia* and *Psydrax latifolia* tall open shrubland over *Triodia pungens* low hummock grassland
- AaEfTp: *Acacia aneura, Acacia pruinocarpa* and *Acacia aptaneura* low woodland over *Eremophila forrestii, Acacia ancistrocarpa* and *Acacia tetragonophylla* tall open shrubland over *Triodia pungens* low hummock grassland
- AaPiCf: *Acacia aneura* low woodland over *Psydrax latifolia, Acacia tetragonophylla* and *Acacia synchronicia* tall open shrubland over *Chrysopogon fallax* and **Cenchrus ciliaris* low to mid open tussock grassland
- AaPlTp: *Acacia ayersiana* x with isolated *Eucalyptus leucophloia* subsp. *leucophloia* woodland over *Petalostylis labicheoides, Dodonaea petiolaris* and *Acacia synchronicia* mid to tall shrubland over *Triodia pungens* and *Triodia basedowii* mid sparse hummock grassland
- AaSaEp: *Acacia aptaneura* and *A. pruinocarpa* low woodland over *Senna artemisioides* subsp. *oligophylla*, *Ptilotus obovatus* and *Acacia tetragonophylla* mid open shrubland over *Enneapogon polyphyllus, Aristida contorta* and *Chrysopogon fallax* low grassland
- AaTb: *Acacia ancistrocarpa, Grevillea wickhamii* and *Acacia pachyacra* mid open shrubland over *Triodia basedowii* and *T. schinzii* low hummock grassland with *Corymbia opaca* low scattered trees
- AaTp: *Acacia aptaneura* and *A. pruinocarpa* low woodland over *Triodia pungens* and **Cenchrus ciliaris* hummock grass mid hummock grassland/ tussock grassland
- AcAhCc: *Acacia citrinoviridis* and *Acacia pruinocarpa* low open woodland over *Atalaya hemiglauca* and *Hakea lorea* subsp. *lorea* tall isolated shrubland over **Cenchrus ciliaris* mid tussock grassland
- AcAsCc: *Acacia citrinoviridis* and *Atalaya hemiglauca* low woodland over *Acacia sclerosperma* subsp. *sclerosperma, Senna artemisioides* subsp. *helmsii* and *Acacia pyrifolia* var. *pyrifolia* mid sparse shrubland over **Cenchrus ciliaris* low tussock grassland
- AdAh: *Acacia dictyophleba* and *Grevillea juncifolia* subsp. *juncifolia* and *Crotalaria cunninghamii* tall open shrubland over *Aristida holathera* var. *holathera* and *Triodia schinzii* low tussock grassland/ hummock grassland
- AdTe: *Acacia dictyophleba* tall open shrubland over *Triodia epactia* mid hummock grassland
- AiDpAh: *Acacia incurvaneura, A. pruinocarpa* and *A. citrinoviridis* mid to low woodland over *Dodonaea petiolaris, A. tetragonophylla* and *A. arida* mid sparse shrubland over *Aristida holathera* var. *holathera, Enneapogon polyphyllus* and *Sporobolus australasicus* low grassland
- AiTb: *Acacia inaequilatera*, *Acacia bivenosa* and *Acacia pyrifolia* var. *pyrifolia* mid to tall shrubland over *Triodia basedowii* and *Triodia longiceps* low sparse hummock grassland
- AiTp: *Acacia inaequilatera, Acacia bivenosa* and *Acacia pyrifolia* var. *pyrifolia* mid to tall shrubland over *Triodia basedowii* and *Triodia longiceps* low sparse hummock grassland
- AiTp: *Acacia inaequilatera, Acacia pyrifolia* var. *pyrifolia* and *Grevillea pyramidalis* subsp. *pyramidalis* tall sparse shrubland over *Triodia pungens, Triodia wiseana* and *Triodia basedowii* low hummock grassland

- AlOc: *Aristida latifolia, Aristida inaequiglumis* and *Eriachne ciliata* mid sparse grassland over *Oldenlandia crouchiana, Heliotropium crispatum* and *Operculina aequisepala* low sparse herbland
- ApAdCc: *Acacia pruinocarpa, Corymbia hamersleyana* and *Acacia citrinoviridis* low to mid open woodland over *Acacia dictyophleba, Hakea lorea* subsp. *lorea* and *Acacia synchronicia* tall sparse shrubland over **Cenchrus ciliaris* and **Cenchrus setiger*
- ApAiTp: *Acacia pruinocarpa* and *Acacia citrinoviridis* low open woodland over *Acacia inaequilatera*, *Eremophila longifolia* and *Acacia ancistrocarpa* mid to tall shrubland over *Triodia pungens* low hummock grassland
- ApTp: *Acacia pachyacra, A. ancistrocarpa* and *A. inaequilatera* mid sparse shrubland over *Triodia pungens*, **Cenchrus ciliaris* and *Eragrostis eriopoda* low hummock grassland/ tussock grassland
- AsCc: *Acacia synchronicia* mid sparse shrubland over *Atriplex amnicola, Maireana pyramidata* and shrubland *Rhagodia eremaea* mid chenopod open shrubland
- AsCc1: *Acacia synchronicia* tall open shrubland over **Cenchrus ciliaris, Sclerolaena costata* and *Trianthema triquetrum* low open chenopod shrubland/ tussock grassland
- AtSaTp: *Acacia tumida* var. *pilbarensis, Grevillea wickhamii* subsp. *hispidula and Gossypium robinsonii* low open mallee shrubland over *Senna artemisioides* subsp. *oligophylla* and *Acacia adoxa* var. *adoxa* sparse heath shrubland over *Triodia pungens* hummock grassland
- CoAaTp: *Corymbia opaca, Acacia inaequilatera* and *Eucalyptus gamophylla* low open woodland over *Acacia ancistrocarpa, Petalostylis labicheoides* and *Grevillea wickhamii* subsp*. hispidula* tall shrubland over *Triodia pungens* low hummock grassland
- CoAdTs: *Corymbia opaca* and *Eucalyptus gamophylla* low isolated trees over *Acacia dictyophleba, Hakea chordophylla* and *Acacia ancistrocarpa* tall sparse shrubland over *Triodia schinzii, Triodia basedowii* and *Triodia pungens* low hummock grassland
- CoAsTb: *Corymbia opaca, Eucalyptus gamophylla* and *Acacia inaequilatera* low open woodland over *Acacia sclerosperma* subsp. *sclerosperma, Acacia dictyophleba* and *Acacia inaequilatera* tall sparse shrubland over *Triodia basedowii* low hummock grassland
- CoAsTp: *Corymbia opaca* and *Acacia inaequilatera* low to mid open woodland over *Acacia sclerosperma* subsp. *sclerosperma, Acacia dictyophleba* and *Acacia pachyacra* tall sparse shrubland over *Triodia pungens* low hummock grassland
- ElGwTs: *Eucalyptus leucophloia* subsp. *leucophloia* low open woodland over *Grevillea wickhamii* subsp. *hispidula* and *Acacia bivenosa* tall sparse shrubland over *Triodia* sp. Shovelanna Hill (S. van Leeuwen 3835) and *Triodia epactia* low hummock grassland.
- ElGwTv: *Eucalyptus leucophloia* subsp. *leucophloia* low open woodland over *Grevillea wickhamii*, *Acacia bivenosa* and *Senna glutinosa* subsp. x *luerssenii* mid sparse shrubland over *Triodia vanleeuwenii* and *Fimbristylis simulans* low hummock grassland/ sedgeland
- EvAcCc: *Eucalyptus victrix* and *Eucalyptus camaldulensis* subsp. *refulgens* mid woodland over *Acacia citrinoviridis*, *A. pyrifolia* var. *pyrifolia* and *A. tumida* var. *pilbarensis* tall sparse shrubland over **Cenchrus ciliaris*, *Tephrosia rosea* var. Fortescue creeks (M.I.H. Brooker 2186)
- EvAhCc: *Eucalyptus victrix, Acacia citrinoviridis* and *Acacia pruinocarpa* mid open woodland over *Atalaya hemiglauca* and *Hakea lorea* subsp. *lorea* tall isolated shrubland over **Cenchrus ciliaris* and **Cenchrus setiger* mid tussock grassland
- SsCc: **Cenchrus ciliaris* and *Aristida inaequiglumis* low tussock grassland with *Stylobasium spathulatum* mid isolated shrubs
- SsTs: *Stylobasium spathulatum* and *Acacia dictyophleba* tall sparse shrubland over *Triodia schinzii* and *Triodia basedowii* low hummock grassland.

The above descriptions do not take into consideration taxonomic (name) changes since survey.

### 2.2.2 THREATENED AND PRIORITY ECOLOGICAL COMMUNITIES

Threatened and Priority Ecological Communities (TEC/PECs) occurring within a 50 km buffer of the survey area were identified by a *Protected Matters Search Tool* (PMST) search (DAWE 2021, search reference

IEFI1W) and DBCA database search request (search reference 07-0321EC). No EPBC-listed TECs were identified by the PMST search. The results of the DBCA search are indicated in **Table 5** and shown on **Map 4**. PECs identified as intersecting the survey area are highlighted in blue.

**Table 5: TECs and PECs identified by the DBCA database search**

| Ecological Community | BC Act status | WA status |
|---|---|---|
| *Brockman Iron cracking clay communities of the Hamersley Range* | - | Priority 1 PEC |
| *Fortescue Marsh (Martuyitha) (Marsh Land System)* | | Priority 1 PEC |
| *Four plant assemblages of the Wona Land System* (previously 'Cracking clays of the Chichester and Mungaroona Range') | - | Priority 1 PEC |
| *Freshwater claypans downstream of the Fortescue Marsh - Goodiadarrie Hills on Mulga Downs Station* | - | Priority 1 PEC |
| *Kumina Land System* | - | Priority 3 PEC |
| *Narbung Land System* | - | Priority 3 PEC |
| *Riparian flora and plant communities of springs and river pools with high water permanence of the Pilbara Region* | - | Priority 2 PEC |
| *Vegetation of sand dunes of the Hamersley Range/Fortescue Valley* | - | Priority 3 PEC |
| *Weeli Wolli Spring Community* | - | Priority 3 PEC |

### 2.2.3 THREATENED AND PRIORITY FLORA

The PMST search (as above) identified no EPBC-listed TF that are known to occur within the 50 km search buffer area.

A search of the DBCA databases (search reference 15-0221FL) was conducted using a 50 km buffer around the supplied shapefiles. The results incorporate the TPFL List, taken from Threatened and Priority Flora Report Forms and DBCA surveys, and WA Herb, taken from vouchered specimens held in the Western Australian Herbarium. **Map 4** shows the locations of conservation-listed flora identified by the DBCA database search.

Fortescue maintains a database of conservation-listed flora and other flora of conservation interest associated with its operational and exploration tenements. This database consists of DBCA database search results requested for flora and vegetation assessments and the results of field surveys it has commissioned. The resultant list, and associated location data, provides a comprehensive understanding of the conservation significant flora and other flora of conservation interest (e.g. significant range extensions, unusual forms) within and close to the survey area. **Map 4** shows the locations of conservation-listed flora identified by Fortescue's significant flora database.

The combined database searches identified 73 vascular flora taxa, listed in **Table 18** in **Appendix Three**, consisting of one TF (see below), 13 P1, 14 P2, 38 P3 and seven P4 taxa.

#### 2.2.3.1 *Seringia exastia* (TF)

*Seringia exastia* (TF) was identified by the database searches. The recent advice provided by DBCA (19/2/2021) with database search results (reproduced below) indicates this species' listing as TF is a technicality based on outdated taxonomy:

> *The search results include records for Seringia exastia. S. exastia (previous known as Keraudrenia exastia) was a species only known from the Kimberley Region. A recently completed taxonomic study that assessed genomic and morphological characters in several Seringia taxa (Wilkins & Whitlock 2016) has concluded that Seringia exastia and S. elliptica are the same species. The taxonomy of the genus has been revised to synonymise S. exastia and S. elliptica under the oldest valid name of S. exastia. As S. elliptica is common and widespread throughout the Pilbara region, central WA and the Northern Territory and extends into South Australia, following the taxonomic revision S. exastia is now considered common and widespread.*

*A nomination to delist the species due to no plausible significant threats to the species has been prepared and considered by the WA Threatened Species Scientific Committee (TSSC). We anticipate that at the next TSSC meeting recommendations will be made to the Minister to delist. However until changes are officially made to the threatened species list, S. exastia is still legally listed as threatened flora, and authorisation to take under section 40 of the Biodiversity Conservation Act 2016 is still required. Although some loss of plants is likely to have occurred and will continue to occur during mining and road works in some parts of the species' distribution, this is not expected to be significant in the context of the entire population. Therefore there should be no impediments to granting authorisation, following the standard process of application made to DBCA's Species and Communities Program.*

*To reduce timeframes and costs associated with approvals under the BC Act, DBCA will not require the standard targeted surveys to be undertaken to inform the threatened flora authorisation impact assessment for Seringa exastia. However, survey reports should still consider Seringia exastia as a listed threatened species and note the presence of the species within a survey area when encountered. Authorisation applications with basic details that the species is known to occur within the applied project area will be accepted and fast-tracked for approval.*

#### 2.2.3.2 Threatened and Priority Flora Likelihood Assessment

Ecoscape conducted a likelihood assessment to identify the TF and PF species that have potential to occur within the survey area. Information to assess the likelihood of a species occurring includes the following sources: ecology as listed on *FloraBase* (WAH 1998-2021; 2021, including specimen collection information) and information from recent nearby surveys, incorporating an assessment of habitats likely to be present in the survey area.

The attributes taken into consideration were:

- broad soil type usually associated with the species
- broad landform usually associated with the species
- usual vegetation (characteristic species) with which the species is usually associated
- species having previously been recorded from within approximately 20 km of the survey area (considered as 'nearby') taking locational accuracy into consideration
- time since recorded (i.e. within the previous 25 years), taking into consideration land use changes since collection
- reliability of record: species identified by only a TPFL record, without an accompanying verified vouchered specimen, may have been incorrectly identified or been subject to taxonomic updates since the record was entered
- number of records for the species
- if the record is for a not naturally occurring population (planted).

The likelihood rating is assigned using the categories listed in **Table 6**.

**Table 6: Categories for likelihood of occurrence of TF and PF**

| Likelihood Category | Criteria |
|---|---|
| **Known to occur** | Species previously recorded within the survey area. |
| **Likely to occur** | Suitable habitat is known to occur within the survey area and multiple records of the species exist within close proximity* |
| **May occur** | Suitable habitat is expected to occur within the survey area and the species has previously been recorded within proximity** |
| **Unlikely to occur** | Suitable habitat is expected to occur within the survey area however previous records are limited and/or historic and/or not in proximity**<br>OR<br>Suitable habitat is not expected to occur within the survey area although previous records exist in proximity** |
| **Very Unlikely to occur** | Suitable habitat is not expected to occur in the survey area<br>AND/OR<br>previous records are limited and/or historic and/or not in proximity** |

* close proximity = 12 km (¼ of the distance of the database search buffer)
** proximity = 25 km (½ of the distance of the database search buffer)

The likelihood assessment is available in **Table 18** in **Appendix Three**. Ten conservation-listed flora taxa have been previously recorded from within the survey area. Three P1, seven P3 and two P4 were identified as Likely to occur based on the information available during the desktop assessment and were prioritised for field survey.

The likelihood of occurrence was re-evaluated following the field survey when actual survey area characteristics (vegetation types, vegetation condition, visibility for individual species) were better understood, and the level of survey effort was considered. The post-survey likelihood is also incorporated into this table and discussed further in **Section 5.1.1.2**.

## 2.3 RELEVANT LITERATURE

The survey area has been subject to numerous previous flora and vegetation surveys that encompass the majority of the survey area has been subject to several previous flora and vegetation surveys as follows:

- Ecoscape (2018) *Fortescue Valley Flora and Vegetation Survey*, unpublished report for Fortescue Metals Group Ltd. This detailed survey includes the southern extent of the survey area (**Map 5**). Occurrences of the *Vegetation of sand dunes of the Hamersley Range/Fortescue Valley* PEC were mapped in detail within the survey area. The Ecoscape (2018) survey area also falls directly adjacent to the Billiards North survey area.
- Markey (2016) *Floristic Survey and Mapping of the Riparian and Halophyte Dominated Communities on the Fortescue Marsh (Martuyitha), Western Australia.* Areas of the central portion have been mapped that correspond with the Fortescue Marsh or adjacent vegetation.
- Cardno (2012a) *Addendum: Nyidinghu Flora and Vegetation Assessment*, prepared for Fortescue Metals Group. Mapping available from this survey corresponds with a portion of the *Vegetation of sand dunes of the Hamersley Range/Fortescue Valley* PEC.
- Cardno (2012b) *Nyidinghu flora and vegetation assessment*, unpublished report for Fortescue Metals Group. This survey includes the southern extent of the survey area.
- Cardno (2012c) *Nyidinghu Rail Spur Flora and Vegetation Assessment*, report prepared for Fortescue Metals Group. This survey area intersects the majority of the survey area from north to south with the exception of the option leading to the Cloudbreak Mine Site.
- ENV Australia Pty Ltd (2011a) *Cloudbreak Flora and Vegetation Assessment*, unpublished report for Fortescue Metals Group Limited. Vegetation mapping is available for a small section of the survey area close to Cloudbreak Mine Site.
- Coffey Environments (2007) *Supplementary Vegetation and Flora Surveys of the Port Hedland to Cloudbreak Rail Corridor and Associated Borrow Pits and Infrastructure*. Small sections from the northern extent of the survey area are included.

- Mattiske Consulting Pty Ltd (2007) *Flora and Vegetation near Fortescue Marshes*, unpublished report for Fortescue Metals Group Ltd. Vegetation mapping is available near the division of the Transport Corridor survey area.
- Mattiske Consulting Pty Ltd (2005) *Flora and Vegetation on the Cloudbreak and White Knight Leases*, unpublished report for Fortescue Metals Group Ltd. Small areas intersect the survey area towards the northern end.
- Biota Environmental Sciences (2004a) *Vegetation and Flora Survey of the Proposed FMG Stage A Rail Corridor*, unpublished report for Fortescue Metals Group Ltd. This survey area intersects a large proportion of the survey area from north to south with the exception of the option leading to the Cloudbreak Mine Site.
- Biota Environmental Sciences (2004b) *Vegetation and Flora Survey of the Proposed FMG Stage B Rail Corridor and Mines Areas*, unpublished report for Fortescue Metals Group Ltd. This survey intersects small portions of the survey area near the northern extents of the transport corridor options.
- ATA Environmental (N/A) *Supplementary Flora Survey.* This survey intersects the northernmost extent of the survey area.

The extent of these previous surveys within the Nyidinghu Transport Corridor survey area is shown in **Map 5**.

The following documents have been reviewed for relevance to the current investigation:

- Ecologia Environment (2016) *Pilbara Bulk Ore Transportation System Project. Assessment on Proponent Information - Environmental Review Document*, report prepared for Mineral Resources Limited
- Lyons (2015) *The riparian flora and plant communities of the Pilbara region of Western Australia*
- Rio Tinto (2016) *Yandicoogina Pocket and Billiard South: detailed responses to public submissions in relation to flora and vegetation*
- Phoenix Environmental Sciences (2014a) *Flora and fauna desktop review for the Extension Project and Bulk Sample*, report prepared for Maiden Iron Pty Ltd
- Phoenix Environmental Sciences (2014b) *Flora and vegetation survey for the Extension Projec*t, report prepared for Australian Aboriginal Mining Corporation Pty Ltd
- ENV Australia Pty Ltd (2013) *Christmas Creek Life of Mine flora and vegetation assessment – update*, unpublished report for Fortescue Metals Group Ltd
- EPA (2013) *Environmental and water assessments relating to mining and mining-related activities in the Fortescue Marsh management area. Advice of the Environmental Protection Authority to the Minister for Environment under Section 16(e) of the Environmental Protection Act 1986*
- Astron Environmental Services (2012a) *Cloudbreak Life of Mine Conservation Significant Flora Survey Phase 1*, report prepared for Fortescue Metals Group Limited
- Astron Environmental Services (2012b) *Iron Valley Project Flora and Vegetation Survey*, unpublished report for URS Australia Pty Ltd on behalf of Iron Ore Holdings Ltd
- Biota Environmental Sciences (2012) *A vegetation and flora survey of the Koodaideri study area*, report prepared for Rio Tinto
- Astron Environmental Services (2011) *Literature Review on Samphire Vegetation Focusing on the Water Requirements of the Community Associate with Fortescue Marsh*, unpublished report prepared for Fortescue Metals Group Limited
- G&G Environmental Pty Ltd (2011) *Flora and vegetation surveys of the FerrAus Limited rail corridor options*, unpublished report for FerrAus Ltd
- Mattiske Consulting Pty Ltd (2011) *Review of Flora and Vegetation Along Weeli Wolli, Mindy Mindy and Coondiner Creeklines*, unpublished report for Rio Tinto
- Onshore Environmental (2011) *Area C and Surrounds Flora and Vegetation Survey*, report prepared for BHP Billiton Iron Ore
- ENV Australia Pty Ltd (2010a) *Christmas Creek flora and vegetation assessment*, unpublished report for Fortescue Metals Group Ltd
- Batini (2009) *Eucalyptus victrix, Karijini National Park*, report to EPA

- Department of Environment and Conservation (2009) *Resource Condition Report for Significant Western Australian Wetland. Wetlands of the Fortescue River System*
- Ecologia Environment (2009a) *Brockman Resources Limited Marillana (E47/1408) Vegetation and Flora Report Version 5*, unpublished report for Brockman Resources Limited
- Ecologia Environment (2009b) *Roy Hill 1 Project Flora and Vegetation Assessment*, unpublished report for Hancock Prospecting Pty Ltd
- Ecologia Environment (2009c) *Roy Hill 1 Infrastructure flora assessment*, unpublished report for Hancock Prospecting Pty Ltd

- Mattiske Consulting Pty Ltd (2009c) *Review of flora and vegetation on Mindy Mindy and unnamed transects north of Hope Downs 4 2008 and 2009*, unpublished report for Rio Tinto
- Ecologia Environment (2008) *BHP Billiton Iron Ore Rapid Growth Project 5 (RGP5) Chichester Deviation Vegetation and Flora Report (Version 3)*, unpublished report for BHPBIO
- Mattiske Consulting Pty Ltd (2008) *Review of flora and vegetation on Coondiner and Kalgan Creeks north of Hope Downs 4*, unpublished report for Rio Tinto
- Greg Barrett & Associates Pty Ltd (2005) *Likely Impact of Drawdown of Groundwater from the Cloud Break Operations on Vegetation Communities.*

Common factors that are considered to be environmentally significant in many of the above documents and are also likely to be significant within the survey area are:

- PECs
- Groundwater Dependent Vegetation (GDV) or Potential GDV
- Sheet Flow Dependent Mulga vegetation
- Priority Flora species.

# 3 METHODS

## 3.1 SURVEY AIMS

The aims of the Detailed flora and vegetation survey were to:

- assess vegetation types and condition occurring within areas not previously surveyed and re-sample existing quadrats to inform vegetation mapping and condition in areas previously surveyed
- determine the regional significance of vegetation types identified as limited in spatial distribution within the survey area
- conduct target searches for and map the occurrences of conservation-listed flora and communities, and determine their regional significance
- identify and map the abundance of weed species and assess their impact on vegetation health
- prepare a comprehensive flora and vegetation report and associated data.

## 3.2 GUIDING PRINCIPLES

The flora and vegetation survey was conducted as a Detailed survey according to the Flora and Vegetation Technical Guidance (EPA 2016). The EPA considers that a Detailed survey requires:

- a comprehensive survey design, including giving consideration to the survey timing that should be conducted during the primary season of survey for the bioregion and disturbance events, and the potential requirement for supplementary surveys
- a minimum of three quadrats (in proportion to the extent of the vegetation unit), located throughout each preliminary vegetation types sampled throughout its geographic range, with additional quadrats and rescoring during supplementary surveys to clarify vegetation unit boundaries
- regional surveys if there is insufficient information available (identified during the desktop assessment) to provide local and regional context
- the survey may include a number of sampling techniques including quadrats, relevés, transects and traverses, as well as opportunistic observations
- the flora inventory should be comprised of data collected from quadrats and relevés, supplemented by opportunistic observations, systematic surveys and targeted inspections of various habitat areas
- it may be appropriate to increase survey effort in areas of unusual habitat
- sampling sites that are placed at representative locations throughout the survey area considering landform, geology, elevation, slope, aspect, surface or groundwater expression and soil type, as well as vegetation structure, composition and condition.

