WAM Database Search Interpretation

At the time when the database searches were requested from the Western Australian Museum, there was limited taxonomic support provided for database searches with NO screening for SRE or subterranean fauna. Database search results for arachnids (pseudoscorpions, scorpions and spiders) and myriapods (centipedes and millipedes) consisted of ALL records from within the Search Area. Database search results were edited prior to screening for SREs to enforce consistency between the different departmental databases. The following edits and filters were applied to the combined data:

A new field "Binomial" was created, into which the Genus and Species field values were concatenated, e.g. Genus [Lychas] + Species [`gracilimanus`] --> Binomial [Lychas 'gracilimanus']

a. Where the genus field was empty or contained the values "Unknown" or "gen. nov.", the unitalicized family rank name was used instead of genus.
b. Where both family and genus fields were empty, unknown, the unitalicized order rank was used in place of the genus.
c. all unidentified 'species' in the 'Binomial' field (e.g. "sp. indet. (juvenile)", "sp?", "unknown") were renamed to "sp. indet."
d. All Binomial morphospecies names ending in "sp. n." were renamed without that suffix, e.g. "Rhagada 'pannawonica' sp. n." was renamed to Rhagada 'pannawonica'.

A field was created called "Ecotype", into which the ecotype of the species was manually recorded, based on taxon and/or sampling methods:

a. Epigean: all species obtained through terrestrial survey methods or belonging to taxa only known to be epigean in W.A., e.g. trapdoor spiders.

b. Troglobite: 'named' species or morphospecies obtained using subterranean sampling methods or from taxa known predominantly from subterranean habitats, e.g. schizomids.

c. ?Epigean: unidentified species from subterranean survey methods of groups known to contain epigean SREs in the Pilbara, e.g. Centipedes from the order Geophilomorpha or family Cryptopidae.

d. ?troglobite: Unidentified species obtained from subterranean fauna survey methods of orders or families rarely sampled in SRE surveys in the Pilbara, e.g. Millipede families Haplodesmidae and Dolodesmidae.

e. Marine and Aquatic: marine and freshwater species respectively.

The data were filtered to exclude records with ecotypes that were not "epigean" or "?epigean".

4 The SRE status of each species present in the filtered data was assessed according to the SRE categories previously used by the WAMTS (Western Australian Museum Taxonomic Services).

Limitation: This report was prepared for Rapallo to inform their invertebrate survey identifications. *Alacran* Environmental Science accepts no liability or responsibility for any use or reliance on this report beyond its purpose. The accuracy and completeness of the information supplied by Rapallo, Genbank or the W.A. Museum have not been verified.

EXECUTIVE SUMMARY

During short-range endemic (SRE) surveys at Lamb Creek (W.A.), Rapallo sampled a collection of potential SRE invertebrates. A subset of 58 specimens representing unidentifiable and or ambiguously identified taxa was sequenced for the gene Cytochrome C Oxidase subunit I (COI) for the purpose of species delimitation (DNA barcoding). A total of 56 samples yielded DNA sequences from eight (8) groups (Orders) of invertebrates, and 26 putative species. Of the 26 distinct species recognised in this collection, one is a described species, 13 belong to known morphospecies and 12 could not be matched with reference sequences. Four of these taxa are known to be widespread, 10 are potential short-range endemics owing to geographical data deficiency (DDG) and two are potential SRE owing to taxonomic data deficiency (DDT):

- Mygalomorphae (trapdoor spiders)
    - Family Anamidae (open hole trapdoor spiders)
        1. *Aname mellosa*, widespread
        2. *Kwonkan* 'MYG324', potential SRE:DDG
    - Family Barychelidae (brush footed trapdoor spiders)
        3. *Synothele* 'MYG311', widespread
- Pseudoscorpiones (pseudoscorpions)
    - Family Atemnidae
        4. *Oratemnus* 'WA1', widespread
    - Family Chthoniidae
        5. *Austrochthonius* 'LCr01', potential SRE:DDT
    - Family Olpiidae
        6. *Euryolpium* 'LCr01', potential SRE:DDG
        7. *Indolpium* 'LCr03', potential SRE:DDG
        8. *Indolpium* 'LCr04', potential SRE:DDG
        9. *Indolpium* 'LCr05', potential SRE:DDG
        10. Olpiidae 'LCr02', potential SRE:DDG
- Scorpiones (scorpions)
    - Family Buthidae (narrow handed scorpions)
        11. *Lychas* 'hairy tail complex', potential SRE:DDG
        12. *Lychas* 'bituberculatus complex', potential SRE:DDG
        13. *Lychas* 'SCO046 (multipunctatus complex)', potential SRE:DDG
- Geophilomorpha (soil centipedes)
    - Family Chilenophilidae
        14. *Sepedonophilus*, 'LCr01', potential SRE:DDG
    - Family Mecistocephalidae
        15. *Mecistocephalus* 'LCr01', potential SRE:DDG
        16. *Mecistocephalus* 'LCr02', potential SRE:DDG
    - Family Oryidae
        17. *Orphnaeus* 'LCr01', potential SRE:DDG
- Scolopendromorpha (centipedes)
    - Family Cryptopidae
        18. *Cryptops* 'LCr01', potential SRE:DDG

19 *Cryptops* 'LCr02', potential SRE:DDG

- Spirobolida (millipedes)
  - Family Trigoniulidae
    - 20 *Austrostrophus* 'clade A', potential SRE:DDG
    - 21 *Austrostrophus* 'clade M', potential SRE:DDG
- Isopoda (slaters)
  - Family Armadillidae
    - 22 *Buddelundia* 'SJ10ma', potential SRE:DDG
    - 23 *Buddelundia* 'SJ13', potential SRE:DDG
    - 24 *Buddelundia* 'SJ15', widespread
    - 25 Buddelundiinae (Armadillidae) 'ISOP009', potential SRE:DDG
- Eupulmonata
  - Family Bothriembryontidae
    - 26 *Bothriembryon* 'BOT065', potential SRE:DDG

Sequences comparisons were made with with those lodged in Genbank as well as unpublished sequences from, Western Australian Museum Molecular Systematics Unit and Alacran Environmental Science.

1 AIMS

During short-range endemic (SRE) surveys at Lamb Creek (W.A.), Rapallo sampled a collection of potential SRE invertebrates. A subset of 58 specimens representing unidentifiable and or ambiguously identified taxa was sequenced for the gene Cytochrome C Oxidase subunit I (COI) for the purpose of species delimitation (DNA barcoding). A total of 56 samples yielded DNA sequences from nine groups (Orders) of invertebrates. This report presents the results of barcoding analyses undertaken for these sequences as well as comparisons with reference sequences sourced from Genbank, the WA Museum MSU and Alacran's database of unpublished sequences.

2 METHODS

2.1 GENOMIC IDENTIFICATION (DNA BARCODING)

Species and morphospecies were initially determined using morphological characteristics. With the exception of slaters (Isopoda) all specimens were identified by Dr Erich Volschenk from Alacran Environmental Science (Alacran). Morphological identification of slaters was undertaken by Dr Simon Judd.

Sequence fragments of the COI gene were amplified from muscle tissues obtained from specimens fixed and preserved in >95% ethanol or from samples fixed in Propylene glycol and later preserved in >95% ethanol. Sequence generation from tissues was undertaken by Genotyping Australia Pty Ltd and AGRF Perth (http://www.agrf.org.au).

Sequence contigs were assembled from forward and reverse amplicons using Geneious R7 version 7.1.9 and were subsequently edited and pruned by eye, prior to consensus sequences being created. Consensus sequences were then assessed for contamination using NCBI Nucleotide BLAST (Basic Local Alignment Search Tool) (https://blast.ncbi.nlm.nih.gov/Blast.cgi).

Sequences sourced from samples previously studied by Alacran (unpublished) but subsequently lodged at the W.A. Museum are identified with the W.A. Museum registration codes:

- Arachnology dept. beginning with "T" and followed by a string of numbers;
- Crustaceans dept beginning with "C" and followed by a string of numbers;
- Molluscs dept beginning with "S" and followed by a string of numbers.

Alacran sequence registration codes use the format of "AES" or "ESV" followed by a string of six numbers. Sequences sourced from GenBank are identified with the Genbank accession code (comprised of two letters followed by a string of six numbers).

Sequence editing, alignment and phylogenetic analysis were performed with Geneious R7. For each analysis sequences were assembled and aligned using ClausalW or the Geneious alignment tool, implementing the following variable settings: Global alignment with free ends; Cost matrix, 70% similarity (IUB); Open gap penalty, 70; Gap extension penalty, 10; refinement iterations, 4.

Phylogenetic analyses were implemented using Geneious R7 and MrBayes (Huelsenbeck et al. 2001; Ronquist et al. 2012). Outgroups were selected from (in order of preference): sister -genus, -family or -order, to the group under investigation, where systematic relationships were known. Species delimitation was based on an 8% sequence divergence threshold for most taxa (Hebert et al. 2003a; Hebert et al. 2003b; Barrett et al. 2005; Robinson et al. 2009). For trapdoor spiders, the delimiting threshold of 9.5 % was used (Castalanelli et al. 2014;

Huey et al. 2019) and 5% was used for scorpions (Volschenk unpublished data). For *Austrostrophus* millipedes, the W.A. Museum clade identification system was used to identify specific clades; however, the divergence between these clades is often very low suggesting strong sexual selection may be present.

Reference taxa were selected from Genbank in two ways, depending on the number of sequences available for each group. For small groups, all reference COI sequences were sourced from Genbank and a subset of two or three samples were selected to represent each species or morphospecies identified. For groups with many reference COI sequences on Genbank, reference sequences were selected from BLAST results undertaken for each query sequence. Sequence BLAST was undertaken using the Nucleotide BLAST tool. Two or three reference sequences were selected from the 50 most similar sequences (using percentage identity) resulting from a BLAST of each query sequence.

2.2 STUDY GROUPS

Taxon composition of the study groups are detailed in the following tables:

- Table 2.1 Sequences of species and morphospecies included in the assessment of *Aname* species.
- Table 2.2 Sequences of species and morphospecies included in the assessment of *Kwonkan* species.
- Table 2.3 Sequences of species and morphospecies included in the assessment of *Synothele* species.
- Table 2.4 Sequences of species and morphospecies included in the assessment of *Oratemnus* species.
- Table 2.5 Sequences of species and morphospecies included in the assessment of *Austrochthonius* species.
- Table 2.6 Sequences of species and morphospecies included in the assessment of Olpiidae species.
- Table 2.7 Sequences of species and morphospecies included in the assessment of *Lychas* species.
- Table 2.8 Sequences of species and morphospecies included in the assessment of Geophilomorpha species.
- Table 2.9 Sequences of species and morphospecies included in the assessment of *Cryptops* species.
- Table 2.10 Sequences of species and morphospecies included in the assessment of *Austrostrophus* species.
- Table 2.11 Sequences of species and morphospecies included in the assessment of Armadillidae species.

The COI DNA sequences for all of the species examined from this survey are listed in Appendix 1.

2.2.1 Mygalomorphae (Trapdoor spiders)

2.2.1.1 Family Anamidae (Open hole trapdoor spiders)

***Aname* sp.**

This analysis aimed to determine the identity of three samples that were loosely assigned to one morphospecies of *Aname* on the basis of morphology. Sequences included in this analysis are listed in Table 2.1.

3 RESULTS

Comparisons of the edited COI DNA sequence with Genbank and Alacran reference sequences are summarised in Table 3.1. Relevant parts of the phylogenetic trees are provided in the Figures Section (Section 5) for visualisation of species' relationships. The raw sequence data is supplied for reference in Appendix 1.

Table 3.1 Summary of species delimitation of query samples with supporting COI DNA divergence (%) results. Short-range endemic groups in Bold with SRE status in superscript: DDG, potential SRE owing to geographical data deficiency; DDT, potential SRE owing to taxonomic data deficiency.

4 DISCUSSION

Representative sequences from taxa unmatched with Genbank references, were submitted to W.A. Museum Molecular Systematics Unit (MSU) for comparison within their unpublished research sequences. The results of this comparison are detailed in Appendix 2 and are summarised in Table 4.1. Of the 14 different sequences provided to WAM MSU, three were matched with unpublished morphospecies and 11 were unmatched.

Table 4.1 Summary of species delimitation from WA Museum MSU, matched morphospecies names in bold.

Accession Code	Taxon name used in the analyses of this report	Western Australian Museum species match
AES210197	*Kwonkan* 'LCr01'	***Kwonkan* 'MYG324'**
AES210213	Buddelundiinae (Armadillidae) 'ISOP009'	Unmatched Armadillidae
AES210080	Bothriembryon 'Pilbara'	***Bothriembryon* 'BOT065'**
AES210202	*Austrochthonius* 'LCr01'	Unmatched *Austrochthonius* species
AES210155	*Cryptops* 'LCr01'	Unmatched *Cryptops* species
AES210179	*Cryptops* 'LCr02'	Unmatched *Cryptops* species
AES210169	*Mecistocephalus* 'LCr02'	Unmatched *Mecistocephalus* species
AES210150	*Mecistocephalus* 'LCr01'	Unmatched *Mecistocephalus* species
AES210141	*Euryolpium* 'LCr01'	Unmatched *Euryolpium* species
AES210267	Olpiidae 'LCr02'	Unmatched Olpiidae '7/4' species
AES210265	*Indolpium* 'LCr03'	Unmatched *Indolpium* species
AES210153	*Indolpium* 'LCr04'	Unmatched *Indolpium* species

Appendix V WAM MSU Sequencing Report

Molecular identification of terrestrial arthropods from near Juna Downs Station, Western Australia (2116)

Report to *Alacran Environmental Science*

31 August 2021

Nerida Wilson and Mark Harvey

Molecular Systematics Unit & Department of Terrestrial Zoology,
Western Australian Museum,
Locked Bag 49, Welshpool DC, Western Australia 6986, Australia

Although identifications in this report were consistent with the best available information and current scientific thinking at the time of identification the use of this report is at the risk of the user. Any liability to users of this report for loss of any kind arising out of the use of this report or the information and identifications it contains is expressly disclaimed.

Summary

Alacran Environmental Science requested identification of mitochondrial COI sequences from specimens of terrestrial invertebrates from near Juna Downs Station, Western Australia. This comprised of 14 supplied sequences (see Table 1 and Appendix 1 for sequence and specimen details). The main objectives of the WA Museum's Molecular Systematics Unit (MSU) were to use these supplied sequences to determine the taxonomic identity of the specimens.

Provided DNA sequences were BLASTED against publicly accessible sequences in GenBank and with data sets derived from current research projects in collaboration with the WA Museum. Extraneous primers sequences were removed prior to analysis. The top 10 blast hits for each major taxon were gathered, duplicates removed, and analysed with a Maximum Likelihood phylogenetic analysis using a GTR+G model of evolution and 100 bootstraps (RAxML). Distances were calculated via tree-based estimates of identical bases in Geneious Prime 2020.2.5.

A summary of sequences queried is in Table 1.

Table 1. Summary of identified sequenced specimens supplied to WA Museum.

FAMILY	GENUS	SPECIES	# of sequences
Anamidae	*Kwonkan*	1 species	1
Armadillidae	indet.	1 species	1
Bothriembryontidae	*Bothriembryon*	1 species	1
Chthoniidae	*Austrochthonius*	1 species	1
Cryptopidae	*Cryptops*	2 species	2
Mecistocephalidae	*Mecistocephalus*	2 species	2
Olpiidae	*Euryolpium*	1 species	1

Olpiidae	Genus 7/4	1 species	1
Olpiidae	*Indolpium*	3 species	3
Trigoniulidae	*Austrostrophus*	1 species	1

Results

Provided COI barcodes were compared to existing data held by the Western Australian Museum. A summary of the results is provided in Table 2. Complete or excised relevant parts of the resulting Maximum Likelihood trees are provided in Appendix 2 for visualisation of genetic relationships. The raw sequence data is supplied for reference in Appendix 3.

Table 2. Summary of identifications of queried specimens (alphabetical by family).

FIELD NO	FAMILY	SPECIES DESIGNATION	SUMMARY OF RESULTS
AES210197	Anamidae	*Kwonkan* MYG324	· this specimen is 2.28% divergent from its nearest relative in the tree (WAMT122817), and falls in a clade known as MYG324 which is a known but undescribed species. Other sequenced specimens are known from Karijini as well as the Juna Downs area. *Appendix 2a.*
AES210213	Armadillidae	Genus indet. sp. indet.	· this specimen fall in a clade that represents a known but undescribed species *Armadillidae* with a code from GenBank ISOP009 (2.13% divergent). That specimen was collected 124 km NW of this target specimen. *Appendix 2b.*
AES210080	Bothriembryontidae	*Bothriembryon BOT065*	· this specimen falls in a clade known as BOT065 and represents a known but undescribed species of *Bothriembryon*. It is 3.97% divergent from the nearest specimen. *Appendix 2c.*
AES210202	Chthoniidae	*Austrochthonius* new sp. 1	· this specimen forms a clade with WAMT135836+T135835; however the specimens are 16.87% divergent, which indicates it is likely a different species. There is no code system for this group, so it is just noted as a new undescribed or previously unsequenced species. *Appendix 2d.*
AES210155	Cryptopidae	*Cryptops* new sp. 1	· this specimen is not closely linked to any other species. It is at least 17.82% divergent from its nearest relative in the tree. However, the support for this node connecting the two taxa is absent, so this relationship is likely somewhat artificially close. There is no code

			system for this group, so it is just noted as a new undescribed or previously unsequenced species. *Appendix 2e.*
AES210179	Cryptopidae	*Cryptops* new sp. 2	· this specimen is 11.11% divergent from its nearest relatives in the tree (WAMT93678+T93668), which represents another undescribed species. These two were found approximately 46 km SW of the target specimen. There is no code system for this group, so it is just noted as a new undescribed or previously unsequenced species, but different to the queried *Cryptops* above. *Appendix 2e.*
AES210169	Mecistocephalidae	*Mecistocephalus* new sp. 1	· this specimen is 13.83% divergent from the other queried *Mecistocephalus* below. However, the support for the node supporting this relationship is absent, so this relationship is likely somewhat artificially close. There is no code system for this group, so it is just noted as a new undescribed or previously unsequenced species, but different to the queried *Mecistocephalus* below. *Appendix 2f.*
AES210150	Mecistocephalidae	*Mecistocephalus* new sp. 2	· this specimen is 13.83% divergent from the other queried *Mecistocephalus* above. However, the support for the node supporting this relationship is absent, so this relationship is likely somewhat artificially close. There is no code system for this group, so it is just noted as a new undescribed or previously unsequenced species, but different to the queried *Mecistocephalus* above. *Appendix 2f.*
AES210141	Olpiidae	*Euryolpium* new sp.	· this specimen is 14.2% divergent from WAMT139754+T139763, and likely represents a different species. However, the support for the node supporting this relationship is absent, so this relationship is likely somewhat artificially close. There is no code system for this group, so it is just noted as a new undescribed or previously unsequenced species. *Appendix 2g.*
AES210267	Olpiidae	Genus 7/4 new sp.	· this specimen is essentially identical to its nearest relatives in the tree (WAMT122180+T122190) and represents a known but undescribed species. The two WAM specimens were found about 7 km north of the queried specimen. The difference between the two highly-supported clades seen in this Appendix is 17.1%. There is no code system for this group, so it is just noted as an undescribed species. *Appendix 2h.*
AES210265	Olpiidae	*Indolpium* new sp. 1	· this specimen is 10.38% divergent from its nearest relative in the tree (WAMT149362). We do not yet have a good grasp of typical species level divergences in this group, so it is unclear if the queried taxa is conspecific with others or not. There is no code system for this

			group, so it is just noted as a new undescribed or previously unsequenced species. *Appendix i.*
AES210153	Olpiidae	*Indolpium* new sp. 2	· this specimen is 11.45% divergent from its nearest relative in the tree (AES210265). We do not yet have a good grasp of typical species level divergences in this group, so it is unclear if the queried taxa is conspecific with others or not. There is no code system for this group, so it is just noted as a new undescribed or previously unsequenced species. *Appendix i.*
AES210210	Olpiidae	*Indolpium* new sp. 3	· this specimen is 12.82% divergent from its nearest relative in the tree (WAMT114698). We do not yet have a good grasp of typical species level divergences in this group, so it is unclear if the queried taxa is conspecific with others or not. There is no code system for this group, so it is just noted as a new undescribed or previously unsequenced species. *Appendix i.*
AES210162	Trigoniulidae	*Austrostrophus* new clade M	· this specimen is at least 6.08% divergent from its nearest relative in the tree (WAMT100193). Based on the topology of the tree, which places this specimen on a branch that falls between known clades, we have allocated this taxon a new clade name (M). In this study system, clades names approximate species-level clades. *Appendix j.*

Conclusions

The sequences supplied represent fourteen different species, from eight different families. Four of those species can be linked with existing sequenced although undescribed species. Ten species are either new, or represent newly sequenced species.

Appendix 1. Specimen data for all sequences, updated with new identifications (in order supplied).

FIELD NO	FAMILY	GENUS	SPECIES	SITE	LATITUDE	LONGITUDE
AES210197	Anamidae	*Kwonkan*	MYG324	ca. 40.9 km ENE. Juna Downs Stn.	22°48'00.00	118°52'23.16
AES210202	Chthoniidae	*Austrochthonius*	new sp.	ca. 40.2 km ENE. Juna Downs Stn.	22°49'00.84	118°52'10.20
AES210141	Olpiidae	*Euryolpium*	new sp.	ca. 43.2 km ENE. Juna Downs Stn.	22°48'46.08	118°53'55.68
AES210265	Olpiidae	*Indolpium*	new sp. 1	ca 22 km E of Juna Downs	22°48'23.7	118°53'08.4
AES210153	Olpiidae	*Indolpium*	new sp. 2	ca. 42.7 km ENE. Juna Downs Stn.	22°48'48.60	118°53'38.04

EXECUTIVE SUMMARY

The Lamb Creek Iron Ore Project (LCIOP) is situated approximately 130 kilometres by road northwest of Newman, Western Australia. Process Minerals International (PMI), a wholly owned subsidiary of Mineral Resources Limited (MRL) is seeking to develop the Lamb Creek Iron Ore Project (LCIOP).

Phoenix Environmental Sciences Pty Ltd (Phoenix) was commissioned by MRL to undertake a significance assessment to examine the potential impacts of the Project on Ghost Bat (*Macroderma gigas*) assemblage.

This report considers the following historical fauna surveys:

- Level 2 Fauna Survey and Targeted Northern Quoll Survey of the Lamb Creek for PMI, Oct 2012 (Rapallo 2012)
- Lamb Creek Flora and Fauna Desktop Survey Review, Sept 2017 (MBS Environmental 2017)
- Lamb Creek and Wedge Project Vertebrate Fauna Desktop Assessment, March 2020 (Western Wildlife 2020)
- J020348 – Detailed vertebrate fauna survey of the Lamb Creek project, Jan 2022 (Rapallo 2022).

Detailed fauna surveys for the Project found that five caves are utilised by Ghost bat. Two caves are located within the Project area (Cave 1; Provisional Category 2, Cave 3; Provisional Category 3) and three caves are located within the vicinity of the Project (Cave 2; Provisional Category 3, Cave 4; Category 3 in an 'apartment block', Cave 5; Category 2). The closest distance from the proposed mine pit to a Ghost Bat cave is 729 m (Cave 1; Category 2). The same cave is located 350 m from a waste rock landform and diversion bund. The remaining caves in proximity to the operational areas are greater than 1km away. Cave 4 and Cave 5 are located 202 and 237 m, respectively, from the access road.

While the gap analysis has found that survey effort does not strictly comply with State and Federal requirements for three of the five caves this is not considered important as each was ultimately identified as a Ghost Bat roost cave. The objective of field surveys in the context of environmental impact assessment is to determine whether caves support significant species; to that end the surveys achieved their aim.

Analysis of the Project against the EPBC Act significant impact criterion for Vulnerable species has concluded that no criteria are met.

Further, analysis of the Project against each of the key threats to Ghost Bats identified by the Threatened Species Scientific Committee (TSSC 2016) reveals the Project represents negligible to low risk to the species. Indirect impact is also expected to be nil or negligible.

Therefore, on the basis of the historic survey effort achieved, and low risk the Project represents to the species, referral to DAWE under the EPBC Act is not considered necessary.

1 INTRODUCTION

Process Minerals International (PMI), a wholly owned subsidiary of Mineral Resources Limited (MRL) is seeking to develop the Lamb Creek Iron Ore Project (the 'Project'; LCIOP), a new iron ore mine situated approximately 130 kilometres (km) by road northwest of Newman, Western Australia (WA; Figure 1-1).

The key components of the Project include a small open cut iron ore mine, crushing and screening process plant, and associated infrastructure. The Project will produce up to 10 million tonnes per annum (Mtpa) of iron ore over a period of 3 to 4 years.

Fauna surveys were undertaken across the Project area in 2012 to support environmental impact assessments. Further fauna surveys were undertaken in 2020 and 2021. The surveys identified that the State and Commonwealth listed species, Ghost Bat (*Macroderma gigas*), occurs within the Project area.

Since referral of the Project under the Environmental Protection and Biodiversity Conservation Act (EPBC Act) in 2012, the Ghost Bat has been listed as Vulnerable under the Western Australian Wildlife Conservation Act 1950 (WC Act) and the EPBC Act.

In November 2021, Phoenix Environmental Sciences Pty Ltd (Phoenix) was commissioned by MRL to undertake a significance assessment to examine the potential impacts of the Project on Ghost Bat (*Macroderma gigas*) assemblage.

1.1 BACKGROUND

1.1.1 Historical approvals

The Project was referred under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) in 2012 and was determined as not a Controlled Action. Environmental impact assessments indicated that the Project would not result in significant impacts that would trigger referral under the *Environmental Protection Act 1986* (EP Act).

The Project was then put on hold until 2020, when MRL re-evaluated the LCIOP and resolved to progress the Project with a smaller disturbance footprint.

The intention was to seek only secondary approvals (Mining Proposal, Works Approval, Native Vegetation Clearing Permit). However, the Department of Mines, Industry Regulation and Safety indicated that it would be likely to refer the Mining Proposal submission under the EP Act. Accordingly, MRL are now proposing to self-refer the Project under s38 of the EP Act.

1.1.2 Historical fauna surveys

Historical fauna surveys for the Project have included the following:

- Level 2 Fauna Survey and Targeted Northern Quoll Survey of the Lamb Creek for PMI, Oct 2012 Rapallo (2012)
- Lamb Creek Flora and Fauna Desktop Survey Review, Sept 2017 (MBS Environmental 2017)
- Lamb Creek and Wedge Project Vertebrate Fauna Desktop Assessment, March 2020 (Western Wildlife 2020)
- J020348 – Detailed vertebrate fauna survey of the Lamb Creek project, Jan 2022 (Rapallo 2022).

PHOENIX ENVIRONMENTAL SCIENCES

Five significant vertebrate fauna species have been recorded from the Lamb Creek study area to date:

- Northern quoll (*Dasyurus hallucatus*) (EN, EPBC and BC Acts) – recorded in 2012
- **Ghost Bat (*Macroderma gigas*) (VU, EPBC and BC Acts) – recorded in 2012, 2020 and 2021**
- Pilbara olive python (*Liasis olivaceus barroni*) (VU, EPBC and BC Acts) – recorded in 2012
- Western pebble-mound mouse (*Pseudomys chapmani*) (Priority 4) – recorded throughout the Project area in 2012 and 2020
- Fork-tailed Swift (*Apus pacificus*) (Mig. and Mar., EPBC Act) – recorded in 2012.

This report is concerned only with the Ghost Bat.

1.1.3 Knowledge and data gaps

Since referral of the Project under the EPBC Act in 2012, the Ghost Bat (*Macroderma gigas*) has been listed as Vulnerable under the *Western Australian Wildlife Conservation Act 1950* and the EPBC Act. At the time of referral, it was listed by the Department of Biodiversity, Conservation and Attractions (DBCA) as a Priority 4 species.

Accordingly, MRL wishes to understand:

- The potential significance of the Project on the Ghost Bat.

1.2 SCOPE OF WORK

The scope of work comprised:

- complete a stand-alone desktop assessment report suitable for inclusion in environmental approval documentation that included –
    - an analysis of the Project against the EPBC Act significant impact criterion (VU) and key threats identified by the Threatened Species Scientific Committee (TSSC 2016), with consideration of historical and recent fauna assessments.

1.3 STUDY AREA

The Project is located within 50 km of the following active mine sites: Mining Area C, Yandi mine, Hope Downs, West Angelas and Yandicoogina mine (Figure 1-2). It is a greenfield site, and the current land use is pastoral. No infrastructure currently exists within the Project area. The Project has a total area of approximately 2,197 ha, and it is expected that up to approximately 657 ha of vegetation will be cleared as a result of its implementation.

A detailed fauna survey was completed in April 2020, with supplementary data collected in April 2021 (Rapallo 2022). The survey area was 1,645 hectares in size, comprising retention licence R47/19 (1,200 hectares), miscellaneous licence L47/736 (388 hectares), and an alternative area for the haul road to intersect with the Great Northern Highway, referred to as intersection version B (58 hectares) (Rapallo 2022). An earlier Level 2/detailed fauna survey was completed in 2012 (Rapallo 2012) over an area that partially overlaps with the current, 2020-2021 survey area (Rapallo 2022).

The Project area has changed since the latest surveys were completed (Rapallo 2022), with tenements L47/974, L47/1008 and M47/1592 added in December 2021, expanding the Project area. Hence, the 2020-2021 fauna survey covered 1,220 hectares (75%) of the current project area, with 555 hectares (25%) unsurveyed. The November 2021 footprint (657 hectares) extends outside the survey area by 24 hectares (4% of total footprint), with most of the unsurveyed area comprising the southern section of the proposed haul road (Figure 1-1)(Rapallo 2022).

2 LEGISLATIVE CONTEXT

The protection of flora and fauna in WA is principally governed by three acts:

- Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act)
- State *Biodiversity Conservation Act 2016* (BC Act)
- State *Environmental Protection Act 1986* (EP Act).

The BC Act came into full effect on 1 January 2019 and replaced the functions of the *Wildlife Conservation Act 1950* (WC Act).

2.1 COMMONWEALTH

The EPBC Act is administered by the Federal Department of Agriculture, Water and the Environment (DAWE). The EPBC Act provides for the listing of Threatened fauna and Threatened Ecological Communities (TECs) as matters of National Environmental Significance (NES). Under the EPBC Act, actions that have, or are likely to have, a significant impact on a matter of NES, require approval from the Australian Government Minister for the Environment through a formal referral process.

Conservation categories applicable to Threatened fauna species under the EPBC Act are as follows:

- Extinct (EX)[1] – there is no reasonable doubt that the last individual has died
- Extinct in the Wild (EW) – taxa known to survive only in captivity
- Critically Endangered (CR) – taxa facing an extremely high risk of extinction in the wild in the immediate future
- Endangered (EN) – taxa facing a very high risk of extinction in the wild in the near future
- Vulnerable (VU) – taxa facing a high risk of extinction in the wild in the medium-term
- Conservation Dependent (CD)[1] – taxa whose survival depends upon ongoing conservation measures; without these measures, a conservation dependent taxon would be classified as Vulnerable, Endangered or Critically Endangered.

2.2 STATE

2.2.1 Threatened and Priority species

In WA, the BC Act provides for the listing of Threatened fauna species (Government of Western Australia 2018a, b)[2] in the following categories:

- Critically Endangered (CR) – species facing an extremely high risk of extinction in the wild in the immediate future[3]
- Endangered (EN) – species facing a very high risk of extinction in the wild in the near future[3]

[1] Species listed as Extinct and Conservation Dependent are not matters of NES and therefore do not trigger the EPBC Act.

[2] The *Wildlife Conservation (Specially Protected Fauna) Notice 2018* and the *Wildlife Conservation (Rare Flora) Notice 2018* have been transitioned under regulations 170, 171 and 172 of the *Biodiversity Conservation Regulations 2018* to be the lists of Threatened, Extinct and Specially Protected species under Part 2 of the BC Act.

[3] As determined in accordance with criteria set out in the ministerial guidelines.

- Vulnerable (VU) – species facing a high risk of extinction in the wild in the medium-term future[3].

Species may also be listed as specially protected (SP) under the BC Act in one or more of the following categories:

- species of special conservation interest (conservation dependent fauna, CD) – species with a naturally low population, restricted natural range, of special interest to science, or subject to or recovering from a significant population decline or reduction in natural range
- migratory species (Mig.), including birds subject to international agreement
- species otherwise in need of special protection (OS).

DBCA administers the BC Act and also maintains a non-statutory list of Priority fauna. Priority species are still considered to be of conservation significance – that is they may be Threatened – but cannot be considered for listing under the BC Act until there is adequate understanding of threat levels imposed on them. Species on the Priority fauna list are assigned to one of four Priority (P) categories, P1 (highest) – P4 (lowest), based on level of knowledge/concern.