Targeted searches were also conducted in areas of habitat suitable for TF and PF identified during the desktop assessment and previous surveys as having potential to occur. The EPA considers that a Targeted survey requires:

- adequate survey design that considers survey timing for the botanical province
- one or more site visits by an experienced botanist to record locations of significant flora and/or vegetation
- systematic searches for significant flora and vegetation in all potentially suitable habitats, including where habitats extend outside the survey boundary
- follow-up Targeted survey (if necessary) where significant flora or vegetation is found during opportunistic sampling
- local or regional Targeted surveys if the results indicate that impacts are likely to occur to significant flora and vegetation.

## 3.3 FIELD SURVEY

### 3.3.1 FIELD SURVEY METHODS

The methods utilised during the field survey followed those outlined in the Flora and Vegetation Technical Guidance (EPA 2016), conducted as a Detailed survey. The surveys were also conducted in accordance with Fortescue's *Flora and Vegetation Assessment Guidelines* (100-GU-EN-005) (Fortescue 2014).

Conservation criteria used in this assessment are outlined in **Table 12**, **Table 13** and **Table 14** in **Appendix One**.

Survey method details are outlined below.

### 3.3.2 FIELD SURVEY TIMING

The field survey was conducted during two phases of field survey:

- 4-16 May 2021 by:
  - Stephen Kern (Principal Botanist, Flora Taking (Biological Assessment) Licence FB62000001; Threatened Flora Collecting Permit TFL74-1920)
  - Kyla Pannell (Botanist, FB62000261)
  - Louisa Carlsson (Ecologist, FB62000295)
  - Julia Mattner (Senior Botanist)
  - Sophie Cochrane (Environmental Scientist)
  - Nicola Storey (Environmental Scientist)
- 16-25 July 2021 by:
  - Stephen Kern
  - Kyla Pannell
  - Louisa Carlsson
  - Julia Mattner.

The survey timing is within the optimal period for primary and supplementary surveys within the bioregion according the Flora and Vegetation Technical Guidance (EPA 2016).

### 3.3.3 FLORISTIC QUADRATS

Floristic quadrat ('quadrat') locations were selected using aerial photography, environmental values and field observations to represent the vegetation values existing at the site. The unmarked quadrats were 50 m x 50 m in dimension, as required according to the Flora and Vegetation Technical Guidance (EPA 2016). Where the vegetation consisted of a narrow linear corridor, quadrats were linear but of the same overall size i.e. 2,500 $m^2$.

The following information was collected from within each quadrat:

- observer
- date
- quadrat/site number
- GPS location (GDA94) of the northwest corner
- digital photograph (spatially referenced with a reference number), taken from the northwest corner, looking diagonally across the quadrat
- broad soil type and colour
- topography
- list of flora species recorded with the average height and total cover within the quadrat for each species
- vegetation description (as per below)
- vegetation condition.

At least three quadrats per vegetation type were recorded for the Detailed survey where there was sufficient extent. Quadrat locations are displayed on the **Map 7** series.

### 3.3.4 TARGETED SEARCHES

Threatened and Priority Flora identified during the desktop analysis and previous surveys as known or having potential to occur were targeted for searches in areas of potential habitat. Targeted searches were conducted in potentially suitable habitat of target species, with the remainder of the site opportunistically searched during site traverses.

The locations of all targeted taxa collected were recorded using a handheld GPS with the following data recorded:

- observer, date and time
- reproductive status and other features such as health of plants, percentage flowering and fruiting
- local abundance/population size and/or population boundary, including outside the development envelopes where possible
- landform
- brief vegetation community description
- representative photos of each species and habitat
- collection of representative specimens.

### 3.3.5 INTRODUCED SPECIES

Introduced species (weeds) were recorded during the collection of the overall flora inventory.

### 3.3.6 VEGETATION DESCRIPTION AND CLASSIFICATION

Vegetation was described from each of the quadrats using the height and estimated cover of dominant and characteristic species of each stratum based on the National Vegetation Information System (NVIS), recorded at Level V (NVIS Technical Working Group & DotEE 2017) (**Table 15** and **Table 16** in **Appendix Two**). Up to three species per stratum from each stratum (upper, mid and ground) were used to formulate vegetation descriptions for each quadrat and each vegetation type.

Vegetation type descriptions were created by combining quadrat descriptions and modifying, where necessary, based on the wider vegetation. Vegetation codes were formulated using the first letter of genus and species names of the dominant species of each stratum e.g. **AaSaEp** refers to ***A****cacia* ***a****ptaneura* low woodland over ***S****enna* ***a****rtemisioides* subsp. *oligophylla* mid open shrubland over ***E****nneapogon* ***p****olyphyllus* low grassland. Where the dominant species make up more than one version of the same code they are distinguished by a number at the end of the code (e.g. **EgAaTb$^{2}$**). Where possible, previous vegetation codes were retained. However, due to the numerous previous surveys (and inconsistently applied coding systems), much of the vegetation type attribution required updating.

### 3.3.7 VEGETATION CONDITION ASSESSMENT

Vegetation condition was assessed broadly and continuously throughout the survey area and at each quadrat using the Vegetation Condition Scale for the Eremaean Botanical Province (EPA 2016) (**Table 17** in **Appendix Two**). As quadrats are located in the best condition parts of a vegetation type, the condition rating of the quadrat may not match that of the broader vegetation type due to the scale of mapping.

## 3.4 STATISTICAL ANALYSIS

### 3.4.1 POST-SURVEY LIKELIHOOD ASSESSMENT

Following the field survey, a post-survey likelihood assessment was conducted to identify conservation-listed species that have potential to occur on site. This assessment was based on survey results, survey effort and habitat identified within in the survey area.

### 3.4.2 FLORISTIC ANALYSIS

#### 3.4.2.1 Survey Area Floristic Analysis

PATN© software (Blatant Fabrications Pty Ltd 2013) was used to undertake statistical analysis to generate floristic groups using the data collected from the quadrats and relevés, in order to better understand local significance of floristic units. PATN analysis has been used for several local floristic analyses including Gibson *et al.* (1994) for the Swan Coastal Plain.

PATN is a multivariate analysis tool that generates estimates of association (resemblance, affinity, distance) between sets of objects described by a suite of variables (attributes) and classifies the objects into groups and condenses the information and displays the patterns in the data graphically. It offers a choice of data transformations prior to multivariate analysis.

Floristic groups, identified using a dendrogram output of the analysis, are used as a tool to inform vegetation type groups at various levels and scales.

For this project the most informative analysis used the Bray Curtis similarity coefficient for rows (species) and columns (sites) as this provides a good estimation of association for ecological applications (Blatant Fabrications Pty Ltd 2013). For this analysis we used presence/absence (1/0) data for each species, deemed the most appropriate approach for data that included previous survey results.

Interpretation of these purely floristic groups into recognisable and mappable on-ground units is a tool used to identify broad vegetation types. Generally, quadrats that are closely floristically related on the dendrogram form identifiable vegetation units, however, interpretation is frequently required for imperfect results. Vegetation types are therefore determined as a combination of floristic analysis and on-ground interpretation using dominant and characteristic species.

#### 3.4.2.2 Regional Floristic Analysis

Fortescue has supplied floristic quadrat data from surveys it has commissioned in the area surrounding the survey area. This data was used in a similar manner, using PATN to identify floristic groups, to form a regional floristic analysis. In total, 2,528 sites were included in the analysis, including 230 from the survey area.

Data was reconciled by removing all singletons (i.e. those species that only occurred once within the data) and all entries with doubtful identification (i.e. those that included a '?' or were only identified to genus or family level), combining taxa where there has been taxonomic review and combining species as a *sens. lat.* where there were entries to both species and subtaxa level and it was not possible to determine which subtaxa was applicable.

The aim of the regional floristics analysis is to determine if the survey area includes unique vegetation (at a floristic level) or if it is similar to other areas at a regional scale (broad analysis). The aim is not to provide a detailed analysis and discussion regarding floristics.

The data used in this analysis was sourced from the following surveys:

- this survey, annotated as '2021_Nyidi'
- Ecoscape (2018), *Fortescue Valley Flora and Vegetation Survey*, unpublished report for Fortescue Metals Group Ltd. – annotated as 'FortValley
- Biota Environmental Sciences (2004a), *Vegetation and Flora Survey of the Proposed FMG Stage A Rail Corridor*, unpublished Report for Fortescue Metals Group Ltd – annotated as associated with Cloudbreak
- Biota Environmental Sciences (2004b), *Vegetation and Flora Survey of the Proposed FMG Stage B Rail Corridor and Mines Areas*, unpublished Report for Fortescue Metals Group Ltd – annotated as associated with Christmas Creek ('ChrisCrk')
- Cardno (2012a), *Addendum: Nyidinghu Flora and Vegetation Assessment*, prepared for Fortescue Metals Group
- Cardno (2012b), *Nyidinghu flora and vegetation assessment*, unpublished report for Fortescue Metals Group

- Cardno (2012c), *Nyidinghu Rail Spur Flora and Vegetation Assessment*, report prepared for Fortescue Metals Group

- Ecoscape (2010b), *Solomon Project Rail Re-alignment Flora and Vegetation Assessment*, unpublished report for Fortescue Metals Group Ltd, included in 'SolRail'
- ENV (2010a), *Christmas Creek flora and vegetation assessment*, unpublished report for Fortescue Metals Group Ltd
- ENV (2010b), *Solomon Project: Kings Flora and Vegetation Assessment*, unpublished report for Fortescue Metals Group Ltd
- ENV (2011b), *Christmas Creek Airstrip Flora, Vegetation and Fauna Assessment*, unpublished report for Fortescue Metals Group Ltd
- ENV (2011a), *Cloudbreak Flora and Vegetation Assessment*, unpublished report for Fortescue Metals Group Limited
- ENV (2012), *Christmas Creek Life of Mine Flora and Vegetation Assessment*, unpublished report for Fortescue Metals Group Ltd.

### 3.4.3 ADEQUACY OF SAMPLING

In order to demonstrate adequacy of sampling, a species accumulation curve was generated by the software Species Diversity and Richness IV (Pisces Conservation Ltd 2010) using five random selections of sample order, using quadrat data only.

# 4 FIELD SURVEY RESULTS

## 4.1 FLORA

### 4.1.1 QUADRAT SUMMARY

A combined total of 268 floristic quadrats are known to occur within the survey area, summarised as follows:

- 147 quadrats sampled during 2021 including:
  - 97 previously established quadrats that were resampled
  - 50 newly established quadrats (including 18 at Billiards North)
- 84 previously established by Fortescue-commissioned surveys with data available
- 37 previously established for which data is not readily accessible and potentially unreliable due to survey timeframe (pre-2010).

### 4.1.2 FLORA INVENTORY

A total of 607 vascular flora were recorded from 194 genera and 59 families from the consolidated surveys including quadrats, relevés, opportunistic observations and searches for conservation-listed flora. There were 18 introduced flora (2.97%) included in the total inventory. Forty-nine (8.07%) of the flora taxa in the inventory are not identified to species level, though only 17 of these (2.80%) were arising from 2021 surveys with the remainder from previously sampled quadrats.

The most commonly represented families were Fabaceae (122 taxa, including one introduced), Poaceae (93, five introduced) and Malvaceae (67, one introduced). The most commonly represented genera were *Acacia* with 58 taxa, *Senna* (18), *Ptilotus* and *Sida* (17 each).

The number of species per quadrat ranged from three in quadrat A130 (not resampled during 2021) to 73 in quadrat NT2111, with an average species diversity per quadrat of 29.04. The most commonly recorded species were **Cenchrus ciliaris* recorded from 114 quadrats, *Ptilotus exaltatus* (107 quadrats) *Acacia pruinocarpa* (94 quadrats) and *Sporobolus australasicus* (93 quadrats).

The combined flora inventory is presented in **Table 19** in **Appendix Four**. Quadrat data is presented in **Appendix Five**.

### 4.1.3 CONSERVATION-LISTED FLORA

#### 4.1.3.1 Threatened Flora

One Commonwealth EPBC Act or Western Australian BC Act-listed TF (*Seringia exastia*) was recorded during the field survey. The locations of *S. exastia* are indicated on **Map 6** and described in more detail in **Table 7**.

#### 4.1.3.2 Priority Flora

Twelve PF were recorded during the field survey or are known to occur based on reliable previous records:

- one Priority 1:
  - *Tecticornia* sp. Christmas Creek (K.A. Shepherd & T. Colmer et al. KS 1063)
- one Priority 2:
  - *Euphorbia inappendiculata* var. *queenslandica* (P2)
- seven Priority 3:
  - *Atriplex flabelliformis*
  - *Dolichocarpa* sp. Hamersley Station (A.A. Mitchell PRP 1479)
  - *Dysphania congestiflora*
  - *Eragrostis* sp. Erect spikelets (P.K. Latz 2122)
  - *Eremophila spongiocarpa*
  - *Stackhousia clementii*
  - *Swainsona thompsoniana*

- three Priority 4:
  - *Eremophila youngii* subsp. *lepidota*
  - *Goodenia nuda*
  - *Lepidium catapycnon.*

Locations of PF are indicated on **Map 6** and described in more detail in **Table 7**.

**Table 7: TF and PF recorded during the field survey**

| ***Seringia exastia* (T)** | |
|---|---|
| **Description:**<br>Shrub to 1 m tall with pink flowers (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on flat to gently undulating sandplains with orange-red sand.<br>**Location:** Transport corridor.<br>**Survey results**: four records with a total of 88 plants in the survey area<br>**Populations:** four populations.<br>**Known records and distribution**: According to *Atlas of Living Australia*, this species is widespread across a large portion of Western Australia and the distribution extends into the Northern Territory and South Australia (ALA 2021). |
| ***Tecticornia* sp. Christmas Creek (K.A. Shepherd & T. Colmer et al. KS 1063) (P1)** | |
| **Description:**<br>Low samphire shrub growing to 0.5 m high (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on seasonally inundated saline flats and floodplains with sandy clay soils.<br>**Location:** Transport corridor where it intersects with the Fortescue Marsh.<br>**Survey results**: 13 records with a total of 223 plants in the survey area.<br>**Populations:** two populations.<br>**Known records and distribution**: According to *NatureMap* (DBCA 2007-2021) there are 101 records of this species from the Pilbara and Little Sandy Desert, with an overall distribution of approximately 260 km (north-south) by 150 km (east-west), largely east of the survey area in Fortescue Marsh. |

| ***Euphorbia inappendiculata* var. *queenslandica* (P2)** | |
|---|---|
| **Description:**<br>Prostrate herb growing to 0.3 m high (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on cracking clays on flat landscapes.<br>**Location:** Transport corridor.<br>**Survey results**: two records with a total of 3 plants in the survey area.<br>**Populations:** two populations.<br>**Known records and distribution**: According to *NatureMap* (DBCA 2007-2021) there are 10 records of this species from the Pilbara and Ord Victoria Plain, with an overall distribution of approximately 500 km (north-south) by 1,150 km (east-west), largely west of the survey area. However, *Atlas of Living Australia* indicates this taxon has additional records across south-eastern Western Australia and is widespread in all other states of Australia (ALA 2021). |
| ***Atriplex flabelliformis* (P3)** | |
| **Description:**<br>Monoecious, erect, rounded perennial herb growing to 0.35 m high. Found in clay loam or loam soils on saline flats or marshes (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on seasonally inundated saline plains/marshes with clay/sandy clay soil.<br>**Location:** Transport corridor where it intersects with the Fortescue Marsh.<br>**Survey results**: two records with a total of 16 plants in the survey area.<br>**Populations:** one population.<br>**Known records and distribution**: According to *NatureMap* (DBCA 2007-2021) there are 51 records of this species with a scattered distribution across Western Australia of approximately 1,100 km (north-south) by 1,400 km (east-west). |

| ***Dolichocarpa* sp. Hamersley Station (A.A. Mitchell PRP 1479) (P3)** | |
|---|---|
| **Description:**<br>Small herb with blue flowers growing to 0.1 m high. Typically found in clay or loam soil on crab hole plains, gentle slopes and in drainage lines (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on plains and claypans.<br>**Location:** Northern section of the transport corridor within the Chichester Range.<br>**Survey results**: four records with a total of 102 plants in the survey area.<br>**Populations:** three populations.<br>**Known records and distribution**: According to *FloraBase* (WAH 1998-2021; 2021), there are 29 records of this species from the Pilbara region. |
| ***Dysphania congestiflora* (P3)** | |
| **Description:**<br>Erect herb growing to 10 cm tall (WAH 1998-2021; 2021).<br><br>Image unavailable | **Habitat:** has been recorded on seasonally inundated flats and saline floodplains with clay soils.<br>**Location:** Fortescue Marsh.<br>**Survey results**: not recorded during the 2021, existing reliable record from a previous survey.<br>**Known records and distribution**: According to *NatureMap* (DBCA 2007-2021) there are 10 records of this species from the Pilbara and Carnarvon regions with an overall distribution of approximately 100 km (north-south) by 600 km (east-west). Most of the records occur within the Fortescue Marsh area. |

| ***Eragrostis* sp. Erect Spikelets (P.K. Latz 2122) (P3)** | |
|---|---|
| **Description:**<br>Erect perennial grass to 30 cm high (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on saline flats and calcrete rises.<br>**Location:** transport corridor where it intersects the marsh.<br>**Survey results**: three locations were recorded where it was abundant.<br>**Populations:** one population.<br>**Known records and distribution**: According to *FloraBase* (WAH 1998-2021; 2021), there are five records of this species from the Pilbara, Great Sandy Desert and Murchison region. |
| ***Eremophila spongiocarpa* (P3)** | |
| **Description:**<br>Compact, succulent-leaved shrub growing to 1 m high with white flowers (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on floodplain margins, saline flats and clay pans.<br>**Location:** Transport corridor where it intersects the Fortescue Marsh.<br>**Survey results**: 58 records with a total of 1,496 plants in the survey area.<br>**Populations:** three populations.<br>**Known records and distribution**: According to *NatureMap* (DBCA 2007-2021) there are 117 records of this species from the Pilbara with an overall distribution of approximately 50 km (north-south) by 150 km (east-west), largely within the Fortescue Marsh area. |

| ***Stackhousia clementii* (P3)** | |
|---|---|
| **Description:**<br>Dense broom-like perennial herb growing to 0.45 m with green/yellow/brown flowers (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on low sand dunes, floodplains and salt lakes/saline plains.<br>**Location:** Transport corridor where it intersects the Fortescue Marsh.<br>**Survey results**: two records with a total of 40 plants in the survey area.<br>**Populations:** one population.<br>**Known records and distribution**: According to *NatureMap* (DBCA 2007-2021) there are 39 records of this species from the Pilbara, Carnarvon, Murchison, Great Sandy Desert, Little Sandy Desert, Central Ranges and Great Victoria Desert regions with an overall distribution of approximately 700 km (north-south) by 1,500 km (east-west), largely within the Fortescue Marsh area. |
| ***Swainsona thompsoniana* (P3)** | |
| **Description:**<br>Erect herb growing to 0.2 m high with purple flowers (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on plains and floodplains with clay/cracking clay soil.<br>**Location:** Transport corridor, north of where it intersects the Fortescue Marsh.<br>**Survey results**: one records with one plant in the survey area.<br>**Populations:** one population.<br>**Known records and distribution**: According to *NatureMap* (DBCA 2007-2021) there are 23 records of this species from the Pilbara region, with an overall distribution of approximately 200 km (north-south) by 350 km (east-west), largely west of the survey area. |

| ***Eremophila youngii* subsp. *lepidota* (P4)** | |
|---|---|
| **Description:**<br>Dense spreading shrub to 3 m high, leaves narrow and scaly with tubular pink-purple flowers.<br> | **Habitat:** has been recorded on alluvial plains and clay depressions.<br>**Location:** Transport corridor where it intersects the Fortescue Marsh.<br>**Survey results**: a single location based on a previous survey result (considered reliable).<br>**Populations:** one population.<br>**Known records and distribution**: According to *NatureMap* (DBCA 2007-2021) there are 61 records of this species from Carnarvon, Gascoyne, Little Sandy Desert and the Pilbara in Western Australia and one record from the Northern Territory, with an overall distribution of approximately 500 km (north-south) by 1,800 km (east-west). |
| ***Goodenia nuda* (P4)** | |
| **Description:**<br>Erect to ascending herb with yellow flowers (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on plains, floodplains and riparian areas.<br>**Location:** Transport corridor where it intersects with the Fortescue Marsh.<br>**Survey results**: five records with a total of 18 plants in the survey area.<br>**Populations:** three populations.<br>**Known records and distribution**: According to *NatureMap* (DBCA 2007-2021) there are 130 records of this species, largely from the Pilbara bioregion with an overall distribution of approximately 500 km (north-south) by 600 km (east-west). |

| ***Lepidium catapycnon* (P4)** | |
|---|---|
| **Description:**<br>Open, woody perennial herb or shrub growing to 0.3 m high with white flowers. Typically found in skeletal soils on hillsides (WAH 1998-2021; 2021).<br> | **Habitat:** has been recorded on rocky ironstone hills.<br>**Location:** Billiards North survey area.<br>**Survey results**: two records with a total of eight plants in the survey area.<br>**Populations:** one population.<br>**Known records and distribution**: According to *NatureMap* (DBCA 2007-2021) there are 94 records of this species from the Pilbara region with an overall distribution of approximately 150 km (north-south) by 300 km (east-west). Most of the records occur to the west and south of the survey areas. |

### 4.1.4 OTHER SIGNIFICANT FLORA

According to the criteria outlined in the Flora and Vegetation Technical Guidance (EPA 2016), *Tephrosia remotiflora* may be of significance as a range extension. This species is mostly distributed in the Kimberley region with one record in the Pilbara. A specimen was collected from quadrat C102, approximately 150 km southeast of the nearest record in the Pilbara and approximately 500 km southwest of the typical distribution in the Kimberley region.

### 4.1.5 FLORA OF TAXONOMIC INTEREST

#### 4.1.5.1 *Corchorus* aff. *tectus*

A taxon recorded as '*Corchorus* aff. *tectus*' was recorded from 13 floristic quadrats, hence relatively common within the survey area from areas of sandy soils. Ecoscape's specimens match voucher specimens housed in the Western Australian Herbarium (P. Sweeny & D. Roberts ONS MC250.06 and J. Bull & A. Buckeridge ONS MTM 60.01) that are filed under the name of *C.* aff. *tectus*. Steve Dillon, Western Australian Herbarium Taxonomist, confirmed that earlier collections by Ecoscape arising from the *Fortescue Valley Flora and Vegetation Survey* (Ecoscape 2018) match the Herbarium specimens of *C*. aff. *tectus*, which differs from *C. tectus sens. str.* by having dendritic hairs on the fruit, amongst other characteristics.

It is apparent that the collections from the survey area also match specimens described as *C. elachocarpus* (Mitchell PRP1462 and Mitchel PRP1135 from Marillana Station) in Halford (2004), with this paper noting that these collections from near the survey area differ from *C. elachocarpus* in 'having narrowly ovate leaves, longer peduncles and pedicels, and broader fruit'. The Halford (2004) publication identified that this entity warrants formal recognition.

For consistency reasons, this species is referred to as *Corchorus* aff. *tectus* in this report. This taxon is considered of taxonomic interest rather than conservation significance as it appears to be locally common.

### 4.1.6 INTRODUCED FLORA

Eighteen introduced flora species (weeds) have been recorded within the survey area, inclusive of 2021 results and previous results, representing 2.97% of the overall flora inventory.