2.2.2 Critical habitat

Under the BC Act, habitat is eligible for listing as critical habitat if it is critical to the survival of a Threatened species or a TEC and its listing is otherwise in accordance with the ministerial guidelines.

2.2.3 Threatened and Priority Ecological Communities

The BC Act provides for the listing of TECs in the following categories:

- Critically Endangered – facing an extremely high risk of becoming eligible for listing as a collapsed ecological community in the immediate future[3]
- Endangered – facing a very high risk of becoming eligible for listing as a collapsed ecological community in the near future[3]
- Vulnerable – facing a high risk of becoming eligible for listing as a collapsed ecological community in the medium-term future[3].

An ecological community may be listed as a collapsed ecological community under the BC Act if there is no reasonable doubt that the last occurrence of the ecological community has collapsed or the ecological community has been so extensively modified throughout its range that no occurrence of it is likely to recover its species composition and/or structure.

The DBCA also maintains a non-statutory list of Priority Ecological Communities (PECs), which may become TECs in the future; however, do not currently meet survey criteria or that are not adequately defined. PECs are assigned to one of five categories depending on their priority for survey or definition, with Priority 1 of highest concern and Priority 5 of lowest concern.

2.2.4 Other fauna

Under the Environmental Protection Authority's (EPA) environmental factor guidelines fauna may be considered significant for a range of reasons other than listing as a Threatened or Priority species. EPA (2016) identifies the following attributes that constitute significant fauna:

- species with restricted distribution
- species subject to a degree of historical impact from threatening processes
- providing an important function required to maintain the ecological integrity of a significant ecosystem.

3 EXISTING ENVIRONMENT

3.1 LAND SYSTEMS AND SURFACE GEOLOGY

DPIRD undertakes land system mapping for WA using a nesting soil-landscape mapping hierarchy (Schoknecht & Payne 2011). While the primary purpose of the mapping is to inform pastoral and agricultural land capability, it is also useful for informing biological assessments. Under this hierarchy, land systems are defined as areas with recurring patterns of landforms, soils, vegetation and drainage (Payne & Leighton 2004).

The Project area is located within the Hamersley subregion of the Pilbara region (Figure 3-1) and intersects five land systems (Table 3-1) of which the Boolgeeda System comprises over 60%.

Table 3-1 Land systems and extent in Project area

Land system	Description	Area (ha)	% of Project area
Boolgeeda System	Stony lower slopes and plains below hill systems supporting hard and soft spinifex grasslands or mulga shrublands.	1,329.4	60.6
McKay System	Hills, ridges, plateaux remnants and breakaways of meta sedimentary and sedimentary rocks supporting hard spinifex grasslands with acacias and occasional eucalypts.	44.0	2.0
Newman System	Rugged jaspilite plateaux, ridges and mountains supporting hard spinifex grasslands.	499.2	22.7
Platform System	Dissected slopes and raised plains supporting shrubby hard spinifex grasslands.	198.1	9.0
Wannamunna System	Hardpan plains and internal drainage tracts supporting mulga shrublands and woodlands and occasionally eucalypt woodlands.	126.3	5.7
	Total	2,197.0	100.0

According to the Surface Geology of Australia 1:1,000,000 scale, Western Australia database (Stewart et al. 2008), the LCIOP intersects four geological formations (Table 3-2; Figure 3-2), of which Colluvium represents over 60% of the Project area.

Table 3-2 Surface geology of the Project area, extent by deposit type

Surface geology	Abbreviation	Description	Area (ha)	% of Project area
Alluvium 38485	Qa	Channel and flood plain alluvium; gravel, sand, silt, clay, locally calcreted.	79.7	3.6
Brockman Iron Formation	Lchk	Banded iron-formation, chert, mudstone and siltstone.	660.9	30.1
Colluvium 38491	Qrc	Colluvium, sheetwash, talus; gravel piedmonts and aprons over and around bedrock; clay-silt-sand with sheet and nodular kankar; alluvial and aeolian sand-silt-gravel in depressions and broad valleys in Canning Basin; local calcrete, reworked laterite.	1,456.4	66.3
Weeli Wolli Formation	Lchw	Banded iron-formation (commonly jaspilitic), mudstone, siltstone; common interlayered metadoleritic sills.	0.1	0
		Total	2197.0	100.0

4 METHODS

The significance assessment has been conducted in the context of various relevant State and Commonwealth survey guidelines, including:

- EPA Environmental Factor Guideline: Terrestrial fauna (EPA 2016)
- Technical Guidance: Terrestrial vertebrate fauna surveys for environmental impact assessment (EPA 2020)
- Survey guidelines for Australia's threatened bats: guidelines for detecting bats listed as threatened under the Environmental Protection and Biodiversity Conservation Act 1999 (DEWHA 2010)
- Conservation Advice. Macroderma gigas: Ghost Bat (Threatened Species Scientific Committee 2016)

A review of DBCA's Threatened and Priority fauna database (DBCA 2021) has also been undertaken to identify Ghost Bat records within 40km of the Project area.

4.1 GAP ANALYSIS

The gap analysis was primarily concerned with reviewing the methods employed to detect Ghost Bat presence with respect to relevant survey guidelines, to determine if surveys undertaken to date were compliant with those guidelines:

- Technical Guidance: Terrestrial vertebrate fauna surveys for environmental impact assessment (EPA 2020)
- Survey guidelines for Australia's threatened bats: guidelines for detecting bats listed as threatened under the Environmental Protection and Biodiversity Conservation Act 1999 (DEWHA 2010).

The following reports detail the survey methods undertaken for the Project:

- Detailed vertebrate fauna survey of the Lamb Creek project (Rapallo 2022)
- Level 2 Fauna Survey and Targeted Northern Quoll Survey of the Lamb Creek (Rapallo 2012).

4.2 SIGNIFICANCE ASSESSMENT

The significance of the potential direct and indirect impacts of the Project on Ghost bat was assessed against the EPBC Act significant impact criterion (VU) and key threats identified by the Threatened Species Scientific Committee (TSSC 2016), with consideration of Project design, Indicative Disturbance Footprint (IDF) and the biological characteristics of Ghost bat.

5 RESULTS

5.1 GHOST BAT BIOLOGY

The Ghost Bat (*Macroderma gigas*) is a large carnivorous bat, weighing approximately 140 – 165 g (Richards *et al.* 2008). Individuals have light grey to dark grey fur and a paler underbelly, with large, partially fused ears, large eyes, a simple nose-leaf, and no tail.

They are Australia's only strictly carnivorous bat, feeding nocturnally for small terrestrial mammals, amphibians, small birds, other bats, lizards, spiders and large insects (Churchill 2008; Richards *et al.* 2008). Much of its prey is captured on the ground and taken to an established feeding site, usually a rocky overhang or cave which are easily recognised by the accumulation of discarded prey, middens, and scat piles. Unlike the majority of microbats, Ghost bat are proficient in navigating and hunting visually without the need to constantly echolocate (Richards *et al.* 2008).

The Ghost Bat was once found across most of mainland Australia, but are now restricted to northern Australia across a range of habitats, such as the arid Pilbara region to the tropical region of northern Queensland (Richards *et al.* 2008). In WA, Ghost bat occur within the Pilbara and Kimberley regions (Woinarski *et al.* 2014). Although the exact reason for their decreased range is unknown, it is certain that Ghost bat are sensitive to disturbance (Richards *et al.* 2008).

The key threats to Ghost bat as listed in Federal conservation advice (Threatened Species Scientific Committee 2016) are:

- Habitat loss (destruction of, or disturbance to, roost sites and nearby areas) due to mining
- Disturbance of (human visitation at) breeding sites
- Modification to foraging habitat
- Collision with fences, especially those with barbed wire
- Collapse or reworking of old mine adits
- Contamination by mining residue at roost sites
- Disease
- Poisoning by cane toads (*Rhinella marina*)
- Competition for prey with foxes and feral cats.

Little information is known about the types of disturbances that lead Ghost bat to abandon their roosts. It is thought that repeated human visitation during the breeding season is a primary cause of roost abandonment (TSSC 2016). Ghost bat is shown to tolerate some audio disturbance from machinery, and disturbance from drilling is much less likely to cause abandonment then blasting impacts. Recent work has shown that caves located within 0.4 and 1.8 km from active mining continue to be used by Ghost bat (Biologic 2016). If abandoned, so long as caves remain unblocked, structural integrity maintained and the microclimate is not disrupted, Ghost bat are likely to re-occupy caves once mining disturbance moves away.

The distribution of Ghost bat in the Pilbara is largely determined by the presence of suitable caves, as they rely on caves for roosting and breeding. There are currently no studies on the home range of Ghost bat in the Pilbara (Biologic 2018), although Tidemann *et al.* (1985) recorded an average foraging area of 61 ha, typically located 1.9 km from a diurnal roost. Individuals were found to return to the same foraging area each night with multiple bats using the same foraging areas.

Ghost bat require a range of cave sites, moving between numerous caves seasonally or as dictated by weather conditions, moonlight, rainfall and fire (Woinarski *et al.* 2014). Ghost Bat may move in small groups between caves, making it difficult to determine whether their absence at monitoring sites between years is due to natural movements or to anthropogenic impacts (Armstrong & Anstee 2000).

Roost sites include sheltered rock formations such as caves, rock crevices and unused mine adits. In the Hamersley Range of the Pilbara, Ghost bat appears to prefer sheltered caves beneath bluffs of larger hills of Brockman Iron formation (Threatened Species Scientific Committee 2016); Brockman Iron and Weeli Wolli Iron formations (both types of Banded ironstone) comprise over 30% of the Project area (Table 3-2).

The species' persistence in the arid Pilbara depends on a stable microclimate. Ideally caves will have temperatures between 23 and 28°C, with 28°C being the optimal maintenance of body temperature (Baudinette *et al.* 2000; Threatened Species Scientific Committee 2016). The preferred range of humidity varies widely between 14 and 84% (Armstrong & Anstee 2000).

Ghost bat disperse widely to forage when they are not breeding. However, during the breeding cycle (Table 5-1), distribution is determined by the presence of suitable roosting sites, few of which are known (Richards *et al.* 2008). Females are likely to stay close to preferred maternity roosts, a cause for serious conservation concern (Richards *et al.* 2008).

Whilst roosting, they are particularly sensitive to disturbance. If disturbed, young may be dislodged by adults in rapid take-off (Toop 1985) and may not return to roosting sites (Woinarski *et al.* 2014). Such susceptibility to disturbance also threatens the viability of roosts with unregulated human visitation, including surveys which target caves and may inadvertently flush individuals into daylight.

Mating is thought to occur during July and August, females baring one young three months later between September and November (Richards *et al.* 2008) (Table 5-1). Young are weaned on prey by their mothers and begin hunting as juveniles, until they are completely independent.

Table 5-1 Approximate breeding cycle for Ghost Bat in the Pilbara

Month	Breeding Stage
July – August	Mating
August – October	Gestation
September – November	Birth

Ghost Bat caves can be categorised based on their usage (Table 5-2) and the timing and frequency of occupancy (Bat Call WA 2021) Table 5-3). Maternity roosts are considered the most significant cave type, followed by diurnal roosts and night roosts. 'Potential' is used to denote the highest Category based on the information collected where insufficient information to confirm the Category has been recorded (e.g., potential roost contains attributes and/or evidence to suggest diurnal roosting though no diurnal roosting has been confirmed). Caves can be categorised accordingly via assessing the structure of the cave in combination with monitoring of Ghost Bat signs.

Table 5-2 Ghost Bat cave categories, in decreasing significance (Bat Call WA 2021)

Category	Description
Maternity roosts	In addition to being used for shelter during the day, these caves have attributes suitable to support breeding, and Ghost bat have been recorded in these caves during the breeding season, including pregnant females or females with pups.
Diurnal roosts	Used for shelter during the day.
Night roosts	Only utilised during the night, mostly to feed on prey items or to rest, and are typically shallow caves and shelters/overhangs that can be well lit during the day.

Bat Call WA (2021) has categorised Ghost Bat caves according to their habitat value, established by occupancy and usage (Table 5-3).

Table 5-3 Bat Call WA Cave Habitat Classifications (Bat Call WA 2021)

Category	Description	Significance*
Category 1	**Diurnal roost caves with permanent Ghost Bat occupancy.** Caves and historical underground mines (adits and declines) that are used continuously as diurnal roosts by large numbers of Ghost Bat for long periods of time.	Must all be assumed to be maternity caves and are critical habitat for the species.
Category 2	**Diurnal roost caves with regular occupancy.** Caves that are used regularly as diurnal roosts by small numbers of Ghost bat but not continuously. These tend to be deep caves with ceiling heights in rear chambers of at least 1.5 m allowing multiple roosting opportunities out of reach of predators. These caves typically have a number of other caves, shelters, and overhangs within a few hundred meters.	Must be assumed to be capable of supporting one or more reproducing females and their offspring. These caves are critical habitat for the species.
Category 3	**Roost caves with occasional occupancy**. Caves that are occasionally used as diurnal roosts and as nocturnal roosts for feeding and resting more frequently.	When directly associated with a Category 2 cave, they form an apartment block grouping that is considered critical habitat. Isolated caves are important habitat for the long-term preservation of the species in the area.
Category 4	**Nocturnal roost caves with opportunistic usage.** This may be anything from a single foraging visit to a longer visit with a resting period or possibly a feeding session.	These caves are not important habitat for the long-term preservation of the species in the area.

***** All Category 1, 2 and 3 caves in apartment blocks are considered to be critical habitat.

5.2 DESKTOP REVIEW

The desktop review identified 113 records of Ghost Bat within 40 km of the Project area (DBCA 2021) (Figure 5-1), found at an average distance of 17.85 km from the Project area. Over 95% of these records have been made since 2012 (DBCA 2021).

Further, the bat assemblage of the survey area was assessed using ultrasonic echolocation recorders during three field deployments by Rapallo; a Level 2 fauna survey and targeted Northern Quoll survey (Rapallo 2012), and a detailed vertebrate fauna survey that included ultrasonic echolocation recorder deployments for detecting Ghost bat in April 2020 and February 2021 (Rapallo 2022)(Table 5-4).

In 2012, a Level 2 fauna survey was conducted at the LCIOP on the 26 March to 12 April. Ultrasonic recorders were placed in seven suitable locations for one night (Rapallo 2012)(Table 5-4). No unambiguous calls attributable to the Ghost Bat could be determined in the recordings made during the survey (with the techniques available at the time). Individuals were sighted at three caves in the survey area: two within the Project area (Cave 1 and Cave 3) and one within the vicinity of the Project (Cave 2) (Rapallo 2012). Seven individuals were recorded at two of these caves: five within the Project and two individuals within the vicinity of the Project (Cave 2). There was no evidence of middens within either cave.

Caves surveyed in 2012 were revisited in 2020 and 2021 and ultrasonic recorders deployed during field trips from the 16 to 28 April 2020 and 20 to 24 February 2021 (Rapallo 2022)(Table 5-4). In 2020, 17 acoustic detectors were installed; 14 set to record ultrasonic calls and three set to record Night

Parrot and Ghost Bat social calls in gullies. Of the 14 echolocation sites surveyed in 2020, three detectors were deployed at cave entrances, four deployed in thin woodland, three in shrubland, one in spinifex plain, two in minor drainage lines and one in an incised gully (Figure 5-2). Detectors were left between one and four nights. Ultrasonic calls of Ghost bat were recorded at Cave 1, Cave 2, and Cave 3. No ultrasonic or social call recordings of Ghost bat were made at any other site in the 2020 survey (Rapallo 2022). Middens were present at Cave 1 (Rapallo 2022).

In February 2021, additional data on Ghost Bat presence was collected while on-site for other studies. Four acoustic detectors were installed to record ultrasonic calls, all deployed at cave sites (Table 5-4; Figure 5-2). Detectors were left between two and three nights. Ultrasonic calls of Ghost Bat were recorded at Cave 3, Cave 4 and Cave 5 (Rapallo 2022), consistent with the known population and dispersal of Ghost Bat observed in the 2012 field survey (Rapallo 2012).

Table 5-4 Summary of Ghost Bat monitoring at Lamb Creek from 2012 – 2021

Survey	Season	Records	Comments from report
Level 2 Fauna Survey and Targeted Northern Quoll Survey of the Lamb Creek (Rapallo 2012)	Autumn	Ultrasonic recorders were deployed one night at seven suitable locations. Ghost Bat were observed roosting in two caves within the Project area (Cave 1 and Cave 3) and one within the survey area (Cave 2) (Figure 5-2).	There are several small cave systems within the survey area that are likely to be used as roosts by Ghost Bat (Rapallo 2012).
Detailed vertebrate fauna survey of the Lamb Creek project (Rapallo 2022)	Autumn	Ultrasonic recorders were deployed between one and four nights at 14 locations. Ghost bat were visually recorded roosting in two caves within the Project area (Cave 1 and Cave 3) and one within the vicinity of the Project area (Cave 2) (Figure 5-2).	At Cave 1 both social and ultrasonic calls were recorded before dawn followed by similar numbers of calls soon after dusk. Calls consistent with foraging Ghost Bats was detected at Caves 2 and 3 on one night each (Rapallo 2022).
	Summer	Ultrasonic recorders were deployed between two and three nights at four locations. Ultrasonic recordings of Ghost bat were recorded at two caves within the Project area (Cave 1 and Cave 3) and two caves within the vicinity of the Project (Cave 4 and Cave 5).	Calls consistent with foraging visits detected at Caves 3 and Cave 4. Calls consistent with diurnally roosting Ghost bat detected at Cave 5 (Rapallo 2022). Rapallo (2022) concluded the survey area (but not Project area) was fully surveyed. Approximately 555 hectares (25%) of the current Project area has not been covered by fauna surveys and is considered a 'partial' limitation. There was also a 'partial' limitation for the timing/rainfall/seasonality of the fauna work due to lower than average rainfall preceding the survey (Rapallo 2022).

5.3 GAP ANALYSIS

The bat survey effort achieved during the 2012 and 2020/2021 field work for the LCIOP is outlined in Table 5-4 and Table 5-5 (Rapallo 2012, 2022). The survey work completed on Ghost Bats in 2012, 2020 and 2021 was wither a component of a detailed survey or opportunistic record.

Table 5-5 Summary of survey effort at Ghost Bat caves (Rapallo 2012, 2022).

Site	Rapallo (2012)		Rapallo (2022)			
			2020 data collected		2021 data collected	
	No. of nights ultrasonic recorder deployed	Compliant	No. of nights ultrasonic recorder deployed	Compliant	No. of nights ultrasonic recorder deployed	Compliant
Cave 1	0	No	4	Yes	3	Yes
Cave 2	1	No	2	No	0	No
Cave 3	0	No	4	Yes	3	Yes
Cave 4	0	No	0	No	2	No
Cave 5	0	No	0	No	2	No

Survey effort for two of the five Ghost Bat caves met Commonwealth (DEWHA 2010) and State (DEWHA 2010) survey requirements for bats (Table 5-5)(Cave 1 and Cave 3). All other sites were not surveyed an adequate number of nights to meet bat survey requirements (Table 5-5).

Rapallo (2022) concluded the survey area (but not Project area) was fully surveyed. Approximately 555 hectares (25%) of the current Project area has not been covered by fauna surveys and is considered a 'partial' limitation. There was also a 'partial' limitation for the timing/rainfall/seasonality of the fauna work due to lower than average rainfall preceding the survey (Rapallo 2022).

5.4 SIGNIFICANCE ASSESSMENT

Five caves were found to be utilised by Ghost bat within or in the vicinity of the Project area. Bat Call WA assigned the five Ghost Bat caves as the following cave type and habitat classification (Pers. Comm., R. Bullen, in Rapallo 2021):

- Within Project area
    - Cave 1 – Provisional Category 2
    - Cave 3 – Provisional Category 3
- Outside Project area
    - Cave 2 – Provisional Category 3
    - Cave 4 – Category 3 (apartment block)
    - Cave 5 – Category 2.

The distance from Ghost Bat caves to the proposed operational and infrastructure areas are provided in Table 5-4. The closest distance from the proposed mine pit to a Ghost Bat cave is 729 m (Cave 1; Category 2). The same cave is located 350 m from a waste rock landform and diversion bund (Table 5-4). The remaining caves in proximity to the mine pit are greater than 1 km away (Table 5-4). Cave 4 and Cave 5 are located 202 m and 237 m, respectively, from the access road.

Table 5-6 Caves recorded in the survey area and their distance to nearest proposed structure and pit of Nov 2021 footprint

Site	Habitat value and use by Ghost Bat	Habitat assessment	Within Project area	Distance (m) from cave to nearest structure as per Nov 2021 footprint		Distance (m) from cave to proposed pit
				Structure	Distance (m)	
Cave 1	Provisional Category 2- Diurnal roost with regular but not continuous occupancy	Potentially critical	Y	Waste rock landform and diversion bund	350	729
Cave 2	Provisional Category 3- Roost caves with occasional occupancy	Noncritical	N	Waste rock landform and diversion bund	1,960	2,049
Cave 3	Provisional Category 3- Nocturnal roost caves with opportunistic usage	Noncritical	Y	Waste rock landform and diversion bund	583	1,285
Cave 4	Category 3 (apartment block)- Nocturnal roost caves with opportunistic usage	Critical	N	Access road	202	9,932
Cave 5	Category 2- Diurnal roost with regular but not consistent occupancy	Critical	N	Access road	237	9,902

The current November 2021 footprint extends outside the survey area by 24 hectares (4% of the total footprint), mostly comprising the southern end of the proposed haul road (Rapallo 2022). At present, no Ghost Bat cave is located within the November 2021 development footprint (Figure 5-2) and there is a 100m buffer around all five caves (Pers. Comm., A. Parker). On that basis therefore, none of the five known roost sites will be physically damaged or lost. It is also considered unlikely that cave structural integrity or roosting site viability will be adversely impacted by blasting or other operational elements associated with the implementation of the LCIOP. Minimal vibration is expected from the waste rock landforms, diversion bund and access road, and disturbance is therefore expected to be unlikely. Therefore, the Project is expected to have minimal impact on Ghost Bat populations.

5.4.1 EPBC Act significant impact criteria assessment

Analysis of the Project against the EPBC Act significant impact criterion for Vulnerable species is presented in Table 5-7. The assessment has found none of the criteria are met, with the implementation of the Project and expected management measures. On that basis re-referral of the Project to DAWE is not expected to be required.

Table 5-7 EPBC Act: Significant Impact Criteria for Vulnerable Listed Species (DoE 2013)

Significant Impact Criterion	Ghost Bat	Comments
Lead to a long-term decrease in the size of an important population of a species	Unlikely	The Project will not result in the direct disturbance or loss of critical Ghost Bat caves. Further, given the size, lifespan and design of operations, the Project is unlikely to lead to a long-term decrease in the population of Ghost Bat.
Reduce the area of occupancy of an important population	Unlikely	The Project will not result in the direct disturbance or loss of critical Ghost Bat caves. The distance from known caves to proposed operational and infrastructure areas are provided above in Table 5-6. There are two caves present in proximity to the proposed blasting areas (categories 2, 3) and a cluster close to the haul road near its intersection with the Great Northern Highway (GNH) intersection (Category 2, 3). The closest distance from the proposed mine pit to a Ghost Bat cave is 729 m (Cave 1; Category 2). The same cave is located 350 m from a waste rock landform and diversion bund. The remaining caves in proximity to the operational area is greater than 1km away. Cave 4 and Cave 5 near the GNH intersection are located over 200 m from the access road. Cave 2 was initially surveyed when a southern haul road route option was under consideration (now dropped), and is at least 2 km from the currently proposed operations On that basis therefore, it is considered unlikely that any of the five known roost sites will be physically damaged or lost. It is also considered unlikely that cave structural integrity or roosting site viability will be adversely impacted by blasting or other operational elements at Lamb Creek. Therefore, the area of occupancy of the species will not be reduced.
Fragment an existing important population into two or more populations	Unlikely	Ghost bat have been recorded in low numbers within the Project area at two caves (Cave 1, Cave 3) located east of the development footprint. No direct disturbance or loss of caves is expected and thus it is considered unlikely the Project will fragment existing populations.
Adversely affect habitat critical to the survival of a species	Unlikely	All critical habitat (Cave 1, Cave 4, Cave 5) has a 100 m buffer implemented (Pers. Comm., A. Parker) to minimise disturbance to caves and preserve foraging habitat. Revegetation will occur after LCIOP operations. Given the distance from known caves to proposed operational blasting areas (Table 5-6), it is unlikely blasting will physically damage caves. Therefore, the Project is unlikely to adversely affect critical habitat.

Significant Impact Criterion	Ghost Bat	Comments
Disrupt the breeding cycle of an important population	Unlikely	Due to the low levels of cave usage recorded thus far (Rapallo 2012, 2022), it is considered unlikely that caves support breeding females. However, scat collection and hormone analysis has not been conducted at Category 2 caves with middens at the Project, therefore this cannot be confirmed. That being said, adverse impacts to Ghost Bat breeding are unlikely due to the distance of known roost sites to mining operations (Table 5-6) and if suitable management techniques are enforced (for example, restricting entry of all 'non-environmental' site personnel from the five caves identified within the vicinity of the Project).
Modify, destroy, remove, or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline	Unlikely	Ghost Bat foraging habitat occurs across all habitat types within the Project area (Rapallo 2022). Approximately 657 ha of Ghost Bat habitat will be disturbed for the development of the Project; however, Project design has incorporated a 100m buffer around each cave located within the Project and within the vicinity of the Project (Cave 1-5; Pers. Comm., A. Parker). Due to the short lifespan of mining and low number of Ghost Bat populations within the Project area, it is unlikely the Project will modify, destroy, remove, isolate, or decrease the availability or quality of habitat to the extent that the species is likely to decline.
Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat	Unlikely	The Project is unlikely to introduce any new species to the area that would impact Ghost Bat.
Introduce disease that may cause the species to decline	Unlikely	There are no known diseases that may lead to Ghost Bat decline as a result of the Project. The Project is unlikely to increase species vulnerability to disease as a result of inbreeding.
Interfere substantially with the recovery of the species	Unlikely	Given the size, lifespan, and design of the Project, it is unlikely to interfere substantially with the recovery of the species.

5.4.2 Assessment of impacts against Key Threats

Key threats to the persistence of Ghost bat are identified by the Threatened Species Scientific Committee (TSSC 2016). Potential impacts arising from implementation of the Project and potential management techniques concerning Ghost bat are summarised in Table 5-8. The impact assessment has largely concluded that where impacts may occur, they are expected to be negligible–low. This is due to the distance of the pit to known roost sites and the fact that impact in the form of loss of foraging habitat will be rectified via rehabilitation immediately following the short mining duration proposed. Five threats are not considered applicable to this Proposal.

Table 5-8 Potential threats to Ghost Bat from implementation of the Project (TSSC 2016)

Threat factor	Consequence rating (TSSC 2016)	Expected impact	Impact details
Habitat loss (destruction of, or disturbance to, roost sites and nearby areas) due to mining	Severe	Negligible potential impact	The distance from known caves to proposed operational and infrastructure areas are provided above in Table 5-6. There are two caves present in proximity to the proposed blasting areas (categories 2, 3) and a cluster close to the haul road near its intersection with the GNH intersection (Category 2, 3). The closest distance from the proposed mine pit to a Ghost Bat cave is 729 m (Cave 1; Category 2). The same cave is located 350 m from a waste rock landform and diversion bund. The remaining caves in proximity to the operational area is greater than 1km away. Cave 4 and Cave 5 are located 202 m and 237 m from the access road, respectively (Table 5-6). Cave 2 was initially surveyed when a southern haul road route option was under consideration (now dropped), and is at least 2 km from the currently proposed operations On that basis therefore, it is considered unlikely that any of the five known roost sites will be physically damaged or lost. It is also considered unlikely that cave structural integrity or roosting site viability will be adversely impacted by blasting or other operational elements at Lamb Creek.
Disturbance of (human visitation at) breeding sites	Moderate-severe	Negligible potential impact	Due to the low levels of cave usage recorded thus far (Rapallo 2012, 2022), it is considered unlikely that caves support breeding females. However, scat collection and hormone analysis has not been conducted at Category 2 caves with middens at the Project, therefore this cannot be confirmed. That being said, so long as personnel are restricted from approaching and entering roost sites at all times, there should be no impacts to these potential breeding sites. In addition, the remote and rugged location of the caves habitat further discourages human visitation.

Threat factor	Consequence rating (TSSC 2016)	Expected impact	Impact details
Modification to foraging habitat	Moderate	Low potential impact	It is expected that approximately 657 ha of vegetation will be cleared as a result of the Project. Rapallo (2022) concluded suitable foraging habitat occurs across all habitats of the survey area. It is considered likely that Ghost Bat use the Project area for foraging, particularly in drainage lines, rocky ridge and gorge habitat (Western Wildlife 2020). The accumulative effect of modifying foraging habitat in the Pilbara is a potential indirect impact to the persistence of Ghost Bat populations. Five active mine sites are located within 50 km of the Project (Figure 1-2) and have potential to cause habitat fragmentation and reduce foraging habitat extent. Little is known regarding the number of caves lost to mine sites within the vicinity of the Project, so the impact of foraging habitat destruction is difficult to assess. However, given the small disturbance footprint, short duration of the proposed Project and requirement to rehabilitate foraging habitat, impacts to foraging habitat are expected to be low, even when taking into consideration the cumulative impacts to such habitat from other mining operations locally.
Collision with fences, especially those with barbed wire	Moderate	Unknown	Fencing will be minimal and no barbed wire fences will be constructed at the Project. That being said there is in fact no evidence that collision with fencing is a threat to the species in the Pilbara.
Collapse or reworking of old mine adits	Minor-moderate	No impact	N/A
Contamination by mine residue at roost sites	Moderate	No impact	Given the distance of roost caves to the proposed pit, it is considered unlikely blast residue or dust will affect the microclimate of Ghost Bat caves. No direct contamination is expected.
Disease	Unknown	No impact	N/A
Poisoning by cane toads	Severe	No impact	N/A
Competition for prey with foxes and feral cats	Unknown	No impact	N/A

5.5 DISCUSSION AND CONCLUSION

Ghost Bat are commonly recorded in the vicinity of the Project. Five Ghost Bat roost caves are present within relatively close proximity of the Project, at varying distances to proposed disturbance; However, significance assessment has revealed no Ghost Bat roost caves are proposed to be directly impacted or lost through its implementation. Indirect impact is also expected to be nil or negligible.

While the gap analysis has found that survey effort does not strictly comply with State and Federal requirements for three of the five caves this is not considered important as each was ultimately identified as a Ghost Bat roost cave. The objective of field surveys in the context of environmental impact assessment is to determine whether caves support significant species; to that end the surveys achieved their aim.

Analysis of the Project against the EPBC Act significant impact criterion for Vulnerable species has concluded that no criteria are met.

Further, analysis of the Project against each of the key threats to Ghost Bats identified by the Threatened Species Scientific Committee (TSSC 2016) reveals the Project represents negligible to low risk to the species. Therefore, on the basis of the historic survey effort achieved, and low risk the Project represents to the species, referral to DAWE under the EPBC Act is not considered necessary.

1. EXECUTIVE SUMMARY

Rapallo Environmental was commissioned by Process Minerals International Pty Ltd (PMI) to conduct a Level 2 fauna survey of the proposed Lamb Creek iron ore mine, two alternative haul road routes and three alternative accommodation village sites. The Lamb Creek project is located approximately 130km north of Newman off the Great Northern Highway in the East Pilbara Region of Western Australia.

The core aims of the survey were to search published literature and databases for data on fauna found in the region; collect baseline data on vertebrate faunal assemblages of the project area and surrounding areas (collectively referred to as 'survey area'; survey for evidence of the presence of species of conservation significance; survey for introduced species; map the habitats of the project area; and identify habitat that could support species of conservation significance.

The Survey was divided into four projects

1) Reconnaissance Survey
2) Level 2 Vertebrate Fauna Survey
3) Level 2 SRE survey
4) Targeted Northern Quoll Survey

Surveys were conducted between the 19-20th March and 26 March – 12 April 2012. Prior to the surveys, database searches were completed to identify if species of conservation significance could potentially use habitats found along the haul road alignment. GIS data and aerial photography was used to demark the survey area, project area and land systems and to identify potential areas of interest.

Five habitat types were identified on the project area with each area being systematically trapped twice for a total of 10 trap sites on the project area. Vertebrate fauna was identified and released each morning as the trap lines were cleared. If specimens could not be immediately identified they were placed in a calico bag and identified at the field camp. After identification the specimens were released near the site of capture when conditions permitted (i.e. nocturnal fauna were not released during midday heat).

A Songbird SM2+ bat recording device was used to survey bat species in the survey area. The device was placed at a suitable location within each habitat for one night during the survey period. Suitable locations included areas with caves, water or mature woodlands with hollow bearing trees.