The majority of weeds were recorded at low density. The following species were the most commonly recorded introduced species occurring and were frequently significant contributor to vegetation condition assessments:

- **Aerva javanica*
- **Cenchrus ciliaris*
- **Cenchrus setiger*
- **Bidens subalternans*
- **Malvastrum americanum.*

None of the introduced flora are Declared Pest plants or WoNS species. Nine of the species are identified as 'Priority' weeds according to a list maintained by Fortescue for management purposes, being **Aerva javanica*, **Cenchrus ciliaris, *Cenchrus setiger* (both *Cenchrus* spp. subject to pastoral exclusion areas), **Chloris virgata,* **Echinochloa colona*, **Malvastrum americanum, *Rumex vesicarius, *Setaria verticillata* and **Vachellia farnesiana*. Weed locations are presented in **Map 9** and each is described in more detail in **Table 8**.

**Table 8: Introduced flora species recorded from the survey area**

| Species | Combined results | Photo |
|---|---|---|
| ***_Aerva javanica_ (Kapok Bush)**<br><br>Perennial herb to 1.6 m high (but usually less) with greyish white flowers throughout much of the year (WAH 1998-2021).<br><br>Usually associated with disturbed areas and drainage lines, and is found throughout much of northern Western Australia.<br><br>**This species is a Fortescue 'priority' weed.** | Location: Widespread within the survey area, particularly along existing BHP rail.<br><br>Impact: significant along existing infrastructure. | |
| ***_Argemone ochroleuca_ (Mexican Poppy)**<br><br>Mexican Poppy is a prickly annual herb to 1 m high with cream or yellowish flowers mainly produced in spring.<br><br>It occurs over much of Western Australia but is more commonly recorded in the Pilbara region (WAH 1998-2021) where it generally occurs in association with rivers and creeks. | Location: Recorded from Weeli Wolli Creek at low density.<br><br>Impact: moderate within localised areas. | |

| Species | Combined results | Photo |
|---|---|---|
| ***Bidens subalternans* (Beggartick)**<br><br>Specimens of *Bidens* previously recorded as **Bidens bipinnata* have been identified as **Bidens subalternans* according to the most recent treatment of the genus in *Flora of Australia Vol. 37* (Orchard 2015). Many records of *Bidens* in the Pilbara are still listed as **B. bipinnata* (WAH 1998-2021), however, this species does not occur within Western Australia based on the recent revision of the genus. Presumably these records represent specimens yet to be formally reviewed and databased at the WAH.<br><br>**Bidens subalternans* is an annual herb growing to 1.5 m high in good conditions, although it is more typically less than 0.5 m high. It occurs over much of Western Australia north of Geraldton (WAH 1998-2021). | Location: widespread throughout the survey area. Typically recorded from Mulga dominated plains.<br><br>Impact: commonly recorded at low density so impact unlikely to be significant. | |
| ***Cenchrus ciliaris* (Buffel Grass)**<br><br>**Cenchrus ciliaris* is a perennial tussock-forming grass to 1 m high (WAH 1998-2021). It is generally associated with drainage lines and floodplains, and is more common in grazed areas. **Cenchrus ciliaris* was either deliberately planted for pasture or accidently introduced (Van Vreeswyk *et al*. 2004) , and has been known from the Pilbara bioregion since the early 1900s (Keighery 2010).<br><br>**This species is a Fortescue 'priority' weed (subject to pastoral exclusion areas).** | Location: widespread and abundant throughout the survey area, particularly from Mulga dominated flats and drainage lines. Commonly recorded from large infestations where it is a dominant component of the vegetation.<br><br>Impact: significant due to widespread distribution as a dominant component of the vegetation. | |

| Species | Combined results | Photo |
|---|---|---|
| ***Cenchrus setiger* (Birdwood Grass)**<br><br>**Cenchrus setiger* is a perennial tussock grass to 0.8 m high (WAH 1998-2021). It differs from **C. ciliaris* in its more robust seed heads but vegetatively the two are virtually identical.<br><br>It occurs over much of the northern portion of Western Australia, and, like **C. ciliaris*, has been known from the Pilbara bioregion since the early 1900s (Keighery 2010).<br><br>**This species is a Fortescue 'priority' weed (subject to pastoral exclusion areas).** | Location: widespread and abundant, particularly from the southern portion of the survey area from Mulga dominated flats and drainage lines. Frequently recorded as a dominant component of the vegetation.<br><br>Impact: significant in some locations. | |
| ***Chloris virgata* (Feathertop Rhodes Grass)**<br><br>**Chloris virgata* is an annual grass to 1 m high (WAH 1998-2021). It is widespread across Western Australia.<br><br>**This species is a Fortescue 'priority' weed.** | Location: single isolated location within the survey area.<br><br>Impact: minor | <br>Photo: Atlas of Living Australia (ALA 2021). Photo credited to Forest & Kim Starr. |
| ***Citrullus amarus* (Pie Melon)**<br><br>**Citrullus amarus* is a trailing or climbing annual herb with yellow flowers and striped or mottled melon fruits, found over much of Western Australia where it favours disturbed areas (WAH 1998-2021). | Location: two locations from a single population along Weeli Wolli Creek.<br><br>Impact: minor | |

| Species | Combined results | Photo |
|---|---|---|
| ***Citrullus colocynthis***<br><br>**Citrullus colocynthis* is a trailing or climbing perennial herb with yellow flowers and melon fruits, found over much of Western Australia where it favours disturbed areas (WAH 1998-2021). | Location: one population within the survey area based on previous data.<br><br>Impact: minor | Image unavailable |
| ***Echinochloa colona* (Awnless Barnyard Grass)**<br><br>**Echinochloa colona* is an annual grass to 0.6 m high that is widespread across the Pilbara and Kimberley regions, with isolated records in the Perth region (WAH 1998-2021).<br><br>**This species is a Fortescue 'priority' weed.** | Location: scattered existing locations. Typically recorded from drainage lines or Mulga groves.<br><br>Impact: minor | |
| ***Flaveria trinervia* (Speedy Weed)**<br><br>**Flaveria trinervia* is an annual herb with distinctive red stems and three-veined leaves and is found throughout much of northern Western Australia. It is listed on *FloraBase* (WAH 1998-2021) as 'alien' (introduced), however, Hussey *et al.* (2007) and the Pilbara Ranking Summary (of the Weed Prioritisation Process) (DPaW 2013) do not list this species, indicating there is debate in relation to **Flaveria trinervia* being native or introduced. | Location: Commonly recorded from the Fortescue Marsh section of the survey area, largely absent elsewhere.<br><br>Impact: minor and localised | |
| ***Malvastrum americanum* (Spiked Malvastrum)**<br><br>**Malvastrum americanum* is a perennial herb or shrub to 1.3 m high (WAH 1998-2021), although within the survey area it has generally been recorded as being less than 0.5 m high. It is usually, but not always, associated with drainage lines and has a wide distribution through northern and arid Western Australia.<br><br>**This species is a Fortescue 'priority' weed.** | Location: widespread throughout the survey area. Typically recorded from Mulga dominated plains or drainage lines.<br><br>Impact: common at low density so impact unlikely to be significant. | |

| Species | Combined results | Photo |
|---|---|---|
| ***Portulaca pilosa* (Djanggara)**<br><br>This species is a succulent herb that may be either erect or more usually prostrate, with linear leaves and most commonly with pink flowers.<br><br>Within Australia it is distributed mostly in the northern part of the continent (ALA 2021). Until recently (2016) this species was not listed as a weed. | Location: two isolated locations at low density across the survey area, typically from Mulga woodlands/groves<br><br>Impact: minor | |
| ***Rumex vesicarius* (Ruby Dock)**<br><br>**Rumex vesicarius* is a fleshy annual herb to 80cm high with red fruit and recorded from most of Western Australia except the tropics (WAH 1998-2021).<br><br>It is frequently found in the Pilbara in disturbed areas including road verges and drainage lines.<br><br>**This species is a Fortescue 'priority' weed.** | Location: single location adjacent to existing BHP rail.<br><br>Impact: localised (minor) |  |
| ***Setaria verticillata* (Whorled Pigeon Grass)**<br><br>**Setaria verticillata* is an annual grass to 1 m high (WAH 1998-2021), but more usually approximately 0.5 m.<br><br>It is widely distributed within Western Australia and, within the Pilbara region, is mostly associated with drainage lines.<br><br>**This species is a Fortescue 'priority' weed.** | Location: scattered at low density, particularly in Mulga and creeklines<br><br>Impact: minor | |

| Species | Combined results | Photo |
|---|---|---|
| ***Solanum nigrum* (Black Berry Nightshade)**<br><br>**Solanum nigrum* is an erect perennial (or short-lived) herb with white flowers to 1 m high (WAH 1998-2021) with an almost State-wide distribution. | Location: single location along Weeli Wolli Creek.<br><br>Impact: minor (localised). |  |
| ***Sonchus oleraceus* (Common Sowthistle)**<br><br>**Sonchus oleraceus* is an annual or biennual herb to 1.5 m high (WAH 1998-2021) with an almost State-wide distribution. | Location: single population recorded from Weeli Wolli Creek.<br><br>Impact: minor (localised). | |
| ***Tridax procumbens* (Tridax)**<br><br>**Tridax procumbens* is a prostrate to erect perennial herb with yellow and white flowers (WAH 1998-2021). It has a widespread distribution from northern Western Australia. | Location: single location along Weeli Wolli Creek.<br><br>Impact: minor (localised). | |

| Species | Combined results | Photo |
|---|---|---|
| ***Vachellia farnesiana* (Mimosa Bush)**<br><br>**Vachellia farnesiana* is an erect spinescent tree or, more often, a shrub to 4 m high.<br><br>It is widely distributed through the north of Western Australia, however it occurs sporadically in areas closer to Perth (WAH 1998-2021). Hussey *et al.* (2007) consider it to have been introduced to Australia prior to European settlement.<br><br>**This species is a Fortescue 'priority' weed.** | Location: scattered locations throughout the survey area, particularly on clay soils and drainage lines.<br><br>Impact: potentially significant at a localised scale. | |

## 4.2 VEGETATION

### 4.2.1 VEGETATION TYPES

Twenty nine vegetation types were recorded from within the survey area (**Table 9**, **Map 7**) based on a combination of structural vegetation type as identified in the field, floristic analysis (see **Section 4.2.4**) and subsequent desktop review.

The vegetation types within the survey area, grouped broadly based on landform types, were:

- plains/flats and valley floors: **AaAsCc**, **AaCf**, **AaEfEp**, **AaPlTe**, **AaSaEp**, **AaTb**, **AaTe**, **AaTp**, **AcCc**, **ApAsCc**, **ApTp**, **AsCc**, **AxEc**, **EgAaTb$^{2}$**, **MgT**l, **Ti**
- cracking clay: **Eb**, **Nd**
- sand dunes: **AdTb**
- hills and slopes: **AaEfTb**, **AaSaEh**, **AiTw**, **EgAaTb$^{1}$**, **ElAiTe**, **ElGwTv**
- drainage lines: **AtTp**, **ElAmTw**, **EvAcCc**, **EvApTe**.

**Table 9: Vegetation types**

The quadrat photographed is indicated in **bold** font.

| Landform | Mapping unit | Vegetation type | Floristic quadrats | Representative photograph | Other characteristic species | Area (ha) and extent (%) |
|---|---|---|---|---|---|---|
| Plain | **AaAsCc** | *Acacia aptaneura* low woodland over *Acacia synchronicia, A. tetragonophylla* and *Senna artemisioides* subsp. *oligophylla* mid sparse shrubland over **Cenchrus ciliaris* mid closed tussock grassland | A079, A128, A129, A134, **B042**, B044, B045, B054, B058, B059, C009, C013, C016, C069, C070, C071, C121, FMG-BE | | *Acacia aneura, Acacia citrinoviridis, Acacia pruinocarpa, Arivela viscosa, Boerhavia coccinea, Chrysopogon fallax, Cucumis variabilis, Gomphrena affinis* subsp. *pilbarensis, Hakea lorea* subsp. *lorea, Ipomoea muelleri, Portulaca oleracea, Ptilotus obovatus, Salsola australis, Sclerolaena cornishiana, Senna notabilis, Sporobolus australasicus* | 1,757.68 ha 5.51% |
| Plain | **AaCf** | *Acacia aptaneura* and *A. catenulata* subsp. *occidentalis* low woodland over *Chrysopogon fallax*, *Dichanthium sericeum* subsp. *humilius* and *Iseilema vaginiflorum* closed tussock grassland | **C102** | | *Acacia tetragonophylla, Setaria verticillata, Urochloa occidentalis* var. *occidentalis* | 10.78 ha 0.03% |

| Landform | Mapping unit | Vegetation type | Floristic quadrats | Representative photograph | Other characteristic species | Area (ha) and extent (%) |
|---|---|---|---|---|---|---|
| Plains | **AaEfEp** | *Acacia aptaneura, A. pruinocarpa* and *A. aneura* low open woodland over *Eremophila forrestii and Dodonaea petiolaris* mid sparse shrubland over *Enneapogon polyphyllus*, *Aristida contorta* and *A. inaequiglumis* low open grassland | A115, B153, B154, B157, B174, B184, C094, **C096**, C097, C100, C105, C106, C108, C111, C113, C116, C123, D3, D4, D6, D7, D9, FMG19, FMG42, FMG45, FMG55, NT2103, NT2105, NT2106, NT2107, NT2108, NT2114, NT2116, NT2117, NT2118, NT2132 | | *Abutilon lepidum, Acacia tetragonophylla, Arivela viscosa, *Bidens subalternans, Boerhavia coccinea, Cheilanthes sieberi* subsp. *sieberi, Chrysopogon fallax, Eriachne pulchella* subsp. *dominii, Evolvulus alsinoides* var. *villosicalyx, Psydrax latifolia, Ptilotus exaltatus, Ptilotus obovatus, Senna artemisioides* subsp. *helmsii, Senna glutinosa* subsp. *x luerssenii, Solanum lasiophyllum, Sporobolus australasicus* | 8,252.53 ha 25.85% |
| Gentle slopes | **AaEfTb** | *Acacia aptaneura* and *A. sibirica* low woodland over *Eremophila forrestii* subsp. *forrestii* mid sparse shrubland over *Triodia brizoides* low open hummock grassland | C095, C101, **NT2102** | | *Abutilon lepidum, Acacia pruinocarpa, Acacia tetragonophylla, Aristida contorta, Cheilanthes sieberi* subsp. *sieberi, Cucumis variabilis, Dodonaea petiolaris, Enneapogon polyphyllus, Euphorbia boophthona, Evolvulus alsinoides* var. *villosicalyx, Goodenia microptera, Hibiscus burtonii, Hibiscus sturtii* var. *campylochlamys, Hibiscus sturtii* var. *platychlamys, Indigofera monophylla, Maireana planifolia, Paspalidium clementii, Polycarpaea corymbosa* var. *corymbosa, Ptilotus exaltatus, Ptilotus obovatus, Sclerolaena cornishiana, Senna artemisioides* subsp. *helmsii, Senna glutinosa* subsp. *x luerssenii, Solanum lasiophyllum, Sporobolus australasicus* | 223.39 ha 0.70% |

| Landform | Mapping unit | Vegetation type | Floristic quadrats | Representative photograph | Other characteristic species | Area (ha) and extent (%) |
|---|---|---|---|---|---|---|
| Plains | **AaPlTe** | *Acacia ayersiana* and *A. pruinocarpa* low open forest over *Petalostylis labicheoides* mid sparse shrubland over *Triodia epactia* low sparse hummock grassland | A109, A110, **B146** | | *Acacia aneura, Acacia inaequilatera, Afrohybanthus aurantiacus, Aristida contorta, Aristida inaequiglumis, Dodonaea petiolaris, Enneapogon polyphyllus, Eriachne pulchella* subsp. *dominii, Evolvulus alsinoides* var. *villosicalyx, Hibiscus burtonii, Hibiscus coatesii, Psydrax latifolia, Psydrax suaveolens, Ptilotus exaltatus, Sida fibulifera, Solanum lasiophyllum* | 161.39 ha 0.51% |
| Hillslopes | **AaSaEh** | *Acacia aptaneura* and *Atalaya hemiglauca* mid woodland over *Senna artemisioides* subsp. *oligophylla* and *Acacia tetragonophylla* mid sparse shrubland over *Eriachne helmsii*, *Sida fibulifera* and *Rhynchosia minima* low tussock grassland/forbland | **C084** | | *Acacia bivenosa, Aristida latifolia, Bothriochloa ewartiana* | 28.45 ha 0.09% |

| Landform | Mapping unit | Vegetation type | Floristic quadrats | Representative photograph | Other characteristic species | Area (ha) and extent (%) |
|---|---|---|---|---|---|---|
| Plains | **AaSaEp** | *Acacia aptaneura* and *A. pruinocarpa* low woodland over *Senna artemisioides* subsp. *oligophylla*, *Ptilotus obovatus* and *Acacia tetragonophylla* mid open shrubland over *Enneapogon polyphyllus*, *Aristida contorta* and *Chrysopogon fallax* low grassland | A035, A037, A038, A042, A082, **B155**, C022, C067 | | *Abutilon lepidum, Abutilon macrum, Arivela viscosa, Boerhavia coccinea, *Cenchrus ciliaris, Cucumis variabilis, Dactyloctenium radulans, Eremophila forrestii, Evolvulus alsinoides* var. *villosicalyx, Gomphrena affinis* subsp. *pilbarensis, Perotis rara, Portulaca oleracea, Psydrax latifolia, Ptilotus obovatus, Senna notabilis, Sida platycalyx, Sporobolus australasicus, Triodia epactia* | 877.29 ha 2.75% |
| Plains | **AaTb** | *Acacia ancistrocarpa*, *A. sclerosperma* subsp. *sclerosperma* and *A. synchronicia* mid open shrubland over *Triodia basedowii* and **Cenchrus ciliaris* low hummock grassland/tussock grassland | B051, C015, C075, C117, C118, **C120** | | *Abutilon otocarpum, Acacia dictyophleba, Acacia inaequilatera, Acacia pachyacra, Aristida holathera* var. *holathera, Arivela viscosa, Bonamia erecta, Chrysopogon fallax, Corchorus* aff. *tectus, Corymbia hamersleyana, Eragrostis eriopoda, Euphorbia boophthona, Portulaca oleracea, Ptilotus obovatus, Senna artemisioides* subsp. *oligophylla, Senna notabilis, Solanum lasiophyllum, Stylobasium spathulatum, Trianthema pilosum* | 191.50 ha 0.60% |

| Landform | Mapping unit | Vegetation type | Floristic quadrats | Representative photograph | Other characteristic species | Area (ha) and extent (%) |
|---|---|---|---|---|---|---|
| Valley floors | **AaTe** | *Acacia ancistrocarpa*, *A. bivenosa* and *Senna artemisioides* subsp. *oligophylla* mid open shrubland over *Triodia epactia, T. longiceps* and *Aristida latifolia* mid hummock/tussock grassland | **B131**, B133 | | *Abutilon lepidum, Abutilon macrum, Acacia inaequilatera, Acacia pyrifolia* var. *pyrifolia, Corchorus lasiocarpus, Euphorbia coghlanii, Evolvulus alsinoides* var. *villosicalyx, Goodenia forrestii, Gossypium australe, Hibiscus sturtii* var. *platychlamys, Indigofera monophylla, Senna notabilis, Triodia vanleeuwenii* | 149.45 ha 0.47% |
| Valley floors | **AaTp** | *Acacia aptaneura* and *A. pruinocarpa* low open woodland over *Triodia pungens* low open hummock grassland | A104, A107, A111, A113, A119, B147, B151, B180, **C091** | | *Acacia bivenosa, Acacia pyrifolia* var. *pyrifolia, Acacia tetragonophylla, Aristida contorta, Arivela viscosa, Boerhavia coccinea, Bulbostylis barbata, Corchorus lasiocarpus, Dodonaea petiolaris, Dysphania rhadinostachya, Enneapogon polyphyllus, Eremophila forrestii, Eremophila latrobei* subsp. *filiformis, Eriachne pulchella* subsp. *dominii, Evolvulus alsinoides var. villosicalyx, Hibiscus burtonii, Indigofera monophylla, Maireana planifolia, Polycarpaea holtzei, Portulaca oleracea, Ptilotus exaltatus, Ptilotus obovatus, Senna glutinosa* subsp. *glutinosa, Senna notabilis, Solanum lasiophyllum, Sporobolus australasicus* | 1,617.86 ha 5.07% |

| Landform | Mapping unit | Vegetation type | Floristic quadrats | Representative photograph | Other characteristic species | Area (ha) and extent (%) |
|---|---|---|---|---|---|---|
| Plains | **AcCc** | *Acacia citrinoviridis* and *A. pruinocarpa* low open woodland over **Cenchrus ciliaris* and **C. setiger* low tussock grassland | A080, A081, B041, NY2104, NY2110, **NY2118** | | *Abutilon lepidum, Atalaya hemiglauca, Boerhavia coccinea, Hakea lorea* subsp. *lorea, Ptilotus obovatus, Senna notabilis, Solanum lasiophyllum, Triodia epactia* | 362.32 ha 1.14% |
| Sand dunes | **AdTb** | *Acacia dictyophleba* and *Stylobasium spathulatum* mid open shrubland over *Triodia basedowii, T. schinzii* and **Cenchrus ciliaris* mid hummock/tussock grassland | C014, C072, **C073**, C074, C114, C119, C122, FMG48, FMG53, FMG-RB | | *Acacia sclerosperma* subsp. *sclerosperma, Aristida holathera* var. *holathera, Bonamia erecta, Corchorus* aff. *tectus, Crotalaria cunninghamii, Eragrostis eriopoda, Eriachne aristidea, Eriachne gardneri, Hakea lorea* subsp. *lorea, Hibiscus brachychlaenus, Indigofera monophylla, Scaevola parvifolia* subsp. *pilbarae, Senna notabilis, Sida cardiophylla, Trianthema pilosum, Trichodesma zeylanicum* var. *grandiflorum, Yakirra australiensis* var. *australiensis* | 83.76 ha 0.26% |

| Landform | Mapping unit | Vegetation type | Floristic quadrats | Representative photograph | Other characteristic species | Area (ha) and extent (%) |

### 4.2.2 VEGETATION SIGNIFICANCE

#### 4.2.2.1 TECs

No vegetation recorded from the survey area was assessed as being representative of any currently described TEC.

#### 4.2.2.2 PECs

Database searches (**Section 2.2.2**) identified four PECs as occurring within the survey area. Each of these were confirmed to occur, based on vegetation and landform present and are described in the following sections.

***Brockman Iron cracking clay communities of the Hamersley Range***

The *Brockman Iron cracking clay communities of the Hamersley Range* PEC is described as:

> *Rare tussock grassland dominated by Astrebla lappacea in the Hamersley Range, on the Brockman land system. Tussock grassland on cracking clays - derived in valley floors, depositional floors. This is a rare community and the landform is rare* (Species and Communities Program DBCA 2021).

Threats to this PEC are identified as heavy grazing, clearing for mining and infrastructure/agriculture developments and altered fire regimes.

The **Eb** vegetation type is considered representative of the *Brockman Iron cracking clay communities of the Hamersley Range* PEC within the survey area. This vegetation type was recorded from a single location corresponding with the location of this PEC identified by the DBCA database searches. The landform (cracking clay) and vegetation (tussock grassland) is consistent with the description of the PEC. However, the dominant species as identified in the community description, *Astrebla lappacea*, was not recorded. The **Eb** vegetation type has a small extent within the survey area of 2.48 ha (0.01%), as shown in **Map 7**. The location was assessed to be in Very Good condition, despite evidence of grazing by cattle. The **Eb** vegetation type is shown in **Image 1** and **Image 2**.

**Image 1: Brockman PEC**

**Image 2: Brockman PEC at quadrat NT2101**

### *Fortescue Marsh (Martuyitha) (Marsh Land System)*

The *Fortescue Marsh (Martuyitha) (Marsh Land System)* PEC is described as:

> *Fortescue Marsh is an extensive, episodically inundated samphire marsh at the upper terminus of the Fortescue River and the western end of Goodiadarrie Hills. It is regarded as the largest ephemeral wetland in the Pilbara. It is a highly diverse ecosystem with fringing mulga woodlands (on the northern side), samphire shrublands and groundwater dependant riparian ecosystems. It is an arid wetland utilized by waterbirds and supports a rich diversity of restricted aquatic and terrestrial invertebrates. Recorded locality for night parrot and bilby and several other threatened vertebrate fauna. Endemic Eremophila species, populations of priority flora and several near-endemic and novel samphires* (Species and Communities Program DBCA 2021).

Threats to this PEC are identified as clearing for mining, altered hydrology (watering and fresh water), grazing and weed invasion.

The samphire-dominated **Ti** vegetation type is considered representative of the *Fortescue Marsh (Martuyitha) (Marsh Land System)* PEC within the survey area. This vegetation type was recorded from a single location corresponding with the location of this PEC identified by the DBCA database searches. The landform (episodically inundated marsh) and vegetation (samphire dominated) is consistent with the description of the PEC. Two other vegetation types (**MgTl** and **AxMp**) occur within the area mapped as Marsh land system but are not dominated by samphires and hence not considered representative of the PEC. The **Ti** vegetation type has an extent within the survey area of 431.78 ha (1.35%), as shown in **Map 7**.

The existing BHP rail appears to have resulted in structural change in vegetation with the small section to the west of the rail that containing a dominant shrub mid stratum (particularly *Acacia stenophylla*). The modified structure is evident in the foreground of **Image 3** with typical vegetation of the Fortescue Marsh shown in **Image 4**.

**Image 3: Fortescue Marsh PEC within survey area**

**Image 4: Fortescue Marsh PEC within survey area**

### *Four plant assemblages of the Wona Land System* (previously 'Cracking clays of the Chichester and Mungaroona Range')

The most applicable of the four plant representative assemblages of this PEC is described as:

> *Cracking clays of the Chichester and Mungaroona Range. This shrubless plain of stony gibber community occurs on the tablelands with very little vegetative cover during the dry season, however during the wet a suite of ephemerals/annuals and short-lived perennials emerge, many of which are poorly known and range-end taxa* (Species and Communities Program DBCA 2021).

Threats to this PEC are identified as grazing, clearing for mining related activities and altered fire regimes.

The **Nd** vegetation type is considered representative of this PEC. This vegetation type was recorded from two locations, corresponding with the mapped locations of this PEC identified by the DBCA database searches. The landform (stony gibber on table lands) and vegetation (largely shrubless with a suite of ephemerals and annuals) is consistent with the description of the PEC (**Image 5** and **Image 6**). The **Nd** vegetation type has an extent within the survey area of 60.15 ha (0.19%), as shown in **Map 7**.

**Image 5: Wona PEC at quadrat C083**

**Image 6: Wona PEC at quadrat C086**

### *Vegetation of sand dunes of the Hamersley Range/Fortescue Valley*

The *Vegetation of sand dunes of the Hamersley Range/Fortescue Valley* PEC is described as:

> *These red linear iron-rich sand dunes lie on the Divide Land system at the junction of the Hamersley Range and Fortescue Valley, between Kalgan Creek and the low hills to the west. A small number are vegetated with Acacia dictyophleba scattered tall shrubs over Crotalaria cunninghamii, Trichodesma zeylanicum var. grandiflorum open shrubland. They are regionally rare, small and fragile and highly susceptible to threatening processes* (Species and Communities Program DBCA 2021).

Threats to this PEC are identified as weed invasion, grazing by cattle, altered fire regimes, erosion and clearing for mining and infrastructure.

The linear sand dunes that characterise this PEC were mapped as vegetation type **AdTb**, the description of which closely matches that of the PEC including dominant flora species present. **AdTb** was recorded from a series of linear dunes towards the southern end of the Transport Corridor survey area (**Map 7**), corresponding with the mapped locations of this PEC identified by the DBCA database searches as well as previous surveys. The **AdTb** vegetation type has an extent within the survey area of 83.76 ha (0.26%), shown in **Image 7** and **Image 8**.

**Image 7: Sand Dunes PEC within the survey area displaying characteristic linear formation**

**Image 8: Sand Dunes PEC vegetation at quadrat C014**

### 4.2.3 OTHER SIGNIFICANT VEGETATION

According to the criteria outlined in the Flora and Vegetation Technical Guidance (EPA 2016), the following vegetation types are considered to be significant, discussed below:

- **EvAcCc** and **EvApTe** as PGDV]
- **AaAsCc**, **AaEfEp** and **AaSaEp** as SFDV.

#### 4.2.3.1 Groundwater Dependent Vegetation

*Eucalyptus camaldulensis sens. lat.* is considered to be an obligate phreatophyte, and therefore vegetation with this species included is representative of GDV (Eamus et al. 2006; Grierson 2010). *Eucalyptus camaldulensis* subsp*. refulgens* was recorded from a single quadrat (NY2104) within the **EvAcCc** vegetation type corresponding with Weeli Wolli Creek. However, it was not a dominant species at this location or elsewhere within the **EvAcCc** vegetation type and therefore this vegetation type is not considered to represent GDV.

*Eucalyptus victrix* may be regarded as a facultative phreatophyte although there is some evidence that it is not dependent on groundwater in all circumstances (Batini 2009; Eamus 2009; Equinox Environmental 2017; Resource and Environmental Management Pty Ltd 2007). Therefore, vegetation dominated or characterised by *Eucalyptus victrix* is considered to be representative of potential GDV. *Eucalyptus victrix* was a dominant species of two vegetation types (**EvAcCc** and **EvApTe**). **EvAcCc** largely corresponds with Weeli Wolli Creek and occupies 350.38 ha or 1.10% of the survey area. **EvApTe** corresponds with mid-sized drainage lines of the Chichester Range towards the north of the survey area and occupies 390.35 ha or 1.22% of the survey area.

There were numerous dead or unhealthy trees observed along the section of Weeli Wolli Creek that intersects the Billiards North survey area (**Image 9**-**Image 12**). Despite surface water being observed during the survey timeframe, there were numerous long-dead trees (presumably *Eucalyptus victrix* or *E. camaldulensis*) as well as visible signs of water stress on surviving trees such as leaf die off, defoliation and bark fracturing. There may be existing impacts to this area of potential GDV from mining operations upstream.

**Image 9: Weeli Wolli Creek within Billiards North area**

**Image 10: Weeli Wolli Creek within Billiards North area**

**Image 11: Bark fracturing evident on *Eucalypt victrix* trees within Weeli Wolli Creek within Billiards North area**

**Image 12: Weeli Wolli Creek within Billiards North area**

#### 4.2.3.2 Sheet Flow Dependent Vegetation

Vegetation dominated by Mulga species (*Acacia aneura, A. aptaneura, A. ayersiana, A. incurvaneura, A. paraneura* and *A. pteraneura*) may be considered to be significant as sheet flow dependent vegetation (SFDV) that is characterised by Mulga grove/intergrove formations.

There were eight vegetation types dominated by the various Mulga species occurring on valley floors within the survey area including **AaAsCc**, **AaCf**, **AaEfEp**, **AaEfTb**, **AaPlTe**, **AaSaEh**, **AaSaEp** and **AaTp**. Of these **AaAsCc** (1,757.68 ha, 5.51%), **AaEfEp** (8,252.53 ha, 25.85%) and **AaSaEp** (877.29 ha, 2.75%) display the characteristic grove-intergrove formation considered to be most representative of SFDV. These vegetation types therefore have the potential to be adversely affected by hydrological change relating to sheetflow.

Vegetation types considered to represent SFDV occupied a combined total of 10,887.50 ha within the survey area (34.11%).

#### 4.2.3.3 Vegetation Types of Limited Spatial Extent

The majority of the survey area (78%) is occupied by six of the 29 vegetation types. Thirteen vegetation types have a limited spatial extent within the survey area of less than 1%. The limited extent may be attributable to the linear survey area and aside from their small extent, they are not considered as significant unless they are significant for reasons other than their size. Three of these small-extent vegetation types are PEC (see **Section 4.2.2.2**) and one is SFDV (**Section 4.2.3.3**) and are significant for these reasons. However, the remainder occur on commonly-occurring landforms and have been interpreted as different vegetation types due to combinations of dominant species, but having no particular significance, or occur on small-scale but otherwise common landforms, including being associated with gullies or drainage lines; see also **Section 4.2.4.2**.

#### 4.2.3.4 Vegetation Characterised by Conservation-listed Flora

The following vegetation types have conservation-listed flora (both P3) as characteristic species, however, in each case they were not recorded as dominant species:

- **Nd**, with *Dolichocarpa* sp. Hamersley Station (A.A. Mitchell PRP 1479) characteristic at low percentage cover
- **Ti**, with *Eremophila spongiocarpa* as characteristic at low percentage cover at a typically low percentage cover.

### 4.2.4 FLORISTIC ANALYSIS

#### 4.2.4.1 Local Floristic Analysis

The floristic analysis dendrogram (**Figure 5** in **Appendix Seven**) indicates that the floristic groups typically correspond (at least broadly) with the assigned vegetation types. However, several vegetation types exhibited poor floristic clustering within the dendrogram (at least in part), outlined as follows:

- **AaAsCc**; a good floristic unit, quadrat A134 is an outlier, possibly because it is intersected by a drainage feature.
- **AaSaEp**; a poor floristic unit, likely attributable to varied vegetation condition and historical impacts. The vegetation includes grove/intergrove formation that may have also impacted floristics (if quadrats located largely within the intergrove rather than the grove).
- **AaTb**; a poor floristic unit, likely attributable to varying levels of existing degradation and weed invasion.
- **AcCc**; all quadrats broadly cluster in the same clade of the dendrogram. This vegetation type has typically high levels of existing disturbance, likely contributing to this result.
- **AdTd**; a good floristic group with the exception of two quadrats (C119, C120) that are in poor condition.
- **AsCc**; this large and broad vegetation type is generally a good floristic unit with the majority of sites clustering at the top of the dendrogram. There are numerous outliers that may be the result of contrasting survey timeframes, alternative fire histories and potentially being situated at intergrades between vegetation types.
- **EgAaTb$^2$**; a good floristic unit with the exception of several quadrats that appear to correspond with higher degradation or contrasting fire history.
- **ElAiTe**, a good floristic unit with the exception of quadrat D11.
- **EvApTe**; a good floristic unit with the exception of quadrat C090.
- **EvAvCc**; a poor floristic unit, likely attributable to varying levels of disturbance.
- **MgTl**; a poor floristic unit with widely separated quadrats, considered largely attributable to varied survey timeframes with contrasting fire history and seasonal conditions.

#### 4.2.4.2 Regional Floristic Analysis

The data used in this analysis was sourced from the various surveys, outlined in **Section 3.4.2.2**. The regional analysis was conducted using data from 2,581 floristic quadrats. In total, 831 vascular flora taxa were included in this data. Species richness ranged from one to 78 and averaged 23.97.

The aim of the regional floristic analysis was its use as a tool to identify if vegetation types identified from the survey area that may be restricted in extent are locally significant (i.e. locally restricted but widespread) or locally and regionally significant (i.e. not widespread).

The regional floristic analysis, the dendrogram for which is included in **Figure 6** in **Appendix Seven**, indicates that overall the quadrats included in the survey area ('2021_Nyidi') most typically were grouped with 'Nyidinghu' (Cardno 2012b, 2012c), 'FortValley' (Ecoscape 2018), 'Cloudbreak' and 'Christmas Creek' quadrats. The quadrats from this survey associated with the Fortescue Marsh were grouped with DPaW's Marsh quadrats (Markey 2016).

The regional analysis broadly indicates that the majority of vegetation types recorded within the survey area are likely to be represented within the surrounding region, with no major clustering of the floristic quadrats from the survey area.

### 4.2.5 VEGETATION CONDITION

The vegetation condition within the survey area ranged from Degraded to Excellent condition, with the Very Good category having the highest proportion, followed by Excellent and Very Good condition (**Table 10**, **Map 9**). Areas of hills typically supported vegetation in the best condition, whilst plains, valley floors and drainage lines were typically in lesser condition. The main factors affecting vegetation condition were grazing by cattle, weed infestation (particularly **Cenchrus ciliaris*) and existing infrastructure.

**Table 10: Vegetation condition**

| Vegetation condition | Extent (ha) | Proportion (%) |
|---|---|---|
| Excellent | 8,101.49 | 25.38% |
| Very Good | 12,798.96 | 40.10% |
| Good | 7,119.75 | 22.31% |
| Poor | 3,139.20 | 9.83% |
| Degraded | 405.09 | 1.27% |
| Completely Degraded | - | 0% |
| Not vegetated | 354.59 | 1.11% |

### 4.2.6 ADEQUACY OF SURVEY

Adequacy of survey can be demonstrated using a species accumulation curve; if the curve has reached (or almost reached) an asymptote it is considered that most species are likely to have been recorded from the survey area.

A species accumulation curve was generated using quadrat data (**Figure 3**). Opportunistic observations, which increase the number of species recorded, are not included in the analysis.

The species accumulation curve suggests that additional survey would identify additional flora taxa. However, the Bootstrap estimate of species richness is 631.6 which is only slightly higher than the actual total of 608 flora taxa when taking opportunistic records into account. This indicates that the overwhelming majority (96.3%) of flora taxa would have been recorded from the survey area.

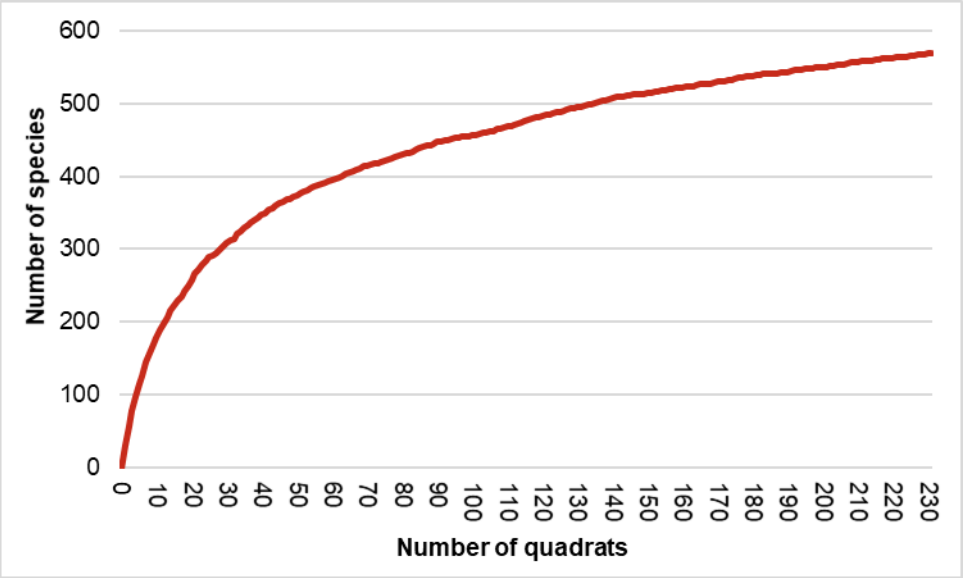

**Figure 3: Species accumulation curve**

## 4.3 BOTANICAL LIMITATIONS

**Survey design:** Two phase, quadrat-based flora and vegetation survey with extensive traverses searching for conservation significant flora. Results from previous surveys were considered as part of survey design and the desktop assessment.

**Survey type:** Detailed flora and vegetation survey with extensive searches for significant flora conducted over a single phase. All areas were adequately surveyed through the use of floristic quadrats to sample vegetation types, and targeted searches for conservation significant flora.

**Type of vegetation classification system:** Vegetation classified at NVIS Level V (NVIS Technical Working Group & DotEE 2017) using largely structural vegetation types defined using dominant and characteristic species and vegetation structure as recorded during the field surveys. Floristic analysis was used to identify major floristic groups and outlier groups of floristic interest.

A full summary of botanical limitations is presented in **Table 11**.

**Table 11: Botanical limitations**

| Possible limitations | Constraints (yes/no): Significant, moderate or negligible | Comment |
|---|---|---|
| Availability of contextual information at a regional and local scale | No | The majority of the survey area has been subject to multiple previous flora and vegetation surveys and there have been many other surveys in the vicinity. Thus, there is good information available to provide local and regional context. |
| Competence/experience of the team conducting the survey, including experience in the bioregion surveyed | No | The lead botanist conducting/overseeing the field surveys (Stephen Kern) has over 15 years' experience conducting flora and vegetation surveys in Western Australia, including the Pilbara region. |

| Possible limitations | Constraints (yes/no): Significant, moderate or negligible | Comment |
|---|---|---|
| Proportion of the flora recorded and/or collected, and any identification issues | Negligible | 608 vascular flora taxa have been recorded from combined surveys. Whilst there are a substantial amount in the inventory that are not identified to species level (49, 8.05%), the majority arise from previous surveys and cannot be retrospectively determined. There were 17 flora taxa (2.79%) from the 2021 surveys that could not be identified with certainty to species level due to the lack of diagnostic reproductive material.<br>None of the unidentified taxa from 2021 are considered likely to represent any conservation-listed flora from the region. |
| Was the appropriate area fully surveyed (effort and extent) | No | The survey area was surveyed adequately to describe the flora, vegetation types and condition.<br>The majority of the vegetation types are represented by at least three floristic quadrats recorded from within them. Vegetation types represented by less than three quadrats have a small spatial extent within the survey area. |
| Access restrictions within the survey area | No | The majority of the survey area was readily accessible by vehicle and on foot. A helicopter was provided to enable access to the entire survey area. |
| Survey timing, rainfall, season of survey | No | The Phase 1 field survey was conducted during May 2021, within the optimal timeframe for primary season for survey in the Pilbara bioregion.<br>The rainfall in the four months prior to the field survey was above the mean for this period (**Figure 2**), also indicated by the rainfall deciles (**Figure 4**). |
| Disturbance that may have affected the results of the survey e.g. fire, flood, clearing | No | No disturbance was considered a significant limitation to the survey results. |

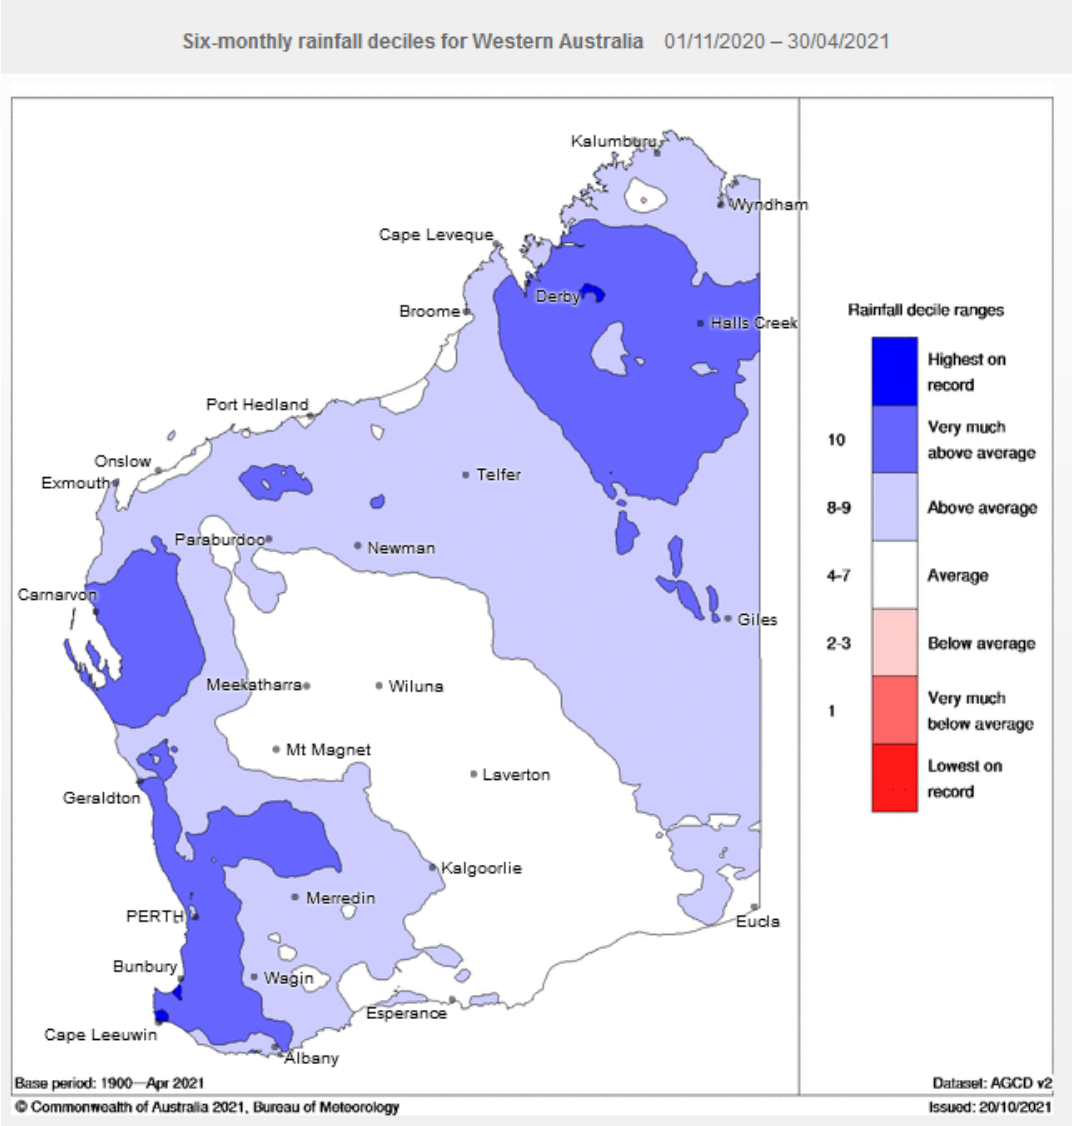

**Figure 4: Rainfall deciles for the 6 months prior to the Phase 1 field survey (BoM 2021c)**

# 5 DISCUSSION

## 5.1 FLORA SIGNIFICANCE

A total of 607 vascular flora species have been recorded from the 2021 and previous surveys from 268 floristic quadrats and opportunistic observations, including during searches for conservation-listed flora. A relatively small proportion of the total flora inventory (18 species; 2.97%) were introduced species, reflecting the level of disturbance in the survey area.

Forty-nine taxa (8.07%) could not be identified to species level due to lack of reproductive material. Many of these unidentified taxa (32, 65.3%) records arise from previous surveys that could not be verified. None of the unidentified taxa collected during the 2021 surveys bear any similarity to conservation listed flora identified by the database searches.

The species accumulation curve indicates that the overwhelming majority of species are likely to have been recorded from the survey area. This indicates that the survey intensity and effort was adequate for the survey area.

### 5.1.1 LOCAL AND REGIONAL ASSESSMENT OF FLORA SIGNIFICANCE

#### 5.1.1.1 Conservation-listed Flora

**Threatened Flora**

One Threatened Flora species (*Seringia exastia*) listed for protection under the Commonwealth EPBC Act and Western Australian BC Act was recorded from within the survey area. However, this species has been subject to recent taxonomic review indicating that its listing is a result of outdated taxonomy as it is no longer considered to be under threat (see **Section 2.2.3.1**). There have been four locations of this species recorded from the survey area with a combined total of 88 plants.

None of the unidentified taxa from the 2021 resemble any currently described TF.