Bird assemblages were assessed and compiled using a combination of trap site specific surveys and opportunistic observations. Two hectare bird surveys, following Birds Australia guidelines, were completed each day between 6am and 9am when bird activity was peak and cryptic species were most detectable. Records from each site were supplemented with opportunistic records.

Spotlight surveys were undertaken on each night that the trap grids were open. Spotlight surveys were run over 30 minutes and were undertaken by a team of four ecologists.

A targeted Northern Quoll survey was conducted on the survey area consisting of 6 trap lines each containing ten cage traps. Each trap line was open for 5 consecutive nights and was checked each morning. Each cage was baited using a mammal bait mixture of honey, oats, peanut butter and sardines. In addition to targeted cage trapping, motion detecting cameras were deployed across the survey area in habitats that had the potential to support Northern Quolls. The targeted Northern Quoll survey was conducted in accordance with guidelines supplied by The Department of Sustainability, Environment Water, Populations and Communities (SEWPaC,).

Habitats were assessed by ground truthing areas of interest identified on aerial photographs and from land system mapping. To assess habitats, transects were walked across large areas of the survey area. Data was recorded at each point along the transect where the habitat changed.

Individual based rarefaction curves (species accumulation curves) were used to investigate the survey success and to calculate species richness values for the survey area. They were produced for each vertebrate fauna group. They were derived from data collected at systematic trap sites only.

Database searches and literature reviews indicated 16 species listed under the *Wildlife Conservation Act 1950*, the *Environmental Protection and Biodiversity (EPBC) Act 1999* and by the Department of Conservation (DEC) could potentially occur on the survey area. Evidence of four species listed under the *EPBC Act* and *Wildlife Conservation Act 1950* were recorded during the survey. Evidence of three species listed as Priority by the DEC were also recorded during the survey.

A total of 8087 vertebrate records were made during the survey at Lamb Creek representing 152 species.

Species listed under the *EPBC Act* and *Wildlife Conservation Act 1950* that were recorded during the survey were the Northern Quoll, the Pilbara Olive Python (*Liasis olivaceus barroni*), the Rainbow Bee-eater (*Merops ornatus*) and the Fork-tailed Swift (*Apus pacificus*). Species recorded during the survey that are listed as Priority by the DEC were the Ghost Bat (*Macroderma gigas*), the Australian Bustard (*Ardeotis australis*) and the Western Pebble-mound Mouse (*Pseudomys chapmani*).

In order to minimise the project's impacts on vertebrate and SRE invertebrate fauna, a series of general recommendations are given below.

- speed limits along haul roads that intersect habitats likely to support species of conservation significance;
- sensitive habitats and habitat features to be marked out to reduce risk of accidental damage;
- man-made water bodies (i.e. turkey nests) to be located away from vehicle traffic areas (as such features often attract the Pilbara Olive Python).
- avoid unnecessary clearing of vegetation, i.e. beyond that strictly required;
- avoid clearing or disturbing habitats that support populations of significant fauna;
- avoid excessive disturbance and clearing around creeks or minor drainage channels;
- rapidly rehabilitate cleared areas such as laydown sites, access tracks and grid lines where these are no longer required;

- avoid direct impacts (clearing and grading) to active nests and large trees, particularly those associated with watercourses as a variety of birds use these habitats;
- wind-rows of topsoil, log debris and leaf litter formed during clearing should be retained, as they create extremely good micro-habitat for a range of fauna, particularly reptiles;
- encourage a culture of environmental consciousness on site by increasing the awareness of the environmental commitments of the project;
- display appropriate signage on site e.g. litter management, speed restrictions, species of conservation significance, important habitat;
- set site and targeted habitat speed limits on site especially in areas where species of conservation significance are regularly reported;
- implement weed control program;
- rubbish disposal procedures should be applied, especially for food refuse, in order to discourage scavenging by crows, foxes and feral cats. Large numbers of these animals can have an adverse impact on other fauna;
- feral animal control program;
- fencing off vulnerable habitats; and
- implementing fire management plans to reduce the risk of large high intensity wildfires.

2. INTRODUCTION

2.1. BACKGROUND

Process Minerals International Pty Ltd (PMI) intends to construct and operate an iron ore mining operation at Lamb Creek, approximately 130 km north-west of Newman the East Pilbara Region of Western Australia (Figure 1). The project includes a proposed mine site, haul routes and an accommodation village. Iron ore will be hauled by road-trains from the site via a dedicated haul road to link in with the Great Northern Highway.

PMI purchased the Lamb's Creek project from Iron Ore Holdings (IOH) in October 2011. No previous fauna studies have been conducted by IOH in the area of the proposed mine. Table 1 and Figure 2 outline the tenements of the Lamb Creek project area.

Table 1 Tenements of the Lamb Creek Project

2.2. SCOPE AND AIMS

Rapallo Environmental was commissioned by PMI to conduct a Level 2 fauna survey (herein referred to as the 'fauna survey') of the proposed Lamb Creek iron ore project area (herein referred to as the

'project area') and adjacent areas of similar habitat. The project area and adjacent habitats that were investigated during the fauna survey combined are referred to as the 'survey area'(Figure 2). In addition, Rapallo Environmental was commissioned to conduct a targeted Northern Quoll survey of the survey area.

The core aims of the survey were to:

- characterise vertebrate fauna assemblages of the survey area;
- characterise habitats of the project area and investigate their linkages to regional habitats;
- collect data on species of conservation significance that occur within and adjacent to the project area (if any);
- identify habitats that may support species of conservation significance on the project area;
- identify habitats that may support species of conservation significance off the project area but within PMI's tenement holding;
- identify, map and survey habitats with potential to support Northern Quolls;
- identify Short-range Endemic (SRE) invertebrates occurring or likely to occur in the survey area;
- describe SRE habitat in the project area; and
- understand survey findings in a regional context to evaluate potential risks to SRE populations.

2.3. EXISTING ENVIRONMENT

2.3.1. CLIMATE

Climate in the Pilbara region of Western Australia is characterised as an arid tropical climate with most rain falling during the hot summers between January and March (Beard 1990). Climatic conditions are influenced by tropical cyclones predominately through these months.

The nearest Bureau of Meteorology (BoM) weather station to the survey area is at Newman Airport (station number 007176), approximately 130 km southeast of Lamb Creek. Mean annual rainfall recorded at this station over the period of 1971 to 2012, is 322 mm (Bureau of Meteorology 2012). February has the highest mean monthly rainfall of 77.3 mm and September has the lowest mean monthly rainfall of 4.5mm (Figure 3).

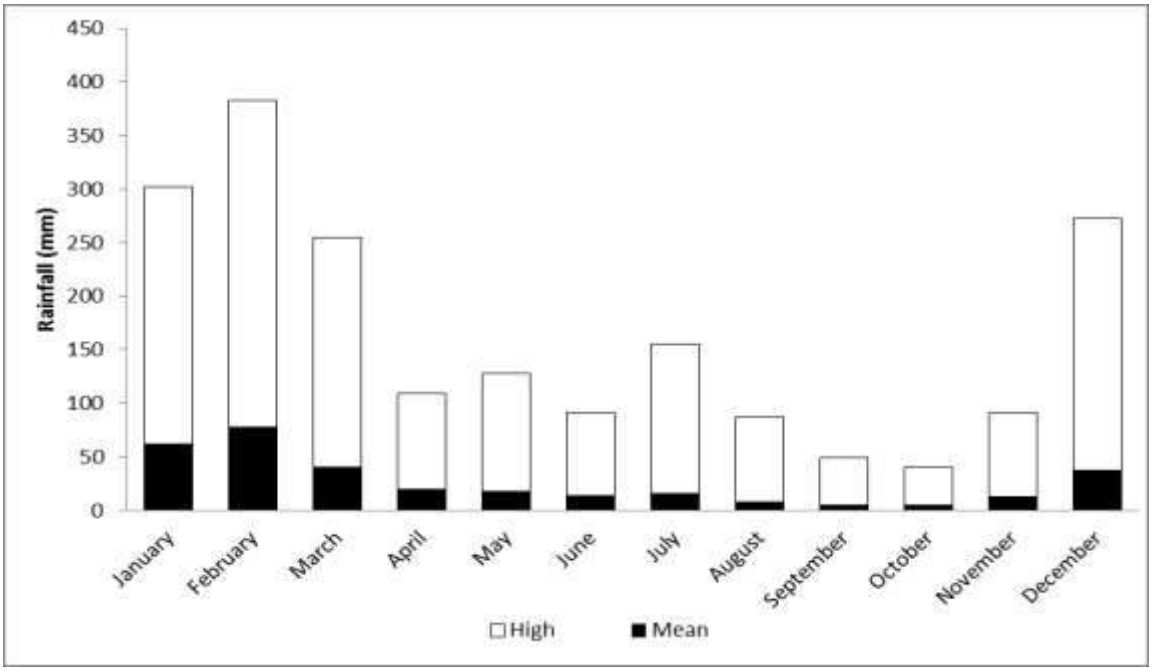

Figure 3 Mean annual rainfall at Newman Airport BoM Station (007176) over years 1971 to 2012

Evaporation rates are not recorded at the Newman Airport BoM Station. However, evaporation in the Central Pilbara Region is estimated to be between 2000 mm and 3500 mm, and is 10 times higher than rainfall (Gardiner 2003). This disparity maintains a typically arid landscape, with the exception of areas located in proximity to river systems and shallow groundwater resources.

The hottest month recorded at the Newman Airport Station is January with a mean maximum temperature of 39.2 °C and a mean minimum temperature of 24.9 °C (Figure 4).

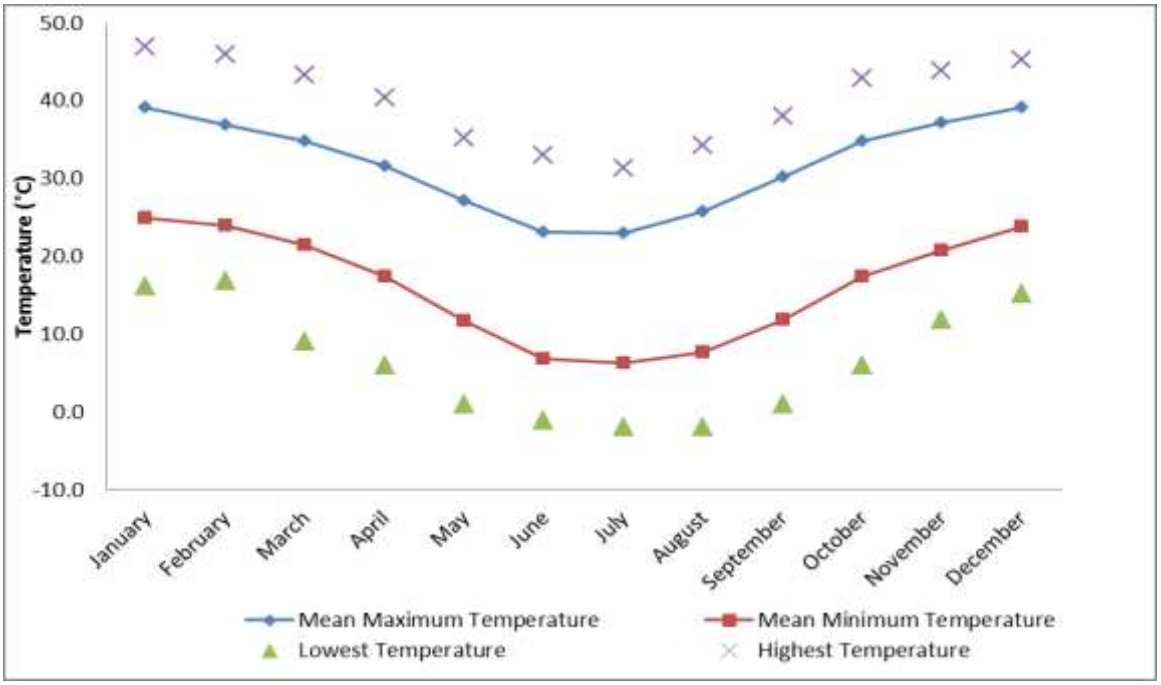

Figure 4 Mean monthly temperatures at Newman Airport BoM Station (007176)

2.3.2. DRAINAGE

Regional stream flow in the Pilbara is ephemeral, related to intense rainfall from with cyclonic activity or localised thunderstorms. Stream flow decays rapidly once rainfall has ceased. The drainage system upstream of the Fortescue Marsh has negligible base flow with stream flow and water table recharge following rainfall events (Van Vreeswyk *et al.* 2004).

The proposed mining area (tenement M47/1468) contains four minor non-perennial (type 2) water courses. The southern proposed haul route option (L47/638, L47/639, L47/641) and two prospective accommodation areas (L47/635, L47/636) are crossed by eight minor non-perennial water courses. Seven non-perennial water courses cross the northern proposed haul road option (L47/637, L47/640) and the northern prospective accommodation area (E47/1329). No major or perennial drainage lines occur within or directly adjacent to the survey area Geoscience Australia.

2.3.3. GEOLOGY

The project area is located in the south-west corner of the Roy Hill 1:250,000 Geological Survey Sheet (Thorne & Tyler 1997). The geology of the project area is generally defined by the assemblage prehnite-pumpellyite-epidote-actinolite. Basement rocks comprise the early Proterozoic Brockman Iron Formation and Weeli Wolli Formation. The Brockman Iron Formation consists of banded iron formation (BIF) and shale, while the Weeli Wolli formation consists of BIF separated by shale and siltstone bands, with younger dolerite sills that intersect the sedimentary sequence (Thorne & Tyler 1997).

Regionally, the fresh basement rocks are typically overlain by weathered basement rocks which occur as lateritic and basal gravel and/or conglomerate deposits. These weathered deposits underlie early Tertiary Channel Iron Deposits (CID), which are the dominant economic-grade iron deposits in the

region. The CID is typically overlain by younger alluvial and colluvial gravels and sediments (Thorne & Tyler 1997).

2.3.4. SOIL AND LANDFORM

The project area is typical of the Eastern Pilbara with rocky hills, small gorges, mostly seasonal watercourses and gravelly loam valleys. The project area is located in the Fortescue Valley Zone of the Fortescue Province which is described by Tillie (2006) as alluvial plains, hardpan wash plains and sandplains (with stony plains, floodplains and some salt lakes) on alluvial deposits over sedimentary rocks of the Hamersley Basin. Soils are generally red deep sands, red loamy earths and red/brown non-cracking clays with some red shallow loams and hard cracking clays. Vegetation is generally mulga shrublands and spinifex grasslands, with some tussock grasslands and halophytic shrublands. This region is located in the Pilbara along the Fortescue River between Millstream National Park and Ethel Creek Station.

The project area has two distinct soil and landform assemblages. The majority of the potential haul road alignment and the edges of the mine tenement are characterised as Fa13. The central part of the mine tenement and small portion of the potential haul road alignment is characterised as Fb3. These are defined in Australian Soils Resource Information System (CSIRO Australia 2012) as follows:

- **Fa13**: Ranges of banded jaspilite and chert along with shales, dolomites, and iron ore formations with some areas of ferruginous duricrust as well as occasional narrow winding valley plains and steeply dissected pediments. This unit is largely associated with the Hamersley and Ophthalmia Ranges. The soils are frequently stony and shallow and there are extensive areas without soil cover: chief soils are shallow stony earthy loams along with some soils on the steeper slopes. Associated are soils on the limited areas of dissected pediments, while and soils occur on the valley plains; and
- **Fb3**: High-level valley plains set in extensive areas of unit Fa13. There are extensive areas of pisolitic limonite deposits: principal soils are deep earthy loams along with small areas of soils.

2.3.5. IBRA ZONE

The project is within the Hamersley subregion (Pilbara 3) under the Interim Biogeographic Regionalisation of Australia (IBRA) system, which covers the southern section of the Pilbara Craton. The Hamersley subregion is a mountainous area of Proterozoic sedimentary ranges and plateaux, dissected by gorges of basalt, shale and dolerite. Vegetation is generally low Mulga woodland over bunch grasses on fine textured soils in the valleys with snappy gums (*Eucalyptus leucophloeia*) over *Triodia* species on skeletal soils of the ranges (Kendrick 2002).

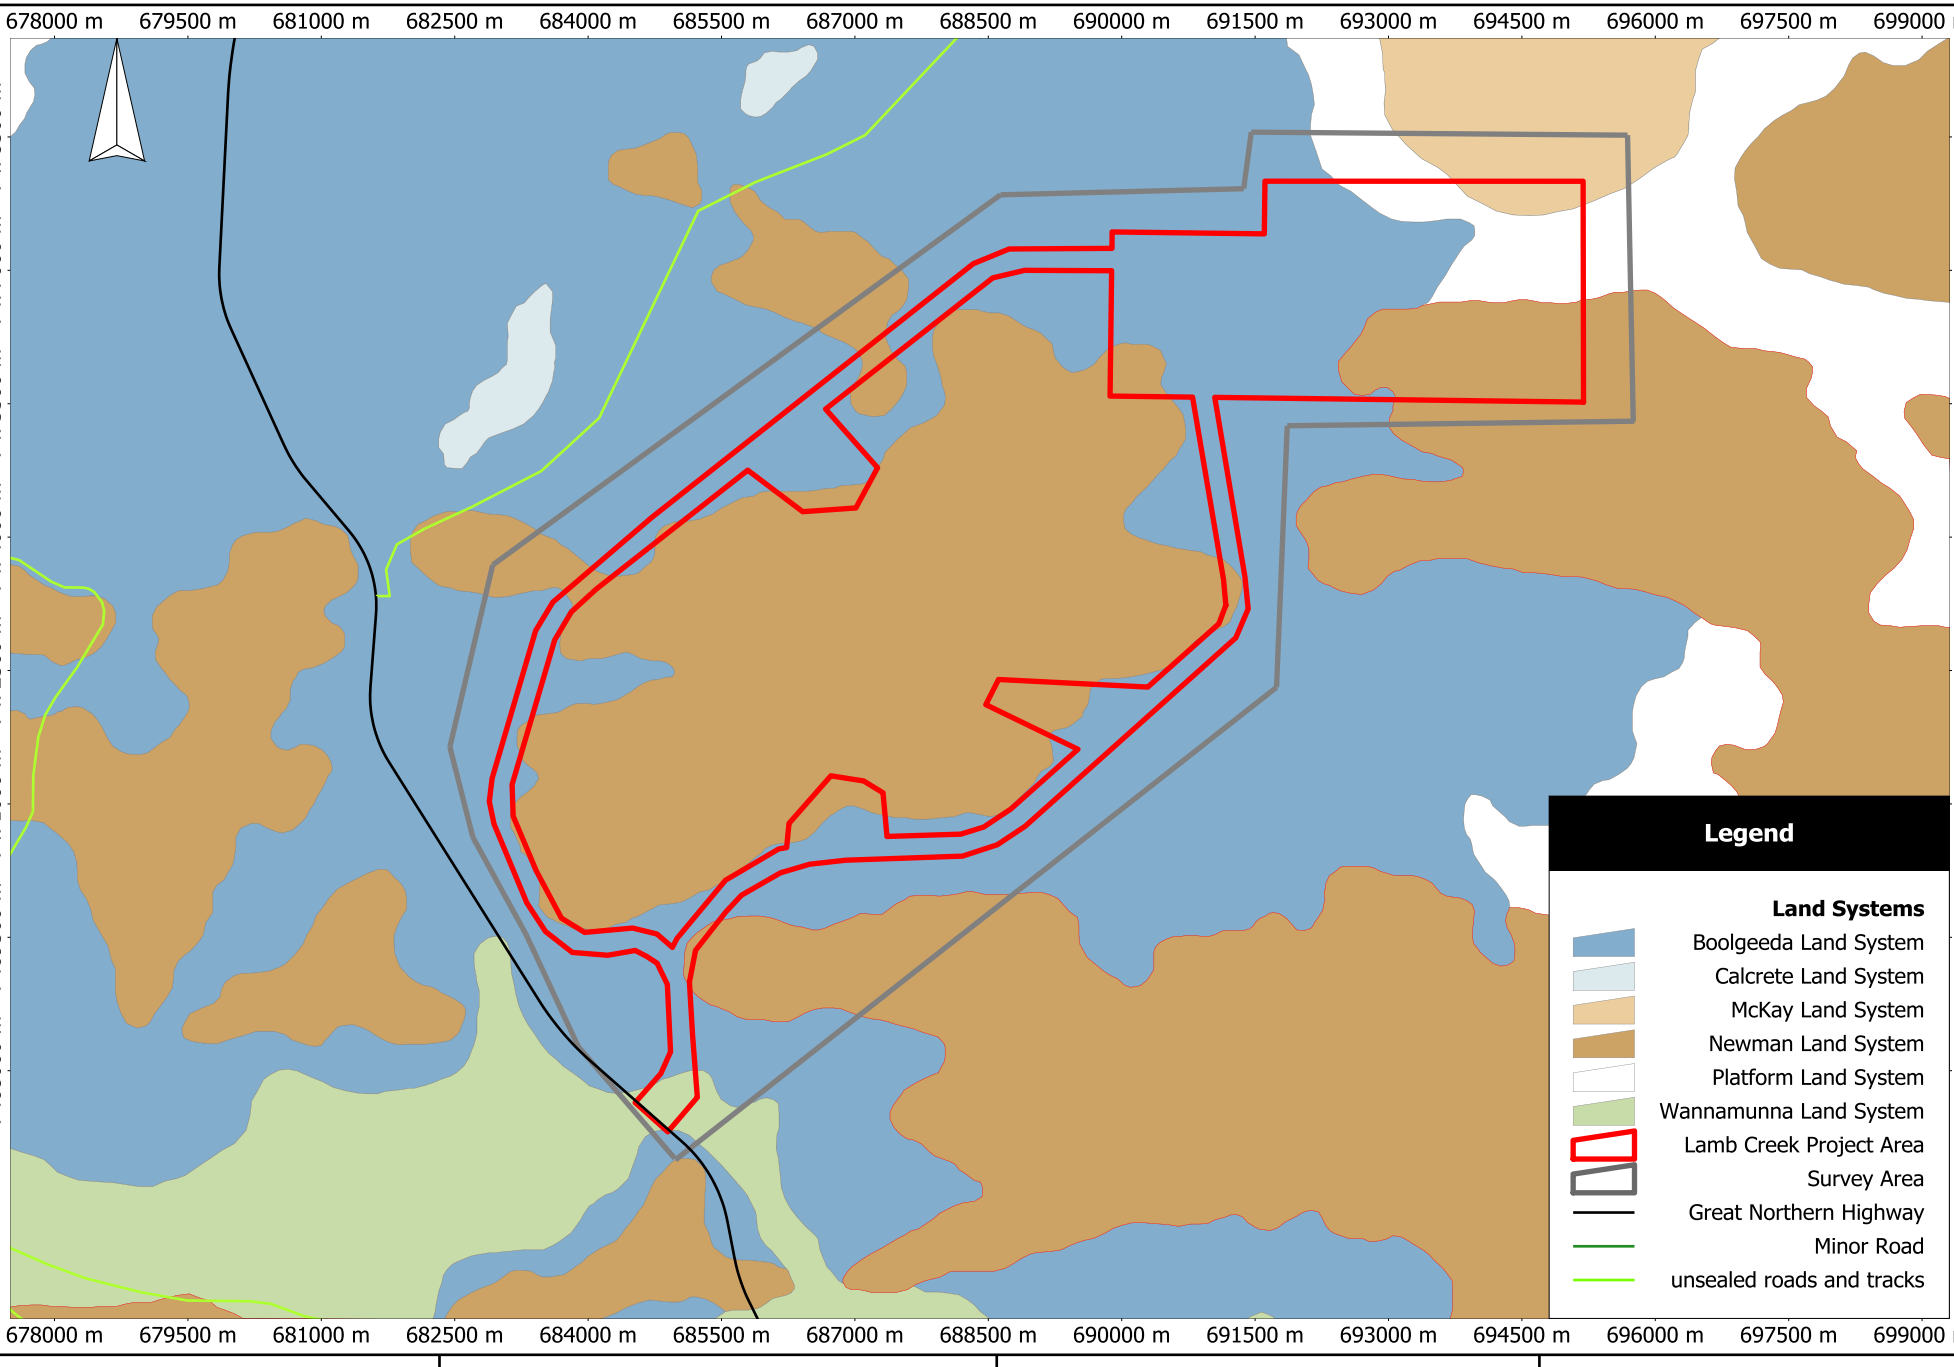
The Hamersley subregion contains calcrete deposits that are refugia and centres of endemism for troglofauna; however the current knowledge of troglofaunal diversity and endemism is preliminary. Several features in the Hamersley subregion serve as refugia. Gorges in the Hamersley Ranges that have permanent water and are protected from fire harbour humidophiles and fire intolerant species. Mountain tops in the Hamersley Ranges provide refuge from fire and support a diversity of restricted flora (Kendrick 2002).

2.3.6. LAND SYSTEMS

The project area covers several land systems within the Hamersley subregion (Figure 5, Table 2), as described by Van Vreeswyk et al. (2004). The approximate area size of each land system located on the project area can be found in Table 2.

Table 2: Land systems on the project area

Land System	Vegetation Description (Van Vreeswyk *et al.* 2004)	Area in the Pilbara (km^2)	Area on Project Area (km^2)	Precent of the land system that occurs within project area
Boolgeeda	Stony lower slopes, level stony plains and narrow sub-parallel drainage floors, relief up to 20 m. A common system in shallow valleys below hill systems such as Newman and Rocklea	7,748	11.584	0.149%
McKay	Hills, ridges, plateaux remnants and minor breakaways of sedimentary and meta sedimentary rocks supporting hard spinifex grasslands, relief up to 100 m	4,202	0.440	0.01%
Newman	Rugged high mountains, ridges and plateaux with near vertical escarpments of jaspilite, chert and shale	14,580	2.77	0.018%
Platform	Erosional surfaces formed by partial dissection of the old tertiary surface; gently inclined upper plains with extensive marginal dissection zones with gently inclined to steep slopes. Floors incised up to 30m with steep stable marginal slopes becoming wider downslope	1,570	1.98	0.12%
Wannamunna	Depositional surfaces, level hardpan washplains subject to overland sheet flow. Broad internal drainage flats receiving run-on from adjacent hardpan surfaces; rare channelled tracts but moistly no organised through drainage. Relief up to 5m	577	0.27	0.04%



Rapallo

Original size: A4 Scale: 1:85,000
Datum MGA94(50)

Process Minerals International

Figure 5

Lamb Creek Land Systems

2.3.7. REGIONAL VEGETATION

The vegetation within the study area is governed by geological, topographical, and edaphic influences of the Fortescue Botanical District (Beard 1990). This district consists predominantly of tree and shrub steppe communities with *Eucalyptus* trees, *Acacia* shrubs and grasses including *Triodia pungens* and *T. wiseana* (Beard 1975). Mulga (*Acacia aneura* and related taxa) occurs in valleys and short-grass plains may be present on alluvial soils (Beard 1990). Communities of *Eucalyptus leucophloia* over *Triodia* species occur on the skeletal soils of the ranges (Kendrick 2002). The other major influence on the flora and vegetation in the Pilbara Region is the heavy rains that occur during and immediately following cyclonic events. Cyclones develop off the north-west coast and often cross the coastline between Karratha and Port Headland and then travel inland over the Fortescue Valley system towards Newman. Vegetation was mapped by Rapallo (2012) in a Level 2 flora and vegetation survey.

2.3.8. LAND USE

Dominant land use within the Hamersley subregion is grazing. Land is classified (in order of spatial dominance) as unallocated crown land and crown reserves, native pastures, conservation, mining and urban (Kendrick 2002).The project area is located in the East Pilbara Region which has a total population of 10,500 people. The major industries in the East Pilbara Region are mining, pastoral and tourism (URS Australia Pty Ltd 2011) . The Shire of East Pilbara contains numerous Aboriginal communities; the largest are Jigalong, Punmu and Parngurr. Aboriginal communities are also located in Nullagine (Irrungadji Community) and Marble Bar (Pipunya and Goodabinya Communities).

2.3.9. RESERVES AND ENVIRONMENTALLY SENSITIVE AREAS

Environmentally sensitive areas (ESAs) are protected under the *Environmental Protection (Clearing of Native Vegetation) Regulation 2004* and are selected for their environmental values at state or national levels.

The project area does not overlay any ESAs as described by the *Environmental Protection (Clearing of Native Vegetation) Regulation 2004* or Priority Ecological Communities (PECs) as defined by DEC. According to the DEC's Native Vegetation Map Viewer, there are no ESAs within five kilometers of the project area. The nearest PEC buffer is located over 6 km south-west of where the proposed haul road will intersect with the Great Northern Highway. That PEC is described as 'Coolibah – Lignum Flats'.

Karijini National Park is located to the west of the project area, approximately 18 km west of the intersection of the proposed haul road and the Great Northern Highway. Mungaroona Range Nature Reserve is approximately 100 km northwest of the project area.

2.4. LEGISLATION AND SURVEY GUIDANCE

The conservation status of flora and fauna species is assessed under Commonwealth and State Acts; the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* and the Western Australian *Wildlife Conservation Act 1950.* In Western Australia the Department of Environment and Conservation (DEC) can also list fauna species under a Priority listing.

In addition to the conservation status of fauna the Environment Protection Authority (EPA) has produced a series of guidance statements to aid in assessing the environmental impacts of developments in Western Australia.

2.4.1. ENVIRONMENTAL PROTECTION AND BIODIVERSITY ACT (EPBC ACT) 1999

At a Federal level the *EPBC Act* contains a list of fauna species that are considered Critically Endangered, Endangered, Vulnerable, Conservation Dependent, Extinct or Extinct in the Wild (Appendix I). The conservation categories and EPBC listed species follow the recommendations of the International Union for the Conservation of Nature and Natural Resources (IUCN, 2008).

The *EPBC Act* also has lists of migratory species that are recognised under international treaties such as the China Australia Migratory Bird Agreement (CAMBA), the Japan Australia Migratory Bird Agreement (JAMBA) and the Bonn Convention (The Convention on the Conservation of Migratory Species of Wild Animals). The list of migratory species under the *EPBC Act* has been revised to include listed species only, thus excluding family listings.

2.4.2. WILDLIFE CONSERVATION ACT 1950

In Western Australia, all native fauna is protected under the *Wildlife Conservation Act 1950* and cannot be collected, kept or culled without the appropriate permits. The *Wildlife Conservation Act 1950* uses a set of Schedules to classify the level of protection given to fauna species.

Fauna species included under conservation acts and/or agreements are formally recognised as of conservation significance under state or federal legislation. Those species listed in JAMBA are also protected under Schedule 3 of the Western Australian *Wildlife Conservation Act 1950*.

The DEC regularly reviews and revises the schedule of threatened fauna listings in Western Australia.

2.4.3. DEC PRIORITY LISTINGS

In Western Australia, the DEC has produced a supplementary list of Priority fauna (Appendix I). These are species that are not considered Threatened under the Western Australian *Wildlife Conservation Act 1950*, but for which the DEC feels there is cause for concern. Thus these species are recognised as having conservation significance and are given consideration when developments are proposed within their distributions and known habitats.

At the State level the recommendations of listed species by the IUCN are not stringently adhered to. Hence a species may be listed as a Priority by the DEC and not listed by the IUCN and vice versa.

In addition to the Priority listings the DEC will recognise the conservation significance of species included in publications such as such as Garnett and Crowley (2000) and Cogger *et al*., (1993) and through interpretation of distribution information. In the latter a species may be considered significant, although this level of significance has no legislative or published recognition, if;

- the species is occurring at the limit of their distribution;
- the species that have a very restricted range e.g. Short Range Endemics; or,

- the species occurs as a breeding colony e.g. some waterbirds.

2.4.4. EPA GUIDANCE STATEMENTS

The Environmental Protection Authority (EPA) Guidance Statement; *Terrestrial Fauna Surveys for Environmental Impact Assessment in Western Australian No 56* (2004) and EPA Position Statement 3; *Terrestrial Biological Surveys as an Element of Biodiversity Protection* (2002) outlines the minimal expectations of the EPA in regards to terrestrial fauna considerations in an environmental impact assessment. The guidance statement provides a number of general recommendations for consideration before a survey:

- level of survey required;
- design and intensity factors;
- survey limitations; and,
- reporting of data.

For the Pilbara IBRA region – Group 2, the guidance statement states that any proposed project with footprint greater than 50 hectares is considered to generate a high scale impact and requires a Level 2 Fauna Survey to adequately assess potential impacts (EPA, 2004). The EPA's Technical Guide; *Terrestrial Vertebrate Fauna Surveys for Environmental Impact Assessment* (Environmental Protection Authority 2004) provides the standards and protocols for undertaking fauna surveys (Level 1 and Level 2) with techniques and methods specific to the different bio-regions of Western Australia.