**Priority Flora**

Twelve PF were recorded from the survey area:

- one Priority 1:
  - *Tecticornia* sp. Christmas Creek (K.A. Shepherd & T. Colmer et al. KS 1063); this taxon was recorded from the section of the survey area that intersects the Fortescue Marsh. According to *NatureMap* (DBCA 2007-2021) there are 101 records of this species from the Pilbara and Little Sandy Desert.
- one Priority 2:
  - *Euphorbia inappendiculata* var. *queenslandica* (P2); this taxon was recorded from isolated plants of two populations within the survey area. According to *NatureMap* (DBCA 2007-2021) there are 10 records of this species from Western Australia (Pilbara and Ord Victoria Plain),. However, *Atlas of Living Australia* indicates this taxon has additional records across southeastern Western Australia and is widespread in all other states of Australia (ALA 2021).
- seven Priority 3:
  - *Atriplex flabelliformis*; this species was recorded from the section of the survey area that intersects the Fortescue Marsh. According to *NatureMap* (DBCA 2007-2021) there are 51 records of this species with a scattered distribution across Western Australia.
  - *Dolichocarpa* sp. Hamersley Station (A.A. Mitchell PRP 1479); This taxon was recorded from locations, restricted to areas of cracking clay soil. According to *FloraBase* (WAH 1998-2021; 2021), there are 29 records of this species from the Pilbara region.
  - *Dysphania congestiflora*; despite not being recorded during the 2021 survey, this species is known to occur within the survey area based on reliable previous records. According to *NatureMap* (DBCA 2007-

2021) there are 10 records of this species from the Pilbara and Carnarvon regions, most from the Fortescue Marsh area.
  - *Eragrostis* sp. Erect spikelets (P.K. Latz 2122); this taxon was recorded from the section of the survey area where it intersects the Fortescue Marsh. According to *FloraBase* (WAH 1998-2021; 2021), there are five records of this species from the Pilbara, Great Sandy Desert and Murchison region.
  - *Eremophila spongiocarpa*; this species was relatively abundant within the Fortescue Marsh section of the survey area. According to *NatureMap* (DBCA 2007-2021) there are 117 records of this species from the Pilbara, largely from the Fortescue Marsh.
  - *Stackhousia clementii*; this species was recorded from the Fortescue Marsh section of the survey area. According to *NatureMap* (DBCA 2007-2021) there are 39 records of this species from a relatively broad distribution.
  - *Swainsona thompsoniana*; this species was recorded from areas of cracking clay soil within the survey area. According to *NatureMap* (DBCA 2007-2021) there are 23 records of this species from the Pilbara region.
- three Priority 4:
  - *Eremophila youngii* subsp. *lepidota*; this taxon is known to occur within the survey area based on a previous reliable record from the Fortescue Marsh section of the survey area. According to *NatureMap* (DBCA 2007-2021) there are 61 records of this species from several bioregions.
  - *Goodenia nuda*; several isolated records of this species were recorded. According to *NatureMap* (DBCA 2007-2021) there are 130 records of this species, largely from the Pilbara bioregion.
  - *Lepidium catapycnon*; two locations of this species were recorded from the Billiards North area of the survey area. According to *NatureMap* (DBCA 2007-2021) there are 94 records of this species from the Pilbara region

None of the unidentified taxa from the 2021 survey resemble any currently described PF taxa.

P1 flora taxa are considered poorly known and are known from few locations which are potentially at risk (DBCA 2019b). One P1 taxon was recorded: *Tecticornia* sp. Christmas Creek (K.A. Shepherd & T. Colmer *et al.* KS 1063), recorded from the survey area where it intersects the Fortescue Marsh. This taxon has been widely recorded and mapped by previous surveys across the Fortescue Marsh (Ecoscape 2018; Markey 2016). Potential impact to this species within the Fortescue Marsh section of the survey area is considered likely to be negligible.

P2 species are considered poorly known and are known from few locations, however, some populations occur in lands reserved for conservation (DBCA 2019b). One P2 taxon was recorded from the survey area, *Euphorbia inappendiculata* var. *queenslandica*. Current records within Western Australia suggest this species is not well known and mostly occurs in the Pilbara (ALA 2021). However, it appears widespread and common across other states, particularly New South Wales. With an extensive national distribution, any impacts to this species within the survey area are unlikely to be significant.

Seven P3 taxa were recorded from the survey areas. P3 taxa are considered poorly known and in need of further survey but are not currently under threat (DBCA 2019b). As such, and based on the known distribution, the P3 taxa within the survey area (listed above) are unlikely to be considered currently under threat and the potential impact is considered negligible.

Three P4 taxa were recorded from the survey area. P4 taxa are rare but present on conservation lands, near threatened but have been adequately surveyed and are not considered to be currently threatened, or are otherwise in need of monitoring (DBCA 2019b). P4 taxa are not currently under threat and, as such, potential impact to the taxa recorded from the survey area is considered likely negligible.

#### 5.1.1.2 Post-survey Likelihood Assessment

The likelihood of conservation-listed flora occurring in the survey area was revised following the field survey. This revised likelihood, that took into account vegetation condition, grazing and other disturbances, actual habitat availability and search effort, is included in **Table 18** in **Appendix Three**. The revised, post-survey

likelihood identified that only one additional conservation-listed flora taxa, *Calotis squamigera* (P1), was considered 'likely' to occur. This taxon has been recorded in close proximity to the survey area, including during 2021 (Ecoscape 2021) from Mulga groves similar to vegetation types recorded within the survey area. Nine taxa (three P1, four P3 and one P4) 'may' occur within the survey area following the post survey likelihood assessment including:

- *Lindernia* sp. Pilbara (M.N. Lyons & L. Lewis FV 1069) (P1)
- *Samolus* sp. Fortescue Marsh (A. Markey & R. Coppen FM 9702) (P1)
- *Synostemon hamersleyensis* (P1)
- *Euphorbia inappendiculata* var. *inappendiculata* (P2)
- *Eleocharis papillosa* (P3)
- *Euphorbia australis* var. *glabra* (P3)
- *Themeda* sp. Hamersley Station (M.E. Trudgen 11431) (P3)
- *Triodia basitricha* (P3)
- *Rhynchosia bungarensis* (P4).

Despite extensive targeted searches for the above taxa, it is considered a possibility that they may occur due to close proximity to known records and suitable habitat occurring within the survey area.

#### 5.1.1.3 Previous Records of Conservation-Listed Flora

The following flora taxa locations within the survey area arising from the database searches are considered unreliable or erroneous and have been excluded from results:

- *Eragrostis crateriformis* (P3); two records of this species have been previously documented within the survey area near the southeastern extent. Both records arise from a previous survey (Cardno 2012b). Both locations were investigated during current and previous surveys (Ecoscape 2018) and no *Eragrostis crateriformis* plants were located. However, the morphologically similar species *Eragrostis leptopoda* was observed at these locations. Therefore, it is considered likely that the identification of this taxon may be erroneous.
- *Goodenia* sp. East Pilbara (A.A. Mitchell PRP 727) (P3); three records of this taxon have been documented within the survey area based on previous surveys, however, they are not included in the DBCA database search results. The locations were extensively searched, without locating any plants of this taxon. The morphologically similar *Goodenia pascua* was recorded elsewhere within the survey area. According to the *Rare and Priority Flora Plants of the Pilbara* mobile app (DPaW and Rio Tinto 2015), the nominated specimen of *Goodenia* sp. East Pilbara (A.A. Mitchell PRP 727) is indistinct from *G. pascua*. Therefore, it is unclear on what basis *Goodenia* sp. East Pilbara (A.A. Mitchell PRP 727) can be justified as a distinct taxon. Accordingly, *Goodenia* sp. East Pilbara (A.A. Mitchell PRP 727) has been excluded from the flora inventory.
- *Samolus* sp. Fortescue Marsh (A. Markey & R. Coppen FM 9702) (P1); there is a single record of this taxon within the Fortescue Marsh section of the survey area based on a previous DBCA survey. This location was searched and corresponds with the **MgTl** vegetation type dominated by *Melaleuca glomerata* and *Triodia longiceps*. *Samolus* sp. Fortescue Marsh (A. Markey & R. Coppen FM 9702) is more typically recorded within of samphire dominated vegetation. There were no plants recorded at the known location or elsewhere within the Fortescue Marsh. This taxon is typically easy to distinguish from a distance as it has characteristic dark green foliage (contrasting with the reddish colouring of the surrounding samphires) and is typically taller than the surrounding samphire vegetation. A drone was utilised to assist with targeted searches for this taxon based on the ability to detect if from a distance. The previous record of *Samolus* sp. Fortescue Marsh (A. Markey & R. Coppen FM 9702) is therefore considered unreliable and potentially erroneous.
- *Eremophila spongiocarpa* (P3); this taxon was extensively recorded from the Fortescue Marsh section of the survey area. However, there is a previous DBCA database search record within the survey area south of the Fortescue Marsh (corresponding with sandplain landform type); this record is considered an inaccurate location.

#### 5.1.1.4 Other Significant Flora

The record of *Tephrosia remotiflora* may be of significance as a range extension, approximately 150 km southeast of the nearest record in the Pilbara and approximately 500 km southwest of the typical distribution in the Kimberley region. This species is not significant for any other reason.

*Corchorus* aff. *tectus* is of potential taxonomic interest, as outlined in **Section 4.1.5.1**. However, this taxon appears to be locally common.

*Frankenia ambita* was considered by Markey (2016) to be a species of taxonomic interest; it was encountered within the Fortescue Marsh section of the survey area and has been recorded widely from other parts of the Fortescue Marsh (Ecoscape 2018; Markey 2016).

*Tecticornia auriculata* was considered as significant by Markey (2016) as it is mostly a coastal species. While this observation is generally reasonable, it also occurs in two other inland locations (Lake Disappointment and Lake Sunshine, both in the Little Sandy Desert IBRA region) thus its suggested significance in association with the Fortescue Marsh is only broadly applicable.

#### 5.1.1.5 Introduced Flora

Eighteen introduced species were recorded during the field survey from the survey area. None of the recorded introduced species have any significance i.e. they are not Declared Pest plants or WoNS species. Nine of the species are identified as 'Priority' weeds according to a list maintained by Fortescue for management purposes, being **Aerva javanica*, **Cenchrus ciliaris, *Cenchrus setiger* (both *Cenchrus* spp. subject to pastoral exclusion areas), **Chloris virgata, *Echinochloa colona*, **Malvastrum americanum, *Rumex vesicarius, **Setaria verticillata* and **Vachellia farnesiana*.

The most significant weed infestations were of **Cenchrus ciliaris* (Buffel Grass), from plains, valley floors and drainage lines, including 114 of the quadrats. This species was also recorded as a dominant species within numerous quadrats and several vegetation types. **Cenchrus ciliaris* has the ability to invade native vegetation when the soil surface is disturbed and can be considered as a significant weed, however, occurrences within the survey area are likely a result of livestock grazing.

Another 'priority' weed species, **Aerva javanica*, is particularly abundant along the existing BHP rail.

There is no formal requirement for Fortescue to control any of the weed species recorded.

## 5.2 VEGETATION SIGNIFICANCE

Twenty-nine vegetation types were recorded from the survey area, associated broadly with plains/flats, cracking clay, sand dunes, hills/slopes and drainage lines. The majority of vegetation types are broadly supported by the floristic analysis. The deviation from floristic units of vegetation types was most commonly attributable to factors such as degradation, fire history, quadrat placement and sampling from multiple contrasting seasons.:

### 5.2.1 THREATENED AND PRIORITY ECOLOGICAL COMMUNITIES

No vegetation was considered similar to any current Western Australian-listed or Commonwealth EPBC Act-listed TEC.

Four PECs have been previously recorded as corresponding, at least in part, with the survey area. These PECs, and the vegetation types associated with them, are described below.

#### *5.2.1.1 Brockman Iron cracking clay communities of the Hamersley Range*

Vegetation type **Eb**, which occurred as a single occurrence occupying 2.48 ha (0.01% of the survey area), intersected an area mapped as the *Brockman Iron cracking clay communities of the Hamersley Range* PEC by the DBCA. However, the species characteristic of the PEC according to the DBCA Species and Communities Program (2021), *Astrebla lappacea*, was not recorded with this vegetation type which was

characterised by *Eriachne benthamii*, *Eragrostis xerophila* and *Aristida latifolia*. However, advice from the DBCA, summarised in Ecoscape (2016), indicates that:

- the community can include other dominant perennial grass species including *Eriachne benthamii* and/or *Aristida latifolia*
- can also include herbfields and occasional emergent shrubs
- occurs on the Brockman and, occasionally, Newman land systems
- the characteristic feature is cracking clay soils.

Neither of these land systems intersect the survey area at the location of the mapped DBCA PEC occurrence, however, the vegetation type is associated with cracking clay soils.

Only one quadrat was recorded within vegetation type **Eb** due to its small extent. The quadrat and vegetation type can be broadly considered representative of the PEC as it has characteristic cracking clay soil and is a perennial tussock grassland with at least some species characteristic of the *Brockman Iron cracking clay communities of the Hamersley Range* PEC. The majority of the PEC is mapped as occurring approximately 100 km to the west of the survey area and to the south of the Hamersley Range, although there are closer outlier occurrences including within Karijini National Park, West Angelas and Juna Downs (Ecoscape 2016).

Vegetation type **Eb** extends out of the survey area to the northwest, however, the total extent of the vegetation type is unknown. The existing DBCA mapping of the *Brockman Iron cracking clay communities of the Hamersley Range* PEC at this location appears to be based on a point location with a 500 m buffer applied. The likely extent of this vegetation type outside of the survey area, based on interpretation of imagery, is 27.97 ha (shown on **Map 7**). Therefore 8.14% of this likely PEC polygon occurs within the survey area.

#### *5.2.1.2 Fortescue Marsh (Martuyitha) (Marsh Land System)*

The Fortescue Marsh PEC occurs as a single unit, associated with the Marsh Land System. The survey area corresponds with 612.05 ha of the land system representing 0.63% of the total land system extent (Payne 2004).

One vegetation type recorded within the survey area, **Ti**, was considered to represent the *Fortescue Marsh* PEC. This vegetation type was characterised by Samphire species (*Tecticornia* species in the Chenopodiaceae family) and occupied 431.78 ha within the survey area. **Ti** extends to the east, through the Marsh, although its total extent is unknown.

#### *5.2.1.3 Four plant assemblages of the Wona Land System*

The *Four plant assemblages of the Wona Land System* (previously 'Cracking clays of the Chichester and Mungaroona Range') ('Wona') PEC consists of the following components (Species and Communities Program DBCA 2021):

- Cracking clays of the Chichester and Mungaroona Range. This shrubless plain of stony gibber community occurs on the tablelands with very little vegetative cover during the dry season, however during the wet a suite of ephemerals/annuals and short-lived perennials emerge, many of which are poorly known and range-end taxa. Priority 1.
- Annual Sorghum grasslands on self mulching clays with a moderate-dense overlay of rocks. This community appears very rare and restricted to the Pannawonica-Robe valley end of Chichester Range. Naturally species poor when dry. Threat: weed invasion. Priority 1.
- Mitchell grass plains (*Astrebla* spp.) on gilgai Priority 3(iii).
- Mitchell grass and Roebourne Plain grass (*Eragrostis xerophila*) plain on gilgai. *Astrebla pectinata*, *A. elymoides*, *E. xerophila*, *Aristida latifolia*, *Eriachne* and *Sida fibulifera*. Typical type, heavily grazed.

Vegetation type **Nd**, occupying 60.15 ha (0.19% of the survey area) is considered to represent the Wona PEC and the description is consistent with the Cracking clays of the Chichester and Mungaroona Range description above. There are two, small, mapped occurrences of this vegetation type is within the Wona Land System

(the eastern patch with quadrat C083). Both occurrences are on upland gilgai plains (tablelands) and largely or entirely confined to the survey area. It is unknown if there are other areas of similar vegetation nearby.

#### *5.2.1.4 Vegetation of sand dunes of the Hamersley Range/Fortescue Valley*

The sand dunes were occupied by a single vegetation type: **AdTb** (*Acacia dictyophleba* and *Stylobasium spathulatum* mid open shrubland over *Triodia basedowii*, *T. schinzii* and **Cenchrus ciliaris* mid hummock/tussock grassland), recorded from 10 quadrats located in the southern section of the Transport Corridor survey area. This vegetation type occupied 83.76 ha.

The interdunal areas and surrounding sandplains were almost entirely mapped as **AaTb**.

The dunes comprising this PEC are regionally restricted in extent and considered to be highly susceptible to threatening processes (Species and Communities Program DBCA 2021).

### 5.2.2 OTHER SIGNIFICANT VEGETATION

Based on the criteria provided in the Flora and Vegetation Technical Guidance (EPA 2016), several vegetation types may be considered as locally or regionally significant.

#### 5.2.2.1 Groundwater Dependent Vegetation

There were no vegetation types recorded within the survey area that were dominated by phreatophytic species that rely on access to groundwater for some stages of their life cycle. *Eucalyptus camaldulensis* subsp. *refulgens* was recorded from a single quadrat (NY2104) along Weeli Wolli Creek. though it was not the dominant tree species. Therefore, it is unlikely that any of the vegetation types recorded may be considered GDV.

#### 5.2.2.2 Potential Groundwater Dependent Vegetation

Several drainage lines within the survey area were dominated by *Eucalyptus victrix*, the dominant species of the upper stratum from the **EvAcCc** and **EvApTe** vegetation types. *Eucalyptus victrix* is considered to be a facultative phreatophyte, although there is some evidence that in some circumstances this species is not dependent on groundwater (Batini 2009; Eamus 2009; Environmental Protection Authority & Hamersley Iron Pty Ltd 2010; Equinox Environmental 2017; Resource and Environmental Management Pty Ltd 2007).

There were numerous dead or unhealthy trees observed along the section of Weeli Wolli Creek that intersects the Billiards North survey area, indicating that there may be existing impacts on this PGDV from upstream mining operations.

Any changes to groundwater or surface water flow may have the potential to affect the **EvAcCc** and **EvApTe** vegetation types.

#### 5.2.2.3 Mulga Communities

There were eight vegetation types dominated by the various Mulga species of which **AaAsCc**, **AaEfEp** and **AaSaEp** display the characteristic grove-intergrove formation considered to be most representative of SFDV. Vegetation types considered to represent SFDV occupied a combined total of 10,887.50 ha within the survey area (34.11%).

Sheet Flow Dependent Vegetation has the potential to be affected by changes to surface water flows that may be caused by obstacles, including roads or railways (or any linear infrastructure), or any changes to topography that prevents heavy rainfall from moving across the slightly-sloping landscape as a ‘sheet’ (Astron Environmental Services 2010).

Fire is also a threat to Mulga vegetation as most Mulga species are fire sensitive and killed by even cool burns (Maslin & Reid 2012), although some are known to resprout from trunks or roots particularly if only scorched (Maslin, van Leeuwen & Reid 2010). Frequent burning has led to the loss of Mulga communities in some areas including in the Pilbara (Maslin & Reid 2012), and it is likely that Mulga seedlings or resprouts within reach of cattle or feral herbivores in particular would be preferentially grazed before *Triodia* species and similar

less palatable plants, leading to the loss of Mulga or reduction in the numbers of plants. Native herbivores would also likely preferentially graze Mulga seedlings or resprouts.

SFDV is widespread in Australia and occurs in Queensland, South Australia and New South Wales, as well as Western Australia (Dunkerley 2002), and therefore cannot be considered to occupy a restricted extent.

#### 5.2.2.4 Vegetation Characterised by Conservation-listed Flora

The following two vegetation types have conservation-listed P3 flora as characteristic species, however, in each case they were not recorded as dominant species:

- **Nd**, with *Dolichocarpa* sp. Hamersley Station (A.A. Mitchell PRP 1479) characteristic at low percentage cover
- **Ti**, with *Eremophila spongiocarpa* as characteristic at low percentage cover at a typically low percentage cover.

Both of these vegetation types are also significant due to being representative of different PECs.

### 5.2.3 LOCAL AND REGIONAL ASSESSMENT OF VEGETATION SIGNIFICANCE

Vegetation types may be considered to be locally or regionally significant if conservation-listed or for criteria outlined above in **Section 5.2.2**.

Thirteen vegetation types within the survey area had small extents (<1%) relative to other vegetation types. Aside from their small extent, they are not considered as significant unless they are significant for reasons other than their size (see above).

### 5.2.4 VEGETATION CONDITION

The vegetation of the survey area ranged from Excellent to Degraded condition. Large, cleared areas were classified as 'not native vegetation'. Areas of hills typically supported vegetation in the best condition, whilst plains, valley floors and drainage lines were typically in lesser condition. The main factors affecting vegetation condition were grazing by cattle, weed infestation and existing infrastructure. There were significant infestations of **Cenchrus ciliaris* (Buffel Grass), particularly from the southern portion of the survey area where this species was commonly the dominant species in the ground stratum, resulting in lesser condition for such areas.

## 5.3 FORTESCUE MARSH

The survey area incorporates a small portion of the Fortescue Marsh. The Marsh is considered to be significant for a number of reasons, reflected in its listing in the Directory of Important Wetlands of Australia as a *Wetland of National Significance* (Australian Government & DAWE 2010). The vegetation of the Marsh, as it relates to the corresponding PEC, is discussed above in **Section 5.2.1.2** above.

Threats to the Marsh ecosystem include (Department of Environment and Conservation 2009);

- cattle; grazing native vegetation, introduction and spread of weeds, soil damage by trampling and wallowing
- altered hydrology including changes due to the construction of Ophthalmia Dam in 1981 that has reduced inflow into the Marsh (although Markey (2016) indicates that flood frequency has been increasing in the last 20 years)
- surrounding mining operations including dewatering, groundwater extraction, long-term or accidental discharge into creeks altering local hydrology, reinjection
- weeds
- climate change that may alter the frequency and longevity of inundation, temperature rise, changes to drought and flood frequency
- eutrophication caused by cattle
- fire, especially late dry season fires that are hotter and expose more soil to erosion, weed invasion and loss of nitrogen in smoke.