The following statements outline the minimal expectations of the EPA in regards to consideration of SRE fauna in an environmental impact assessment.

- EPA Position Statement No. 3: Terrestrial Biological Surveys as an Element of Biodiversity Protection (EPA 2002).
- EPA Guidance Statement No. 20: Sampling of Short Range Endemic Invertebrate Fauna for Environmental Impact Assessment in Western Australia (EPA 2009).

Guidance Statement No. 20 addresses the general standards required for SRE surveys and to develop a common framework by which they should be carried out. It also sets out the expectations in respect of the quality and quantity of data collected during SRE surveys, and how this data should be analysed and reported.

Importantly, the Guidance Statement recognises and discusses limitations on current knowledge in respect to SRE fauna. In particular, the limitations encountered after recording rare and cryptic taxa are discussed and the low probability of further survey success acknowledged. If such specimens are restricted to impact zones, risked based analysis based using habitat as a surrogate for distribution will be considered (EPA 2009).

2.4.5. SHORT RANGE ENDEMISM

Harvey (2002) reviewed the occurrence of short range endemism in Australian invertebrate fauna. The main criterion nominated for inclusion as a SRE species was that the species had a naturally small range of less than 10,000 square kilometres. He identified a series of major groups of

invertebrates as having a very high proportion of species that satisfied characterisation as SRE's. Harvey (2002) found that those species possessed a series of ecological and life-history traits including:

- Poor powers of dispersal.
- Confinement to discontinuous habitats.
- Usually highly seasonal; only active during cooler, wetter periods.
- Low levels of fecundity.

Based on these traits and after reviewing the literature in Australia, Harvey (2002) listed a series of invertebrate groups that either showed high levels of short range endemism or were likely to possess SRE species after further taxonomic studies. The list of groups includes:

- Mygalomorph Spiders
- Scorpions
- Pseudoscorpions
- Millipedes
- Snails

These taxa are of particular risk of possessing SRE species and survey methodologies should include specific systems that aim to record members of each taxon.

The EPA Guidance Statement No. 20 (EPA 2009) indicates that the optimal time for conducting surveys in the Pilbara is in the cyclone season (November to April), when there is sufficient rainfall to stimulate enhanced activity in otherwise cryptic groups such as *Quistrachia* (land snails) and male mygalomorph spiders. The SRE survey of the survey area was completed at the end of this period, with good rainfall preceding the survey.

2.4.6. NORTHERN QUOLL SURVEY GUIDELINES

The Department of Sustainability, Environment Water, Populations and Communities (SEWPaC,) has released survey and referral guidelines for Northern Quoll (*Dasyurus hallucatus*) (Department of Sustainability, Environment, Water, Population and Communities 2011). The guidelines include maps of known and potential distribution, survey methods, and guidelines for determining whether projects in potential Northern Quoll habitat should be referred to SEWPaC under the *Environment Biodiversity and Conservation Act 1999.*

For the purposes of assessment under the *EPBC Act*, SEWPaC (2011) recommends that surveys for Northern Quoll involve an initial reconnaissance survey which aims to identify the need for further investigations through a targeted survey. These should be conducted by a suitably qualified person with demonstrated skill in mammal surveys, maximise the chance of detecting the species, and account for uncertainty and error (such as false presences and absences).

A reconnaissance survey can be conducted at any time of the year but should be undertaken in the early planning stages of the project. The reconnaissance survey should assess the suitability of habitat for northern quolls, both for denning / shelter and dispersal and foraging purposes. Suitable habitat should be mapped during this survey and habitat areas calculated. Data collected should describe the

habitat quality including information on vegetation, microhabitat, fire history, presence of introduced predators, grazing history and landscape condition. A reconnaissance survey may investigate the presence or potential presence of the northern quoll by using non-invasive techniques such as active searching for scats and latrine sites, motion sensitive cameras, hair tubes or spotlighting where appropriate.

A targeted survey is recommended for any proposal occurring within the modelled distribution of the species and where the reconnaissance survey identifies the presence of quolls and / or habitat critical to the survival of northern quoll. The objective of the targeted survey is to determine the relative abundance and distribution of Northern Quolls likely to be impacted by the proposed development. The survey protocol should be designed so that the total population of Northern Quolls in the impact area can be calculated. A targeted survey should be undertaken before development and during the months of May, June, July or August (primarily to avoid any disturbance during the reproductive period) and include proposed impact areas as well as adjacent suitable habitat.

Records of the species exist within 50 kilometres of the project area. In addition, potential suitable habitat for the species exists on the project area. As a result, PMI has proceeded with undertaking a targeted Northern Quoll survey in conjunction with its Level 2 Fauna Survey.

3. METHODS

The survey was divided into four sections:

- a Reconnaissance Survey (Section 3.5);
- a systematic surveys for vertebrate fauna (Section 3.6):
- a systematic surveys for SRE's (Section 3.7) ; and,
- a targeted survey for Northern Quolls (Section 3.8).

3.1. SCIENTIFIC LICENCE

This survey was licensed under the Western Australian Wildlife Conservation Act 1950 Regulation 17 "Licence to Take Fauna for Scientific Purposes" licence number: SF008562 (Appendix II).

3.2. VOUCHERING

Rapallo will voucher specimens if:

- it can't be identified in the field (typically difficult species such as *Ramphotyphlops*);
- it is a species of taxonomic confusion/interest; or
- it is possibly an un-described species.

Rapallo sought advice from the Western Australian Museum (WAM) prior to the field survey in regards of fauna that may be required for vouchering. WAM advised Rapallo that they were not currently in need of vouchered specimens from the survey region.

3.3. PERSONNEL

Table 3 outlines the personnel that were involved in the field survey and the preparation of this report.

Table 3 Personnel involved in this survey

Shaun Stevens	Laborer	•		

3.4. DESKTOP SURVEY

Prior to the field survey, database searches were completed to determine if species of conservation significance had either been recorded within the survey area or had the potential to occur within habitats found on the project area. Table 4 describes which databases were used for information regarding species of conservation significance. Results of the database searches are presented in Appendices 4-8. An in-depth description of all potential conservation significant species found on the survey area can be found in section 6.

Table 4 Database Searches undertaken for the Lamb Creek survey area.

Search	Latitude	Longitude	Buffer (kilometres)	Comments
DEC Threatened Fauna Database (2012a)	22°50' 18" S	118°50' 17" E	50	Point Search
DEC Threatened Ecological Communities Database (2012b)	22°50' 18" S	118°50' 17" E	50	Point Search
SEWPaC Environmental Reporting Tool (2012)	22°46'01"S 22°53'52"S 22°53'56"S 22°45'57"S	118°42'17.89"E 118°42'17.89"E 118°56'4.52"E 118°55'55.96"E	10	Area Search
NatureMap(2012c)	22°26' 29" S	118°18' 53" E	40	Point Search
Birds Australia BirdData (Birdlife Australia 2012)	22°50'19"S	118°50'16"E	40	Point Search
WAM Mollusc Database (2012a)	22°50' 18" S	118°50' 17" E	50	Point Search
WAM Terrestrial SRE Database (2012b)	22°50' 18" S	118°50' 17" E	50	Point Search

In addition to the above database sources, data from previous fauna surveys in the region were reviewed. Table 5 details which reports were used for the regional literature review.

Table 5 Regional literature sources

Report	Author	Distance from Lamb Creek (km)
Fauna survey of the proposed Hope Downs 4 mining area.	Ninox Wildlife Consulting, (2009)	30km SE of Lamb Creek
Yandicoogina Junction South West and Oxbow Fauna Survey.	Biota Environmental Sciences, (2010)	41km NE of Lamb Creek.
Fauna survey of proposed Iron Ore Mine, Cloud Break.	Bamford Consulting Ecologists, (2005)	80km NE of Lamb Creek
Fauna Habitats and Fauna Assemblage of the Proposed FMG Stage B Rail Corridor and Mindy Mindy, Christmas Creek, Mt Lewin and Mt Nicholas Mine Areas.	Biota Environmental Sciences, (2005)	Mindy Mindy approximately 80km E of Lamb Creek.

3.5. RECONNAISSANCE SURVEY

Prior to the deployment of field teams to the survey area, aerial photographs and land system shape files were analysed to identify areas of interest across the survey area.

A two-day reconnaissance survey, via helicopter, of the survey area was conducted on the 19-20 March 2012 by staff from Rapallo Environmental. The aims of this survey were to identify habitat types, assess the road access to the survey area and ground truth areas of interest identified from GIS maps and aerial photography. A total of 5 unique habitat types were identified during the reconnaissance survey as being capable of supporting different assemblages of vertebrate fauna.

The reconnaissance survey team also deployed motion detecting cameras which were placed in caves and under rock overhangs at the bases of mesas and banded iron stone (BIF) outcrops. A total of 10 motion detecting cameras were deployed during the reconnaissance survey in the locations shown in Figure 6. These cameras were retrieved after approximately two weeks. Videos were downloaded and examined for fauna recordings.

3.6. VERTEBRATE FAUNA SURVEY

3.6.1. SYSTEMATIC TRAPPING

Rapallo Environmental used a nested pitfall trap grid to survey the terrestrial fauna of the survey area. Each site consisted of:

- twenty Elliot traps;
- ten funnel traps;
- six regular bucket pitfall traps; and
- six bucket pitfall traps with narrowed entrances.

The trap configuration is illustrated in Figure 7.

Ten trap sites were deployed, two sites for each major habitat.

Each pitfall trap had a white polystyrene tray to provide shelter, and a moist sponge to prevent desiccation for any captures.

Funnel traps were covered with a sheet of foil insulation to shelter any captives from extreme daytime temperatures.

Table 6 shows the total number of trap nights by habitat type in the survey area fauna survey. Habitat codes are described in Section 4.2.

Table 6 Trap night summary by habitat and trap type for the Lamb Creek L2 Fauna Survey

Habitat Code	Pitfall Traps	Elliot Traps	Funnel Traps	Total Nights
SHET	168	280	140	588
MEAT	168	280	140	588
STABM	168	280	140	588
FLAGMA	180	300	150	630
SATOM	168	280	140	588
Total	**852**	**1420**	**710**	**2982**

Vertebrate fauna was identified and released each morning as the trap lines were cleared. If specimens could not be immediately identified they were placed in a calico bag and identified at the field camp. After identification the specimens were released near the site of capture when conditions permitted (i.e. nocturnal fauna were not released during midday heat).

The following data were recorded for each capture:

- trap site and trap number;
- species;
- number of animals;
- sex and reproductive condition; and
- age class (juvenile/adult).

3.6.2. BIRD SURVEYS

Bird assemblages were assessed and compiled using a combination of trap site specific surveys and opportunistic observations.

Two hectare bird surveys, following Birds Australia guidelines, were completed each day between 6am and 9am when bird activity was peak and cryptic species were most detectable.

Records from each site were supplemented with opportunistic records. These records were collected at trap sites, during travel between trap sites and during day time forage surveys. Birds were identified by direct observation or by auditory survey. Road kill was examined whenever possible and species recorded where possible.

3.6.3. BAT SURVEYS

Bat surveys were conducted on the survey area using SM2BAT+ and ANABAT SD1 ultrasonic recorders. Both devices were placed in suitable locations on the survey area. Suitable locations included areas with caves, water or mature woodlands with hollow bearing trees.

Data collected on the ANABAT device was analysed by Dr. Kyle Armstrong of Specialised Zoological.

In addition, Rapallo deployed Harp Traps along potential fly-ways and next to water bodies. Traps were set prior to sun set and checked at the conclusion of spotlight activities each night. Harp traps were closed after being checked.

3.6.4. SPOTLIGHTING

Spotlight surveys were undertaken in each of the habitat types recorded on the survey area. In order to not disturb nocturnal fauna, spotlight surveys were not conducted at the systematic trap sites. Spotlight surveys were run over 30 minutes and were undertaken by a team of four ecologists.

Any terrestrial fauna or potential SRE's recorded during the searches were recorded using GPS locations. Habitat and time were noted if species of conservation significance were recorded during the survey.

3.6.5. HAND FORAGING AND HABITAT ASSESSMENT TRANSECTS

Transects were walked across the survey area to supplement data collected during other survey activities and to characterise and demarcate habitats. Additionally, they were used to survey habitats considered suitable for potential SREs.

Transects were plotted using data collected during the Reconnaissance Survey. They were designed to intercept several habitats at a time.

Each transect was walked by two ecologists. Each time the habitat type noticeably changed, the following data were collected to characterise the new habitat:

- GPS reading;
- soil type and characteristics;

- geology;
- landform;
- litter depth;
- evidence of disturbance (i.e. fire, grazing);
- understorey vegetation density and composition; midstorey vegetation density; canopy density and composition; and
- suitability for species of conservation significance.

During each transect, Rapallo staff would undertake foraging activities including lifting bark and old tin, rolling old logs and raking through sand and leaf litter.

The following data would be collected each time vertebrate fauna or potential SREs were encountered:

- GPS reading;
- species, sex, maturity; and
- habitat type.

If potential SREs were encountered, they were vouchered following guidelines released by the WAM (WAM 2008). Evidence of species of conservation significance was photographed if encountered.

3.6.6. MOTION DETECTING CAMERAS

Motion detecting cameras (MDCs) were deployed across the survey area in habitats with potential to support Northern Quolls. A total of 10 MDCs were deployed during the reconnaissance survey, these cameras were left for a period of two weeks before being collected and redeployed at an additional seven sites on the survey area for 6 days. Scoutguard motion detecting cameras were used for this survey. Each camera was programmed to record for 30 seconds at one minute intervals with detection sensitivity set to high.

Each camera was securely fastened at each location and focused onto a bait station. The bait used consisted of tinned cat food with high sardine content.

Data recorded from the MDCs has been included in the overall species list for the survey.

3.6.7. OPPORTUNISTIC RECORDS

While traversing the survey area, records were taken of all potential SRE invertebrates and their burrows. A brief habitat description was recorded, as well as GPS coordinates and site photos.

3.7. SRE SURVEY

Surveys for potential SRE specimens were in conjunction with sections 3.3.1, 3.6.2 and 3.6.5. Additional survey techniques, designed specifically for the detection of SRE's are described in section 3.7.1.

A total of 14 sites were foraged for SRE taxa (Figure 12). Litter samples were collected for later processing. At each forage site, SRE taxa were searched for by turning rocks, raking litter, raking under hummocks of *Triodia*, lifting bark and turning old logs. Clumps of vinous *Fiscus* sp. were targeted, when present, for potential SRE gastropods.

3.7.1. LEAF LITTER COLLECTION

Leaf litter was collected from 14 sites (Figure 12). The species of tree or shrub from under which leaf litter was collected was recorded. These sites were divided into the following landform types:

- south facing slopes/hillsides;
- creek lines;
- outcrops; and
- plains.

Leaf litter was collected in a twenty litre bucket and sifted using 1.5 millimetre sieves. The final mixture of organic matter was taken back to the Rapallo Environmental laboratory and run through either Tullgren Funnels or Winkler traps. Sifted samples were run for approximately 48 hours.

Specimens collected from the Tullgren Funnels and Winkler traps were sorted under a microscope at the Rapallo Environmental laboratory. Potential SRE taxa were separated from the bulk samples and vouchered for taxonomic identification according to WAM (2011) guidelines.

3.7.2. CATEGORIES OF SHORT-RANGE ENDEMISM

Currently, there is no accepted system to determine the likelihood that a species is an SRE. For the purposes of this report we have adopted the three-tier SRE likelihood system developed by (Phoenix Environmental Sciences 2012, Appendix 10), wherein species are categorised based on the different probabilities of short-range endemism: 'confirmed', 'likely' or 'potential' SRE (Table 2-1). These categories are dynamic and can change as knowledge of SRE status is updated.

Although the different categories of SRE-likelihood may help to set conservation priorities, SRE taxa of all categories should be assessed on their merit, in order to determine appropriate conservation measures that adhere to the Precautionary Principle within environmental impact assessments. That is, "where there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason to postpone measures to prevent environmental degradation" (Environmental Protection Authority 2002).

3.7.3. TAXONOMIC IDENTIFICATION

All potential SRE taxa were sent off to taxonomic experts for identification before being vouchered in the WAM collection. The following taxonomists were involved with specimen identification:

- Dr Volker Framenau (Phoenix) Millipedes, centipedes, pseudoscorpions, spiders
- Dr Simon Judd (Phoenix) Slaters
- Dr Corey Whisson (WAM) Land snails
- Dr Erich Volschenk (Scorpion ID) Scorpions

3.8. TARGETED NORTHERN QUOLL SURVEY

A targeted survey for the Northern Quoll was conducted simultaneously with the fauna survey. The targeted Northern Quoll survey was designed following methods described in Northern Quoll Survey Guidelines (SEWPaC 2011). Potential trap sites were identified during the Reconnaissance Survey.

Six sites were selected for the targeted Northern Quoll survey. These sites consisted of deeply dissected gorges and along the face of rocky escarpments. Each trap site consisted of 10 cage traps deployed approximately 100 m apart. The distance between traps was extended slightly where suitable habitat was not continuous. Locations were recorded using a GPS for each cage trap.

Traps were set in locations that provided shade and were covered with a sheet of foil insulation or a hessian sack to shelter any captive animals from weather such as wind, rain and sunlight. Traps were baited using a mixture of peanut butter, rolled oats, honey and tinned sardines and were rebaited every second day.

Traps were set out for five nights on each line. Traps were cleared before 9 am each day. Each bait ball was replaced after two nights if no captures were recorded in a trap. Traps were moved if ants were active in the trapping area.

The following data was recorded if a capture occurred:

- date, trap number
- sex
- weight
- foot length
- head length and width

The reproductive status of each quoll was determined using diagnostics outlined in Oakwood (2000).

Following measurement all quolls were individually marked with a micro-chip inserted subcutaneously between the shoulder blades. This enabled swift identification of recaptured individuals without the need of handling them a second time.

A small (2 mm^2) piece of ear tissue was removed and stored in 100% ethanol for DNA analysis.

3.9. BIODIVERSITY ASSESSMENT AND SPECIES RICHNESS

3.9.1. SPECIES ACCUMULATION CURVE

Individual based rarefaction curves (species accumulation curves) were produced for each vertebrate fauna group. They were derived from data collected at systematic trap sites only.

Rarefaction curves enable evaluation of the sampling effort and can be used to predict the potential number of species found on a survey (Colwell 2000). EstimateS V8.02 was used to generate the species accumulation curves.

Curves were constructed by plotting individuals caught along the x-axis against Coleman rarefaction estimates along the y-axis. The data was sampled 10,000 times.

3.9.2. SPECIES RICHNESS

Data collected during systematic and standardised fauna surveys can be analysed by a series of models to determine site specific species richness. Such calculations are useful for determining the biodiversity of a survey area and the expected number of species (species richness). Inference derived from biodiversity calculations is constrained if there are limited regional calculations to compare the results to.

Species richness estimators are often influenced by sampling issues such as low sample size, small number of species dominating data sets or a high number of species recorded only once or twice. These issues are most easily overcome by using a combination of appropriate non-parametric species richness models and comparing the outputs against the Cole-rarefaction used as the estimator of species richness in this report.

The following species richness estimators were used to assess the biodiversity of the Lamb Creek survey area:

- ACE Mean;
- ICE Mean;
- Chao Mean;
- Jacknife Mean.

Species richness estimators were calculated for each major vertebrate fauna group.

3.10. SURVEY LIMITATIONS AND CONSTRAINTS

An assessment of the limitation of the survey has been displayed in Table 7 in accordance with Guidance Statement No. 56 (Environmental Protection Authority 2004).

Table 7 Summary of limitations experienced during the Survey

Aspect	Constraint	Comment
Experience of Consultants	No	All members of the survey team have experience in undertaking fauna surveys. At least one member of any field team group was extremely experienced with surveying for and identifying Pilbara fauna.
Scope	No	Scope and intensity of survey were suitable to achieve the survey aims.
Proportion of fauna identified, recorded and/or collected	No	High fauna abundance and diversity was recorded during the survey.
Information sources e.g. previously available information (whether historic or recent) vs. new data.	No	Extensive surveying has been undertaken in the Pilbara region including several surveys within 50 kilometers of the survey area within the previous five years.

Aspect	Constraint	Comment
Proportion of task achieved and further work may be required	No	All habitat areas were well surveyed and the timing was optimal for presence of most native species.
Timing, weather, seasons. Cycle	No	Only a single season of surveying was undertaken. This survey was completed at the end of the wet season. Warm days and availability of water would have positively affected the activity of most species.
Disturbances that affected the survey	Yes, Partial	Isolated storms during the survey period may have affected trap numbers on several nights.
Survey Intensity	No	Survey intensity was appropriate for the survey areas size and proportion of habitats.
Completeness of Survey	No	All landsystems and habitats in the survey area were adequately surveyed.
Resources	No	The survey was adequately resourced.
Access Problems and Remoteness	No	All areas were accessible by 4WD or quad bike.
Availability of contextual information within the region	No	There are numerous studies, completed within the last five years, on habitats found within the survey area.

3.11. SOURCES OF INFORMATION

The following literature sources have been used to determine nomenclature, taxonomy and fauna distribution patterns used in this report:

- **Mammals:** Van Dyck and Strahan (2008), Menkhorst and Knight (2011);
- **Bats:** Churchill (2008);
- **Reptiles:** Cogger (2000); Storr et al.(2002); Storr et al.(1999); Wilson and Swan (2008);
- **Amphibians:** Tyler et al. (2000), Tyler and Doughty (2009);
- **Birds:** Christidis and Boles (2008); Barrett (2003); Johnstone and Storr (1998 and 2004); Benshemesh (2000); Marchant and Higgins (1993);Garnett and Crowley (2000); Higgins (1999).

Nomenclature for herpetofauna and mammals follows that of the Western Australian Museum Reptile and Frog Checklist and Mammal Checklist (Western Australian Museum 2012c) except where indicated otherwise. Nomenclature for birds follow Christidis and Boles (2008), except where indicated otherwise.

4. RESULTS

4.1. DESKTOP SURVEY RESULTS

Desktop searches of the DEC Threatened and Priority Fauna database, SEWPaC's Protected Matters database, NatureMap, Birddata and the Western Australian Museum are detailed in Appendices 4-8. Table 8 details the results of these database searches.

A search of the WAM databases identified 18 SRE taxa that have the potential to occur in the survey area.

Data from regional literature sources has been collated and presented in Appendix IX.

A total of 16 species of conservation significance have been recorded within 50 kilometres of the survey area. Based on an analysis of regional literature sources and data collected on habitats form this survey, Rapallo anticipates that 11 of these species could occur on the project area.

4.2. HABITATS

Six habitats were identified on the project area as potentially being able to support varying faunal assemblages (Table 9). All habitats generally conformed to the vegetation communities described by Beard (1990) and land systems described by Van Vreeswyk *et al* (2004).

Table 8 List of Species of Conservation Significance that have been recorded within 50 kilometres of the Project Area

Species	Common Name	Conservation Category		Section	Likelihood of Occurrence
		State	Federal		
Pezoporus occidentalis	**Night Parrot**	Schedule 1 - Species rare or likely to become extinct	Critically Endangered	6.1	**LOW** - Lack of suitable habitat on the project area
Dasyurus hallucatus	**Northern Quoll**	Schedule 1 - Species rare or likely to become extinct	Endangered	6.2	**HIGH** – Suitable habitat occurs on the project area, one individual recorded in the survey area (Figure 8).
Rhinonicteris aurantius	**Orange Leaf-nosed Bat** (Pilbara Population)	Schedule 1 - Species rare or likely to become extinct	Vulnerable	6.3	**MEDIUM –** Suitable habitat near ore body and records from Rio Tinto Area C
Liasis olivaceus barroni	**Pilbara Olive Python**	Schedule 1 - Species rare or likely to become extinct	Vulnerable	6.4	**HIGH** – Suitable habitat occurs on the project area, one individual recorded in the project area (Figure 8).
Falco peregrinus	**Peregrine Falcon**	Schedule 4 - Other specially protected fauna	Not Listed	6.5	**HIGH** – Suitable habitat occurs in the north-east section project area
Ramphotyphlops ganei	**Blind Snake**	Priority 1 – Poorly known taxa	Not Listed	6.6	**MEDIUM** – May occur in moist gullies on the project area.
Psuedomys chapmani	**Western Pebble-mound Mouse**	Priority 4 - Taxa in need of monitoring	Not Listed	6.7	**HIGH** - Suitable habitat, several active Pebble-mounds recorded during survey (Figure 8).
Macroderma gigas	**Ghost Bat**	Priority 4 - Taxa in need of monitoring	Not Listed	6.8	**HIGH** – Suitable habitat present on project area and species was recorded during the survey (Figure 8).
Ardeotis australis	**Australian Bustard**	Priority 4 - Taxa in need of monitoring	Not Listed	6.9	**HIGH** - Suitable habitat occurs on the project area, species recorded during the survey

Species	Common Name	Conservation Category		Section	Likelihood of Occurrence
		State	Federal		
					(Figure 8).
Burhinus grallarius	**Bush Stone-curlew**	Priority 4 - Taxa in need of monitoring	Not Listed	6.10	**MEDIUM** - Suitable habitat occurs on the project area.
Falco hypoleucos	**Grey Falcon**	Priority 4 - Taxa in need of monitoring	Not Listed	6.11	**LOW** - Potential occasional visitor during irruptive events
Merops ornatus	**Rainbow Bee-eater**	Not Listed	Migratory - listed overfly/marine area	6.12	**HIGH** - Suitable habitat on the project area – recorded in one location on the project area during survey (Figure 8).
Ardea modesta	**Eastern Great Egret**	Not Listed	Migratory - wetland species	6.13	**LOW** - Lack of suitable habitat on the project area
Ardea ibis	**Cattle Egret**	Not Listed	Migratory - wetland species	6.14	**LOW** - Lack of suitable habitat on the project area
Charadrius veredus	**Oriental Plover**	Not Listed	Migratory - wetland species	6.15	**LOW** - Lack of suitable habitat on the project area
Apus pacificus	**Fork-tailed Swift**	Not Listed	Migratory - listed overfly/marine area	6.16	**HIGH** – Recorded at several locations during the survey (Figure 8).

Table 9 Habitats found on the project area

Habitat Name	Habitat Code	Land System	Habitat Description	Species of Conservation Significance that could use habitat
Acacia aptaneura over hummock grassland	SATOM	Boolgeeda, Newman	**Vegtation:** *Acacia aptaneura* and/or *Corymbia deserticola* low woodland over *Acacia elechantha* and mixed *Eremophila* species over *Triodia wiseana* very open hummock grassland **Geology, Soil, Landform:** Stony and loamy alluvial plains with occasional, very minor drainage channels	Australian Bustard, Bush Stone-curlew, Fork-tailed Swift, Rainbow Bee-eater,
Minor drainage with *Corymbia*, *Acacia*, *Gossypium* over *Triodia* hummock grassland	MEAT	Boolgeeda, Platform	**Vegtation:** *Corymbia hamersleyana* scattered low trees over *Gossypium robinsonii, Acacia elachantha* tall open shrubland over *Triodia wiseana* hummock grassland and *Eulalia aurea, Eragrostis eriopoda* very open tussock grassland. **Geology, Soil, Landform:** Sandy/stony alluvial drainage, well defined	Rainbow Bee-eater, Australian Bustard, Bush Stone-curlew, Fork-tailed Swift.
Eucalyptus leucophloia leucophloia woodland over mixed shrubs over *Triodia wiseana* grassland	SHET	Newman, Platform, McKay, Platform	**Vegtation:** *Eucalyptus leucophloia* subsp. *leucophloia*, low open woodland over mixed species (typically *Gossypium robinsonii*, *Acacia hilliana*, *Grevillea wickhamii*, *Keraudrenia nephrosperma*) scattered shrubs over *Triodia wiseana* hummock grassland. **Geology, Soil, Landform:** Plateaus, scree slopes, breakaways and minor drainage lines with exposed rock or stony soils	Western Pebble-mound Mouse, Ghost Bat, Pilbara Olive Python, Fork-tailed Swift, Rainbow Bee-eater.
Eucalyptus gamophylla woodland over hummock	STABM	Boolgeeda, Newman,	**Vegtation:** *Eucalyptus gamophylla* low open woodland over *Acacia elachantha* or *Acacia hilliana, Senna glutinosa* subsp. *pruinosa* open shrubland over *Triodia brizoides*,	Western Pebble-mound Mouse, Rainbow Bee-eater, Pilbara Olive Python, Fork-tailed Swift,

Habitat Name	Habitat Code	Land System	Habitat Description	Species of Conservation Significance that could use habitat
grassland			*Triodia wiseana* hummock grassland. **Geology, Soil, Landform:** Scree slopes and stony plains, adjacent to plateaus, with shallow stony soils and occasional, very minor drainage channels	Australian Bustard, Bush Stone-curlew.
Mulga groves	FLAGMA	Boolgeeda, Wannamunna	**Vegtation:** *Acacia aptaneura* low woodland over *Themeda triandra*, *Cymbopogon ambiguus*, *Chrysopogon fallax* open tussock grassland. **Geology, Soil, Landform:** Clay and loam floodplains	Australian Bustard, Rainbow Bee-eater, Bush Stone-curlew, Fork-tailed Swift.
Gorges	GORGE	Newman	**Vegtation:** Open woodland with *Ficus* sp., *Terminalia*, *Brachychiton* sp *Cymbopogon ambiguus*, *Eucalyptus leucophloia* subsp. *leucophloia* over mixed *Gossypium robinsonii*, *Grevillea wickhamii* and *Chrysopogon fallax*. **Geology, Soil, Landform:** Steep sided gorge incised into ironstone plateau	Pilbara Olive Python, Northern Quoll

Lamb Creek Species of Conservation Significance

4.3. VERTEBRATE FAUNA SURVEY SUMMARY

A total of 8087 fauna records were made during the fauna survey of the Lamb Creek survey area representing 152 species.

4.4. MAMMALS

4.4.1. ASSEMBLAGE

Mammalian fauna was underrepresented for the Lamb Creek survey area with 164 individuals representing 22 species being recorded in total. Of these captures, seven bat species were recorded. Regionally, 42 species have been recorded within a 100km radius of the Lamb Creek project area including six species of conservation significance.

Systematic captures of small mammals were dominated by small Dasyurids which accounted for 64% of all systematic captures on the survey area. The most common species of mammal recorded during the survey was the Stripe-faced Dunnart (*Sminthopsis macroura*) with 35 individuals recorded during systematic trapping and one record from spotlighting surveys. This species was recorded across all habitat types surveyed on the project area.

Mammalian diversity and abundance were highest in the FLAGMA habitat type with six species being recorded while mammal diversity and abundance were lowest in the MEAT habitat type.

A singul record of the Northern Quoll was made from a motion detecting camera during the survey. It was recorded on a camera located in a gorge off the project area but within the survey area, encircled by the proposed haul roads. The Northern Quoll is listed as Endangered under the *EPBC Act* and as Schedule 1 - Species that are rare or likely to become extinct under the *WCA Act*. A single Northern Quoll scat was also found underneath a rocky overhang (Figure 8). Further information on the species is provided in section 6.2.

Several Ghost Bats (*Macroderma gigas*) were also recorded in the survey, including two sighting on the project area (Figure 8). This species is listed by DEC as Priority 4 - Taxa in need of monitoring. Seven individuals were recorded from two caves including one cave situated within the proposed impact area and one in the survey area. Further information on this species is presented in section 6.8.

Evidence the Western Pebble-mound Mouse, listed by DEC as Priority 4 - Taxa in need of monitoring, was also recorded in the survey area. Numerous pebble mounds were recorded across the project area (Figure 8). Further information on this species is presented in section 6.6.

Acoustic analysis of bat calls was conducted by Dr Kyle Armstrong of Specialised Zoological, the results are listed below in Table 11.

Three introduced mammal species were recorded during the survey; domesticated cattle, house mice, and wild dogs/dingoes. The abundance of introduced mammal species was low. The house mice were recorded on the FLAGMA floodplains while Cattle observations were confined to drainage related habitats. Only secondary signs of wild dogs/dingoes (tracks) were recorded.

(Mean ± SD; range; [1] s,p: number of sequences measured, combined total number of pulses measured).

4.4.2. SPECIES ACCUMULATION CURVE AND SPECIES RICHNESS ESTIMATES

The species accumulation curve in Figure 9 indicates a flattening as it approaches the theoretical asymptote of 6.98 species. The geometry of the curve indicates few, if any trappable mammal species remain undetected in the habitat types surveyed in the survey area.