## LEGEND

Transport Corridor Survey Area

Billiards North Survey Area

**Soil Landscape Mapping (DPIRD 2019)**

- 282Cp: Rugged sandstone hills, ridges, stony footslopes and interfluves supporting low acacia shrublands or hard spinifex grasslands with scattered shrubs
- 282Mk: Hills, ridges, plateaux remnants and breakaways of meta sedimentary and sedimentary rocks supporting hard spinifex grasslands with acacias and occasional eucalypts
- 282Ne: Rugged jaspilite plateaux, ridges and mountains supporting hard spinifex grasslands
- 282Rk: Basalt hills, plateaux, lower slopes and minor stony plains supporting hard spinifex and occasionally soft spinifex grasslands with scattered shrubs
- 282Wo: Basalt upland gilgai plains supporting Roebourne Plains grass and Mitchell grass tussock grasslands, minor hard spinifex grasslands or annual grasslands/herbfields
- 283Mc: Stony plains and occasional tor fields based on granite supporting hard and soft spinifex shrubby grasslands
- 283Rk: Basalt hills, plateaux, lower slopes and minor stony plains supporting hard spinifex and occasionally soft spinifex grasslands with scattered shrubs
- 283Ro: Low plateaux, mesas and buttes of limonite supporting soft spinifex and occasionally hard spinifex grasslands
- 284Ad: Stony plains and low silcrete hills supporting hard spinifex grasslands
- 284Bg: Stony lower slopes and plains below hill systems supporting hard and soft spinifex grasslands or mulga shrublands
- 284Ca: Low calcrete platforms and plains supporting shrubby hard spinifex grasslands
- 284Ch: Stony alluvial plains supporting snakewood and mulga shrublands with sparse tussock grasses
- 284Co: Flood plains with weakly gilgaied clay soils supporting coolibah woodlands with tussock grass understorey
- 284Cw: Plains fringing the Marsh land system and supporting snakewood and mulga shrublands with some halophytic undershrubs
- 284Dv: Gently undulating sandplains with minor dunes, supporting hard spinifex hummock grasslands with numerous shrubs
- 284Fa: Washplains and gilgai plains supporting groved mulga tall shrublands and minor tussock grasslands
- 284Ft: Alluvial plains and flood plains supporting patchy grassy eucalypt and acacia woodlands and shrublands and tussock grasslands
- 284Jm: Stony hardpan plains and rises supporting groved mulga shrublands, occasionally with spinifex understorey
- 284Ms: Lakebeds and flood plains subject to regular inundation, supporting samphire shrublands, salt water couch grasslands and chenopod shrublands
- 284Ne: Rugged jaspilite plateaux, ridges and mountains supporting hard spinifex grasslands
- 284Ri: Narrow, seasonally active flood plains and major river channels supporting moderately close, tall shrublands or woodlands of acacias and fringing communities of eucalypts sometimes with tussock grasses or spinifex
- 284Ur: Stony plains, alluvial plains and drainage lines supporting shrubby soft spinifex grasslands
- 285Bg: Stony lower slopes and plains below hill systems supporting hard and soft spinifex grasslands or mulga shrublands
- 285Ne: Rugged jaspilite plateaux, ridges and mountains supporting hard spinifex grasslands
- 285Ri: Narrow, seasonally active flood plains and major river channels supporting moderately close, tall shrublands or woodlands of acacias and fringing communities of eucalypts sometimes with tussock grasses or spinifex

## LEGEND

Transport Corridor Survey Area

Billiards North Survey Area

**Geological units**

- AFj: Pelite, chert and thin-bedded metasandstone; intruded by metadolerite sills in the Hamersley Range
- AFjo: Metamorphosed quartzitic sandstone, pelite and chert (locally stromatolitic)
- AFm: Amygdaloidal metabasaltic flora and breccia
- AFmk: Metamorphosed volcanic sandstone, pelite, chert and metadolomite; local accretionary lapilli and stromatolites
- AFt: Metamorphosed mafic to intermediate volcanic sandstone, pelite, metabasaltic flows and breccia, chert and metadolerite; local accretionary lapilla and stromatolites
- AFtc: Metamorphosed stromatolitic limestone and dolomite, pelite and volcanic sandstone
- AHm: Chert, banded iron-formation and pelite
- AgSm: Metamorphosed biotite monzogranite and minor granodiorite; weakly to strongly foliated; local metabasalt and metadolerite xenoliths intruded by a network of metamorphosed muscovite pegmatite veins
- Czc: Colluvium – partly consolidated quartz and rock fragments in silt and sand matrix; old valley-fill deposits
- Czk: Calcrete – sheet carbonate; found along major drainage lines
- Czp: Robe pisolite: pisolitic limonite deposits developed along river channels
- Czr: Hematite-geothite deposits on banded iron-formation and adjacent scree deposits
- Czz: Brecciated siliceous caprock over dolomitic rock; angular chert fragments in a chert matrix; overlies Wittenoom Formation
- PLHb: Brockman Iron Formation" banded iron-formation, chert and pelite
- PLHj: Weeli Wolli Formation: banded iron-formation (commonly jaspilitic), pelite and numerous metadolerite sills
- Qa: Alluvium – unconsolidated silt, sand and gravel; in drainage channels and on adjacent floodplains
- Qc: Colluvium – unconsolidated quartz and rock fragments in soil; locally derived soil and scree and talus deposits
- Ql: Lacustrine deposits – clay and silt; claypan (predominantly fresh water) deposits
- Qs: Eolian deposit – sand; in sheets and longitudinal dunes
- Qw: Alluvium and colluvium – red brown sandy and clayey soil; on low slopes and sheetwash areas

# APPENDIX ONE LEGISLATIVE CONTEXT, DEFINITIONS AND CRITERIA

## COMMONWEALTH ENVIRONMENT PROTECTION AND BIODIVERSITY CONSERVATION ACT 1999

The EPBC Act is a legal framework to protect and manage matters of national environmental significance (MNES) including important flora, fauna, ecological communities and heritage areas listed under the Act.

Threatened taxa (flora and fauna) are protected under the EPBC Act, which lists species and ecological communities that have been assessed as meeting the criteria to be listed as Critically Endangered, Endangered, Vulnerable, Conservation Dependant, Extinct, or Extinct in the Wild, as detailed in **Table 12**.

Threatened Ecological Communities protected under the EPBC Act are categorised as Critically Endangered, Endangered or Vulnerable, also detailed in this table.

Migratory species subject to international agreements are also protected under the EPBC Act. The definition of a migratory species under the Act follows that prescribed by the Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention) (Department of the Environment 2021):

> *Migratory species are the entire population or any geographically separate part of the population of any species or lower taxon of wild animals, a significant proportion of whose members cyclically and predictably cross one or more national jurisdictional boundaries.*

Species listed by the following international agreements are currently protected under the EPBC Act:

- Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention)
- China-Australia Migratory Bird Agreement (CAMBA)
- Japan-Australia Migratory Bird Agreement (JAMBA)
- Republic of Korea-Australia Migratory Bird Agreement (ROKAMBA).

**Table 12: EPBC Act categories for flora, fauna and ecological communities**

| Category | Threatened species | Threatened Ecological Communities |
|---|---|---|
| **Extinct** | A native species is eligible to be included in the extinct category at a particular time if, at that time, there is no reasonable doubt that the last member of the species has died. | n/a |
| **Extinct in the wild** | A native species is eligible to be included in the extinct in the wild category at a particular time if, at that time:<br>(a) it is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; or<br>(b) it has not been recorded in its known and/or expected habitat, at appropriate seasons, anywhere in its past range, despite exhaustive surveys over a time frame appropriate to its life cycle and form. | n/a |
| **Critically Endangered (CE)** | A native species is eligible to be included in the *critically endangered* category at a particular time if, at that time, it is facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with the prescribed criteria. | An ecological community is eligible to be included in the *critically endangered* category at a particular time if, at that time, it is facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with the prescribed criteria |

| Category | Threatened species | Threatened Ecological Communities |
|---|---|---|
| **Endangered (EN)** | A native species is eligible to be included in the *endangered* category at a particular time if, at that time:<br>(a) it is not critically endangered; and<br>(b) it is facing a very high risk of extinction in the wild in the near future, as determined in accordance with the prescribed criteria. | An ecological community is eligible to be included in the *endangered* category at a particular time if, at that time:<br>(a) it is not critically endangered; and<br>(b) it is facing a very high risk of extinction in the wild in the near future, as determined in accordance with the prescribed criteria. |
| **Vulnerable (VU)** | A native species is eligible to be included in the *vulnerable* category at a particular time if, at that time:<br>(a) it is not critically endangered or endangered; and<br>(b) it is facing a high risk of extinction in the wild in the medium term future, as determined in accordance with the prescribed criteria. | An ecological community is eligible to be included in the *vulnerable* category at a particular time if, at that time:<br>(a) it is not critically endangered or endangered; and<br>(b) it is facing a high risk of extinction in the wild in the medium term future, as determined in accordance with the prescribed criteria. |
| **Conservation Dependent** | A native species is eligible to be included in the conservation dependent category at a particular time if, at that time:<br>(a) the species is the focus of a specific conservation program the cessation of which would result in the species becoming vulnerable, endangered or critically endangered; or<br>(b) the following subparagraphs are satisfied:<br>(i) the species is a species of fish;<br>(ii) the species is the focus of a plan of management that provides for management actions necessary to stop the decline of, and support the recovery of, the species so that its chances of long-term survival in nature are maximised;<br>(iii) the plan of management is in force under a law of the Commonwealth or of a State or Territory;<br>(iv) cessation of the plan of management would adversely affect the conservation status of the species. | n/a |

## WESTERN AUSTRALIAN ENVIRONMENTAL PROTECTION ACT 1986

The Western Australian EP Act was created to provide for an Environmental Protection Authority (the EPA) that has the responsibility for:

- prevention, control and abatement of pollution and environmental harm
- conservation, preservation, protection, enhancement and management of the environment
- matters incidental to or connected with the above.

The EPA is responsible for providing the guidance and policy under which environmental assessments are conducted. It conducts environmental impact assessments (based on the information provided by the proponent), initiates measures to protect the environment and provides advice to the Minister responsible for environmental matters.

## WESTERN AUSTRALIAN BIODIVERSITY CONSERVATION ACT 2016

The Western Australian BC Act provides for the conservation, protection and ecologically sustainable use of biodiversity and biodiversity components in Western Australia.

Threatened species (both flora and fauna) and ecological communities that meet the categories listed within the BC Act are protected under this legislation and require authorisation by the Minister to take or disturb. These are known as Threatened Flora, Threatened Fauna and Threatened Ecological Communities. The conservation categories of Critically Endangered, Endangered and Vulnerable are detailed in **Table 13**; these categories align with those of the EPBC Act. Some State-listed threatened species and ecological communities are provided with additional protection as they are also listed under the Commonwealth EPBC Act (see **Table 12** for conservation status category descriptions).

The most recent Western Australian flora and fauna listings were published in the Government Gazette on 11 September 2018 (Government of Western Australia 2018a).

### PRIORITY-LISTED FLORA AND FAUNA

Flora are listed as PF where populations are geographically restricted or threatened by local processes, or where there is insufficient information to formally assign them to TF categories. Whilst PF are not specifically listed in the BC Act, some may qualify as being of special conservation interest and thereby have a greater level of protection than unlisted species.

There are three categories covering Western Australian-listed TF and four categories covering PF species which are outlined in **Table 13**. PF for Western Australia are regularly reviewed by the DBCA whenever new information becomes available, with species status altered or removed from the list when data indicates that they no longer meet these requirements.

Conservation significant fauna species are listed by the DBCA as Priority Fauna where populations are geographically restricted or threatened by local processes, or where there is insufficient information to formally assign them to threatened fauna categories. Whilst Priority Fauna are not specifically listed in the BC Act, these have a greater level of significance than other native species. The categories covering Priority Fauna species are outlined in **Table 13**.

Flora and fauna species may be listed as being of special conservation interest if they have a naturally low population, have a restricted natural range, are subject to or recovering from a significant population decline or reduction of range or are of special interest, and the Minister considers that taking may result in depletion of the species. Migratory species and those subject to international agreement are also listed under the Act. These are known as 'specially protected species' in the BC Act.

**Table 13: Conservation codes for Western Australian flora and fauna (DBCA 2019b)**

| **Conservation Codes for Western Australian Flora and Fauna** | |
|---|---|
| Threatened, Extinct and Specially Protected fauna or flora[1] are species[2] which have been adequately searched for and are deemed to be, in the wild, threatened, extinct or in need of special protection, and have been gazetted as such.<br>**The *Wildlife Conservation (Specially Protected Fauna) Notice 2018* and the *Wildlife Conservation (Rare Flora) Notice 2018* have been transitioned under regulations 170, 171 and 172 of the *Biodiversity Conservation Regulations 2018* to be the lists of Threatened, Extinct and Specially Protected species under Part 2 of the *Biodiversity Conservation Act 2016*.**<br>**Categories of Threatened, Extinct and Specially Protected fauna and flora are:** | |
| **T** | **Threatened species**<br>Listed by order of the Minister as Threatened in the category of critically endangered, endangered or vulnerable under section 19(1), or is a rediscovered species to be regarded as threatened species under section 26(2) of the *Biodiversity Conservation Act 2016* (BC Act).<br>Threatened fauna is that subset of 'Specially Protected Fauna' listed under schedules 1 to 3of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018* for Threatened Fauna.<br>Threatened flora is that subset of 'Rare Flora' listed under schedules 1 to 3of the *Wildlife Conservation (Rare Flora) Notice 2018* for Threatened Flora.<br>The assessment of the conservation status of these species is based on their national extent and ranked according to their level of threat using IUCN Red List categories and criteria as detailed below. |

| Conservation Codes for Western Australian Flora and Fauna | |
|---|---|
| **CR** | **Critically endangered species**<br>Threatened species considered to be "*facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with criteria set out in the ministerial guidelines*".<br>Listed as critically endangered undersection 19(1)(a) of the BC Act in accordance with the criteria set out in section 20 and the ministerial guidelines. Published under schedule 1 of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018* for critically endangered fauna or the *Wildlife Conservation (Rare Flora) Notice 2018* for critically endangered flora. |
| **EN** | **Endangered species**<br>Threatened species considered to be "*facing a very high risk of extinction in the wild in the near future, as determined in accordance with criteria set out in the ministerial guidelines*".<br>Listed as endangered under section 19(1)(b) of the BC Act in accordance with the criteria set out in section 21 and the ministerial guidelines. Published under schedule 2 of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018* for endangered fauna or the *Wildlife Conservation (Rare Flora) Notice 2018* for endangered flora. |
| **VU** | **Vulnerable species**<br>Threatened species considered to be "*facing a high risk of extinction in the wild in the medium-term future, as determined in accordance with criteria set out in the ministerial guidelines*".<br>Listed as vulnerable undersection 19(1)(c) of the BC Act in accordance with the criteria set out in section 22 and the ministerial guidelines. Published under schedule 3of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018* for vulnerable fauna or the *Wildlife Conservation (Rare Flora) Notice 2018* for vulnerable flora. |
| **Extinct species**<br>**Listed by order of the Minister as extinct under section 23(1) of the BC Act as extinct or extinct in the wild.** | |
| **EX** | **Extinct species**<br>Species where "*there is no reasonable doubt that the last member of the species has died*", and listing is otherwise in accordance with the ministerial guidelines (section 24 of the BC Act).<br>Published as presumed extinct under schedule 4of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018* for extinct fauna or the *Wildlife Conservation (Rare Flora) Notice 2018* for extinct flora. |
| **EW** | Extinct in the wild species<br>Species that "*is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; and it has not been recorded in its known habitat or expected habitat, at appropriate seasons, anywhere in its past range, despite surveys over a time frame appropriate to its life cycle and form*", and listing is otherwise in accordance with the ministerial guidelines (section 25of the BC Act).<br>Currently there are no threatened fauna or threatened flora species listed as extinct in the wild. If listing of a species as extinct in the wild occurs, then a schedule will be added to the applicable notice. |
| **Specially protected species**<br>**Listed by order of the Minister as specially protected under section 13(1) of the BC Act. Meeting one or more of the following categories: species of special conservation interest; migratory species; cetaceans; species subject to international agreement; or species otherwise in need of special protection.**<br>**Species that are listed as threatened species (critically endangered, endangered or vulnerable) or extinct species under the BC Act cannot also be listed as Specially Protected species.** | |
| **MI** | **Migratory species**<br>Fauna that periodically or occasionally visit Australia or an external Territory or the exclusive economic zone; or the species is subject of an international agreement that relates to the protection of migratory species and that binds the Commonwealth; and listing is otherwise in accordance with the ministerial guidelines (section 15of the BC Act).<br>Includes birds that are subject to an agreement between the government of Australia and the governments of Japan (JAMBA), China (CAMBA) and The Republic of Korea (ROKAMBA), and fauna subject to the *Convention on the Conservation of Migratory Species of Wild Animals* (Bonn Convention), an environmental treaty under the United Nations Environment Program. Migratory species listed under the BC Act are a subset of the migratory animals that are known to visit Western Australia, protected under the international agreements or treaties, excluding species that are listed as Threatened species.<br>Published as migratory birds protected under an international agreement under schedule 5 of the Wildlife Conservation (Specially Protected Fauna) Notice 2018. |
| **CD** | **Species of special conservation interest (conservation dependent fauna)**<br>Fauna of special conservation need being species dependent on ongoing conservation intervention to prevent it becoming eligible for listing as threatened, and listing is otherwise in accordance with the ministerial guidelines (section 14of the BC Act).<br>Published as conservation dependent fauna under schedule 6 of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018.* |
| **OS** | **Other specially protected species**<br>Fauna otherwise in need of special protection to ensure their conservation, and listing is otherwise in accordance with the ministerial guidelines (section 18of the BC Act).<br>Published as other specially protected fauna under schedule 7of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018*. |

| Conservation Codes for Western Australian Flora and Fauna | |
|---|---|
| P | **Priority species**<br>Possibly threatened species that do not meet survey criteria, or are otherwise data deficient, are added to the Priority Fauna or Priority Flora Lists under Priorities 1, 2 or 3. These three categories are ranked in order of priority for survey and evaluation of conservation status so that consideration can be given to their declaration as threatened fauna or flora.<br>Species that are adequately known, are rare but not threatened, or meet criteria for near threatened, or that have been recently removed from the threatened species or other specially protected fauna lists for other than taxonomic reasons, are placed in Priority 4. These species require regular monitoring.<br>Assessment of Priority codes is based on the Western Australian distribution of the species, unless the distribution in WA is part of a contiguous population extending into adjacent States, as defined by the known spread of locations. |
| 1 | **Priority 1: Poorly-known species**<br>Species that are known from one or a few locations (generally five or less) which are potentially at risk. All occurrences are either: very small; or on lands not managed for conservation, e.g. agricultural or pastoral lands, urban areas, road and rail reserves, gravel reserves and active mineral leases; or otherwise under threat of habitat destruction or degradation. Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements and appear to be under immediate threat from known threatening processes. Such species are in urgent need of further survey. |
| 2 | **Priority 2: Poorly-known species**<br>Species that are known from one or a few locations (generally five or less), some of which are on lands managed primarily for nature conservation, e.g. national parks, conservation parks, nature reserves and other lands with secure tenure being managed for conservation. Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements and appear to be under threat from known threatening processes. Such species are in urgent need of further survey. |
| 3 | **Priority 3: Poorly-known species**<br>Species that are known from several locations, and the species does not appear to be under imminent threat, or from few but widespread locations with either large population size or significant remaining areas of apparently suitable habitat, much of it not under imminent threat. Species may be included if they are comparatively well known from several locations but do not meet adequacy of survey requirements and known threatening processes exist that could affect them. Such species are in need of further survey. |
| 4 | **Priority 4: Rare, Near Threatened and other species in need of monitoring**<br>(a) Rare. Species that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection but could be if present circumstances change. These species are usually represented on conservation lands.<br>(b) Near Threatened. Species that are considered to have been adequately surveyed and that are close to qualifying for vulnerable but are not listed as Conservation Dependent.<br>(c) Species that have been removed from the list of threatened species during the past five years for reasons other than taxonomy. |

**[1] The definition of flora includes algae, fungi and lichens.**
**[2] Species includes all taxa (plural of taxon - a classificatory group of any taxonomic rank, e.g. a family, genus, species or any infraspecific category i.e. subspecies or variety, or a distinct population).**

## THREATENED AND PRIORITY ECOLOGICAL COMMUNITIES

Western Australian TECs are protected under the BC Act and are categorised much like those of the EPBC Act. Western Australian definitions and criteria for TECs are shown in **Table 14**.

Currently described TECs are listed on the DBCA website, with the most recent list endorsed by the Minister for Environment in June 2018 (DBCA 2018).

DBCA also maintains a list of Priority Ecological Communities (PECs). PECs include potential TECs that do not meet survey criteria, or that are not adequately defined. They are not protected under legislation but are taken into consideration as part of the environmental approvals process.

Currently described PECs are listed on the DBCA website, with the most recent list dated 20 March 2021 (Species and Communities Program, DBCA 2021). Definitions and criteria for PECs are shown in **Table 14**.

**Table 14: DBCA definitions and criteria for TECs and PECs (DEC 2013)**

| Criteria | Definition |
|---|---|
| **Threatened Ecological Communities** | |
| **Presumed Totally Destroyed (PD)** | An ecological community that has been adequately searched for but for which no representative occurrences have been located. The community has been found to be totally destroyed or so extensively modified throughout its range that no occurrence of it is likely to recover its species composition and/or structure in the foreseeable future.<br>An ecological community will be listed as presumed totally destroyed if there are no recent records of the community being extant and either of the following applies (A or B):<br>A. Records within the last 50 years have not been confirmed despite thorough searches of known or likely habitats or<br>B. All occurrences recorded within the last 50 years have since been destroyed |
| **Critically Endangered (CR)** | An ecological community that has been adequately surveyed and found to have been subject to a major contraction in area and/or that was originally of limited distribution and is facing severe modification or destruction throughout its range in the immediate future, or is already severely degraded throughout its range but capable of being substantially restored or rehabilitated.<br>An ecological community will be listed as Critically Endangered when it has been adequately surveyed and is found to be facing an extremely high risk of total destruction in the immediate future. This will be determined on the basis of the best available information, by it meeting any one or more of the following criteria (A, B or C):<br>A. The estimated geographic range, and/or total area occupied, and/or number of discrete occurrences since European settlement have been reduced by at least 90% and either or both of the following apply (i or ii):<br>i. geographic range, and/or total area occupied and/or number of discrete occurrences are continuing to decline such that total destruction of the community is imminent (within approximately 10 years);<br>ii. modification throughout its range is continuing such that in the immediate future (within approximately 10 years) the community is unlikely to be capable of being substantially rehabilitated.<br>B. Current distribution is limited, and one or more of the following apply (i, ii or iii):<br>i. geographic range and/or number of discrete occurrences, and/or area occupied is highly restricted and the community is currently subject to known threatening processes which are likely to result in total destruction throughout its range in the immediate future (within approximately 10 years);<br>ii. there are very few occurrences, each of which is small and/or isolated and extremely vulnerable to known threatening processes;<br>iii. there may be many occurrences but total area is very small and each occurrence is small and/or isolated and extremely vulnerable to known threatening processes.<br>C. The ecological community exists only as highly modified occurrences that may be capable of being rehabilitated if such work begins in the immediate future (within approximately 10 years). |
| **Endangered (EN)** | An ecological community that has been adequately surveyed and found to have been subject to a major contraction in area and/or was originally of limited distribution and is in danger of significant modification throughout its range or severe modification or destruction over most of its range in the near future.<br>An ecological community will be listed as Endangered when it has been adequately surveyed and is not Critically Endangered but is facing a very high risk of total destruction in the near future. This will be determined on the basis of the best available information by it meeting any one or more of the following criteria (A, B, or C):<br>A. The geographic range, and/or total area occupied, and/or number of discrete occurrences have been reduced by at least 70% since European settlement and either or both of the following apply (i or ii):<br>i. the estimated geographic range, and/or total area occupied and/or number of discrete occurrences are continuing to decline such that total destruction of the community is likely in the short term future (within approximately 20 years);<br>ii. modification throughout its range is continuing such that in the short term future (within approximately 20 years) the community is unlikely to be capable of being substantially restored or rehabilitated.<br>B. Current distribution is limited, and one or more of the following apply (i, ii or iii):<br>i. geographic range and/or number of discrete occurrences, and/or area occupied is highly restricted and the community is currently subject to known threatening processes which are likely to result in total destruction throughout its range in the short term future (within approximately 20 years);<br>ii. there are few occurrences, each of which is small and/or isolated and all or most occurrences are very vulnerable to known threatening processes;<br>iii. there may be many occurrences but total area is small and all or most occurrences are small and/or isolated and very vulnerable to known threatening processes.<br>The ecological community exists only as very modified occurrences that may be capable of being substantially restored or rehabilitated if such work begins in the short-term future (within approximately 20 years). |

| Criteria | Definition |
|---|---|
| **Vulnerable (VU)** | An ecological community that has been adequately surveyed and is found to be declining and/or has declined in distribution and/or condition and whose ultimate security has not yet been assured and/or a community that is still widespread but is believed likely to move into a category of higher threat in the near future if threatening processes continue or begin operating throughout its range.<br>An ecological community will be listed as Vulnerable when it has been adequately surveyed and is not Critically Endangered or Endangered but is facing a high risk of total destruction or significant modification in the medium to long-term future. This will be determined on the basis of the best available information by it meeting any one or more of the following criteria (A, B or C):<br>A. The ecological community exists largely as modified occurrences that are likely to be capable of being substantially restored or rehabilitated.<br>B. The ecological community may already be modified and would be vulnerable to threatening processes, is restricted in area and/or range and/or is only found at a few locations.<br>C. The ecological community may be still widespread but is believed likely to move into a category of higher threat in the medium to long term future because of existing or impending threatening processes. |
| **Priority ecological communities** | |
| **Priority One** | *Poorly known ecological communities*<br>Ecological communities with apparently few, small occurrences, all or most not actively managed for conservation (e.g. within agricultural or pastoral lands, urban areas, active mineral leases) and for which current threats exist. Communities may be included if they are comparatively well-known from one or more localities but do not meet adequacy of survey requirements, and/or are not well defined, and appear to be under immediate threat from known threatening processes across their range. |
| **Priority Two** | *Poorly known ecological communities*<br>Communities that are known from few small occurrences, all or most of which are actively managed for conservation (e.g. within national parks, conservation parks, nature reserves, state forest, unallocated Crown land, water reserves, etc.) and not under imminent threat of destruction or degradation. Communities may be included if they are comparatively well known from one or more localities, but do not meet adequacy of survey requirements, and / or are not well defined, and appear to be under threat from known threatening processes. |
| **Priority Three** | *Poorly known ecological communities*<br>i. Communities that are known from several to many occurrences, a significant number or area of which are not under threat of habitat destruction or degradation or;<br>ii. Communities known from a few widespread occurrences, which are either large or within significant remaining areas of habitat in which other occurrences may occur, much of it not under imminent threat, or;<br>iii. Communities made up of large, and/or widespread occurrences, that may or may not be represented in the reserve system, but are under threat of modification across much of their range from processes such as grazing by domestic and/or feral stock, and inappropriate fire regimes.<br>Communities may be included if they are comparatively well known from several localities, but do not meet adequacy of survey requirements and / or are not well defined, and known threatening processes exist that could affect them. |
| **Priority Four** | Ecological communities that are adequately known, rare but not threatened or meet criteria for Near Threatened, or that have been recently removed from the threatened list. These communities require regular monitoring.<br>i. Rare. Ecological communities known from few occurrences that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection, but could be if present circumstances change These communities are usually represented on conservation lands.<br>ii. Near Threatened. Ecological communities that are considered to have been adequately surveyed and that do not qualify for Conservation Dependent, but that are close to qualifying for Vulnerable.<br>iii. Ecological communities that have been removed from the list of threatened communities during the past five years. |
| **Priority Five** | *Conservation Dependent Ecological Communities*<br>Ecological Communities that are not threatened but are subject to a specific conservation program, the cessation of which would result in the community becoming threatened within five years. |

# FLORA CRITERIA

## OTHER SIGNIFICANT FLORA

According to the Flora and Vegetation Technical Guidance (EPA 2016) other than being listed as Threatened or Priority Flora, a species can be considered as significant if it is considered to be:

- locally endemic or association with a restricted habitat type (e.g. Groundwater Dependent Ecosystems, Sheet Flow Dependent Vegetation)
- a new species or has anomalous features that indicate a potential new species
- at the extremes of range, recently discovered range extensions (generally considered greater than 100 km or in a different bioregion), or isolated outliers of the main range)
- unusual species, including restricted subspecies, varieties or naturally occurring hybrids
- relictual status, being representative of taxonomic groups that no longer occur widely in the broader landscape.

## INTRODUCED FLORA

Introduced plant species, known as weeds, are plants that are not indigenous to an area and have been introduced either directly or indirectly (unintentionally) through human activity. Species are regarded as introduced if they are listed as 'alien' on *FloraBase* (Western Australian Herbarium [WAH] 1998-2021) and are designated with an asterisk (*) in this document.

### Weeds of National Significance

At a national level there are 32 weed species listed as Weeds of National Significance (WoNS) (Weeds Australia & Centre for Invasive Species Solutions 2021). The Commonwealth *Australian Weeds Strategy 2017-2027* (Invasive Plants and Animals Committee 2016) describes broad goals and objectives to manage these species.

### Declared Pest Plants

The Western Australian Organism List (WAOL) details organisms listed as Declared Pests under the *Biosecurity and Agriculture Management Act 2007* (BAM Act). Under the BAM Act, Declared Pests are listed as one of the three categories, or exempt:

- C1 (exclusion), that applies to pests not established in Western Australia; control measures are to be taken to prevent their entry and establishment
- C2 (eradication), that applies to pests that are present in Western Australia but in low numbers or in limited areas where eradication is still a possibility
- C3 (management), that applies to established pests where it is not feasible or desirable to manage them in order to limit their damage
- exempt (no category).

# VEGETATION CRITERIA

## OTHER SIGNIFICANT VEGETATION

According to the Flora and Vegetation Technical Guidance (EPA 2016) other than being listed as a TEC or PEC, vegetation can be considered as significant if it is considered to have:

- restricted distribution
- a degree of historical impact from threatening processes
- a role as a refuge
- provides an important function required to maintain ecological integrity of a significant ecosystem.

Groundwater Dependent and Sheet Flow Dependent (Mulga) Vegetation may be considered as significant and are described below.

## Groundwater Dependent Vegetation

*Groundwater Definition*

Groundwater is water that is found in the saturated zone of the soil, where all soil pores are filled with water. The water table is the upper surface of the saturated zone in an unconfined aquifer. Groundwater may also occur as a perched aquifer located above unsaturated rock formations as a result of a discontinuous permeable layer or held under pressure in a confined aquifer (Goulburn-Murray Water 2010).

*Groundwater Dependent Ecosystems Definition*

Groundwater Dependent Ecosystems (GDEs) have been defined as ecosystems that are dependent on groundwater for their survival at some stage or stages of their lifecycle, however groundwater use cannot be equated with groundwater dependence (Eamus 2009). In some contexts (including that of a flora and vegetation assessment), GDEs are also known as Groundwater Dependent Vegetation (GDV).

Hatton and Evans (1998) identified four types of GDEs based on their geographic setting: terrestrial vegetation (vegetation communities and dependent fauna that have seasonal or episodic dependence on groundwater), river base flow systems (aquatic and riparian ecosystems that exist in or adjacent to streams that are fed by groundwater base flow), aquifer and cave ecosystems, and wetlands.

Eamus *et al.* (2006) identified three primary classes based on type of groundwater reliance:

5. Aquifer and cave ecosystems.
6. All ecosystems dependent on the surface expression of groundwater:
    a) river base flows
    b) wetlands, swamplands
    c) seagrass beds in estuaries
    d) floodplains
    e) mound springs
    f) riparian vegetation
    g) saline discharge to lakes
    h) low lying forests.
7. All ecosystems dependent on the subsurface presence of groundwater, often accessed via the capillary fringe (non-saturated zone above the water table) when roots penetrate this zone:
    a) River Red Gum (*Eucalyptus camaldulensis*) forests
    b) Banksia woodlands
    c) Riparian vegetation in the wet/dry tropics.

GDEs in arid areas, including the Pilbara region, are generally determined to be vegetation associated with riparian areas. GDEs dependent on the surface expression of groundwater (Eamus *et al.* 2006 class 2) includes vegetation associated with wetlands (permanent or semi-permanent pools) within riparian areas, and generally includes *Melaleuca argentea* in association with other species described below.

GDEs associated with the subsurface presence of groundwater (Eamus *et al.* 2006 class 3) includes riparian vegetation characterised by the phreatophytic species described below.

Direct impacts on GDEs (clearing), and indirect impacts, including from dewatering and reinjection, frequently feature as being a significant environmental impact in mining approvals documents e.g. Office of the Appeals Convenor (2016a, 2016b), Rio Tinto (2016).

*Phreatophytic Species*

Phreatophytic species rely on groundwater sources for water intake (Maunsell Australia Pty Ltd 2006) essentially the water requirements of phreatophytes are greater than can be provided from the surface soil profile (e.g. riparian vegetation) or they are dependent on free water availability (e.g. wetland species). They frequently show low tolerance to extended water stress due to a lack of physiological and/or morphological adaptation to drought and respond to significant water deficit by a decline in health and eventual death (*ibid.).*

Obligate phreatophytes are dependent on free access to water (i.e. they are wetland species) whereas facultative phreatophytes can switch their water source between the soil surface profile in times of rain, to groundwater in times of drought when the soil surface profile (vadosphere) is depleted (Grierson 2010).

Phreatophytic species likely to occur in the Pilbara include:

- *Eucalyptus camaldulensis sens. lat.*, which is regarded as a facultative phreatophyte that is dependent on groundwater for part of its lifecycle and/or in times of drought. This species has been reported to be tolerant of groundwater falls of up to 4 m per year (Maunsell Australia Pty Ltd 2006), has both lateral and sinker roots and is tolerant of waterlogging (Grierson 2010).
- *Eucalyptus victrix*, which may be regarded as a facultative phreatophyte. It is considered to be relatively drought tolerant and likely to be tolerant of gradual declines to the water table (to a degree) (Maunsell Australia Pty Ltd 2006). *Eucalyptus victrix* has lateral and sinker roots (i.e. a dimorphic root system) but is not tolerant of waterlogging (Grierson 2010). There is some conjecture that this species is actually a vadophyte (i.e. relies on water from within the soil surface profile, and is independent of groundwater) or, at best, weakly phreatophytic (Resource and Environmental Management Pty Ltd 2007). Depth to groundwater is likely to be an important indicator of groundwater dependence (Equinox Environmental 2017).
- wetland species such as *Melaleuca argentea*
- *Melaleuca xerophila* may be groundwater dependent in some areas (Markey 2016).

Vegetation containing *Eucalyptus camaldulensis sens. lat.* and *Melaleuca argentea* is generally considered to represent a GDE.

However, there is supporting evidence that, in some circumstances, *Eucalyptus victrix* does not always depend on groundwater (Batini 2009; Eamus 2009; EPA 2010; Resource and Environmental Management Pty Ltd 2007). Depth to groundwater provides guidance to determining if the vegetation is likely to be groundwater dependent or not. Where the depth to groundwater is more than 10 m below the soil surface *Eucalyptus victrix* is unlikely to be able to access the resource (Barron *et al.* 2012); therefore *Eucalyptus victrix*-dominated vegetation is not likely to be groundwater dependent. However, where the depth to groundwater is less than 10 m, or where depth to groundwater is unknown but is potentially in this range, *Eucalyptus victrix*-dominated vegetation is considered to be potentially groundwater dependent (i.e. representative of a potential GDE).

### Atlas of Groundwater Dependent Ecosystems

The Groundwater Dependent Ecosystems Atlas (BoM 2021b) indicates the presence of known GDEs and Inflow Dependent Ecosystems (IDEs) in Australia.

An Inflow Dependent Ecosystem is one in which the vegetation within the landscape is likely to be accessing water in addition to rainfall, from soil or surface water or groundwater, assessed using remotely sensed data. The likelihood of a landscape using additional water is rated from one to 10 (low to high), with a rating above six indicating that a landscape is likely to be inflow dependent (BoM 2021b).

### Sheet Flow Dependent Vegetation

Sheet Flow Dependent Vegetation (SFDV) occurs through much of the arid and semi-arid zones of the world and is characterised by a mosaic of low cover or bare areas with low water infiltration rates (run-off areas) and high biomass cover with high infiltration rates (run-on areas) (Saco, Willgoose & Hancock 2007). The high biomass component in Australia is generally characterised by Mulga (a suite of related *Acacia* species; Maslin & Reid 2012), although other vegetation is also considered as SFDV (Ecologia Environment 2010).

These mosaics form over time due to a positive feedback wherein the increases in soil moisture in vegetated patches reinforces the pattern. They are considered to have an important role in stabilising the ecosystem and assist ecosystem recovery from disturbance. World-wide, these mosaics occur frequently in the form of irregular clusters of vegetation surrounded by bare soil, but also form bands, stripes or arcs with banded vegetation usually forming along contour lines and intercepting surface water flow. They occur most frequently on gentle slopes but also occur on relatively steep slopes. Interruptions to the banding pattern result in the

formation of erosion gullies and rills that concentrate water flow, with the landscape no longer displaying sheet flow and disrupting the formation of banded vegetation (Saco, Willgoose & Hancock 2007).

The most commonly known form of SFDV in Australia is 'grove-intergrove' Mulga wherein the 'grove' of Mulga trees and shrubs form the high-infiltration, high-biomass component and the 'intergrove' represents the low-infiltration, low-biomass component of the system. These form on relatively flat (very gently sloping) landscapes (Muller 2005; The University of Western Australia, Grierson & Page 2012). Grove-intergrove Mulga formations are known to occur over much of Australia including in Queensland, Western Australia, New South Wales and South Australia, and all occur on gently sloping alluvial-colluvial plains (Dunkerley 2002). The relatively soil high nutrient status (due to interception and retention of organic material), moisture (including soil moisture), shelter and diversity of structure within the Mulga groves are significant as habitat for both flora and fauna species (Freudenberger & Hiernaux 2001; Page 2013; Woinarski, Burbidge & Harrison 2014), including fossorial fauna species that, through their burrows and nests, aerate the soil and increase rainwater infiltration (Tongway 1994), in an otherwise depauperate environment.

Linear infrastructure, including roads and railways, are known to alter surface water hydrology, thereby placing SFDV at risk of degradation (Astron Environmental Services 2010).

## ENVIRONMENTALLY SENSITIVE AREAS

There are a number of areas within Western Australia identified as being of environmental significance within which the exemptions to the Native Vegetation Clearing Regulations do not apply. These are referred to as Environmentally Sensitive Areas (ESAs), and are declared under section 51B of the EP Act and described in the *Environmental Protection (Environmentally Sensitive Areas) Notice*.

## CONSERVATION ESTATE

The National Reserve System is a network of protected areas managed for conservation under international guidelines. The objective of placing areas of bushland into the Conservation Estate is to achieve and maintain a comprehensive, adequate and representative reserve system for Western Australia. The Conservation and Parks Commission is the vesting body for conservation lands, forest and marine reserves that are managed by DBCA (Government of Western Australia 2018b).

# APPENDIX TWO FIELD SURVEY CRITERIA

**Table 15: NVIS structural formation terminology, terrestrial vegetation (NVIS Technical Working Group & DotEE 2017)**

| | **Cover characteristics** | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Foliage cover * | 70-100 | 30-70 | 10-30 | <10 | » 0 (scattered) | 0-5 (clumped) | unknown |
| | Cover code | d | c | i | r | bi | bc | unknown |
| Growth Form | **Height Ranges (m)** | **Structural Formation Classes** | | | | | | |
| **tree, palm** | <10,10-30, >30 | closed forest | open forest | woodland | open woodland | isolated trees | isolated clumps of trees | tree, palm |
| **tree mallee** | <3, <10, 10-30 | closed mallee forest | open mallee forest | mallee woodland | open mallee woodland | isolated mallee trees | isolated clumps of mallee trees | tree mallee |
| **shrub, cycad, grass-tree, tree-fern** | <1,1-2,>2 | closed shrubland | shrubland | open shrubland | sparse shrubland | isolated shrubs | isolated clumps of shrubs | shrub, cycad, grass-tree, tree-fern |
| **mallee shrub** | <3, <10, 10-30 | closed mallee shrubland | mallee shrubland | open mallee shrubland | sparse mallee shrubland | isolated mallee shrubs | isolated clumps of mallee shrubs | mallee shrub |
| **heath shrub** | <1,1-2,>2 | closed heathland | heathland | open heathland | sparse heathland | isolated heath shrubs | isolated clumps of heath shrubs | heath shrub |
| **chenopod shrub** | <1,1-2,>2 | closed chenopod shrubland | chenopod shrubland | open chenopod shrubland | sparse chenopod shrubland | isolated chenopod shrubs | isolated clumps of chenopod shrubs | chenopod shrub |
| **samphire shrub** | <0.5,>0.5 | closed samphire shrubland | samphire shrubland | open samphire shrubland | sparse samphire shrubland | isolated samphire shrubs | isolated clumps of samphire shrubs | samphire shrub |
| **hummock grass** | <2,>2 | closed hummock grassland | hummock grassland | open hummock grassland | sparse hummock grassland | isolated hummock grasses | isolated clumps of hummock grasses | hummock grass |
| **tussock grass** | <0.5,>0.5 | closed tussock grassland | tussock grassland | open tussock grassland | sparse tussock grassland | isolated tussock grasses | isolated clumps of tussock grasses | tussock grass |
| **other grass** | <0.5,>0.5 | closed grassland | grassland | open grassland | sparse grassland | isolated grasses | isolated clumps of grasses | other grass |
| **sedge** | <0.5,>0.5 | closed sedgeland | sedgeland | open sedgeland | sparse sedgeland | isolated sedges | isolated clumps of sedges | sedge |

| Source: (based on Walker & Hopkins 1990) | | | | | | |

**Table 17: Vegetation condition scale for the Eremaean and Northern Botanical Provinces (EPA 2016)**

| Condition rating | Description |
|---|---|
| **Excellent** | Pristine or nearly so, no obvious signs of disturbance or damage caused by human activities since European settlement. |
| **Very Good** | Some relatively slight signs of damage caused by human activities since European settlement. For example, some signs of damage to tree trunks caused by repeated fire, the presence of some relatively non-aggressive weeds, or occasional vehicle tracks. |
| **Good** | More obvious signs of damage caused by human activity since European settlement, including some obvious impact on the vegetation structure such as that caused by low levels of grazing or slightly aggressive weeds. |
| **Poor** | Still retains basic vegetation structure or ability to regenerate it after very obvious impacts of human activities since European settlement, such as grazing, partial clearing, frequent fires or aggressive weeds. |
| **Degraded** | Severely impacted by grazing, very frequent fires, clearing or a combination of these activities. Scope for some regeneration but not to a state approaching good condition without intensive management. Usually with a number of weed species present including very aggressive species. |
| **Completely Degraded** | Areas that are completely or almost completely without native species in the structure of their vegetation; i.e. areas that are cleared or 'parkland cleared' with their flora comprising weed or crop species with isolated native trees or shrubs. |

# APPENDIX THREE DESKTOP ASSESSMENT RESULTS AND LIKELIHOOD ASSESSMENTS

**Table 18: Flora database search results, habitat and likelihood assessment**

Blue shading indicates high likelihood; dark blue indicates species is known (recorded) from the survey area

| DBCA* | FMG ** | *Map code* | Species name | Habitat | Flowering | Distance (km) **** | Likelihood of occurrence | |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | Desktop | Post-survey |
| | | | **Threatened Flora** | | | | | |
| **WAH** | X | Ser | *Seringia exastia* | Sandplains with red sand. Pindan Plain. Sand dunes and gravel plains | Apr – Dec | 18 | May occur | Known |
| | | | **DBCA Priority 1** | | | | | |
| **WAH** | X | Csq | *Calotis squamigera* | Pebbly loam | Jul | 2 | Likely | Likely |
| **WAH** | X | Cma | *Cochlospermum macnamarae* | Granite outcrop, granite hills. Skeletal red-brown sand | - | 36 | Very unlikely | Very unlikely |
| **WAH** | | Dch | *Dipteracanthus chichesterensis* | Red/brown (cracking) clay | Sep | 8 | May occur | Unlikely |
| **WAH, TP** | | Hol | *Helichrysum oligochaetum* | Red clay. Alluvial plains | - | 36 | Unlikely | Unlikely |
| **WAH** | | Lsp | *Lindernia* sp. Pilbara (M.N. Lyons & L. Lewis FV 1069) | Edge of water features on clay | - | 1 | May occur | May occur |
| **WAH, TP** | X | Msc | *Myriocephalus scalpellus* | Clay. Depression on flood plain | - | 13 | May occur | Unlikely |
| **WAH** | | Rsp | *Rorippa* sp. Fortescue Valley (M.N. Lyons & R.A. Coppen FV 0760) | Riparian slope at water's edge | - | 30 | Unlikely | Unlikely |
| **WAH** | X | Ssf | *Samolus* sp. Fortescue Marsh (A. Markey & R. Coppen FM 9702) | Sandy clay loam soil. Floodplain/marsh | - | 0 | Known | May occur |
| **WAH** | X | Sha | *Synostemon hamersleyensis* | Brown sandy loam. Rocky ironstone hills | - | 6 | Likely | May occur |
| **WAH, TP** | X | Tgl | *Tecticornia globulifera* | Brown clayey loam. saline flat / marsh | - | 5 | Likely | Unlikely |
| **WAH** | X | TsC | *Tecticornia* sp. Christmas Creek (K.A. Shepherd & T. Colmer et al. KS 1063) | Red-orange/white sandy clay/sandy loam. Plains | - | 0 | Known | Known |
| **WAH** | | Tve | *Triodia veniciae* | Clay loam. Gentle slopes/small hills | - | 25 | Very unlikely | Very unlikely |
| **WAH** | X | Vsp | *Vittadinia* sp. Coondewanna Flats (S. van Leeuwen 4684) | Red-brown sandy clay. Plains/low hills | - | 25 | Unlikely | Unlikely |
| | | | **DBCA Priority 2** | | | | | |
| **WAH** | | Aca | *Adiantum capillus-veneris* | Moist, sheltered sites in gorges and on cliff walls | - | 4 | Unlikely | Very unlikely |
| **WAH** | X | Ala | *Aristida lazaridis* | Sand or loam | Apr | 23 | May occur | Unlikely |
| **WAH** | X | Cpr | *Cladium procerum* | Perennial pools | - | 34 | Unlikely | Very unlikely |

| DBCA* | FMG ** | *Map code* | Species name | Habitat | Flowering | Distance (km) **** | Likelihood of occurrence | |
|---|---|---|---|---|---|---|---|---|
| | | | | | | | Desktop | Post-survey |
| **WAH** | X | Epu | *Eremophila pusilliflora* | Red / brown loamy soil. Plains | Feb-Mar | 24 | Very unlikely | Very unlikely |
| **WAH** | X | Eii | *Euphorbia inappendiculata* var. *inappendiculata* | Red-brown sandy/loamy clay. Plains / claypan | May | 8 | May occur | May occur |
| **WAH** | X | Eiq | *Euphorbia inappendiculata* var. *queenslandica* | Brownish loamy clay. Cracking claypan or plain | - | 29 | May occur | Known |
| **WAH** | X | Gka | *Gompholobium karijini* | Plateau, flat to gently undulating or on top of hills / slopes | Aug-Sep | 16 | Unlikely | Unlikely |
| **WAH** | | Hsp | *Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708) | Riparian zones. Gorges | Apr | 46 | Unlikely | Unlikely |
| **WAH** | X | Ira | *Ipomoea racemigera* | Brown silty loam. Drainage lines or flats | Apr-Jun | 27 | Unlikely | Unlikely |
| **WAH** | | Ipa | *Isotropis parviflora* | Valley slope or ironstone plateau | Mar | 13 | May occur | Unlikely |
| **WAH** | | Kau | *Kohautia australiensis* | Brown sandy loam. Calcrete plains or hills | - | 29 | Unlikely | Unlikely |
| **WAH** | X | Pre | *Paspalidium retiglume* | Clay | Apr | 45 | Unlikely | Unlikely |
| **WAH** | | SsH | *Scaevola* sp. Hamersley Range basalts (S. van Leeuwen 3675) | Skeletal, brown gritty soil over basalt. Summits of hills, steep hills | Jul-Aug | 11 | Unlikely | Unlikely |
| **WAH** | X | Tpi | *Teucrium pilbaranum* | Crab hole plain in a river floodplain, margin of calcrete table | May or Sep | 14 | May occur | Unlikely |
| | | | **DBCA Priority 3** | | | | | |
| **WAH** | | Asp | *Abutilon* sp. Pritzelianum (S. van Leeuwen 5095) | Plains, floodplains, sand dunes. Red-brown or orange-brown sandy or loamy soil. Open *Acacia* shrubland over *Triodia* grassland | Apr-Sep | 7 | May occur | Unlikely |
| **WAH, TP** | | Aef | *Acacia effusa* | Scree slopes of low ranges, undulating stony plains. Stony red-brown loam soil | May-Aug | 44 | Very unlikely | Very unlikely |
| **WAH, TP** | | Ale | *Acacia levata* | Hillslopes. Sand or sandy loam over granite. *Triodia* grassland with scattered *Acacia* shrubs | May | 25 | Unlikely | Unlikely |
| **WAH, TP** | X | Asu | *Acacia subtiliformis* | Rocky ridges, calcrete hills, undulating plains. Light brown rocky loam or brown clay soils. *Acacia* shrubland over *Triodia* grassland with scattered *Eucalyptus* and *Corymbia* trees | Apr-Jun | 2 | May occur | Unlikely |
| **WAH** | | Ace | *Amaranthus centralis* | Sand plains, granite outcrops, river banks, flats. Clay loam or sandy soil. Open woodland of *Acacia/Eucalyptus/Corymbia* over mixed shrubland with *Triodia* spp | May | 23 | Very unlikely | Very unlikely |
| **WAH** | | Apr | *Ampelopteris prolifera* | Gullies, wetlands | - | 40 | Very unlikely | Very unlikely |
| **WAH** | X | Aje | *Aristida jerichoensis* var. *subspinulifera* | Hardpan plains. Mulga/open *Acacia* shrubland over open *Triodia* grassland and/or tussock grassland with scattered *Eucalyptus* trees | Mar-Jul | 22 | Unlikely | Unlikely |
| **WAH** | X | Afl | *Atriplex flabelliformis* | Saline flats or marshes with red-brown clay loam soil. Samphire vegetation | - | 0 | Known | Known |

# Threatened and Priority Flora Report Form

Version 1.4 March 2021

***Please complete as much of the form as possible, with emphasis on those sections bordered in black.*** For information on how to complete the form please refer to the Threatened & Priority Flora Report Form (TPRF) manual on the DBCA website at www.dpaw.wa.gov.au/plants-and-animals/threatened-species-and-communities/threatened-plants

**TAXON:** Atriplex flabelliformis **TPFL Pop. No:**

**OBSERVATION DATE:** 6/5/2021 **CONSERVATION STATUS:** P3 **New population** ☒

**OBSERVER/S:** Stephen Kern **PHONE** 08 9430 8955

**ROLE:** Botanist **ORGANISATION:** Ecoscape

**EMAIL:** stephenk@ecoscape.com.au

**DESCRIPTION OF LOCATION** (Provide at least nearest town/named locality, and the distance and direction to that place)**:**

Approximately 130 km NW of Newman, western end of the Fortescue Marsh

**Reserve No:**

**DBCA DISTRICT:** Pilbara **LGA:** East Pilbara Land manager present: ☐

**DATUM:**
GDA94 / MGA94 ☒
AGD84 / AMG84 ☐
WGS84 ☐
Unknown ☐

**COORDINATES:** (If UTM coords provided, **Zone** is also required)
DecDegrees ☐ DegMinSec ☐ UTMs ☒
**Lat / Northing:** 7523535
**Long / Easting:** 706271
**ZONE:** 50

**METHOD USED:**
GPS ☒ Differential GPS ☐ Map ☐
No. satellites: _____ Map used: _____
Boundary polygon captured: ☐ Map scale: _____

**LAND TENURE:**

| | | | | |
|---|---|---|---|---|
| Nature reserve ☐ | Timber reserve ☐ | Private property ☐ | Rail reserve ☐ | Shire road reserve ☐ |
| National park ☐ | State forest ☐ | Pastoral lease ☐ | MRWA road reserve ☐ | Other Crown reserve ☐ |
| Conservation park ☐ | Water reserve ☐ | UCL ☒ | SLK/Pole _____ to _____ | Specify other: _____ |

**AREA ASSESSMENT:** Edge survey ☐ Partial survey ☒ Full survey ☐ Area observed (m²): 2500

**EFFORT:** Time spent surveying (minutes): _____ No. of minutes spent / 100 m²: _____

**POP'N COUNT ACCURACY:** Actual ☐ Extrapolation ☐ Estimate ☒ Count method: _____
(Refer to field manual for list)

**WHAT COUNTED:** Plants ☒ Clumps ☐ Clonal stems ☐

**TOTAL POP'N STRUCTURE:**

| | Mature: | Juveniles: | Seedlings: | Totals: |
|---|---|---|---|---|
| Alive | 15 | | | |
| Dead | | | | |

Area of pop (m²): _____
Note: Pls record count as numbers (not percentages) for database.