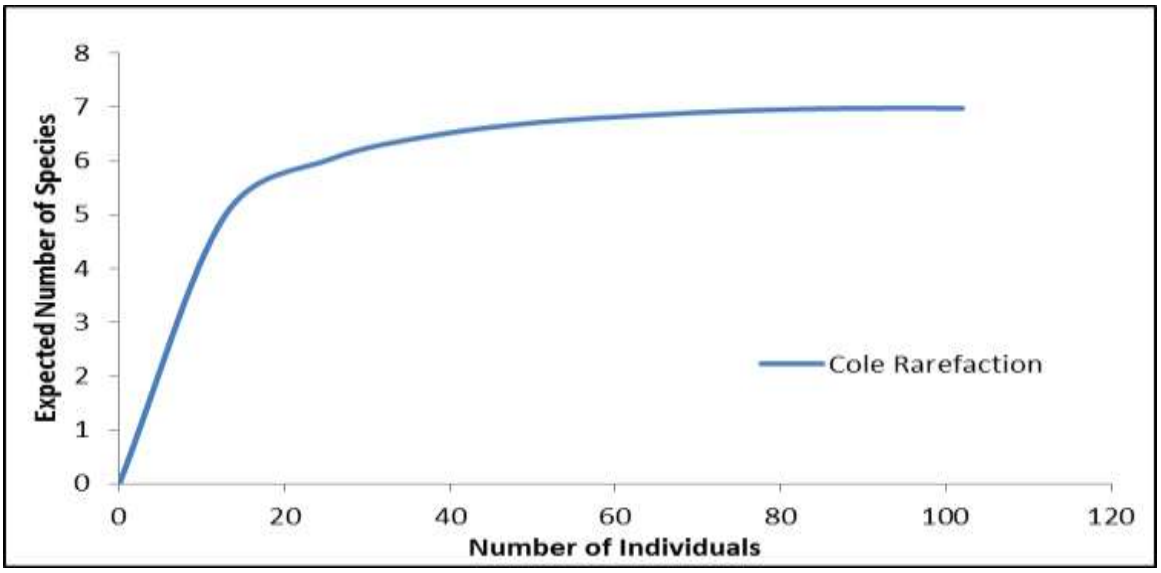

Figure 9 Individual based rarefaction curve for mammal species surveyed using systematic techniques

Based on the data collected during the survey and non-parametric analysis of species richness, between six and seven species could occur in the habitats in the survey area (Table 12).

Table 12 Observed and estimated non-volant mammal species richness

Type	Species Richness
Trapped Non-volant Mammal Species	7
ACE Mean	7
Jackknife1 Mean	7
ICE Mean	7
Chao1 Mean	7

4.5. REPTILES AND AMPHIBIANS

4.5.1. ASSEMBLAGE

Analysis of regional reports and databases indicate that 98 reptile species and five frog species could potentially occur within the project area at Lamb Creek.

Reptile records were high during the survey period with a total of 58 species observed from 782 records. The reptile assemblage comprised 13 species of Gecko, five species of Pygopods, 18 species of Skinks, six species of Agamids, seven Elapid species, seven Varanid species and two species of Pythons. Table 13 details the reptile species recorded by habitat during the survey.

The most common species recorded were *Ctenophorus caudicinctus* (n=108), with the majority of records coming from foraging and opportunistic recordings followed by *Lucasium stenodactylum* (n=107) which was predominantly found from systematic records. These species were recorded across all five habitat types that were systematically surveyed and foraged.

The majority of species records were from systematic surveys (n=449) with the remainder being found opportunistically (n=146) or while foraging/spotlighting (n=186).

Species richness for reptiles was generally consistent across the five habitat types surveyed. Reptile species richness was found to be highest in the MEAT (n=25) habitat type while reptile abundance was found to be highest across the SATOM habitat type (n=182). Reptile species richness was lowest on the STABM habitat type (n=21) with reptile abundance being lowest on the FLAGMA habitat type.

One reptile species of conservation significance was recorded during the survey. The Pilbara Olive Python is listed by DEC under the *Wildlife Conservation Act 1950* as Schedule 1 – Species that are rare or likely to become extinct. The species is also listed under the *EPBC Act* as Vulnerable. One opportunistic record of this species was made along the southern haul road option in the STABM habitat type. Further information on this species can be found in section 6.4.

Amphibian diversity was low across the whole survey area with only two species recorded during the survey. Of those two species only one, *Cyclorana maini*, was found to be abundant with over 800 individuals recorded during systematic surveys. Of these records, 706 were recorded from the FLAGMA habitat type. The second species recorded on the survey area, *Litoria rubella*, was found in much lower numbers during systematic surveys (n=2).

Table 14 details the amphibians recorded by habitat during the survey.

4.5.2. SPECIES ACCUMULATION CURVE AND SPECIES RICHNESS ESTIMATES

The reptile species accumulation curve shown in Figure 10 appears to be increasing as it approaches the theoretical asymptote. This indicates that several species may have remained undetected during the survey. The results of the asymptote calculation have potentially been influenced by a large number of species recorded either once or twice during the survey.

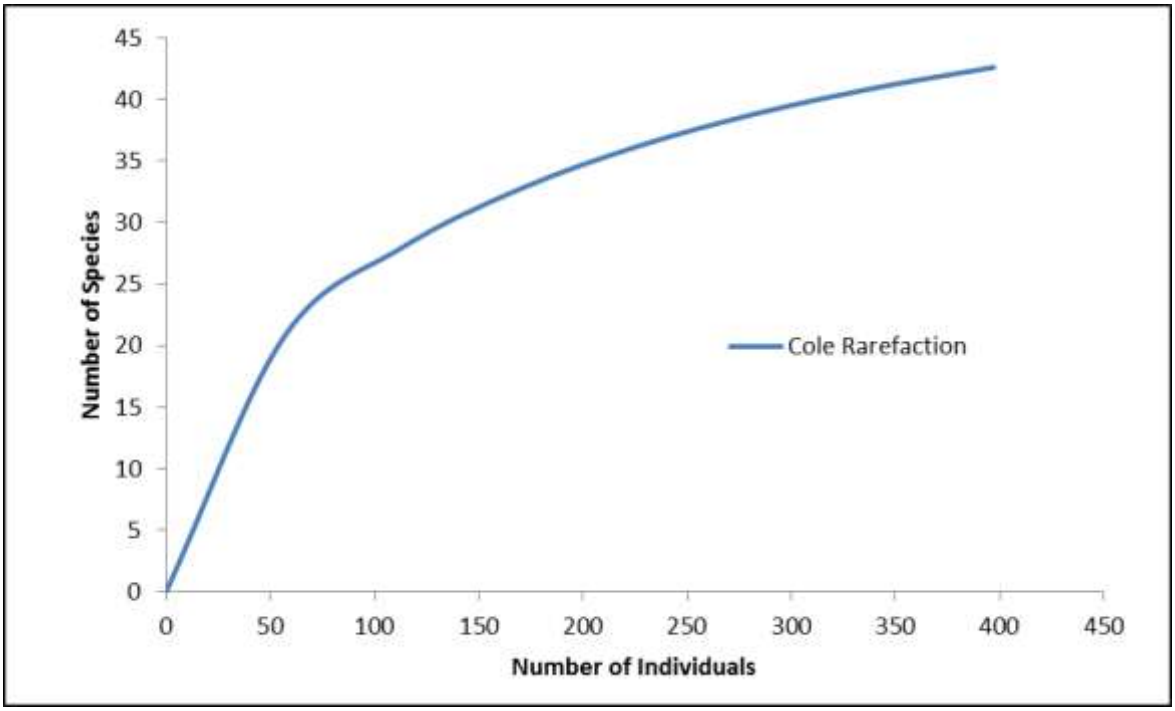

Figure 10 Individual based rarefaction curve (species accumulation curve) for reptile species surveyed using systematic techniques.

Based on observed data and non-paramentric estimators, between 49.63 and 57.06 species could occur in habitats on the survey area (Table 15).

Table 15 Observed and estimated reptile species richness

Type	Species Richness
Trapped reptile Species	44
ACE Mean	56.14
Jackknife1 Mean	53.63
ICE Mean	57.06
Chao1 Mean	49.63

4.6. BIRDS

4.6.1. ASSEMBLAGE

Avifauna was the most commonly observed fauna group during the survey with a total of 76 species recorded from 7145 records (Table 16). The majority of species were recorded during systematic surveys (n=67) while the remaining six species were recorded opportunistically or during spotlight surveys. Bird diversity was lower than expected as 148 species have been recorded within the region. However, suitable habitat for many of those species, namely waders and other aquatic birds, is lacking on the project area

The highest bird diversity (n=47) was recorded in the STABM habitat type while the bird abundance was highest in the FLAGMA habitat type. Avifauna abundance was highest in the FLAGMA habitat type due to several large flocks of irruptive species such as Budgerigars and Zebra Finches at the site. The lowest abundance and diversity was recorded in the SHET habitat type, probably reflecting this habitats low botanical diversity.

The most commonly recorded species during the survey were irruptive species such as the Budgerigar, Zebra Finch and Diamond Dove with flocks in excess of 100 regularly recorded. Generalist honeyeaters also dominated the bird assemblage (Table 16).

Three bird species of conservation significance were recorded during the survey. The Australian Bustard is listed by DEC as Priority 4 – Taxa in need of monitoring. Three records were made during the survey; an adult and chick were recorded at dusk within the impact area while the chick was recorded again the following day. It is likely that these were the same individuals that were recorded several nights later along an access road bordering the impact area.

The Fork-tailed Swift is listed under the *EPBC Act* as Migratory. This species was recorded at seven sites during systematic surveys and opportunistically across the survey area (Figure 8).

The Rainbow Bee-eater is listed under the *EPBC Act* as Migratory. One individual of this species was recorded during systematic surveys on the project area in the STABM habitat type (Figure 8).

Further information on the ecology and conservation significance of these species can be found in section 6.

4.6.2. SPECIES ACCUMULATION CURVE AND SPECIES RICHNESS ESTIMATES

The species accumulation curve in Figure 11 shows that the curve fails to flatten as it reaches the theoretical asymptote. The geometry of the curve indicates that it is likely that further bird species remain undetected in the habitat types surveyed utilising 2 hectare bird surveys.

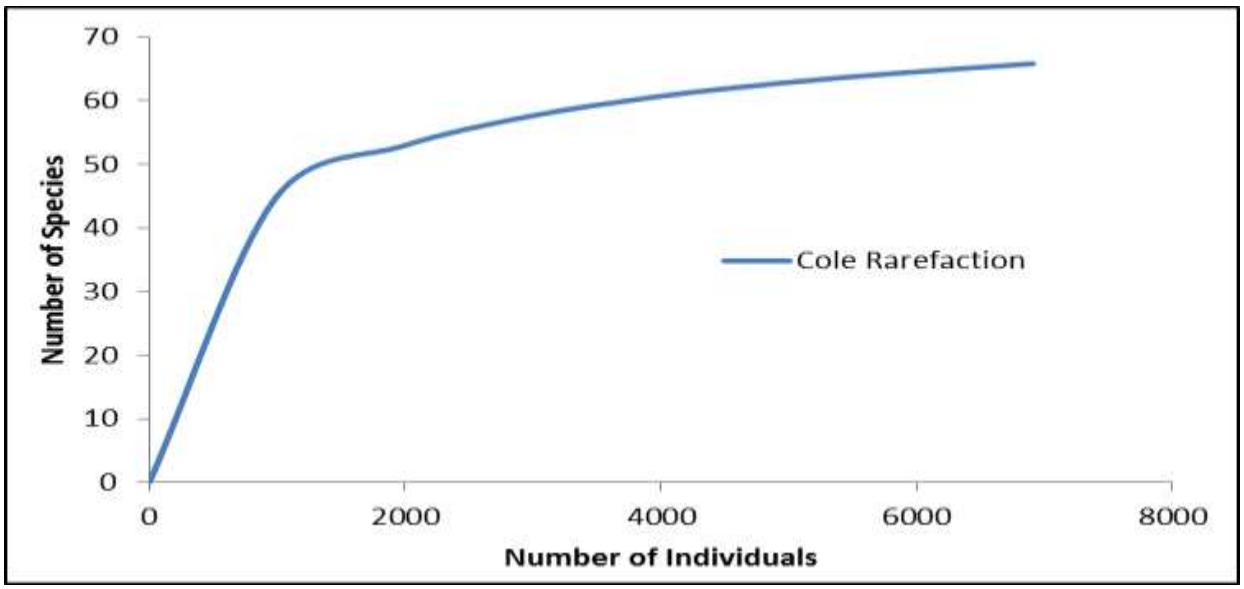

Figure 11 Individual based rarefaction curve (species accumulation curve) for bird species surveyed using utilising two hectare bird surveys.

The discrepancy between the number of species recorded during the two hectare bird surveys and the theoretical asymptote can be accounted for by the addition of opportunistic bird records. The total avian assemblage recorded during the survey of 76 species suggests that the combined datasets are close to the actual number of avian species utilising the survey area during the season.

Estimates of species richness for avifauna are prone to errors. The major cause of the error is the highly mobile or migratory nature of bird species. Thus, species richness calculations can only be used to deduce the survey effort at a seasonal time scale rather than an annual time scale.

Based on observed data and non-parametric estimators, between 77.5 and 99.37 species could occur in habitats on the project area, (Table 17).

Table 17 Observed and estimated avifauna species richness

Type	Species Richness
Recorded Avian Species	67
ACE Mean	81.63
Jackknife1 Mean	77.5
ICE Mean	79.55
Chao1 Mean	99.37

4.7. SHORT RANGE ENDEMICS

A total of 37 specimens were submitted for identification and assessment of SRE status with taxonomists of the WAM, Phoenix and Scorpion ID.

Nine mollusc specimens were submitted for identification. Taxonomic identifications suggest that the samples represented three species but none were found to be potential SRE taxa (Appendix 10).

The other 28 specimens comprised three spider species, including two mygalomorphs; four pseudoscorpion species; one centipede species, one millipede species, two slater species and 3 scorpion species.

Of the 14 taxa identified, 6 were identified as potential SRE and one was identified as a likely SRE (Appendix XII). Results of taxonomic identifications are summarised in Table 18 and discussed in detail in section .

Table 18 Summary of the SRE status of taxa collected in the survey and submitted for identification

Higher taxon	Family	Species	SRE status	Remarks	Record Site
Mollusca	Bulimulidae	*Bothriembryon* sp. nov.	Not SRE	Undescribed widespread species	Gorge
	Pupillidae	*Pupoides beltianus*	Not SRE	Widespread species	STABM 2, Forage
		Gastrocopta cf. *mussoni*	Not SRE	Widespread species	Ficus, MEAT2
Araneomorphae (modern spiders)	Zodariidae	*Zodariidae* sp. indet.	Not SRE	Not SRE target group	SHET 2
Mygalomorphae (trapdoor spiders)	Barychelidae	*Aurecocrypta* 'MYG057'	Not SRE	Widespread in Pilbara	STABM1
		Synothele 'MYG255'	Potential	First record of species	STABM2
Pseudoscorpiones (pseudoscorpions)	Atemnidae	*Oratemnus* sp. indet.	Not SRE	Commonly collected in Pilbara, not considered SRE	FLAGMA2
	Cheiridiidae	*Cheiridiidae* sp. indet.	Not SRE	Commonly collected in Pilbara, not considered SRE	SHET2
	Chthoniidae	*Austrochthonius* 'pilbara'	Potential	Possibly representing species complex, under revision at WAM	STABM2
	Olpiidae	*Beierolpium* '8/2' *Beierolpium* sp. indet.	Not SRE	Commonly collected in Pilbara, not considered SRE	SHET1 & 2, STABM2

Chilopoda - Geophilomorpha (soil centipedes)	indet.	*Geophilomorpha* sp. indet.	Potential	Taxonomically poorly resolved	STABM2
Diplopoda - Spirobolida (millipedes)	Triguniulidae	*Austrostrophus* sp. indet.	Potential	May represent *Austrostrophus* 'DIP018', currently considered potential SRE	STABM2
Isopoda	Armadillidae	*Buddelundia* '13'	Potential	Possibly also found at Wonmunna mining lease	FLAGMA2
		Spherillo sp. indet.	Likely	Rarely found in the Pilbara	STABM2
Scorpiones (Scorpions)	Buthidae	*Lychas* 'harveyi'	Not SRE	Widespread in Pilbara	SHET, STABM1
		Lychas 'pilbara1'	Not SRE	Widespread in Pilbara	SHET, STABM1
	Urodacidae	*Urodacus* sp. indet	Potential SRE	Habitat may support SRE species.	FLAGMA 2

4.8. TARGETED NORTHERN QUOLL SURVEY

Three hundred cage trap nights were sampled during the Target Northern Quoll Survey, representing six sites of ten cages left open for 5 nights. No Northern Quolls were captured.

Lamb Creek SRE Sample Sites

5. DISCUSSION

5.1. HABITATS

Flora surveys of the Lamb Creek project area conducted by Rapallo (2012) identified six vegetation associations. The vegetation associations roughly match the habitats identified in this survey, with some small variations. In total, six habitats were identified (Table 9). All habitats generally conformed to the habitats described by Beard (1990) and Van Vreeswyk et al. (2004).

The habitats of the project area were all typical of the Pilbara bio-region, especially its expression in the south eastern areas of the Pilbara and on the south eastern edge of the Hamersley Range. No Priority Ecological Communities (PEC) or Threatened Ecological Communities (TEC) occur within 50 km of the project area (DEC 2012b).

Low plains and alluvial deposits dominated the majority of the project area with *Eucalyptus* woodland over hummock grassland covering 46% of the project area (SATOM). The habitat type is considered to be wide spread throughout the Pilbara.

The south-western section of the haul road alignment consists of a broad shallow drainage valley that supports *Acacia aptaneura* low woodland over *Themeda triandra, Cymbopogon ambiguus, Chrysopogon fallax* open tussock grassland (FLAGMA). Several SRE specimens were collected from this habitat type. This habitat type occurs on approximately 3% of the Lamb Creek project area.

At the fringes of the valley, steep sided gullies and gorges associated with rocky breakaways and outcrops with *Eucalyptus leucophloia* subsp. *leucophloia* woodland over mixed shrubs over *Triodia wiseana* grassland becoming the dominant habitat type (GORGE, STABM and SHET). This habitat occurs on 25% of the project area. The remaining sections of the haul road are flat plains with alluvial deposits and dominant vegetation types include *Triodia* grassland, mixed acacia shrublands and mulga woodlands over perennial grasslands. Several SRE specimens, Western Pebble-mound Mouse mounds and a record of the Pilbara Olive Python were collected from these habitat types.

Defined, ephemeral drainage systems dissect the valley and plains along the haul road alignment (MEAT). Larger drainage systems support tall *Corymbia* trees (>10 meters) and thick *Acacia* shrublands. Some drainage systems, particularly the north-eastern portions of the project area have been heavily degraded by cattle grazing and weeds are present. Buffel grass (**Cenchrus ciliaris*), an introduced grass species, was present in much of the degraded areas and sparsely in some of the less impacted habitat areas.

5.2. MAMMALS

The mammal species recorded during the survey are typical of mammalian fauna assemblages in the Pilbara region.

A discussion of the regional mammal records and records collected during the survey are presented below. Appendix XI contains the data recorded using ANABAT software to record ultrasonic calls.

5.2.1. FAMILY DASYURIDAE (CARNIVOROUS MARSUPIALS)

Five species of the family Dasyuridae were recorded during the survey of the Lamb Creek project area. The family Dasyuridae comprised 64% of the total mammal captures on the survey area.

The Little Red Kaluta (*Dasykaluta rosamondae*) was recorded 20 times during the survey. This species is endemic to the Pilbara region and typically occurs amongst spinifex-hummock grasslands on sandy, stony or clay plains. This species has also been recorded in stony-hill country (Van Dyck & Strahan 2008; Menkhorst & Knight 2011)

The Long-tailed Planigale (*Planigale ingrami*) was recorded six times during the survey in the SHET and FLAGMA habitat types. The distribution of the species in the Pilbara is highly isolated from other northern populations (Van Dyck & Strahan 2008).

The Stripe-faced Dunnart (*Sminthopsis macroura*) was the most common species of mammal recorded during the survey with 36 individuals. This species is most commonly found on sandy substrates but is often found on cracking clay and stony plains with associated hummock and tussock grassland and arid shrublands (Menkhorst & Knight 2011).

The Northern Quoll (*Dasyurus hallucatus*) is listed as Endangered under the *EPBC Act*. In the Pilbara, Northern Quolls typically use a variety of rocky formations for denning and foraging (Van Dyck & Strahan 2008; Rapallo Environmental 2010). The Northern Quoll was not recorded in cage traps during the survey however an individual was recorded on a motion detecting camera during the survey. A Northern Quoll scat was also found underneath a rocky overhang. Subsequent trapping at this site did not reveal any further evidence of Northern Quolls. Further information on the ecology and conservation significance of this species can be found in Section 6.1.

5.2.2. FAMILY MACROPODIDAE

One species of kangaroo and one species of wallaby were recorded during the survey.

The Euro (*Macropus robustus*) was recorded several times during the survey, from direct opportunistic sightings and on a motion detecting cameras. This species is found throughout the Pilbara, with a wider distribution across almost all of Western Australia, excluding the Nullarbor and South-West regions (Van Dyck & Strahan 2008; Menkhorst & Knight 2011).The Euro typically shows preferences for rocky regions and outcrops but can occur in most habitat types. They are distinguished from other large kangaroo species by their shaggy coat; shorter, stockier proportions and bare rhinarium. Records of this species are common within 40 km of the project area (DEC 2012c).

Rothschild's Rock Wallaby (*Petrogale rothschildsii*) was recorded two times during the Targeted Northern Quoll Survey. Additional records were made of individuals on motion detecting cameras and while spotlighting. This species is a Pilbara endemic utilising rocky ridges of the Hamersley and Chichester ranges. Throughout Australia, rock wallabies have declined in abundance and distribution. Current data suggests this species has not suffered similar extensive declines (Van Dyck & Strahan 2008; Menkhorst & Knight 2011).

5.2.3. FAMILY MURIDAE (RODENTS)

Five species from the family Muridae were recorded during the survey. Four species were recorded during systematic trapping while evidence of a single species was recorded during foraging transects.

The Desert Mouse (*Pseudomys desertor*) is widely distributed across arid Australia and is locally common where it does occur. Like the Sandy Inland Mouse, populations are known to respond to large rainfall events, after which they can become extremely common (Dickman *et al.* 1999). This species is often recorded and there are several records within 40 km of the project area (DEC 2012c).

The Sandy Inland Mouse (*Pseudomys hermannsburgensis*) is a widely distributed rodent species that is characteristic of the arid interior. It is an irruptive species with populations responding to increased levels of seed produced after large rainfall events (Van Dyck & Strahan 2008).The species can become extremely common during such irruptive seasons (Dickman *et al.* 1999). In the Pilbara, The Sandy Inland Mouse is common and frequently recorded. It is well represented in regional records, being recorded several times within 40km of the project area (DEC 2012c).

The Common Rock Rat (*Zyzomys argurus*) is a wide ranging species that occurs in disjunct populations through northern Australia. This species is frequently recorded throughout the Pilbara and is well represented regionally, being recorded within 40 km of the project area (DEC 2012c). Although primarily found on rocky outcrops and in areas of complex rock formations, this species is reported to use extensive rocky plains and slopes between outcrops as either foraging habitat or during dispersal (Van Dyck & Strahan 2008). A single individual was recorded during the survey.

The Western Pebble Mound Mouse (*Pseudomys chapmani*) is listed by DEC as Priority 4- taxa in need of monitoring. This species builds large prominent mounds that were recorded at 35 locations during the survey, typically in the low sloping, stony foothills. Occupation of the mounds can be determined by the structure of the entrances. Most mounds located during the survey were deemed to be active. Further information on the ecology and conservation significance of this species is provided in Section 6.2.5.

The introduced House Mouse (*Mus musculus*) was recorded twice during the survey. Although typically found close to human habitation they are known to utilise most habitat types within Australia and are often found in remote locations.

5.2.4. FAMILY CANIDAE

Two species of Canid could potentially occur on the project area. The Red Fox (*Vulpes vulpes*) and the Dingo/Feral Dog (*Canis lupus dingo/familiaris*) are both found in the Pilbara and have been recorded within 40km of the project area however no individuals of either species were recorded during the survey.

5.2.5. FAMILY MEGADERMATIDAE

This family is represented in Australia by the Ghost Bat (*Macroderma gigas*). This species is currently listed as P4 – Taxa in need of monitoring under the *Wildlife Conservation Act, 1950*. It is the largest species of microbat in Australia and is highly predatory, taking a variety of vertebrate species including birds, reptiles, rodents and other bats (Churchill 2008). Five Ghost Bats were recorded on the project area from two roost caves, and one additional cave occupied by Ghost Bats was recorded in the central survey

area (Figure 8). There was no evidence of middens within either cave suggesting other roosts are located in the surrounding area.

5.2.6. FAMILY EMBALLONURIDAE

Twenty individuals of Common Sheath-tailed Bats (*Taphozous georgianus*) were recorded roosting in caves within the survey area. This widely distributed species does not hang when roosting like other bat species, but clings to the wall, propped up by its forearms. Consequently it is the only species to utilise fissures, vertical crevices and mine shafts (Van Dyck & Strahan 2008). This species is common and has been recorded within 40kms of the project area. As well as being frequently encountered on foraging transects, this species was recorded at four locations by the SM2+ bat recorder.

The Yellow-bellied Sheath-tailed Bat (*Saccolaimus flaviventris*) was recorded at four locations on the survey area. This species is widespread across tropical Australia with its range extending into southern temperate Australia during summer (Churchill 2008). This species was recorded at four locations during the survey by the SM2+ bat recorder.

5.2.7. FAMILY MOLOSSIDAE

The Northern Free-tailed Bat is a widespread species that utilises most habitats across northern Australia. This species is commonly recorded roosting in hollow tree spouts, often in large colonies. This species is one of the few Australia microbats that have an audible call. This species was recorded at one location during the survey by the SM2+ bat recorder.

5.2.8. FAMILY VESPERTILIONIDAE

Four individuals of the Inland Cave Bat (*Vespadelus finlaysoni*) were recorded roosting inside a cave on the project area. This species is widely distributed in arid and semi-arid Australia and are usually associated with rocky areas (Churchill 2008). Records of this species have been made within 40km of the project area. This species was also recorded at all locations sampled by the SM2+ bat recorder.

The Gould's Wattled Bat (*Chalinolobus gouldii*) was recorded in five locations on the survey area, this species is widespread and common across Australia occupying virtually habitats from tropical rainforest, alpine regions, deserts, woodlands and urban areas (Churchill 2008). This species was also recorded at one location sampled by the SM2+ bat recorder.

The Little Broad-nosed Bat (*Scotorepens greyii*) was recorded at four locations on the survey area. This species is found across northern Australia, through central Australia and into southern New South Wales (Churchill 2008). This species typically roosts in tree hollows and under bark but is also frequently found in abandoned dwellings (Van Dyck & Strahan 2008). This species was recorded at four locations during the survey by the SM2+ bat recorder.

5.3. REPTILES

5.3.1. FAMILIES GEKKONIDAE AND PYGOPODIDAE (GECKOS AND LEGLESS LIZARDS)

A total of 18 species of geckos and legless lizards from 334 records were made during the Lamb Creek survey. The total number of species captured represents 69% of the 26 species found within the region.

Three species of the genus *Diplodactylus* were recorded during the survey. *Diplodactylus conspicillatus* and *Diplodactylus savagei* were both recorded from the SHET habitat type with capture numbers of one and two respectively. *Diplodactylus pulcher* was recorded twice during the survey with one record coming from both the MEAT and FLAGMA habitat types.

The genus *Lucasium* was represented twice during the survey with large numbers (n=107) of *Lucasium stenodactylum* being recorded across all five habitat types found on the project area. *Lucasium wombeyi* was found to be less common on the project area (n=8) with records from the SATOM and STABM habitat types.

Two species of *Gehyra* were recorded during the survey; *Gehyra punctata* and *Gehyra variegata*. *Gehyra punctata* was the most abundant species recorded during spotlight surveys (n=60) with all records of this species coming from rocky outcrops and gorges during spotlight surveys rather than through systematic trapping. Conversely *G. variegata* was predominantly recorded during systematic surveys (n=30) with only two of those records coming from foraging surveys.

Several genera of gecko were represented by a single species during the survey; *Crenadactylus ocellatus*, *Heteronotia binoei*, *Rhynchoedura ornata*, *Nephrurus wheeleri*, *Oedura marmorata* and *Strophurus wellingtonae*.

Three of these species; *H. binoei* (n=18), *O. marmorata* (n=20) and *R. ornata* (n=66) can be considered common in the Pilbara region with numerous records of these species occurring within 40 km of the project area (DEC 2012c). *Oedura marmorata* is commonly found within rocky gorges, rocky outcrops, scree slopes and woodlands while *H. binoei* and *R. ornata* are commonly found within arid and semi-arid regions of Australia. Within the project area these species were found to be locally abundant within their preferred habitat types.

Strophurus wellingtonae was recorded four times during the survey with two systematic records and two spotlighting records. These records are a good example of a common species that is infrequently encountered in traps. This species was recorded in areas of Mulga/spinifex associations on heavy red soils, the habitat type it is known to favour (Wilson & Swan 2008). This species has been recorded within 40 km of the project area (DEC 2012c).

Nephrurus wheeleri was recorded once during spotlighting surveys from a deep narrow rock crevice in a creek bed with *Corymbia* and *Triodia* associations. Two individuals were found sheltering inside the narrow entrance. This species has two distinct populations with the Pilbara population preferring rocky ranges and outcrops with spinifex associations (Wilson & Swan 2008).This species has been recorded several times within 40 km of the project area.

A single record of *Crenadactylus ocellatus* was made during the survey from the MEAT habitat types. This monotypic genus is secretive and rarely found far from cover. It is a terrestrial generalist dwelling under rocks and surface litter (DEC 2012c). Records of this species have been made within 40 km of the project area (DEC 2012c).

The most commonly recorded Pygopod species during the survey were *Delma elegans* and *Lialis burtonis*. *Lialis burtonis* is a common species and is Australia's most widespread reptile species occurring in all habitat types except for high altitudes, cooler regions of the southern Australian mainland and Tasmania (Wilson & Swan 2008). During systematic surveys this species was recorded three times, once in each of the SATOM, MEAT and SHET habitat types.

Delma elegans was also recorded three times during the survey. Once from under woody debris around the campsite and twice during systematic surveys from the MEAT and FLAGMA habitat types. This species is restricted to the Pilbara region and is known to shelter in spinifex associations in rocky areas of the Hamersley Ranges and adjacent lowlands (Wilson & Swan 2008).

Delma nasuta and *Delma tincta* were recorded twice and once respectively during systematic surveys of the project area. *Delma nasuta* was recorded from the SHET and FLAGMA habitat types while *D. tincta* was recorded from the FLAGMA habitat type. Both these species are widespread across several habitat types in Western Australia (Wilson & Swan 2008). Both of these species have been previously recorded within 40 km of the project area (DEC 2012c).

A single species of the genus *Pygopus* was found during the survey, two records of *Pygopus nigriceps* were recorded from the SATOM and FLAGMA habitat types. This common species is widespread across Western Australia (Wilson & Swan 2008). Records of this species have been made previously within 40 km of the project area (DEC 2012c).

Delma pax was notably absent from the species record. This species is restricted to the Pilbara and is common in the region with several records within 40 km of the project area. This species is expected to occur on the project area as suitable habitat occurs within the boundaries of the tenement.

5.3.2. FAMILY SCINCIDAE (SKINKS)

A total of 208 skinks comprising 18 species were recorded during the survey of the Lamb Creek survey area.

The skink fauna of Lamb Creek was dominated by the ubiquitous *Ctenotus* skinks. This widespread radiation of skinks has colonised all arid and semi-arid habitats and most tropical and temperate habitats on mainlaind Australia (Wilson & Swan 2008). Records from this genus comprised 58% of all skink records found on the survey area.

The most abundant skink species recorded during the survey was *Cryptoblepharus ustulatus* (n=45). Opportunistic sightings of this species were commonly made during the checking of Northern Quoll cage traps. This species is exclusively found among rocky habitats in the Pilbara region.

Several species were notably absent from the species record for the Lamb Creek survey area. No members of the genus *Eremiascincus* were recorded during the survey. The Broad-banded Sandswimmer (*Eremiascincus richardsonii*) is typically found in areas with hard soils with some populations in the Pilbara inhabiting caves and gorges. The Narrow-banded Sandswimmer (*Eremiascincus fasciolatus*) is more typically found in areas of sandy soil dominated by spinifex (Cogger 2000). Suitable habitat for these species occurs on the project area and both species have been recorded within a 40 km radius of the project area (DEC 2012c).

5.3.3. FAMILY AGAMIDAE (DRAGONS)

Six out of the ten regionally recorded species of dragons were recorded during the survey from a total of 195 records.

The Ring-tailed Dragon (*Ctenophorus caudicinctus*) was the most ubiquitous species during the survey being recorded 108 times. This widespread and common species was mostly found on stony loam plains and stony hills. The Military Dragon (*Ctenophorus isolepis*), another widespread and common species

was also found in high numbers (n=76) on the survey area utilising similar habitats to *C. caudicinctus* however records show a preference to stony loam plains with no individuals being recorded on the SHET habitat type.