**QUADRATS PRESENT:** No. _____ Size _____ Data attached ☐ Total area of quadrats (m²): _____

| | | | | |
|---|---|---|---|---|
| **Summary Quad. Totals:** Alive | | | | |

**REPRODUCTIVE STATE:** Clonal ☐ Vegetative ☐ Flowerbud ☐ Flower ☐
Immature fruit ☐ Fruit ☒ Dehisced fruit ☐ Percentage in flower: 100%

**CONDITION OF PLANTS:** Healthy ☒ Moderate ☐ Poor ☐ Senescent ☐

**COMMENT:**

| **THREATS - type, agent and supporting information:**<br>Eg clearing, too frequent fire, weed, disease. Refer to field manual for list of threats & agents. **Specify agent** where relevant.<br>Rate current and potential threat impact: N=Nil, L=Low, M=Medium, H=High, E=Extreme<br>Estimate time to potential impact: S=Short (<12mths), M=Medium (<5yrs), L=Long (5yrs+) | **Current impact (N-E)** | **Potential Impact (L-E)** | **Potential Threat Onset (S-L)** |
|---|---|---|---|

# Threatened and Priority Flora Report Form

Version 1.4 March 2021

**HABITAT INFORMATION:**

**LANDFORM:**
Crest ☐
Hill ☐
Ridge ☐
Outcrop ☐
Slope ☐
Flat ☐
Open depression ☐
Drainage line ☐
Closed depression ☐
Wetland ☒

**ROCK TYPE:**
Granite ☐
Dolerite ☐
Laterite ☐
Ironstone ☐
Limestone ☐
Quartz ☐
Specify other: _____

**LOOSE ROCK:**
(on soil surface; eg gravel, quartz fields)
0-10% ☐
10-30% ☐
30-50% ☐
50-100% ☐

**SOIL TYPE:**
Sand ☐
Sandy loam ☐
Loam ☐
Clay loam ☒
Light clay ☐
Peat ☐
Specify other: _____

**SOIL COLOUR:**
Red ☐
Brown ☐
Yellow ☐
White ☐
Grey ☒
Black ☐
Specify other: _____

**DRAINAGE:**
Well drained ☐
Seasonally inundated ☒
Permanently inundated ☐
Tidal ☐

Specific **Landform** Element: _____
(Refer to field manual for additional values)

**CONDITION OF SOIL:** Dry ☒ Moist ☐ Waterlogged ☐ Inundated ☐

**VEGETATION CLASSIFICATION*:**
Eg: **1**. Banksia woodland (B. attenuata, B. ilicifolia); **2**. Open shrubland (Hibbertia sp., Acacia spp.) ; **3**. Isolated clumps of sedges (M.tetragona)

1. Tecticornia indica
2.
3.
4.

**ASSOCIATED SPECIES:**

Other (non-dominant) spp

* Please record up to four of the most representative vegetation layers (with up to three dominant species in each layer). Structural Formations should follow 2009 *Australian Soil and Land Survey Field Handbook* guidelines – refer to field manual for further information and structural formation table.

**CONDITION OF HABITAT:** Pristine ☐ Excellent ☐ Very good ☒ Good ☐ Degraded ☐ Completely degraded ☐

**COMMENT:**

**FIRE HISTORY:** **Last Fire:** Season/Month: _____ Year: _____ **Fire Intensity:** High ☐ Medium ☐ Low ☐ No signs of fire ☒

**FENCING:** Not required ☒ Present ☐ Replace / repair ☐ Required ☐ Length req'd: _____

**ROADSIDE MARKERS:** Not required ☒ Present ☐ Replace / reposition ☐ Required ☐ Quantity req'd: _____

**OTHER COMMENTS:** (Please include recommended management actions and/or implemented actions - include date. Also include details of additional data available, and how to locate it.)

**FLORA AUTHORISATION / LICENCE No:** FB62000001 Note if only observing plants (i.e. no specimens or plant matieral is taken) then no authorisation/licence is required. For further information on authorisation and licening requirements see the Threatened Flora and Wildlife Licensing pages on DBCA's website. Any actions carried out under authorisations/licences should be recorded above in the OTHER COMMENTS section.

**SPECIMEN:** Collectors No: _ WA Herb. ☐ Regional Herb. ☐ District Herb. ☐ Other:

**LODGEMENT:** WA Herb Lodgement No: _____

**ATTACHED:** Map ☐ Mudmap ☐ Photo ☐ GIS data ☐ Field notes ☐ Other: _____

**COPY SENT TO:** Regional Office ☐ District Office ☐ Other: _____

Submitter of Record: Stephen Kern Role: Botanist Signed: Stephen Kern Date: 1/2/2022

Please return completed form to **Species And Communities Program** DBCA,
Locked Bag 104, BENTLEY DELIVERY CENTRE WA 6983 **OR** email to: flora.data@dbca.wa.gov.au

# Threatened and Priority Flora Report Form

Version 1.4 March 2021

***Please complete as much of the form as possible, with emphasis on those sections bordered in black.*** For information on how to complete the form please refer to the Threatened & Priority Flora Report Form (TPRF) manual on the DBCA website at www.dpaw.wa.gov.au/plants-and-animals/threatened-species-and-communities/threatened-plants

**TAXON:** Dolichocarpa sp. Hamersley Station (A.A. Mitchell PRP 1479) **TPFL Pop. No:**

**OBSERVATION DATE:** 10/5/2021 **CONSERVATION STATUS:** P3 **New population** ☒

**OBSERVER/S:** Stephen Kern **PHONE** 08 9430 8955

**ROLE:** Botanist **ORGANISATION:** Ecoscape

**EMAIL:** stephenk@ecoscape.com.au

**DESCRIPTION OF LOCATION** (Provide at least nearest town/named locality, and the distance and direction to that place)**:**

Approximately 145 km NNW of Newman

**Reserve No:**

**DBCA DISTRICT:** Pilbara **LGA:** East Pilbara Land manager present: ☐

**DATUM:**
GDA94 / MGA94 ☒
AGD84 / AMG84 ☐
WGS84 ☐
Unknown ☐

**COORDINATES:** (If UTM coords provided, **Zone** is also required)
DecDegrees ☐ DegMinSec ☐ UTMs ☒
**Lat / Northing:** 7547599
**Long / Easting:** 725250
**ZONE:** 50

**METHOD USED:**
GPS ☒ Differential GPS ☐ Map ☐
No. satellites: _____ Map used: _____
Boundary polygon captured: ☐ Map scale: _____

**LAND TENURE:**

| | | | | |
|---|---|---|---|---|
| Nature reserve ☐ | Timber reserve ☐ | Private property ☐ | Rail reserve ☐ | Shire road reserve ☐ |
| National park ☐ | State forest ☐ | Pastoral lease ☐ | MRWA road reserve ☐ | Other Crown reserve ☐ |
| Conservation park ☐ | Water reserve ☐ | UCL ☒ | SLK/Pole _____ to _____ | Specify other: _____ |

**AREA ASSESSMENT:** Edge survey ☐ Partial survey ☒ Full survey ☐ Area observed (m²): 2500

**EFFORT:** Time spent surveying (minutes): _____ No. of minutes spent / 100 m²: _____

**POP'N COUNT ACCURACY:** Actual ☐ Extrapolation ☐ Estimate ☒ Count method: _____
(Refer to field manual for list)

**WHAT COUNTED:** Plants ☒ Clumps ☐ Clonal stems ☐

**TOTAL POP'N STRUCTURE:**

| | Mature: | Juveniles: | Seedlings: | Totals: |
|---|---|---|---|---|
| Alive | 200 | | | |
| Dead | | | | |

Area of pop (m²): _____
Note: Pls record count as numbers (not percentages) for database.

**QUADRATS PRESENT:** No. _____ Size _____ Data attached ☐ Total area of quadrats (m²): _____

| | | | | |
|---|---|---|---|---|
| **Summary Quad. Totals:** Alive | | | | |

**REPRODUCTIVE STATE:** Clonal ☐ Vegetative ☐ Flowerbud ☐ Flower ☒
Immature fruit ☐ Fruit ☒ Dehisced fruit ☐ Percentage in flower: 100%

**CONDITION OF PLANTS:** Healthy ☒ Moderate ☐ Poor ☐ Senescent ☐

**COMMENT:**

| **THREATS - type, agent and supporting information:**<br>Eg clearing, too frequent fire, weed, disease. Refer to field manual for list of threats & agents. **Specify agent** where relevant.<br>Rate current and potential threat impact: N=Nil, L=Low, M=Medium, H=High, E=Extreme<br>Estimate time to potential impact: S=Short (<12mths), M=Medium (<5yrs), L=Long (5yrs+) | **Current impact (N-E)** | **Potential Impact (L-E)** | **Potential Threat Onset (S-L)** |
|---|---|---|---|
| • Potential infrastructure | N | M | M |

# Threatened and Priority Flora Report Form

Version 1.4 March 2021

**HABITAT INFORMATION:**

**LANDFORM:**
Crest ☐
Hill ☐
Ridge ☐
Outcrop ☐
Slope ☐
Flat ☐
Open depression ☐
Drainage line ☐
Closed depression ☐
Wetland ☒

**ROCK TYPE:**
Granite ☐
Dolerite ☐
Laterite ☐
Ironstone ☐
Limestone ☐
Quartz ☐
Specify other: _____

**LOOSE ROCK:**
(on soil surface; eg gravel, quartz fields)
0-10% ☐
10-30% ☐
30-50% ☐
50-100% ☐

**SOIL TYPE:**
Sand ☐
Sandy loam ☐
Loam ☐
Clay loam ☐
Light clay ☒
Peat ☐
Specify other: _____

**SOIL COLOUR:**
Red ☒
Brown ☒
Yellow ☐
White ☐
Grey ☐
Black ☐
Specify other: _____

**DRAINAGE:**
Well drained ☐
Seasonally inundated ☒
Permanently inundated ☐
Tidal ☐

Specific **Landform** Element: _____
(Refer to field manual for additional values)

**CONDITION OF SOIL:** Dry ☒ Moist ☐ Waterlogged ☐ Inundated ☐

**VEGETATION CLASSIFICATION*:**
Eg: **1**. Banksia woodland (B. attenuata, B. ilicifolia); **2**. Open shrubland (Hibbertia sp., Acacia spp.) ; **3**. Isolated clumps of sedges (M.tetragona)

1. Tecticornia indica
2.
3.
4.

**ASSOCIATED SPECIES:**

Other (non-dominant) spp

* Please record up to four of the most representative vegetation layers (with up to three dominant species in each layer). Structural Formations should follow 2009 *Australian Soil and Land Survey Field Handbook* guidelines – refer to field manual for further information and structural formation table.

**CONDITION OF HABITAT:** Pristine ☐ Excellent ☐ Very good ☐ Good ☒ Degraded ☐ Completely degraded ☐

**COMMENT:**

**FIRE HISTORY:** **Last Fire:** Season/Month: _____ Year: _____ **Fire Intensity:** High ☐ Medium ☐ Low ☐ No signs of fire ☒

**FENCING:** Not required ☒ Present ☐ Replace / repair ☐ Required ☐ Length req'd: _____

**ROADSIDE MARKERS:** Not required ☒ Present ☐ Replace / reposition ☐ Required ☐ Quantity req'd: _____

**OTHER COMMENTS:** (Please include recommended management actions and/or implemented actions - include date. Also include details of additional data available, and how to locate it.)

**FLORA AUTHORISATION / LICENCE No:** FB62000001 Note if only observing plants (i.e. no specimens or plant matieral is taken) then no authorisation/licence is required. For further information on authorisation and licening requirements see the Threatened Flora and Wildlife Licensing pages on DBCA's website. Any actions carried out under authorisations/licences should be recorded above in the OTHER COMMENTS section.

# Threatened and Priority Flora Report Form

Version 1.4 March 2021

**HABITAT INFORMATION:**

**LANDFORM:**
Crest ☐
Hill ☐
Ridge ☐
Outcrop ☐
Slope ☐
Flat ☒
Open depression ☐
Drainage line ☐
Closed depression ☐
Wetland ☐

**ROCK TYPE:**
Granite ☐
Dolerite ☐
Laterite ☐
Ironstone ☐
Limestone ☐
Quartz ☐
Specify other: _____

**LOOSE ROCK:**
(on soil surface; eg gravel, quartz fields)
0-10% ☐
10-30% ☐
30-50% ☐
50-100% ☐

**SOIL TYPE:**
Sand ☐
Sandy loam ☐
Loam ☐
Clay loam ☒
Light clay ☐
Peat ☐
Specify other: _____

**SOIL COLOUR:**
Red ☒
Brown ☒
Yellow ☐
White ☐
Grey ☐
Black ☐
Specify other: _____

**DRAINAGE:**
Well drained ☒
Seasonally inundated ☐
Permanently inundated ☐
Tidal ☐

Specific **Landform** Element: _____
(Refer to field manual for additional values)

**CONDITION OF SOIL:** Dry ☒ Moist ☐ Waterlogged ☐ Inundated ☐

**VEGETATION CLASSIFICATION*:**
Eg: **1**. Banksia woodland (B. attenuata, B. ilicifolia); **2**. Open shrubland (Hibbertia sp., Acacia spp.) ; **3**. Isolated clumps of sedges (M.tetragona)

1. Acacia aptaneura
2.
3.
4.

**ASSOCIATED SPECIES:**

Other (non-dominant) spp

* Please record up to four of the most representative vegetation layers (with up to three dominant species in each layer). Structural Formations should follow 2009 *Australian Soil and Land Survey Field Handbook* guidelines – refer to field manual for further information and structural formation table.

**CONDITION OF HABITAT:** Pristine ☐ Excellent ☐ Very good ☐ Good ☒ Degraded ☐ Completely degraded ☐

**COMMENT:**

**FIRE HISTORY:** **Last Fire:** Season/Month: _____ Year: _____ **Fire Intensity:** High ☐ Medium ☐ Low ☐ No signs of fire ☒

**FENCING:** Not required ☒ Present ☐ Replace / repair ☐ Required ☐ Length req'd: _____

**ROADSIDE MARKERS:** Not required ☒ Present ☐ Replace / reposition ☐ Required ☐ Quantity req'd: _____

**OTHER COMMENTS:** (Please include recommended management actions and/or implemented actions - include date. Also include details of additional data available, and how to locate it.)

**FLORA AUTHORISATION / LICENCE No:** FB62000001 Note if only observing plants (i.e. no specimens or plant matieral is taken) then no authorisation/licence is required. For further information on authorisation and licening requirements see the Threatened Flora and Wildlife Licensing pages on DBCA's website. Any actions carried out under authorisations/licences should be recorded above in the OTHER COMMENTS section.

# Threatened and Priority Flora Report Form

Version 1.4 March 2021

**HABITAT INFORMATION:**

**LANDFORM:**
Crest ☐
Hill ☐
Ridge ☐
Outcrop ☐
Slope ☐
Flat ☒
Open depression ☐
Drainage line ☐
Closed depression ☐
Wetland ☐

**ROCK TYPE:**
Granite ☐
Dolerite ☐
Laterite ☐
Ironstone ☐
Limestone ☐
Quartz ☐
Specify other: _____

**LOOSE ROCK:**
(on soil surface; eg gravel, quartz fields)
0-10% ☐
10-30% ☐
30-50% ☐
50-100% ☐

**SOIL TYPE:**
Sand ☐
Sandy loam ☐
Loam ☐
Clay loam ☒
Light clay ☐
Peat ☐
Specify other: _____

**SOIL COLOUR:**
Red ☒
Brown ☒
Yellow ☐
White ☐
Grey ☐
Black ☐
Specify other: _____

**DRAINAGE:**
Well drained ☒
Seasonally inundated ☐
Permanently inundated ☐
Tidal ☐

Specific **Landform** Element: _____
(Refer to field manual for additional values)

**CONDITION OF SOIL:** Dry ☒ Moist ☐ Waterlogged ☐ Inundated ☐

**VEGETATION CLASSIFICATION*:**
Eg: **1**. Banksia woodland (B. attenuata, B. ilicifolia); **2**. Open shrubland (Hibbertia sp., Acacia spp.) ; **3**. Isolated clumps of sedges (M.tetragona)

1.
2.
3.
4.

**ASSOCIATED SPECIES:**

Other (non-dominant) spp

* Please record up to four of the most representative vegetation layers (with up to three dominant species in each layer). Structural Formations should follow 2009 *Australian Soil and Land Survey Field Handbook* guidelines – refer to field manual for further information and structural formation table.

**CONDITION OF HABITAT:** Pristine ☐ Excellent ☐ Very good ☐ Good ☒ Degraded ☐ Completely degraded ☐

**COMMENT:**

**FIRE HISTORY:** **Last Fire:** Season/Month: _____ Year: _____ **Fire Intensity:** High ☐ Medium ☐ Low ☐ No signs of fire ☒

**FENCING:** Not required ☒ Present ☐ Replace / repair ☐ Required ☐ Length req'd: _____

**ROADSIDE MARKERS:** Not required ☒ Present ☐ Replace / reposition ☐ Required ☐ Quantity req'd: _____

**OTHER COMMENTS:** (Please include recommended management actions and/or implemented actions - include date. Also include details of additional data available, and how to locate it.)

**FLORA AUTHORISATION / LICENCE No:** FB62000001 Note if only observing plants (i.e. no specimens or plant matieral is taken) then no authorisation/licence is required. For further information on authorisation and licening requirements see the Threatened Flora and Wildlife Licensing pages on DBCA's website. Any actions carried out under authorisations/licences should be recorded above in the OTHER COMMENTS section.

**SPECIMEN:** Collectors No: _ WA Herb. ☐ Regional Herb. ☐ District Herb. ☐ Other:

**LODGEMENT:** WA Herb Lodgement No: _____

**ATTACHED:** Map ☐ Mudmap ☐ Photo ☐ GIS data ☒ Field notes ☐ Other: _____

**COPY SENT TO:** Regional Office ☐ District Office ☐ Other: _____

Submitter of Record: Stephen Kern Role: Botanist Signed: Stephen Kern Date: 1/2/2022

# Threatened and Priority Flora Report Form

Version 1.4 March 2021

## HABITAT INFORMATION:

**LANDFORM:**
Crest ☐
Hill ☐
Ridge ☐
Outcrop ☐
Slope ☐
Flat ☒
Open depression ☐
Drainage line ☐
Closed depression ☐
Wetland ☐

**ROCK TYPE:**
Granite ☐
Dolerite ☐
Laterite ☐
Ironstone ☐
Limestone ☐
Quartz ☐
Specify other: _____

**LOOSE ROCK:**
(on soil surface; eg gravel, quartz fields)
0-10% ☐
10-30% ☐
30-50% ☐
50-100% ☐

**SOIL TYPE:**
Sand ☐
Sandy loam ☐
Loam ☐
Clay loam ☐
Light clay ☒
Peat ☐
Specify other: _____

**SOIL COLOUR:**
Red ☒
Brown ☒
Yellow ☐
White ☐
Grey ☐
Black ☐
Specify other: _____

**DRAINAGE:**
Well drained ☒
Seasonally inundated ☐
Permanently inundated ☐
Tidal ☐

Specific **Landform** Element: _____
(Refer to field manual for additional values)

**CONDITION OF SOIL:** Dry ☒ Moist ☐ Waterlogged ☐ Inundated ☐

**VEGETATION CLASSIFICATION*:**
Eg: **1**. Banksia woodland (B. attenuata, B. ilicifolia); **2**. Open shrubland (Hibbertia sp., Acacia spp.) ; **3**. Isolated clumps of sedges (M.tetragona)

1.
2.
3.
4.

**ASSOCIATED SPECIES:**

Other (non-dominant) spp

* Please record up to four of the most representative vegetation layers (with up to three dominant species in each layer). Structural Formations should follow 2009 *Australian Soil and Land Survey Field Handbook* guidelines – refer to field manual for further information and structural formation table.

**CONDITION OF HABITAT:** Pristine ☐ Excellent ☐ Very good ☒ Good ☐ Degraded ☐ Completely degraded ☐

**COMMENT:**

**FIRE HISTORY:** **Last Fire:** Season/Month: _____ Year: _____ **Fire Intensity:** High ☐ Medium ☐ Low ☐ No signs of fire ☒

**FENCING:** Not required ☒ Present ☐ Replace / repair ☐ Required ☐ Length req'd: _____

**ROADSIDE MARKERS:** Not required ☒ Present ☐ Replace / reposition ☐ Required ☐ Quantity req'd: _____

**OTHER COMMENTS:** (Please include recommended management actions and/or implemented actions - include date. Also include details of additional data available, and how to locate it.)

**FLORA AUTHORISATION / LICENCE No:** FB62000001 Note if only observing plants (i.e. no specimens or plant matieral is taken) then no authorisation/licence is required. For further information on authorisation and licening requirements see the Threatened Flora and Wildlife Licensing pages on DBCA's website. Any actions carried out under authorisations/licences should be recorded above in the OTHER COMMENTS section.