The Long-nosed Dragon (*Amphibolurus longirostris*) is a common and wide spread species ranging from western and central Western Australia through to central Northern Territory. Five records were made of this species on the survey area, predominantly from minor drainage lines in the MEAT habitat type. Records of this species occur within 40 km of the project area, it is usually found along gorges and *Eucalypt* lined watercourses (Wilson & Swan 2008).

Two species were recorded twice on the survey area; *Caimanops amphiboluroides*, *Diporiphora valens* and *Pogona minor*. *Caimanops amphiboluroides* was recorded from a systematic record from the FLAGMA habitat type and an opportunistic record of the species from the basecamp site located within the SATOM habitat type. A cryptic species, it is infrequently encountered in systematic surveys and if disturbed slides slowly from view making opportunistic records difficult to obtain. This species has been recorded within 40 km of the project area and is found in Mulga woodlands and shrublands on heavy stony soils (Wilson & Swan 2008). *Diporiphora valens* is a Pilbara endemic restricted to the arid interior of the Pilbara, the species is known to occur in shrublands and low woodlands over spinifex. Two records were made of this species from the FLAGMA habitat type, fitting the typical habitat preference detailed in Wilson and Swan (2008). This species has been recorded within 40 km of the project area (DEC 2012c).

Three records were made on the survey area of the Dwarf Beared Dragon (*Pogona minor*). Two of these records were systematic records with a single individual being recorded in both the MEAT and STABM habitat types along with a single opportunistic record of the species. *Pogona minor* occurs across a large area of the Australian mainland from central South Australia and southern Northern Territory across to coastal Western Australia and north into the Pilbara region. It is found in woodland and shrubland habitats and records have been made within 40 km of the project area.

5.3.4. FAMILY ELAPIDAE (FRONT FANGED LAND SNAKES)

A total of seven species of Elapid snake were encountered during surveys of the Lamb Creek survey area. The most common species recorded were the Mulga Snake (*Pseudechis australis*) and the Yellow-faced Whipsnake (*Demansia psammophis* subsp. *cupreiceps*) with three records for each species. All records of these species were made during systematic surveys. Records of *P. australis* were made from the MEAT, SHET and FLAGMA habitat types while the records of *D. psammophis cupreiceps* records were made from the SATOM, MEAT and STABM habitat types. *Pseudechis australis* is a large elapid snake capable of causing human fatalities and is a common and widespread species across a wide range of semi-arid and arid Australia while the *cupreiceps* subspecies of *D. psammophis* is found from the arid interior of Western Australia to the north-west coast of the state. Numerous records for both species have been found within 40 km of the project area.

Two capture records were recorded for both *Parasuta monachus* and *Suta fasciata*. *Parasuta monachus* has a narrow range within the Pilbara region and is usually found on hard red soils with *Acacia* woodland associations. The records for *P. monachus* were made from the SHET habitat type. *Suta fasciata* is found on stony soils supporting woodlands in the Pilbara region (Wilson & Swan 2008). The *S. fasciata* individuals were recorded from the SHET and SATOM habitat types. Records of *P. monachus* exist

within 40km of the project area however no records of *S. fasciata* have been made within 100km of the project area.

Mengden's Brown Snake (*Pseudonaja mengdeni*) was recorded once during the reconnaissance survey while placing a motion detecting camera in a rocky gorge. This individual had evidence of attempted predation around the tail. This species was not recorded during systematic surveys of the Lamb Creek survey area however records exist of this species being recorded within 40 km of the project area (DEC 2012c)

The Ringed Brown Snake (*Pseudonaja modesta*) was recorded once during systematic surveys from the STABM habitat type. This species is widespread across Australia being found from semi-arid to central arid regions. *P. modesta* records have been made within 40 km of the project area and suitable habitat exists within the tenement.

One record of the Pilbara Bandy-Bandy was made during systematic surveys. This species was recorded from the SHET habitat type. *V. snelli* is a cryptic species and is rarely encountered. *V. snelli* individuals feed exclusively on blind snakes of the genus Typhlopidae. This species is restricted to the Pilbara region of Western Australia. Records of this species have been made within 40 km of the project area (DEC 2012c).

5.3.5. FAMILY TYPHLOPIDAE (BLIND SNAKES)

No species of Typhlopid blind snakes were recorded during the survey however four species have been regionally recorded including the Priority 4 species; *Ramphotyphlops ganei*. Three species are Pilbara restricted; *Ramphotyphlops ammodytes, Ramphotyphlops grypus* and *Ramphotyphlops hammatus*. Suitable habitat occurs on the project area for all of these species to potentially occur.

5.3.6. FAMILY PYTHONIDAE (PYTHONS)

Two python species were recorded from single individuals encountered on the survey area. One record of *Antaresia perthensis* was made during spotlight surveys of a rocky gorge. This species, the world's smallest python; is restricted to the Pilbara region and inhabits rocky outcrops and woodlands. It is often associated with termite mounds (Wilson & Swan 2008). Records of this species exist within 40km of the project area.

The Pilbara Olive Python (*Liasis olivaceus* subsp. *barroni*) was opportunistically recorded once on the project area during the survey. An individual was found on the southern haul road option early in the morning. This individual was approximately three metres long and was found to be in good condition. The individual moved off in the direction of a nearby rocky escarpment. This species is state listed as Schedule 1 – Species that are rare or likely to be become extinct under the *Wildlife Conservation Act, 1950* and federally listed as Vulnerable under the *EPBC Act*. Habitat capable of supporting populations of *L. olivaceus* subsp. *barroni* occurs on the project area and records of this species have been recently made within 40 km of the project area.

Notable absentees from the species record include the Black-headed Python (*Aspidites melanocephalus*) and the Stimson's Python (*Antaresia stimsoni*). These species are commonly encountered in the Pilbara region. As suitable habitat for these species is located in the region, these two species are expected to occur on the project area.

5.3.7. FAMILY VARANIDAE (GOANNAS/MONITORS)

The genus *Varanus* was represented by 36 individuals comprising seven species on the Lamb Creek survey area. The most commonly recorded species was *Varanus acanthurus* with a total of 14 captures from the MEAT (n=3) and SHET (n=11) habitat types. This species is widespread across northern Australia commonly occurring in rocky ranges and on heavy to stony soils (Wilson & Swan 2008). This species has been recorded within a 40 km radius of the project area (DEC 2012c)

Varanus brevicauda, the worlds' smallest monitor, was recorded nine times during systematic surveys. This species is a very secretive and generally stays close to spinifex cover. *V. brevicauda* was recorded in three different habitat types with three individuals being recorded in each habitat type. *V. brevicauda* is a widespread species occurring across central and northern Western Australia and the southern half of the Northern Territory. Regional data shows that this species has been recorded within 40 km of the project area.

Varanus tristis was recorded four times during systematic surveys and once during the reconnaissance survey. The systematic records were from the MEAT (n=3) and SHET (n=1) habitat types while a single opportunistic record was made in a weathered conglomerate drainage system. *V. tristis* is widespread across Australia occurring in many different habitat types including the semi-arid and arid zones. This species has been recorded within 40 km of the project area.

Four species were recorded in low numbers on the survey area. *Varanus bushi*, *Varanus giganteus*, *Varanus panoptes* and *Varanus pilbarensis* were recorded two, three, one and three times respectively. *V. bushi* was systematically trapped once in the SATOM habitat type and opportunistically caught once in the MEAT habitat type. This species is a Pilbara endemic with a limited distribution, it is usually found in Mulga and *Eucalyptus* woodlands (Wilson & Swan 2008). Records of this species have been found within 40 km of the project area.

The Perentie (*Varanus giganteus*) was opportunistically recorded twice during the survey and also recorded once during spotlight surveys of the SHET habitat type. This species is Australia's largest goanna. The distribution of *V. giganteus* ranges from the Pilbara region through central Australia to central Queensland encompassing semi-arid and arid zones (Wilson & Swan 2008). This species has been regionally recorded within 40 km of the project area.

A single *Varanus panoptes* individual was recorded from the side of the southern haul road option in the STABM habitat type. This species has two disjunct populations, one in the Pilbara region and the other across most of Queensland and the northern half of the Northern Territory. In the Pilbara region it is found on riverine flats, woodlands and grasslands. The species has been recorded in the region within 40 km of the project area.

Varanus pilbarensis was opportunistically recorded three times during the survey. *V. pilbarensis* was exclusively encountered in rocky regions such as gorges, rocky outcrops and scree fields. This species is a Pilbara endemic and its distribution is limited by the above habitats. Regional data indicates this species has been recorded within 40 km of the project area.

5.4. AMPHIBIANS

Only two of the five amphibian species that are known to occur regionally were captured during the survey. The Sheep Frog (*Cyclorana maini*) being by far the most common with over 800 records.

Records of this species increased dramatically after several thunderstorms that occurred during the survey. *C. maini* was recorded across all the habitat types surveyed with the majority of records (n=706) coming from the FLAGMA habitat type. This species is common and widespread across Western Australia from the Pilbara region east through central Western Australia and into the Northern Territory. It is commonly found on flood plains and near ephemeral stream beds (Tyler & Doughty 2009). Records of this species have been made within 40 km of the project area (DEC 2012c) .

The Desert Tree Frog (*Litoria rubella*) was recorded four times during the survey, twice in the MEAT habitat type during systematic surveys and twice around the basecamp site in the SATOM habitat type. This species was only found after several thunderstorms that occurred during the survey. In Western Australia this species is found in the semi-arid and arid zones from the Pilbara north into the Kimberley (Tyler & Doughty 2009). This species is commonly found around areas of human habitation and has been recorded within 40 km of the project area.

The low diversity of amphibian fauna in the species records for Lamb Creek can possibly be attributed to climatic conditions during the survey as well as inappropriate habitats on the project area for several species. While several thunderstorms did occur it is possible that insufficient water was available to stimulate burrowing frog species in the Myobatrachidae family.

5.5. AVIFAUNA

Species diversity and abundance on the Lamb Creek survey area was affected by heavy wet season rains as well as cyclonic activity. Extra rainfall has led to a flow on effect, with high levels of seed, invertebrates and flowering trees and shrubs. This provides excellent breeding conditions for many species resulting in the abundance of several irruptive species during the survey. Irruptive species such as the Budgerigar (n=3143) and the Zebra Finch (n=1329) were the most common species recorded during the survey. Higher than normal numbers of uncommon nomadic and irruptive species were recorded during the survey, in particular honeyeater species that are infrequently recorded away from mass flowering events. White-fronted Honeyeater, Pied Honeyeater, Black-chinned Honeyeater and Grey Honeyeater were all recorded multiple times during the survey with many feeding in the flowering *Corymbia* sp. along drainage lines. Ground Cuckoo-shrike is another infrequently recorded nomadic species that was sighted several times during the survey.

Raptor species were common across the survey area with 11 species being recorded. The high diversity seen in raptors could be the result of increased prey abundance on the survey area brought on by good breeding conditions for many of the prey species.

The largest group of birds absent from the species record for the Lamb Creek survey area are the birds associated with wetlands and/or riparian habitats. Thirty wetland species have been recorded regionally, probably in ephemeral drainage systems located near the project area that become inundated in times of heavy rain. One wetland species, the White-faced Heron, was recorded flying over the southernmost end of the survey area, bordering the Great Northern Highway.

Three species of conservation significant birds were recorded during the survey. The Australian Bustard, listed by DEC as Priority 4 – Taxa in need of monitoring, displayed a preference for the SATOM habitat type of *Acacia aptaneura* and/or *Corymbia deserticola* low woodland over *Acacia elachantha* and mixed *Eremophila* species over *Triodia wiseana* very open hummock grassland.

The Fork-tailed Swift is listed under the *EPBC Act* as Migratory, this species was recorded flying over all the identified habitat types on the project area with the highest abundance (n=100) occurring over the FLAGMA habitat type of *Acacia aptaneura* low woodland over *Themeda triandra*, *Cymbopogon ambiguus*, *Chrysopogon fallax* open tussock grassland.

The Rainbow Bee-eater eater is listed under the *EPBC Act* as Migratory, one individual was recorded in the STABM habitat type of *Eucalyptus gamophylla* low open woodland over *Acacia elachantha* or *Acacia hilliana*, *Senna glutinosa* subsp. *pruinosa* open shrubland over *Triodia brizoides*, *Triodia wiseana* hummock grassland.

Regionally, a further eight species of conservation significance have been recorded however suitable habitat for these species does not occur on the project area making their presence at Lamb Creek unlikely.

5.6. INVERTEBRATES

5.6.1. ARANEAE – MYGALOMORPHAE (TRAPDOOR SPIDERS)

The Western Australian mygalomorph fauna is vast and many families and genera remain taxonomically poorly known (Phoenix Environmental Sciences 2012). A recent molecular study of Pilbara Mygalomorphae (Helix 2012) provided a new benchmark for diversity estimates in the Pilbara which by far exceeds the species richness of the region documented in during the DEC Pilbara Biological Survey (Durrant *et al.* 2010). Many of these genetic lineages are known from very restricted ranges only (Helix 2012; Phoenix 2012).

During the SRE survey, two mygalomorph spiders from STABM 1 and 2 were collected.

Both mygalomorph spiders collected during the survey belong to the family Barychelidae. Barychelid spiders vary in size and are distinguished by well-developed claw tufts and short terminal segment of the posterior lateral spinnerets (Raven 1994). They are a cryptic group with deep burrows (to 60cm) and well camouflaged and lack the thick trapdoor commonly associated with trapdoor spiders or the extensive webbing around the entrance associated with other mygalomorphs species.

The DEC Pilbara survey recovered four species of Barychelid trapdoor spiders in three genera, of which *Synothele* was with four species most diverse (Durrant *et al.* 2010). Molecular data suggests 20 different molecular lineages within the family indicate a much higher diversity in the region. As many of the known species have restricted ranges (Helix 2012) there is high potential for this genus to contain SRE species/morphospecies.

The mygalomorph specimens collected in the STABM2 pitfall traps during the survey was identified as *Aurecocrypta* 'MYG057'. This species is not uncommon throughout the Pilbara region of Western Australia (WAM 2012b)(WA Museum database). It is not an SRE.

The other mygalomorph specimen, collected at STABM1, was identified as *Synothele* 'MYG255'; a fairly large species within the genus. It is the first representative of this new morphospecies in the WA Museum reference collection. As this genus typically has restricted ranges in the Pilbara, this specimen is considered a potential SRE.

While there is no way to determine whether the species is an SRE from this single survey, the STABM habitat in which it was collected is widespread and continuous on and off the project area. Additionally, only small amounts of the habitat type will be impacted by the proposed project. If the species is an SRE, Rapallo believes there is a low risk of it being impacted by the proposed project.

5.6.2. PSEUDOSCORPIONES (FALSE SCORPIONS OF PSEUDOSCORPIONS)

Pseudoscorpiones superficially resemble scorpions but lack the tail or a sting of scorpions. Most species most species are less than 1 cm long. Pseudoscorpions can be found inhabiting a wide variety of habitats including leaf litter, soil, under the bark of trees, under stones, and in rock crevices (Harvey, Milledge, & Yen 1989). In Western Australia, 17 families of pseudoscorpions have been recorded to date (Harvey 2011). The group contains several SRE species.

Database results from WAM indicate that one SRE pseudoscorpion species has been recorded at Area C, within 15 km of the survey area. Eleven pseudoscorpion specimens were collected during the survey. They belong to four different families (Artemnidae, Chthoniidae and Olpiidae). Only one species, *Austrochthonius* 'pilbara', is considered a potential SRE.

The taxonomy of the group Artemnidae is unclear although current evidence suggests that most species are widespread. Similarly, specimens collected from the group Cheiridiidae are at present poorly known but initially data suggests that most species from this group are widespread. It is highly unlikely that species from this group would be SREs.

The Opliidae group contains some of the most frequently recorded species in xeric habitats in the Pilbara. Species from the genus *Beierolpiu,* such as those found at Lamb Creek, are generally considered widespread and thus not SRE species. Some genera and species in the Opliidae group however, may be considered range restricted, particularly subterranean species.

One species in the family Cthoniidae was collected during the survey. *Austrochthonius* 'pilbara', was collected in a litter sample from below a blue mallee at STABM2. The species is currently poorly defined and may consist of a group of species. It is currently considered a potential SRE. While the distribution of this species is unknown, the habitat in which it was found is widespread and continuous on and off the project area.

Other species of *Austrochthonius* occur in leaf litter and soil environments throughout much of southwestern Australia, as well as subterranean ecosystems in Cape Range and near Busselton (Harvey 1991; Harvey & Mould 2006). The taxonomy of the Western Australian species is not resolved. The deep genetic divergences within the genus demonstrated in recent molecular analyses are, unfortunately, not reflected in their morphology and thus species identification is extremely difficult. The genus *Austrochthonius* is currently under revision at the Western Australian Museum (M. Harvey personal communication).

5.6.3. CHILOPODA (CENTIPEDES)

The centipedes represent a diverse group of predatory arthropods ranging from about 4 to 300mm long. Each pair of legs is attached to a separate body segment which distinguishes this class from the millipedes (Diplopoda; two pairs of legs per segment) (Colloff *et al.* 2012).

All five orders of centipedes can be found in Australia of which two orders and one family are associated with relictual habitats and therefore potential SRE. Geophilomorpha, Lithobiomorpha and the Cryptopidae (within the Scolopendromorpha) are associated with relictual habitats such as moist and deep leaf litter. Geophilomorpha and Cryptopidae have also been found in subterranean environments in the Pilbara where they are limited to very small ranges (e.g. Edgecombe 2005).

No SRE centipedes have been recorded within 40 km of the project area according to the WAM database search. However, one centipede specimen was collected from a litter sample at STABM2 during the survey and submitted for identification. It was identified as belonging to the order Geophilomorpha and is considered a potential SRE.

The taxonomy of the Geophilomorpha is poorly resolved and it is currently impossible to identify the specimen beyond order level. Based on their high diversity in combination for the preference for moist, deep litter habitats, all undescribed representatives of the Geophilomorpha are here considered potential SREs. While the distribution of this species is unknown, the habitat in which it was found is widespread and continuous on and off the project area.

5.6.4. DIPLOPODA (MILLIPEDES)

Particular orders of Millipedes are one of the main target groups of SRE surveys, with SRE species frequently occurring in some groups. Within Western Australia SREs are particularly expected within the orders Sphaerotheriida (rolling millipedes) and Polydesmida, (Harvey 2002; Environmental Protection Authority 2009). A recent review of Australian *Atelomastix* (order Spirostreptida) found all of 29 species treated were SREs (Edward & Harvey 2010).

No SRE millipede species were reported in the WAM database searches. However, one millipede specimen was collected in the STABM2 blue mallee leaf litter sample during the survey. It has been identified as *Austrostrophus* sp. indet., a member of the Triguniulidae family and a potential SRE.

The millipede family Triguniulidae represents a conspicuous element of the Southeast Asian and Indonesian faunas where 21 genera are recognised (Hoffman 2003). In Australia, however, the group has few representatives, including two monotypic genera from WA, *Austrostrophus* and *Speleostrophus* (Hoffman 1994, 2003). *Speleostrophus nesiotes*, endemic to caves on Barrow Island is the only Australian native millipede on a State endangered list (Mesibov 2006).

The genus *Austrostrophus* was described only fairly recently and includes a single species, *A. stictopygus* (Hoffman 2003). At the time of its description, *A. stictopygus* was thought to have a very narrow distribution and was only known from the Burrup Peninsula. Recent surveys as part of resource developments in the Pilbara have shown that the species is widespread throughout the region (Harvey *et al.* 2011) .

The specimen submitted for identification was a juvenile and could not be identified to species level. It is possible that it represents a second undescribed species known in addition to *A. stictopygus*, namely *Austrostrophus* 'DIP018' collected from two localities in the southeastern Pilbara and currently considered a potential SRE. Consequently, *Austrostrophus* sp. indet. from Lamb Creek is considered a potential SRE. While the distribution of this species is unknown, the habitat in which it was found is widespread and continuous on and off the project area.

5.6.5. ISOPODA (SLATERS)

Due to their reduced dispersal ability and narrow habitat preferences, slaters are one of the target groups of SRE surveys (Harvey 2002). The WAM database search recorded no slaters within 40 km of the project area. Two slater specimens were collected in litter samples at FLAGMA2 and STABM2 (Figure 12). These have been identified as two different species. One is a potential SRE and the other is a likely SRE.

The specimen collected in a litter sample from below a strap-leaved *Acacia* sp. at FLAGMA2 (Figure 12) was identified as *Buddelundia* '13', a member of the Armadillidae. The genus is currently under taxonomic revision by S. Judd. Species of *Buddelundia* often have a very wide distribution and are not expected to have many SRE species (S. Judd personal communication in Phoenix Environmental 2012).

However, *Buddelundia* '13' represents a small species-complex that is restricted to the Pilbara. This species was previously collected at the Wonmunna mining lease 80 km west of Newman (Phoenix Environmental Sciences 2011). However, the single specimen collected here is not fully mature so a determination is tentative. It is considered a potential SRE (S. Judd personal communication in Phoenix Environmental 2012). While the taxonomic resolution and distribution of this species is unknown, the habitat in which it was found is widespread and continuous on and off the project area.

The second isopod specimen was collected in the blue mallee sample at STABM2. The specimen is only tentatively associated with the genus *Spherillo*. It almost certainly belongs to a different, unnamed genus (S. Judd personal communication in Phoenix Environmental 2012). There have been very few specimens of this genus collected in the Pilbara, but species diversity appears high. This genus was also collected at Wonmunna (Phoenix Environmental Sciences 2011) but both clearly represent different species. It is extremely rare to find these armadillids among the epigean isopods of the Pilbara and they are therefore considered likely SREs (S. Judd personal communication in Phoenix Environmental 2012). This specimen was collected in a habitat that is widely distributed and continuous on and off the project area.

5.6.6. SCORPIONES

Thirteen scorpion samples were collected during the Lamb Creek fauna survey. The bulk of the samples were from the family Buthidae in the genus *Lychas.* This genus is widespread across the Australian mainland and is also distributed throughout Africa, eastern Asia and India. Two morpho-species were identified from the collected samples. *Lychas* 'harveyi' is a widespread species, particularly in the Pilbara where it is one of the most common scorpion species (Phoenix Environmental 2012). The nine specimens were identified as belonging to this morpho-species and were collected from all habitat types surveyed. *Lychas* 'pilbara1' is a widespread species that was recorded in the SATOM, SHET and MEAT habitat types. Although widely distributed throughout the Pilbara this species is not common and seldom collected. Neither *Lychas* species is regarded as an SRE species.

A single specimen of the genus *Urodacus* was collected from the FLAGMA2 site. *Urodacus* is an endemic genus that is highly diverse. The 23 species that are currently described may represent as little as 20% of the actual diversity within the genus. The Pilbara Biological Surveys recorded one formally described species and 9 undescribed species. Unfortunately certain identification of scorpions from this genus can only be made from adult male individuals. Consequently the specimen recorded from Lamb creek can only be recorded as *Urodacus* sp. indet owing to the immature life-stage of the sample collected. Further specimens are necessary to determine identification and SRE status of this species.

Given the relictual nature of the Wannamunna land system where this speciemen was collected it is possible that this species may represent a SRE species.

5.6.7. HABITAT ASSOCIATION

Four potential and one likely SRE species have been recorded in the STABM habitat type, which is described as *Eucalyptus gamophylla* low open woodland over *Acacia elachantha* or *Acacia hilliana*, *Senna glutinosa* subsp. *pruinosa* open shrubland over *Triodia brizoides, Triodia wiseana* hummock grassland. It is located on the Boolgeeda land system which covers a very large area of the Pilbara (approximately 7,748 km^2). This vegetation type is distributed over approximately 46% of the project area and is continuous with similar habitat in adjacent off footprint areas.

The other potential SRE species was collected at FLAGMA2. Despite being in flat, relatively open areas, both of these sites were noticeably wetter than the other foraging sites with traplines becoming inundated during rain, particularly STABM2.

The FLAGM2 trapping/litter site is located in the Wannamunna land system which comprises only a small portion (approximately 3%) of the project area near the intersection of the proposed haul road and the Great Northern Highway. The Wannamunna land system is a relatively uncommon land system with high conservation and pastoral value that supports the majority of the priority flora species recorded in Rapallo's flora survey (Rapallo Environmental 2012) and 'at risk' ecological communities 'Grove/inter-grove mulga, eastern Hamersley Range' and 'Valley floor mulga' mentioned in Kendrick (2002). Presence of a potential SRE species further supports the ecological value of this land system.

Recommendations regarding the management of habitats for SREs are presented in Section 7.

6. SPECIES OF CONSERVATION SIGNIFICANCE

Database searches for the area surrounding the haul road alignment indicate that 16 fauna species of conservation significance have been recorded in the region. Seven of these species were recorded within the habitats of the project area during surveys. Their locations are mapped in Figure 8. Based on an analysis of habitats recorded during the survey, an additional three species may occasionally use habitats of the project area (Table 9).

6.1. NIGHT PARROT – *PEZOPORUS OCCIDENTALIS*

The Night Parrot is listed under the *Wildlife Conservation Act 1950* as Schedule 1 – Fauna that are rare or likely to become extinct and under the *EPBC Act* as Critically Endangered and Migratory.

This enigmatic species was once relatively common throughout the arid zone but has declined in the last 80 years with the increase in pastoral activities in arid and semi-arid Australia. Although previously wide-ranging this species is known now from a few recent sightings and specimens. Sightings are centred on the Boulia region in western Queensland and the Fortescue Marsh in the Pilbara (Johnstone & Storr 1998).

Practically nothing is known about the biology of this species, although it is known to be highly nomadic. Recent records have corresponded with rainfall events and abundant food resources (Johnstone & Storr 1998).

There is one record of a Night Parrot located approximately 60 km northeast of the project area, at Mingawirriewirrie (Minga) Well. Pastoral activities across the region have decreased within the previous 20 years. As such there are potentially suitable areas of habitat for this species to use on the project area. While it is considered unlikely that the species is found on the project area, the possibility cannot be completely discounted; however it is acknowledged that sightings of this species are extremely rare.

6.2. NORTHERN QUOLL – *DASYURUS HALLUCATUS*

The Northern Quoll is listed under the *Wildlife Conservation Act 1950* as Schedule 1 – Fauna that are rare or likely to become extinct and under the *EPBC Act* as Endangered.

The Northern Quoll is a large omnivorous marsupial that was historically distributed throughout the northern areas of Australia (Van Dyke and Strahan, 2008). It has suffered wide-spread and drastic population reductions, a trend linked to altered fire regimes, habitat degradation, predation and competition from feral animals and poisoning resulting from consumption of cane toads (Braithwaite & Griffiths 1994; Oakwood 2000). Today the species distribution is confined to several isolated pockets of northern Queensland, the plateaus of Arnhem Land, the eastern Kimberley, offshore islands and the Pilbara (Van Dyke and Strahan, 2008). The Pilbara and offshore islands may represent the last populations free of cane toads.

There is limited data on the species ecology, especially the Pilbara populations. Most of the data from the Pilbara has been collected in relation to mineral development. Based on this data, it appears that the species is less likely to use riparian habitats containing hollows, as has been observed in other populations. The Pilbara populations seem closely tied to rocky habitats that contain caves and crevices. Rapallo (2010) reported extremely high densities associated with rocky mesas 20 kilometres to the east

of Port Hedland. This population appeared to avoid the surrounding hummock grassland plains and only occasionally use riparian habitats.

The project area and surrounds contain features such as gorges, rocky outcroppings, caves and overhangs as well as fig trees that appear to be suitable habitat to support Northern Quolls. However, the survey area appears to be only sparsely populated by Northern Quolls and there are very few records within 50 kilometres of the project area. Two observations were also recorded at Phil's Creek, 40 km west of Lamb Creek in habitats similar to those of the project area (Rapallo Environmental 2012)

A single record of the Northern Quoll was made during the survey from a motion detecting camera (Table 4). This camera was located in the central survey area but outside of the project footprint, along a gorge that is ringed by the proposed haul road. An old scat was also located within the same area ringed by the haul road.

Given the survey effort used to detect the presence of the species (182 MDC Camera nights and 300 cage trap nights), it would appear that there are no large populations of the species on the project area. Rapallo has deployed MDCs in similar habitats 300 kilometres to the WNW of the project area (Rapallo 2011). MDCs at these sites had a success rate of 59% and an average detection length of 2.8 days before Northern Quolls were detected. This survey had a detection rate of 0.5% on the MDCs.

Based on the survey effort used, Rapallo believes it is unlikely that an extensive population of Northern Quolls populates the project area, or habitats adjacent to it. It is more likely that the individual recorded during the survey is a dispersing individual. If there are permanent populations, they appear to be very sedentary based on the results of the camera and cage trap surveys.

Further recommendations relating to the Northern Quoll, including management and mitigation measures, are presented in section 7.

6.3. ORANGE LEAF-NOSED BAT – *RHINONICTERIS AURANTIA*

The Pilbara population of the Orange Leaf-nosed Bat is listed under the *Wildlife Conservation Act 1950* as Schedule 1 – Fauna that are rare or likely to become extinct and under the *EPBC Act* as Vulnerable.

The Orange Leaf-nosed Bat is an endemic species distributed across the top end of the Northern Territory and the Kimberley (Kulzer *et al.* 1970), with relict populations in the Pilbara region (Churchill 2008). They are considered to be the only remaining representatives of a diverse group that was present in the Miocene, and the species itself is thought to be old following the discovery of three – five million year old fossil material in the Riversleigh World Heritage Area (Archer, Hand, & Godthelp 1991).

The Orange Leaf-nosed Bat is unable to enter torpor (daily hibernation) to conserve heat. This species is susceptible to suffering exhaustion and hypothermia when exposed to cool roost temperatures (Kulzer *et al.* 1970). Orange Leaf-nosed Bats have one of the highest rates of pulmocutaneous water loss recorded for a mammal when exposed to low humidity (Baudinette *et al.* 2000). Consequently, during the dry season, they are restricted to relatively deep subterranean roosts that are able to provide a stable, warm and humid environment (Churchill, Helman, & Hall 1988; Armstrong 2007; Churchill 2008) . These suitable roosts are uncommon in the landscape although some underground mine workings in the Pilbara provide additional habitat (Armstrong, 2007).

As the Orange Leaf-nosed Bat has been recorded in close proximity to Lamb Creek (at mine site Area C), it is possible that this species may occur in or near the project area. Although no evidence of Pilbara Leaf-nosed Bats was detected during the survey it is possible that the deep clefts in the cliffs in the north-east of the project area may lead to sufficiently deep caves. These clefts were not explored due to unstable geology. Although no permanent water sources are in the immediate area, the surrounding region has not been surveyed and a bore dam within a few kilometres would provide adequate permanent water for Pilbara Leaf-nosed Bats.

6.4. PILBARA OLIVE PYTHON – *LIASIS OLIVACEUS* SUBSP. *BARRONI*

The Pilbara Olive Python is listed under the *Wildlife Conservation Act 1950* as Schedule 1 – Fauna that are rare or likely to become extinct and under the *EPBC Act* as Vulnerable. It is a subspecies of the Olive Python that is found only in the Pilbara region of Western Australia. It can grow up to five meters in length and will use rocky hills and gorges associated with creek-lines as habitat. Records of the species are generally associated with permanent water sources.

Some evidence suggests that it is more common than was once thought in the Pilbara, though it remains listed. Development of mines and associated infrastructure and a decline in some target prey species may be having a negative impact on the species abundance and distribution. Cats and foxes may also have a negative impact upon the species, predating upon hatchlings and juveniles.

One Pilbara Olive Python was observed during the survey (Figure 8). It was recorded crossing stony plains between the Hamersley massive and Lamb Creek. The rocky hills, gorges and drainages of the project area are highly suitable for the species. There are likely to be other individuals on the project area.

The proposed project is likely to have an impact on local populations of the species. Further recommendations regarding the species are presented in Section 7.

6.5. PEREGRINE FALCON - *FALCO PEREGRINUS*

The Peregrine Falcon is listed as Schedule 4 - Other Specially Protected Fauna The species was not listed in the DEC Threatened Fauna search undertaken for the area. The Peregrine Falcon experienced a large population decline as a result of reduced breeding success caused by herbicide and pesticide use. Since the banning of such chemicals the population has stabilised and expanded. In Western Australia, populations are stable in areas with granite outcrops and cliffs (Johnstone & Storr 1998). In the absence of such habitats, the species has been known to use nests of species from the family Corvidae and occasionally hollows for nesting (Marchant & Higgins 1993).

The species may occasionally hunt over the project area. The presence of rocky outcrops means that there is potential for the species to nest in or near the project area, but no nests were observed. The project is unlikely to have a significant impact on the species through removal of foraging habitat as it is contiguous with vast areas of similarly habitat.

6.6. *RAMPHOTYPHLOPS GANEI*

Ramphotyphlops ganei is classified as Priority 1 – Poorly known taxa. It is a relatively large and robust blind snake, growing to approximately 33cm long and 1.5cm thick. They can be distinguished by other Pilbara blind snakes by their large and robust size, scalation (mid-body scales 24 rows), snout shape

(rounded from above and in profile) and length of nasal cleft in the 2nd upper labial scale (extends vertically to top of head) (Plate 9) (Wilson & Swan 2008).

This species was first collected in 1985 and first described in 1998. Very little is known about its ecology. Only 28 records of the species have been made in the Pilbara (DEC 2012c). This species appears to be restricted to the Pilbara, recorded from Pannawonica, throughout the Hamersley Ranges through to Newman, and north to the edge of the Chichester Range, south of Port Hedland. Wilson and Swan (2008), report that this species may be associated with moist gorges and gullies but recent records from areas of snake-wood and acacia scrub indicate that this may not be the case.

There are two records of this species within 20 km of the project area listed on NatureMap (DEC 2012c). This species is usually recorded through pit fall trapping, of which there were 10 arrays of 20 pit falls across five suitable habitat types. No *R. ganei* were recorded during the survey but, habitat of moderate suitability, such as drainages and outcroppings, are present in the project area. Thus the habitat has moderate potential to support *R. ganei*.

6.7. WESTERN PEBBLE-MOUND MOUSE – *PSEUDOMYS CHAPMANI*

The Western Pebble-mound Mouse is listed as Priority 4 - Taxa in need of monitoring by the DEC. It is endemic to Western Australia and is noted for the large mounds of pebbles constructs around burrow systems. Dormant and extinct mounds displaying these characteristics suggest the species was once distributed south into the Murchison. Its current distribution is limited to the Pilbara and northern Gascoyne regions of Western Australia (Van Dyck & Strahan 2008).

The species is communal with up to ten individuals living in an active burrow system at any one time. The pebble mounds around the burrows are roughly similar throughout their distribution with pebbles ranging between 0.5 and 3.5 centimetres in width. The mound area generally varies with mound age but mounds 4m in diameter have been reported.

Numerous mounds attributed to the species were recorded during the survey. The majority of mounds were active (Figure 8). This species is likely to be impacted by the project due to the abundance of active mounds throughout the project area. It will be difficult to avoid all active mounds.

6.8. GHOST BAT –*MACRODERMA GIGAS*

The Ghost Bat is classified by DEC as Priority 4 - taxa in need of monitoring. The Ghost Bat is the largest Australian microbat species. Weighing an average 105 grams they are almost twice the weight of the next largest microbat (Churchill 2008). They are the only strictly carnivorous bat in Australia, feeding on frogs, birds, reptiles, mammals (including other bats) and large insects. Prey is caught and carried to an established feeding site (rock overhang or small cave). These sites are easily recognised by the accumulation of prey remains on the floor. Searching for these sites is one way of determining the presence of Ghost Bats. They can also be detected by searching large caves, mines and deep rock fissures for day roosting sites (Churchill 2008). As this species does not use echolocation to hunt for prey like other microbats, consequently they are difficult to detect using ANABAT.

Ghost Bats have a widespread but patchy distribution across a diverse range of habitats (Van Dyck & Strahan 2008). The exact reason for their decline is unknown, although this species is sensitive to disturbance. Genetic studies have shown that this species is highly reliant on a few maternity sites and thus highly susceptible to swift decline if these sites are compromised.

There are several small cave systems within the survey area that are likely to be used as roosts by Ghost Bats. Ghost bats were observed roosting in two caves in the project area (Figure 8) and one in the survey area. Five Ghost Bats were observed in one cave and two in the other. Ghost Bats may also forage in other habitats in the project area. Several potential caves were observed on the project area but were not searched due to inaccessibility or safety issues (unstable rocks). One roost cave containing two Ghost Bats is located on the proposed impact area, inside the proposed ore body. The other is adjacent in the area of hills ringed by haul road. Fencing can adversely affect bats when it is initially erected. Any fencing of the project area to limit stock movements through the area may cause direct mortalities through striking of the fence line. Noise and vehicle movements would also impact caves as constant disturbance through noise or vibration can cause bat species to abandon caves. It is highly likely mining operations in the area would impact the local Ghost Bat population in the short term, resulting in the abandonment of those caves whilst mining operations occur. Measures to mitigate the impact of such activities are discussed in Section 7.

6.9. AUSTRALIAN BUSTARD – *ARDEOTIS AUSTRALIS*

The Australian Bustard is classified as Priority 4 – Taxa in need of monitoring by DEC. Garnett and Crowley (2000) list the species as near threatened.

The species is widely distributed but has suffered massive historical population declines. It is particularly vulnerable to intensive agricultural practices and fox predation (Garnett & Crowley 2000). The species uses a wide variety of grass habitats; including tussock grasslands, *Triodia* and grassy woodlands. They can also use chenopod flats and have been reported in modified habitats such as golf courses. The species feeds on a variety of insects (particularly stick insects) and fruit (Johnstone & Storr 1998).

The project area contains suitable habitats for the species. Two Australian Bustards were recorded on two separate evenings during the survey (Figure 8). The species is highly mobile and there is a low risk of long term detrimental impacts to the Pilbara population as a result of the proposed project.

6.10. BUSH STONE-CURLEW – *BURHINUS GRALLARIUS*

The Bush Stone-curlew is listed as Priority 4 – taxa in need of monitoring by DEC. Garnett and Crowley (2000) list the species as near threatened. The species is associated with lightly wooded areas where there is an abundance of fallen logs and leaf litter. Once distributed in all but the most arid areas of Australia, the species has suffered large range contractions and population declines. It is particularly vulnerable to feral animal predation but has also suffered from land clearing and altered fire regimes (Johnstone & Storr 1998).

Whilst not common, the species is still moderately abundant throughout the Pilbara. It uses tussock grassland plains and shrub lands of *Acacia* as well as ephemeral drainage systems.

This species was not recorded during the survey. However, the habitats of the project area are potentially suitable for the species. The species is highly mobile and there are large areas of suitable habitat throughout the Pilbara. While the project may have a localised impact on the species, it is unlikely to have a long term impact on the regional population of the species.

6.11. GREY FALCON - *FALCO HYPOLEUCOS*

The Grey Falcon is listed by the DEC as Priority 4 - Taxa in need of monitoring. The Grey Falcon's total population estimated at fewer than 5,000 individuals and 1,000 pairs (Garnett & Crowley 2000).Garnett and Crowley (2000) list it as Near Threatened and if any decline is detected the species will need to be reclassified as Vulnerable. The species is generally found north of 26°S (Gascoyne, Lake Carnegie and Warburton) (Johnstone & Storr 1998), but have been infrequently sighted from the Murchison northward (Birddata, 2012). There are an estimated 50 pairs in South Australia and consistently few sightings across the country (Garnett & Crowley 2000). However, it continues to be seen throughout its range (Reid & Fleming 1992), and evidence for general decline across arid zone is lacking (Garnett & Crowley 2000).

The distribution of the Grey Falcon is centred on inland drainage systems where there is an average annual rainfall of less than 500 mm. There it frequents timbered lowland plains, particularly *Acacia* shrublands that are crossed by tree-lined watercourses. It also hunts far out into treeless areas and frequents tussock grassland and open woodland, especially in winter (Olsen & Olsen 1986).

The nearest records for the species are within 20 km from the project area. The project is inside the species' core distribution and contains habitats that are suitable for its use, including areas with large eucalypts near dry watercourses. The Grey Falcon may occur in the project area; however, it is unlikely to nest there due to limited availability of water. The project may impact the species if large eucalypts are removed or if significant watercourse alterations are undertaken.

6.12. RAINBOW BEE-EATER – *MEROPS ORNATUS*

The Rainbow Bee-eater *Merops ornatus* is listed as a Migratory Terrestrial Species under the *EPBC Act*. The Rainbow Bee-eater prefers open or lightly timbered areas, often near water. This species has been recorded in dry open sclerophyll forest, open woodlands and shrublands, including mallee, spinifex tussock grassland with scattered trees, chenopod shrubland with scattered trees and riparian or littoral assemblages. It is often seen around disturbed areas such as quarries, road cuttings and mines where exposed bare soil provides suitable breeding sites (Marchant & Higgins 1993). The Rainbow Bee-eater is a migratory bird and moves north from the southern areas of Australia during winter (Johnstone & Storr 1998).

One individual was recorded during the survey. There is suitable habitat across the project area. The species is highly mobile and there is a low risk of long term detrimental impacts to the Pilbara population as a result of the proposed project.

6.13. EASTERN GREAT EGRET – *ARDEA MODESTA*

The Eastern Great Egret can be found throughout Australia, with the exception of the arid regions. It is listed under the *EPBC Act* as both a Migratory Marine and Migratory Wetland species. The Eastern Great Egret inhabits terrestrial wetlands, estuarine, littoral habitats and grasslands. It prefers permanent water bodies on floodplains and the shallows of deep permanent lakes (Marchant & Higgins 1993), though it can be seen on any watered area including damp grasslands (Johnstone & Storr 1998). The species may be recorded on the project area after wide-spread flooding, but it is unlikely to use the area regularly. It was not recorded during the fauna survey.

6.14. CATTLE EGRET - *ARDEA IBIS*

The Cattle Egret is listed as a Migratory Wetland species under the *EPBC Act*. In Western Australia the Cattle Egret is common in areas of medium to high rainfall. The Cattle Egret uses grasslands, woodlands and wetlands, and is not common in arid areas (Johnstone & Storr 1998). The species may be recorded on the project area after wide-spread flooding, but it is unlikely to use the area regularly. It was not recorded during the fauna survey.

6.15. ORIENTAL PLOVER – *CHARADRIUS VEREDUS*

The Oriental Plover is listed as a Migratory Wetland species under the *EPBC Act*. It moves south from breeding grounds in Mongolia and China to spend winters (southern summer) in Indonesia, Australia and sometimes New Zealand. It is found inland, generally in open grassland in arid or semi-arid climates and may be found in estuarine or littoral environments. The Oriental Plover prefers flat inland plains sparsely vegetated with short grass and hard bare ground such as claypans, playing fields, lawns and cattle camps (Marchant & Higgins 1993). The species was not recorded during the fauna survey.

6.16. FORK-TAILED SWIFT – *APUS PACIFICUS*

The Fork-tailed Swift is listed under the *EPBC Act* as a Migratory Marine species. It breeds in north-east and mid-east Asia and winters in Australia and southern New Guinea. It is a visitor to most parts of Western Australia, arriving in the Kimberley in late September, in the Pilbara and Eucla by November and in the south-west land division by mid-December. The species generally returns to its breeding grounds by April. It ranges from common in the Kimberley; uncommon to moderately common in the north-west, west and south-eastern coasts and rare or scarce elsewhere (Johnstone & Storr 1998).

Fork-tailed Swifts were recorded across all five habitat types in the project area. Flocks of approximately 100 individuals were recorded at one location. This irruptive species is likely to be a transient user of the habitats in the project area following the significant rainfall that occurred in the project area in the months preceding the survey.

7. MANAGEMENT AND MITIGATION

While most birds, larger mammals and reptiles will able to avoid the impact of clearing for the project, smaller mammals, reptiles and burrowing frogs will be unavoidably killed by the large machinery used for vegetation removal and ground preparation, or by exposure to predators. All fauna are at risk of impacts from habitat impacts, disturbance, introduction of non-native predators, and vehicle impacts.

In order to minimise the project's impacts on vertebrate and SRE invertebrate fauna, a series of general recommendations are given below.

7.1. SENSITIVE HABITAT AREAS

Two habitats have been identified as supporting a disproportionate high number of species of conservation significance, the FLAGMA habitat type which falls within the Wannamunna land system and the STABM habitat type which falls within the Boolgeeda land system.

The Boolgeeda land system is relatively extensive throughout the Pilbara. Species of conservation significance that are found within the STABM habitat type are likely to found elsewhere in the same habitats of the local area. Rapallo recommends that, where possible, these habitats should be avoided. Mine site planning should recognise the value of this habitat in the local area and where possible, infrastructure should be placed away from the habitat type.

Rapallo recommends avoiding disturbance in FLAGMA habitat type of the Wannamunna land system. If disturbance cannot be avoided, Rapallo recommends consulting the DEC to determine the most effect mitigation measures.

7.2. SENSITIVE HABITAT FEATURES

Direct records of species of conservation significance were collected from several habitat features. Such features include caves and gorges. These features should be avoided to ensure long term persistence of these species during and after the operation of the mine.

If sensitive caves or habitat features cannot be avoided, Rapallo recommends consulting the DEC to determine the most effective mitigation measures.

Data on these features are provided in Appendix X.

7.3. MANAGEMENT AND MITIGATION RECOMMENDATIONS

Specific management measures should be developed as further mine site planning is undertaken. However the following, broad measures are recommended to reduce impact on species of conservation significance, specifically the Northern Quoll and Pilbara Olive Python:

- speed limits along haul roads that intersect habitats likely to support species of conservation significance;
- signage delineating zones of conservation significant species and/or their habitat;
- sensitive habitats and habitat features to be marked out to reduce risk of accidental damage;

- man-made water bodies (i.e. turkey nests) to be located away from high traffic areas (as such features often attract the Pilbara Olive Python);
- provide trained fauna handling personnel to supervise clearing works so that slow moving fauna such as the Pilbara Olive Python can be captured and relocated.

7.4. GROUND DISTURBANCE AND REHABILITATION MANAGEMENT

Before any large-scale clearing is undertaken, the following measures should be implemented:

- avoid unnecessary clearing of vegetation, i.e. beyond that strictly required;
- avoid clearing or disturbing habitats that support populations of significant fauna;
- avoid excessive disturbance and clearing around creeks or minor drainage channels;
- progressively rehabilitate cleared areas such as laydown sites, access tracks and grid lines where these are no longer required;
- avoid direct impacts (clearing and grading) to active nests and large trees, particularly those associated with watercourses as a variety of birds use these habitats; and
- wind-rows of topsoil, log debris and leaf litter formed during clearing should be retained to provide for rehabilitation, and they create extremely good micro-habitat for a range of fauna, particularly reptiles.

Most habitats found within the proposed project area are also found outside the project area. The level of impact caused by the project could be reduced by increasing the health of other similar habitats. This could be done by:

- undertaking weed control projects;
- fencing off vulnerable habitats; and
- implementing fire management plans to reduce the risk of large high intensity wildfires.

7.5. AVOIDANCE AND MINIMISATION OF IMPACTS TO SREs

Distribution of possible SRE taxa suggests that they are associated with sheet flow and minor drainage areas on plains. Impacts to SRE taxa could be avoided and minimised through the following measures:

- protect creek line habitats and minimise clearing near creek lines, drainage lines and sheet flows;
- limit the number of access tracks across creek lines and drainage;
- manage and exclude impacts from areas where potential SRE's have been found wherever possible; and
- fire management to ensure long term viability of habitats that are recognised to support potential SRE's on the project area.

7.6. NOISE, VIBRATION AND LIGHT MANAGEMENT

Noise, vibration and altered light regimes can impact the behaviour of conservation significant species and SRE taxa. Equipment and infrastructure (i.e. processing plants) should be located in areas/habitats

deemed as low risk for species of conservation significance and possible SRE's (i.e. not adjacent to creek lines, drainage, and very moist habitats)

7.7. ENVIRONMENTAL AWARENESS AND EDUCATION PROGRAM

Environmental awareness and education programs for on-site personnel should be designed to achieve the following:

- encourage a culture of environmental consciousness on site by increasing the awareness of the environmental commitments of the project;
- display appropriate signage on site e.g. litter management, speed restrictions, species of conservation significance; and
- set site and targeted habitat speed limits on site especially in areas where species of conservation significance are regularly reported.

7.8. INVASIVE SPECIES MANAGEMENT PROGRAM

As the project falls within an active cattle station, the project area is susceptible to carrying a heavy weed load and supporting non-native predators. Such species have negative impacts on the Northern Quoll and other species of conservation significance. Rapallo recommends implementing an invasive species management program. Such a program may offset the localised impacts of the proposed mining project. An invasive species management program could include:

- weed control program;
- rubbish disposal procedures should be applied, especially for food refuse, in order to discourage scavenging by crows, dogs, foxes and feral cats. Large numbers of these animals can have an adverse impact on other fauna, humans and infrastructure; and
- feral animal control program.

APPENDICES

Appendix I: State and Federal Conservation Codes

Western Australian *Wildlife Conservation Act 1950* - Fauna

Priority 1	Taxa with few, poorly known populations on threatened lands. Taxa which are known from few specimens or sight records from one or a few localities on lands not managed for conservation, e.g. agricultural or pastoral lands, urban areas, active mineral leases. The taxon needs urgent survey and evaluation of conservation status before consideration can be given to declaration as threatened fauna.
Priority 2	Taxa with few, poorly known populations on conservation lands. Taxa which are known from few specimens or sight records from one or a few localities on lands not under immediate threat of habitat destruction or degradation, e.g. national parks, conservation parks, nature reserves, State forest, vacant Crown land, water reserves, etc. The taxon needs urgent survey and evaluation of conservation status before consideration can be given to declaration as threatened fauna.
Priority 3	Taxa with several, poorly known populations, some on conservation lands. Taxa which are known from few specimens or sight records from several localities, some of which are on lands not under immediate threat of habitat destruction or degradation. The taxon needs urgent survey and evaluation of conservation status before consideration can be given to declaration as threatened fauna.
Priority 4:	Taxa in need of monitoring. Taxa which are considered to have been adequately surveyed, or for which sufficient knowledge is available, and which are considered not currently threatened or in need of special protection, but could be if present circumstances change. These taxa are usually represented on conservation land.

Western Australian Wildlife Conservation Act 1950-Flora

Declared Rare Flora R	Taxa, which have been adequately searched for and are deemed to be in the wild either rare, in danger of extinction, or otherwise in need of special protection, and have been gazetted as such.
Declared Rare Flora X	Taxa which have not been collected or otherwise verified, over the past 50 years despite thorough searching, or of which all known wild populations have been destroyed more recently, and have been gazetted as such.
Priority 1	Taxa which are known from one or a few (generally <5) populations which are under threat, either due to small population size, or being on lands under immediate threat, eg road verges, urban areas, farmland, active mining leases etc, or the plants are under threat, eg from disease, grazing by feral animals etc. May include taxa with threatened populations on protected lands. Such taxa are under consideration for declaration as 'rare flora', but are in urgent need of further survey.
Priority 2	Taxa which are known from one or a few (generally <5) populations at least some of which are not believed to be under immediate threat) i.e. not currently endangered). Such taxa are under consideration for declaration as 'rare flora', but are in urgent need for further study.
Priority 3	Taxa which are known from several populations, and the taxa are not believed to be under immediate threat (i.e. not currently endangered), either due to the

	number of known populations (generally > 5), or known populations being large and either widespread or protected. Such taxa and under consideration for declaration as 'rare flora' but are in need of further study.
Priority 4	Taxa which are considered to have been adequately surveyed and which, whilst being rare, are not commonly threatened by any identifiable factors. These taxa require monitoring every 5-10 years.

Commonwealth *Environment Protection and Biodiversity Conservation Act* 1999

Extinct	A native species is eligible to be included in the *extinct* category at a particular time if, at that time, there is no reasonable doubt that the last member of the species has died.
Endangered	A native species is eligible to be included in the *endangered* category at a particular time if, at that time: (a) it is not critically endangered; and (b) it is facing a very high risk of extinction in the wild in the near future, as determined in accordance with the prescribed criteria.
Vulnerable	A native species is eligible to be included in the *vulnerable* category at a particular time if, at that time: (a) it is not critically endangered or endangered; and (b) it is facing a high risk of extinction in the wild in the medium-term future, as determined in accordance with the prescribed criteria.

WILDLIFE CONSERVATION REGULATIONS 1970

Regulation 17:- Licence to Take Fauna for Scientific Purposes

FURTHER CONDITIONS (OF LICENCE NUMBER SF008562)

1. The licensee shall take fauna only in the manner stated on the endorsed Regulation 17 licence application form and endorsed related correspondence.

2. Except in the case of approved lethal traps, the licensee shall ensure that measures are taken in the capture and handling of fauna to prevent injury or mortality resulting from that capture or handling. Where traps or other mechanical means or devices are used to capture fauna these shall be deployed so as to prevent exposure of trapped animals to ants and debilitating weather conditions and inspected at regular intervals throughout each day of their use. At the conclusion of research all markers etc and signs erected by the licensee and all traps shall be removed, all pitfalls shall be refilled or capped and the study area returned to the condition it was in prior to the research/capture program. During any break in research, cage traps should be removed and pitfalls either removed, capped or filled with sand.

3. No collecting is to be undertaken in areas where it would impinge on pre-existing scientific research programs.

4. Any form of colour marking of birds or bats shall only be undertaken in accordance with the requirements of the Australian Bird and Bat Banding Scheme.

5. Any inadvertently captured specimen of fauna which is declared as likely to become extinct, rare or otherwise in need of special protection is to be released immediately at the point of capture. Where such a specimen is injured or deceased, the licensee shall contact Department of Environment and Conservation licensing staff at Kensington (08 9423 2434) for advice on disposal. Records are to be kept of any fauna so captured and details included in the report required under further condition 6 below.

6. Within one month of the expiration of this licence, the holder shall submit an electronic return detailing the locality, site, geocode, date and number of each species captured, sighted or vouchered during the currency of the licence, into the Department of Environment and Conservation Fauna Survey Database (DECFSD). A copy of any paper, report or thesis resulting from the research shall on completion be lodged with the Director General. If a renewal of this licence is required, the licensee shall submit a written progress report for activities undertaken during this licence period prior to the expiry of this licence.

7. Not more than ten specimens of any one protected species shall be taken and removed from any location less than 20km apart. Where exceptional circumstances make it necessary to take large series in order to obtain adequate statistical data the collector will proceed with circumspection and justify their actions to the Director General in advance.

8. All holotypes and syntypes and a half share of paratypes of species or subspecies permitted to be permanently taken under this licence shall be donated to the Western Australian Museum. Duplicates (one pair in each case) of any species collected which represents a significant extension of geographic range shall be donated on request to the Western Australian Museum.

9. To prevent any unnecessary collecting in this State, all specimens and material collected under the authority of this license shall, on request, be loaned to the Western Australian Museum. Also, the unused portion or portions of any specimen collected under the authority of this license shall be offered for donation to the Western Australian Museum or made available to other scientific workers if so required.

Appendix IV: DEC Threatened Ecological Communities Search Results

DEPARTMENT OF ENVIRONMENT AND CONSERVATION

THREATENED AND PRIORITY ECOLOGICAL COMMUNITIES INFORMATION

CONDITIONS IN RESPECT OF SUPPLY OF INFORMATION

1. All requests for data are to be made in writing to the Director General, Department of Environment and Conservation Attention: Species and Communities Branch

2. The data supplied may not be supplied to other organisations, nor be used for any purpose other than for the project for which they have been provided, without the prior written consent of the data custodian (Val English), Species and Communities Branch.

3. Specific locality information for threatened and priority ecological communities (TECs/PECs) is regarded as confidential, and should be treated as such by receiving organisations. Specific locality information for TECs/PECs may not be used in public reports without the written permission of the Director General, Department of Environment and Conservation. Publicly available reports may only show generalised locations (ie buffer locations). The TEC database manager is to be contacted for guidance on the presentation of TEC/PEC information.

4. Note that the Department of Environment and Conservation respects the privacy of private landowners who may have threatened and priority ecological communities on their property. Locations of TECs/PECs identified in the data as being on private property should be treated in confidence, and contact with property owners made through the Department of Environment and Conservation.

5. Receiving organisations should note that while every effort has been made to prevent errors and omissions in the data provided, they may be present. The Department of Environment and Conservation accepts no responsibility for this.

6. Receiving organisations must also recognise that the Threatened Ecological Communities database is subject to continual updating and amendment, and such considerations should be taken into account by the user.

7. It should be noted that the supplied data do not necessarily represent a comprehensive listing of the threatened and priority ecological communities of the area in question. Its comprehensiveness is dependant on the amount of survey carried out within the specified area. Private property has been relatively little surveyed. The receiving organisation should employ a consultant, if there is any likelihood of the presence of any threatened or priority ecological community, to undertake a survey of the area under consideration.

8. Acknowledgment of the Department of Environment and Conservation as source of the data is to be made in any published material. Copies of all such publications are to be forwarded to the Department of Environment and Conservation, Attention: Manager, Species and Communities Branch.

Threatened and Priority Ecological Community buffers in WA

UNDER NO CIRCUMSTANCES IS THIS DATA TO BE PROVIDED TO ANY THIRD PARTIES, for more details see conditions for the supply of this information.

Citation

Title: Threatened and Priority Ecological Community buffers in WA

Custodian: Department of Environment & Conservation

Description

Abstract: Ecological communities throughout WA that are "Presumed Totally Destroyed", "Critically Endangered", "Endangered", "Vulnerable", "Priority 1-5", "Lower Risk" and "Not evaluated". Communities are based on various life-forms including plants, invertebrates and micro-organisms.

Geographical Bounding Box

North: -14.788854

South: -35.005719

East: 128.870214

West: 113.765525

Data Currency and Status

Beginning Date: 1/1/94

Ending Date: current

Maintenance/Update: As requested

Access

Stored Data Format: ESRI shapefile

Coordinate System: GCS_GDA_1994

Access Constraints:	Digital data is only available with written permission of the custodian. In addition, some occurrence data eg. location of sites on private land, is password restricted.

Data Quality

Positional Accuracy:	Point location data within occurrences usually from GPS fix, usually within 100 metres. Some digitized from hard copy.
Attribute Accuracy:	Not documented.
Logical Consistency:	Not documented.
Completeness:	Information on specific communities was obtained from regional, subregional or specific habitat surveys of floristic communities, invertebrate communities, wetland assemblages and communities of micro-organisms.

Attributes List:

Name	Description
BDY_ID	Associated boundary polygon unique identifier
OCC_UNIQUE	Unique occurrence identifier
COM_ID	Shortened community name identifier
COM_NAME	Community name
CT_DESC	State listed Category of Threat
S_ID_COUNT	Number of Site IDs within a buffer
FIRST_S_ID	First site identifier
LAST_S_ID	Last site identifier
BUFFER	Buffer radius from site ID or boundary in metres

General Information:

Priority Ecological Communities	■ There are 284 known PECs and subtypes , 271 (~95%) of these on the TEC/PEC database ■ The location of priority communities is good, but not complete across the state ■ There is a formal list of PECs at http://www.dec.wa.gov.au/content/view/849/2017/ ■ Many PECs are awaiting endorsement as TECs
buffers	■ The buffer radius around each occurrence of a TEC or PEC is included to help ensure that developments with potential to impact groundwater or surface water are picked up. ■ For wetland TEC or PECs we seek to include an area within the buffer zone that is intended to help protect groundwater and surface water. The area required to protect different types of wetlands from a variety of hydrological impacts will, of course, differ.

- For upland TEC or PECs that are believed not to be groundwater dependent, the buffer area radius encompasses the TEC or PEC site location recorded in the TEC database, and extends at least to the furthest point in the occurrence. This is to ensure that the 'buffer' area encompasses at least the entire TEC or PEC. This means that some linear occurrences may need a larger buffer radius to encompass the entire occurrence.
- Occurrences with a buffer distance of 0 are no longer extant.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected.

Information on the coverage of this report and qualifications on data supporting this report are contained in the caveat at the end of the report.

Information about the EPBC Act including significance guidelines, forms and application process details can be found at http://www.environment.gov.au/epbc/assessmentsapprovals/index.html

Report created: 12/04/12 12:31:56

Summary
Details
- Matters of NES
- Other Matters Protected by the EPBC Act
- Extra Information

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance - see http://www.environment.gov.au/epbc/assessmentsapprovals/guidelines/index.html

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Areas:	None
Threatened Ecological Communities:	None
Threatened Species:	6
Migratory Species:	8

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place and the heritage values of a place on the Register of the National Estate. Information on the new heritage laws can be found at http://www.environment.gov.au/heritage/index.html

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species. Information on EPBC Act permit requirements and application forms can be found at http://www.environment.gov.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	5
Whales and Other Cetaceans:	None
Critical Habitats:	None
Commonwealth Reserves:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

Place on the RNE:	None
State and Territory Reserves:	1
Regional Forest Agreements:	None
Invasive Species:	4
Nationally Important Wetlands:	None

Details

Matters of National Environmental Significance

Threatened Species		[Resource Information]
Name	Status	Type of Presence
BIRDS		
Pezoporus occidentalis		
Night Parrot [59350]	Endangered	Species or species habitat likely to occur within area

Name	Status	Type of Presence
MAMMALS		
Dasyurus hallucatus		
Northern Quoll [331]	Endangered	Species or species habitat likely to occur within area
Rhinonicteris aurantia (Pilbara form)		
Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat likely to occur within area
PLANTS		
Lepidium catapycnon		
Hamersley Lepidium, Hamersley Catapycnon [9397]	Vulnerable	Species or species habitat likely to occur within area
Thryptomene wittweri		
Mountain Thryptomene [16645]	Vulnerable	Species or species habitat likely to occur within area
REPTILES		
Liasis olivaceus barroni		
Olive Python (Pilbara subspecies) [66699]	Vulnerable	Species or species habitat may occur within area

Migratory Species [Resource Information]

* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
Migratory Marine Birds		
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat may occur within area
Ardea alba		
Great Egret, White Egret [59541]		Species or species habitat may occur within area
Ardea ibis		
Cattle Egret [59542]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Merops ornatus		
Rainbow Bee-eater [670]		Species or species habitat may occur within area
Pezoporus occidentalis		
Night Parrot [59350]	Endangered	Species or species habitat likely to occur within area
Migratory Wetlands Species		
Ardea alba		
Great Egret, White Egret [59541]		Species or species habitat may occur within area
Ardea ibis		
Cattle Egret [59542]		Species or species habitat may occur within area
Charadrius veredus		
Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species [Resource Information]

* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat may occur within area
Ardea alba Great Egret, White Egret [59541]		Species or species habitat may occur within area
Ardea ibis Cattle Egret [59542]		Species or species habitat may occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area

Extra Information

State and Territory Reserves [Resource Information]

Name	State
Karijini	WA

Invasive Species [Resource Information]

Weeds reported here are the 20 species of national significance (WoNS), along with other introduced plants that are considered by the States and Territories to pose a particularly significant threat to biodiversity. The following feral animals are reported: Goat, Red Fox, Cat, Rabbit, Pig, Water Buffalo and Cane Toad. Maps from Landscape Health Project, National Land and Water Resouces Audit,

Name	Status	Type of Presence
Mammals		
Felis catus Cat, House Cat, Domestic Cat [19]		Species or species habitat likely to occur within area
Oryctolagus cuniculus Rabbit, European Rabbit [128]		Species or species habitat likely to occur within area
Vulpes vulpes Red Fox, Fox [18]		Species or species habitat likely to occur within area
Plants		
Cenchrus ciliaris Buffel-grass, Black Buffel-grass [20213]		Species or species habitat likely to occur within area

Caveat

The information presented in this report has been provided by a range of data sources as acknowledged at the end of the report.

This report is designed to assist in identifying the locations of places which may be relevant in determining obligations under the Environment Protection and Biodiversity Conservation Act 1999. It holds mapped locations of World Heritage and Register of National Estate properties, Wetlands of International Importance, Commonwealth and State/Territory reserves, listed threatened, migratory and marine species and listed threatened ecological communities. Mapping of Commonwealth land is not complete at this stage. Maps have been collated from a range of sources at various

Not all species listed under the EPBC Act have been mapped (see below) and therefore a report is a general guide only. Where available data supports mapping, the type of presence that can be determined from the data is indicated in general terms. People using this information in making a referral may need to consider the qualifications below and may need to seek and consider other

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

For species where the distributions are well known, maps are digitised from sources such as recovery plans and detailed habitat studies. Where appropriate, core breeding, foraging and roosting areas are indicated under 'type of presence'. For species whose distributions are less well known, point locations are collated from government wildlife authorities, museums, and non-government organisations; bioclimatic distribution models are generated and these validated by experts. In some cases, the distribution maps are based solely on expert knowledge.

Only selected species covered by the following provisions of the EPBC Act have been mapped:

- migratory and
- marine

The following species and ecological communities have not been mapped and do not appear in reports produced from this database:

- threatened species listed as extinct or considered as vagrants
- some species and ecological communities that have only recently been listed
- some terrestrial species that overfly the Commonwealth marine area
- migratory species that are very widespread, vagrant, or only occur in small numbers

The following groups have been mapped, but may not cover the complete distribution of the species:

- non-threatened seabirds which have only been mapped for recorded breeding sites
- seals which have only been mapped for breeding sites near the Australian continent

Such breeding sites may be important for the protection of the Commonwealth Marine environment.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Department of Environment, Climate Change and Water, New South Wales
-Department of Sustainability and Environment, Victoria
-Department of Primary Industries, Parks, Water and Environment, Tasmania
-Department of Environment and Natural Resources, South Australia

252.	25261	*Pseudechis australis (Mulga Snake)*			
253.	25263	*Pseudonaja modesta (Ringed Brown Snake)*			
254.	25264	*Pseudonaja nuchalis (Gwardar)*			
255.	25009	*Pygopus nigriceps*			
256.	25270	*Ramphotyphlops ammodytes*			
257.	25277	*Ramphotyphlops grypus*			
258.	25279	*Ramphotyphlops hamatus*			
259.	25288	*Ramphotyphlops waitii*			
260.	24982	*Rhynchoedura ornata (Beaked Gecko)*			
261.	24927	*Strophurus elderi*			
262.	24932	*Strophurus jeanae*			
263.	24949	*Strophurus wellingtonae*			
264.	25269	*Suta fasciata (Rosen's Snake)*			
265.	25202	*Tiliqua multifasciata (Central Blue-tongue)*			
266.	25209	*Varanus acanthurus (Spiny-tailed Monitor)*			
267.	25210	*Varanus brevicauda (Short-tailed Pygmy Monitor)*			
268.	30825	*Varanus bushi (Pilbara Mulga Monitor)*			
269.	25211	*Varanus caudolineatus*			
270.	25212	*Varanus eremius (Pygmy Desert Monitor)*			
271.	25215	*Varanus gilleni (Pygmy Mulga Monitor)*			
272.	25218	*Varanus gouldii (Bungarra or Sand Monitor)*			
273.	25222	*Varanus panoptes subsp. panoptes*			
274.	25223	*Varanus panoptes subsp. rubidus*			
275.	25224	*Varanus pilbarensis (Pilbara Rock Monitor)*			
276.	25227	*Varanus tristis subsp. tristis (Racehorse Monitor)*			
277.	25311	*Vermicella snelli*			

Conservation Codes
T - Rare or likely to become extinct
X - Presumed extinct
IA - Protected under international agreement
S - Other specially protected fauna
1 - Priority 1
2 - Priority 2
3 - Priority 3
4 - Priority 4
5 - Priority 5

[1] For NatureMap's purposes, species flagged as endemic are those whose records are wholely contained within the search area. Note that only those records complying with the search criterion are included in the calculation. For example, if you limit records to those from a specific datasource, only records from that datasource are used to determine if a species is restricted to the query area.

Appendix VII: Birdlife Australia Birdata Search Results

Bird list for one degree square containing the point 118.83503, -22.82911

Common Name	Scientific Name
Emu	*Dromaius novaehollandiae*
Stubble Quail	*Coturnix pectoralis*
Brown Quail	*Coturnix ypsilophora*
Plumed Whistling-Duck	*Dendrocygna eytoni*
Freckled Duck	*Stictonetta naevosa*
Black Swan	*Cygnus atratus*
Australian Wood Duck	*Chenonetta jubata*
Pink-eared Duck	*Malacorhynchus membranaceus*
Grey Teal	*Anas gracilis*
Pacific Black Duck	*Anas superciliosa*
Hardhead	*Aythya australis*
Australasian Grebe	*Tachybaptus novaehollandiae*
Common Bronzewing	*Phaps chalcoptera*
Crested Pigeon	*Ocyphaps lophotes*
Spinifex Pigeon	*Geophaps plumifera*
Diamond Dove	*Geopelia cuneata*
Peaceful Dove	*Geopelia striata*
Tawny Frogmouth	*Podargus strigoides*
Spotted Nightjar	*Eurostopodus argus*
Australian Owlet-nightjar	*Aegotheles cristatus*
Australasian Darter	*Anhinga novaehollandiae*
Little Pied Cormorant	*Microcarbo melanoleucos*
Great Cormorant	*Phalacrocorax carbo*
Little Black Cormorant	*Phalacrocorax sulcirostris*
Pied Cormorant	*Phalacrocorax varius*
Australian Pelican	*Pelecanus conspicillatus*
Black-necked Stork	*Ephippiorhynchus asiaticus*
Black Bittern	*Ixobrychus flavicollis*
White-necked Heron	*Ardea pacifica*
Eastern Great Egret	*Ardea modesta*
White-faced Heron	*Egretta novaehollandiae*
Little Egret	*Egretta garzetta*
Nankeen Night-Heron	*Nycticorax caledonicus*
Glossy Ibis	*Plegadis falcinellus*
Australian White Ibis	*Threskiornis molucca*
Straw-necked Ibis	*Threskiornis spinicollis*
Royal Spoonbill	*Platalea regia*
Yellow-billed Spoonbill	*Platalea flavipes*
Black-shouldered Kite	*Elanus axillaris*
Letter-winged Kite	*Elanus scriptus*
Square-tailed Kite	*Lophoictinia isura*
Black-breasted Buzzard	*Hamirostra melanosternon*
White-bellied Sea-Eagle	*Haliaeetus leucogaster*
Whistling Kite	*Haliastur sphenurus*
Black Kite	*Milvus migrans*

Brown Goshawk	*Accipiter fasciatus*
Collared Sparrowhawk	*Accipiter cirrocephalus*
Spotted Harrier	*Circus assimilis*
Swamp Harrier	*Circus approximans*
Wedge-tailed Eagle	*Aquila audax*
Little Eagle	*Hieraaetus morphnoides*
Nankeen Kestrel	*Falco cenchroides*
Brown Falcon	*Falco berigora*
Australian Hobby	*Falco longipennis*
Peregrine Falcon	*Falco peregrinus*
Buff-banded Rail	*Gallirallus philippensis*
Spotless Crake	*Porzana tabuensis*
Eurasian Coot	*Fulica atra*
Australian Bustard	*Ardeotis australis*
Bush Stone-curlew	*Burhinus grallarius*
Black-winged Stilt	*Himantopus himantopus*
Black-fronted Dotterel	*Elseyornis melanops*
Red-kneed Dotterel	*Erythrogonys cinctus*
Little Button-quail	*Turnix velox*
Gull-billed Tern	*Gelochelidon nilotica*
Galah	*Eolophus roseicapillus*
Little Corella	*Cacatua sanguinea*
Cockatiel	*Nymphicus hollandicus*
Australian Ringneck	*Barnardius zonarius*
Budgerigar	*Melopsittacus undulatus*
Bourke's Parrot	*Neopsephotus bourkii*
Pheasant Coucal	*Centropus phasianinus*
Horsfield's Bronze-Cuckoo	*Chalcites basalis*
Pallid Cuckoo	*Cacomantis pallidus*
Southern Boobook	*Ninox novaeseelandiae*
Eastern Barn Owl	*Tyto javanica*
Blue-winged Kookaburra	*Dacelo leachii*
Red-backed Kingfisher	*Todiramphus pyrrhopygius*
Sacred Kingfisher	*Todiramphus sanctus*
Rainbow Bee-eater	*Merops ornatus*
Black-tailed Treecreeper	*Climacteris melanura*
Spotted Bowerbird	*Ptilonorhynchus maculatus*
Western Bowerbird	*Ptilonorhynchus guttatus*
Splendid Fairy-wren	*Malurus splendens*
White-winged Fairy-wren	*Malurus leucopterus*
Variegated Fairy-wren	*Malurus lamberti*
Rufous-crowned Emu-wren	*Stipiturus ruficeps*
Striated Grasswren	*Amytornis striatus*
Redthroat	*Pyrrholaemus brunneus*
Weebill	*Smicrornis brevirostris*
Western Gerygone	*Gerygone fusca*
Slaty-backed Thornbill	*Acanthiza robustirostris*
Yellow-rumped Thornbill	*Acanthiza chrysorrhoa*
Chestnut-rumped Thornbill	*Acanthiza uropygialis*
Inland Thornbill	*Acanthiza apicalis*

Red-browed Pardalote	*Pardalotus rubricatus*
Striated Pardalote	*Pardalotus striatus*
Pied Honeyeater	*Certhionyx variegatus*
Singing Honeyeater	*Lichenostomus virescens*
Grey-headed Honeyeater	*Lichenostomus keartlandi*
Grey-fronted Honeyeater	*Lichenostomus plumulus*
White-plumed Honeyeater	*Lichenostomus penicillatus*
Yellow-throated Miner	*Manorina flavigula*
Spiny-cheeked Honeyeater	*Acanthagenys rufogularis*
Grey Honeyeater	*Conopophila whitei*
Crimson Chat	*Epthianura tricolor*
Black Honeyeater	*Sugomel niger*
Brown Honeyeater	*Lichmera indistincta*
Black-chinned Honeyeater	*Melithreptus gularis*
Grey-crowned Babbler	*Pomatostomus temporalis*
White-browed Babbler	*Pomatostomus superciliosus*
Chiming Wedgebill	*Psophodes occidentalis*
Varied Sittella	*Daphoenositta chrysoptera*
Ground Cuckoo-shrike	*Coracina maxima*
Black-faced Cuckoo-shrike	*Coracina novaehollandiae*
White-winged Triller	*Lalage sueurii*
Rufous Whistler	*Pachycephala rufiventris*
Grey Shrike-thrush	*Colluricincla harmonica*
Crested Bellbird	*Oreoica gutturalis*
Masked Woodswallow	*Artamus personatus*
Black-faced Woodswallow	*Artamus cinereus*
Little Woodswallow	*Artamus minor*
Grey Butcherbird	*Cracticus torquatus*
Pied Butcherbird	*Cracticus nigrogularis*
Australian Magpie	*Cracticus tibicen*
Grey Fantail	*Rhipidura albiscapa*
Willie Wagtail	*Rhipidura leucophrys*
Little Crow	*Corvus bennetti*
Torresian Crow	*Corvus orru*
Magpie-lark	*Grallina cyanoleuca*
Red-capped Robin	*Petroica goodenovii*
Hooded Robin	*Melanodryas cucullata*
Horsfield's Bushlark	*Mirafra javanica*
Australian Reed-Warbler	*Acrocephalus australis*
Rufous Songlark	*Cincloramphus mathewsi*
Brown Songlark	*Cincloramphus cruralis*
Spinifexbird	*Eremiornis carteri*
Welcome Swallow	*Hirundo neoxena*
Fairy Martin	*Petrochelidon ariel*
Tree Martin	*Petrochelidon nigricans*
Mistletoebird	*Dicaeum hirundinaceum*
Zebra Finch	*Taeniopygia guttata*
Star Finch	*Neochmia ruficauda*
Painted Finch	*Emblema pictum*
Australasian Pipit	*Anthus novaeseelandiae*

Crow & Raven species

Arthropoda	Arachnida	Araneae	Mygalomorphae	Nemesiidae	Yilgarnia	`MYG197`		Australia	Area C, 81.4 km NW. of Newman	22°57`29"S	119°04`09"E	-22.9581	119.069
Arthropoda	Arachnida	Araneae	Mygalomorphae	Nemesiidae	Yilgarnia	`MYG197`		Australia	Area C, 83.9 km NW. of Newman	22°59`35"S	119°00`57"E	-22.9931	119.016
Arthropoda	Arachnida	Pseudoscorpiones	Panctenata	Garypidae	Synsphyronus	`PSE014 long hand 2`		Australia	Area C, 87.3 km NW. of Newman	22°53`43"S	119°02`42"E	-22.8953	119.045
Arthropoda	Arachnida	Pseudoscorpiones	Panctenata	Garypidae	Synsphyronus	`PSE014 long hand 2`		Australia	Area C, 74.1 km NW. of Newman	22°55`04"S	119°11`21"E	-22.9178	119.189

Appendix IX: Regional Comparison of Species

Mammals										
	Database Searches									
Scientific Name	Common Name	Lamb Creek Level 2 Fauna Survey	Conservation Significance	EPBC Search (10 km buffer)	DEC Search	Naturemap Records (40 km radius)	Fauna Survey of the proposed Hope Downs 4 mining area. (Ninox Wildlife Consulting, 2009)	Yandicoogina Junction South West and Oxbow Fauna Survey. (Biota Environmental Sciences, 2010)	Fauna survey of proposed Iron Ore Mine, Cloud Break. (Bamford Consulting Ecologists, 2005)	Fauna Habitats and Fauna Assemblage of the Proposed FMG Stage B Rail Corridor and Mindy Mindy, Christmas Creek, Mt Lewin and Mt Nicholas Mine Areas. (Biota Environmental Sciences, 2005)
Tachyglossidae										
Tachyglossus aculeatus	Echidna								▼	
Dasyuridae										
Dasykaluta rosamondae	Kaluta	▼				▼	▼		▼	
Dasyurus hallucatus	Northern Quoll		EPBC - E,	▼	▼	▼				
Ningaui timealeyi	Pilbara Ningaui	▼				▼	▼	▼	▼	
Planigale aff. ingrami		▼				▼			▼	
Planigale aff. maculata							▼			
Pseudantechinus woolleyae	Wolley's False Antechinus		IUCN- LC							
Sminthopsis macroura	Stripe- faced Dunnart	▼				▼			▼	
Sminthopsis ooldea	Ooldea Dunnart					▼	▼			
Sminthopsis youngsoni	Lesser Hairy-footed Dunnart									▼
Phalangeridae										
Trichosurus vulpecula	Northern Brush-tail Possum					▼				
Thylacomyidae (Bilbies)										
Macrotis lagotis	Bilby		EPBC - V DEC - S1	V					▼	
Macropodidae										
Macropus robustus	Euro					▼	▼		▼	▼
Macropus rufus	Red Kangaroo					▼	▼		▼	
Petrogale rothschildi	Rothschild's Rock-wallaby					▼				▼
Pteropodidae										
Pteropus scapulatus	Little Red Flying-fox					▼				
Megadermatidae										
Macroderma gigas	Ghost bat	▼	p4		▼					
Hipposideridae										
Rhinonicteris aurantius	Pilbara Leaf-nosed Bat		EPBC - V, DEC - S1	▼	▼					
Emballonuridae										
Taphozous georgianus		▼				▼	▼	▼	▼	
Taphozous hilli						▼				
Saccolaimus flaviventris	Yeollow-bellied Sheath-tail bat					▼	▼	▼	▼	
Vespertilionidae										
Chalinolobus gouldii	Gould's Wattled Bat					▼	▼	▼	▼	
Chalinolobus morio	Chocolate Wattled Bat						▼

Bos taurus	Cow	▼						▼		

Taxonomy follows Western Australian Museum Mammals Checklist, Last modified: 12 August 2008 except where indicated otherwise.

■ Recorded on Threatened and Priority Fauna Database Search for the area (DEC) as schedule 1 or 4

■ Recorded on Protected Matters Database Search for the area - EPBC Act 1999 (DEH) as endangered (e), vulnerable (v) or migratory (m)

■ Priority listed by DEC

IUCN (2009) - VU = Vulnerable, EN = Endangered, NT - Near Threatened, LC = Least Concern, DD = Data Deficient

Reptiles and Amphibians											
Scientific Name	family	Common Name	Lamb Creek Level 2 Fauna Survey	Conservation Significance	DEC Search	EPBC Search	Naturemap Records	Fauna Survey of the proposed Hope Downs 4 mining area. Amphibians											
Cyclorana mainii	Hylidae	Sheep Frog	▼				▼				▼
Cyclorana platycephala	Hylidae										
Litoria rubella	Hylidae		▼				▼			▼	
Neobatrachus aquilonius	Myobatrachidae	Northern Burrowing Frog					▼				
Pseudophryne douglasi	Myobatrachidae						▼				
Uperoleia russeli	Myobatrachidae						▼				
Reptiles											
Chelidae (Turtles)											
Chelodina steindachneri	Chelidae	Flat-shelled Turtle								▼	
Agamidae (dragons)											
Amphibolurus longirostris	Agamidae	Long nosed Dragon	▼				▼	▼	▼	▼	
Caimanops amphiboluroides	Agamidae	Mulga Dragon	▼					▼			
Ctenophorus caudicinctus	Agamidae	Ring-tailed Dragon	▼				▼	▼	▼	▼	▼
Ctenophorus isolepis	Agamidae	Central Military Dragon	▼				▼		▼		▼
Ctenophorus nuchalis	Agamidae	Central Netted Dragon					▼			▼	
Ctenophorus reticulatus	Agamidae	Western Netted Dragon					▼			▼	
Ctenophorus scutulatus	Agamidae	Lozenge-marked Dragon					▼				
Diporophora valens	Agamidae		▼				▼				
Diporiphora winneckei	Agamidae	Cane-grass Dragon									
Pogona minor	Agamidae	Dwarf Bearded Dragon	▼		▼		▼	▼			
Tympanocryptis cephalus	Agamidae	Pebble Mimicking Dragon					▼				
Boidae (Pythons)											
Antaresia perthensis	Boidae	Pygmy Python	▼				▼				
Antaresia stimsoni	Boidae	Stimson's Python					▼				
Aspidites melanocephala	Boidae	Black-headed Python					▼	▼		▼	
Liasis olivaceus subsp. barroni	Boidae	Pilbara Olive Python	▼	DEC - S1, EPBC - V	▼	▼	▼				
Elapidae (Front-fanged Land snakes)											
Acanthophis wellsi	Elapidae	Pilbara Death Adder					▼	▼			
Brachyurophis approximans	Elapidae						▼				
Demansia psammophis subsp. cupreiceps	Elapidae	Yellow-faced Whipsnake	▼				▼		▼		
Demansia rufescens	Elapidae	Rusty Whipsnake					▼				
Furina ornata	Elapidae	Moon Snake					▼				
Parasuta monachus	Elapidae	Monk Snake	▼				▼				
Pseudechis australis	Elapidae	King Brown	▼				▼				
Pseudonaja mengdeni	Elapidae	Gwardar	▼								
Pseudonaja modesta	Elapidae	Ringed Brown Snake	▼				▼				
Pseudonaja nuchalis	Elapidae	Western Brown Snake					▼				
Suta fasciata	Elapidae	Rosen's Snake	▼								
Suta punctata	Elapidae	Little Spotted Snake					▼				
Vermicella snelli	Elapidae	Pilbara Bandy Bandy	▼				▼	▼

Gekkonidae (Geckos)											
Crendactylus ocellatus	Gekkonidae	Clawless Gecko	▼				▼				
Diplodactylus conspicillatus	Gekkonidae	Fat-tailed Gecko	▼				▼			▼	▼
Diplodactylus granariensis rex	Gekkonidae										
Diplodactylus pulcher	Gekkonidae		▼				▼				
Diplodactylus savagei	Gekkonidae		▼				▼	▼			
Gehyra pilbara	Gekkonidae						▼				
Gehyra punctata	Gekkonidae		▼				▼		▼		
Gehyra purpurascens	Gekkonidae						▼				
Gehyra variegata	Gekkonidae		▼				▼	▼		▼	
Heternotia spelea	Gekkonidae	Prickly Cave Gecko					▼			▼	
Heteronotia binoei	Gekkonidae	Bynoe's Gecko	▼				▼			▼	
Lucasium stenodactylum	Gekkonidae		▼				▼	▼	▼		▼
Lucasium wombeyi	Gekkonidae						▼				
Nephurus levis subsp. pilbarensis	Gekkonidae	Knob-tailed Gecko									
Nephurus wheeleri subsp. cinctus	Gekkonidae	Banded Knob-tail Gecko	▼				▼	▼			
Oedura marmorata	Gekkonidae	Marbled Velvet Gecko	▼				▼		▼		
Rhynchoedura ornata	Gekkonidae	Beaked Gecko	▼				▼				
Strophurus elderi	Gekkonidae	Jewelled Gecko					▼				
Strophurus jeanae	Gekkonidae										
Strophurus strophurus	Gekkonidae	Spiny-tailed Gecko									
Strophurus wellingtonae	Gekkonidae		▼				▼	▼			
Underwoodisaurus milli	Gekkonidae	Thick-tailed Gecko					▼				
Underwoodisaurus seorsus	Gekkonidae	Pilbara Thick-tailed Gecko	Proposed Priority species								
Pygopodidae (legless lizards)											
Delma elegans	Pygopodidae		▼				▼				
Delma butleri	Pygopodidae										
Delma haroldi	Pygopodidae						▼	▼			
Delma pax	Pygopodidae						▼		▼		
Delma nasuta	Pygopodidae		▼				▼		▼		
Delma tincta	Pygopodidae	Excitable Delma	▼				▼	▼			
Lialis burtonis	Pygopodidae	Burton's Legless Lizard	▼				▼	▼		▼	
Pygopus nigriceps	Pygopodidae	Hooded Scaly-foot	▼				▼	▼			
Scincidae (Skinks)											
Carlia munda	Scincidae		▼				▼	▼	▼	▼	▼
Carlia tricantha	Scincidae						▼	▼			
Cryptoblepharus buchananii	Scincidae						▼				
Cryptoblepharus plagiocephalus	Scincidae									▼	
Cryptoblepharus ustulatus	Scincidae		▼				▼				
Ctenotus ariadnae	Scincidae										▼
Ctenotus duricola	Scincidae						▼	▼			▼
Ctenotus grandis	Scincidae						▼				
Ctenotus hanloni	Scincidae						▼		▼

Taxonomy follows Christidis and Boles (2008)* except where indicated otherwise such as . Great Egret *(Ardea alba) i*s a WAM listing - Western Australian Museum Birds Checklist, Last modified: 6 October 2008. Both names are presented because EPBC Act 1999 lists Great Egre*t (A. alba)* Christidis and Boles (2008) lists *Adea modesta* (Eastern Great Egret). Reference to subspecies such as "western ssp" comes from DEC listings.

Taxonomy follows Western Australian Museum Bird Checklist, Last modified: 6 October 2008 except where indicated otherwise.	**WAM**

SUMMARY

Bat identifications from acoustic recordings are provided from Lamb Creek, c. 120 km WNW of Newman, in the Pilbara region of Western Australia. Six species of bat were identified as being present (Table 1). Details supporting the identifications are provided, as recommended by the Australasian Bat Society (ABS 2006). A summary of pulse parameters is provided in Table 2, and representative call sequences are illustrated in Figure 1. Further data is available should verification be required.

COMMENTS ON IDENTIFICATIONS

The yellow-bellied sheath-tailed bat *Saccolaimus flaviventris* was distinguished from the northern free-tailed bat *Chaerephon jobensis* by the pattern of harmonics (*S. flaviventris*: harmonics c. 10 kHz apart with most energy in h2 at c. 20 kHz; *C. jobensis*: harmonics c. 20 kHz apart with most energy in h1 at c. 20 kHz; Figure 1).

No unambiguous calls of bats of conservation significance (ghost bat *Macroderma gigas*; Pilbara leaf-nosed bat *Rhinonicteris aurantia*) were present. All short duration multi-harmonic signals were allocated to the common sheath-tailed bat *Taphozous georgianus* based on pulse structure and energy distribution; and all signals with a characteristic frequency above 100 kHz were from Finlayson's cave bat *Vespadelus finlaysoni* (Figure 1).

METHODS

Data recorded with a Wildlife Acoustics Song Meter SM2BAT were supplied as WAV format files on three 4 GB SD cards (recording settings were not available from the submitted data); plus one DAT format file as downloaded from a Titley Scientific AnaBat SD1 bat detector. Each WAV file was opened and inspected in Cool Edit 2000. Species were identified based on information in McKenzie and Muir (2000) and McKenzie and Bullen (2009), and nomenclature follows Armstrong and Reardon (2006). Signals recorded with the AnaBat SD1 detector were reinterpreted from the DAT file in CFC Read 4.3s software and examined in AnalookW 3.8s software. The frequency division ratio was set to a factor of 8. Three call variables were measured on good quality search phase pulses in representative call sequences: pulse duration (milliseconds), maximum frequency (kHz) and characteristic frequency (kHz). To double-check whether any signals of *R. aurantia* were present, a continuous representation of the AnaBat recordings in ZCA and MAP files was examined.

Definition of confidence level codes:

— Not detected.

◆ Unambiguous identification of the species at the site based on measured call characteristics and comparison with available reference material. Greater confidence in this ID would come only after capture and supported by morphological measurements or a DNA sequence.

NC Needs Confirmation. Either call quality was poor, or the species cannot be distinguished reliably from another that makes similar calls. Alternative identifications are indicated in the *Comments on identifications* section of this report. If this is a species of conservation significance, further survey work might be required to confirm the record.

Appendix XII: WAM SRE Reports

Land snails from Lamb Creek, ca. 120km NW of Newman (Western Australia)

Brief Report to *Rapallo Environmental*

15 June 2012

Corey S. Whisson

Department of Aquatic Zoology, Western Australian Museum,
Locked Bag 49, Welshpool DC, Western Australia 6986, Australia

Although identifications in this report were consistent with the best available information and current scientific thinking at the time of identification the use of this report is at the risk of the user. Any liability to users of this report for loss of any kind arising out of the use of this report or the information and identifications it contains is expressly disclaimed.

SUMMARY

The samples from Lamb Creek, approximately 120km NW of Newman, submitted to the Western Australian Museum on the 22nd May 2010, contained three single species of land snails belonging to the families Bulimulidae and Pupillidae. None are considered short-range endemic species. Some pupillid specimens were juvenile and could not be identified past family level.

METHODS

8 samples of land snail specimens were collected by the environmental consultancy *Rapallo Environmental* during a faunal survey of the Lamb Creek area, approximately 120km north-west of Newman, Western Australia in April 2012. These specimens were presented to the Mollusc Section of the Western Australian Museum for identification and comment on the 22nd of May 2012 (WAMTS-057).

Specimen data, giving the site numbers and co-ordinates, habitat information and the collecting methods employed were provided with the specimens.

Land snail specimens were examined under a *Leica* MZ95 dissecting microscope. They were compared with dry and preserved specimens in the Molluscan Collections of the Western Australian Museum and with descriptions and figures in relevant publications. As we have limited material from the project areas, most of the survey specimens have been registered and deposited into the Western Australian Museum's Mollusc Collection.

RESULTS

The land snails collected during this survey belong to the terrestrial pulmonate families Bulimulidae and Pupillidae (Appendix A). The three species identified from this survey are considered to form part of the indigenous Western Australian fauna.

Bulimulidae

***Bothriembryon* sp. nov.**

Undescribed widespread species.

Family Pupillidae

Subfamily *Gastrocoptinae*

***Gastrocopta* cf. *mussoni* Pilsbry, 1917**

Probably conspecific with *G.mussoni* which is a widespread species

Subfamily Pupillinae

***Pupoides beltianus* (Tate, 1894)**

Widespread species

Appendix 1 Short-range Endemic invertebrates identified from Lamb Creek

EXECUTIVE SUMMARY

In May 2012, Phoenix Environmental Sciences Pty Ltd (Phoenix) was commissioned by Rapallo to identify pseudoscorpions, centipedes, millipedes, isopods and spiders collected at Lamb Creek, Western Australia. A total of 18 samples were identified and screened for short-range endemic (SRE) invertebrate taxa. The scorpions delivered to Phoenix will be reported on separately through ScorpionID (E. Volschenk).

There are uncertainties in determining the range-restrictions of many invertebrates in Western Australia due to lack of surveys, lack of taxonomic resolutions within target taxa and problems in identifying certain life stages. To account for these uncertainties Phoenix uses a three-tier categorisation for short-range endemism: confirmed SRE, likely SRE and potential SRE.

The identification material included 11 morphospecies in 11 genera from nine families. These include one likely SRE:

- a slater, *Spherillo* sp. indet. (Armadillidae) – rarely collected in the Pilbara with some troglomorphic features.

The material also included five potential SREs:

- a trapdoor spider, *Synothele* 'MYG255' (family Barychelidae) – currently only know from a single male collected at Lamb Creek; it is recommended to conduct a molecular analysis to compare the COI sequence with the database at the WA Museum
- a pseudoscorpion, *Austrochthonius* 'pilbara' (family Chthoniidae) – this species possibly represents a species complex which may include SREs; currently under revision at the WA Museum (M.S. Harvey)
- a soil centipede, Geophilomorpha sp. indet. – taxonomically poorly resolved centipede order; due to high diversity and cryptic lifestyle in moist and deep leaf litter considered potential SREs
- a millipede, *Austrostrophus* sp. indet. (Trigoniulidae) – unidentifiable juvenile; two species are currently known in the genus from the Pilbara one of which is widespread (*A. stictopygus*), the other is a potential SRE (*Austrostrophus* 'DIP018')
- a slater, *Buddelundia* '13' (Armadillidae) – possibly conspecific to specimens collected 80 km west of Newman.

1 SCOPE OF WORKS

In May 2012, Phoenix Environmental Sciences Pty Ltd (Phoenix) was commissioned by Rapallo to identify spiders, pseudoscorpions, centipede, millipedes and slaters collected at Lamb Creek, Western Australia (project PMI Lamb Creek 13726). A total of 18 samples were identified and screened for short-range endemic (SRE) invertebrate taxa.

2 BACKGROUND

2.1.1 Short-range endemic invertebrates

Short-range endemic fauna are defined as animals that display restricted geographic distributions, nominally less than 10,000 km^2, that may also be disjunct and highly localised (Harvey 2002; Ponder & Colgan 2002). The most appropriate analogy is that of an island, where the movement of fauna is restricted by the surrounding marine waters, therefore isolating the fauna from other terrestrial populations. Isolating mechanisms and features such as roads, urban infrastructure, large creek lines and ridges can act to prevent the dispersal and gene flow of the less mobile invertebrate species.

Short-range endemism in terrestrial invertebrates is believed to have evolved through two primary processes (Harvey 2002):

- **Relictual short-range endemism**: relictual SREs are thought to have had wider distributions during more mesic geological periods. Australia's aridification over the last 60 million years resulted in a contraction of the ranges of these species into relatively small habitat pockets where moist conditions persist (relictual Gondwanan habitats). Evolutionary processes over long periods of isolation typically resulted in each population developing into a distinctive species. Millipedes and slaters are typical relictual SREs and they are generally found in deep gullies often on the south-facing slopes of mountains, hills and ridges. Relictual SREs often inhabit areas with: high rainfall, areas where topography induces fog, areas with permanent water (swamps, creek lines and river systems) or deep litter beds. Sometimes habitats have various combinations of these features.
- **Habitat specialisation**: habitat specialist SREs may have settled in particular isolated habitat types by means of dispersal or phoresy (transport of one organism by another) and evolved in isolation into distinct species. Such habitat islands include rocky outcrops (pseudoscorpions in the genus *Synsphyronus* or spiders in the family Selenopidae are typical examples) or salt lakes (e.g. wolf spiders of the genus *Tetralycosa*). Unlike relictual SREs in mesic habitats, habitat specialist SREs are restricted by environmental parameters other than humidity and are often found in arid environments such as the Pilbara.

Invertebrate groups that contain SRE taxa are generally well distributed across the Australian landscape and well adapted to semi-arid environments due to a variety of behavioural and morphological features that have developed to avoid desiccation and predation. They generally possess (Harvey 2002):

- poor powers of dispersal
- confinement to discontinuous habitats
- seasonality, i.e. only active in cooler or wetter months
- slow growth
- low levels of fecundity.

2.1.2 Categories of short-range endemism

Currently, there is no accepted system to determine the likelihood that a species is an SRE. The uncertainty in categorising a specimen as SRE originates in a number of factors including:

- **Poor regional survey density** (sometimes taxon-specific): A regional fauna is simply not known well enough to assess the distribution of species. This factor also considers the fact that, simply because a species has not been found regionally, does not mean it is really absent; this confirmation ('negative proof') is almost impossible to obtain ('absence of proof is not proof of absence').
- **Lack of taxonomic resolution**: many potential SRE taxa (based on habitat constraints, SRE status of closely related species, or morphological peculiarities such as troglomorphism) have never been taxonomically treated and identification to species level is very difficult or impossible as species-specific character systems have not been defined. Good taxonomic resolution does not necessarily require a published revision, but generally requires a taxonomist to be actively working on this group or a well-established, preferably publicly available, reference collection (i.e. museum collection).
- **Problems of identification**: SRE surveys often recover life stages of potential SRE taxa that cannot be confidently identified based on morphological characters, even if revisions exist. These include, for example, juvenile or female millipedes, mygalomorph spiders and scorpions. Molecular techniques are increasingly being employed to overcome these identification problems.

Considering these factors of uncertainty, Phoenix currently employs a simple three-tier system to categorise the different probabilities of short-range endemism: confirmed, likely or potential SRE (Table 2-1). These categories are dynamic and can change with every single survey as knowledge of SRE status is updated. For example, the millipede *Austrostrophus stictopygus* Hoffman, 2003 (order Spirobolida) has been shown widespread in the Pilbara based on material collected as part of environmental assessment studies following its initial description from few localities (Harvey *et al.* 2011; Hoffman 2003).

Life stages of species that cannot be identified at the species level, e.g. some females and juveniles, are assessed based on the knowledge of the higher taxon they belong to, i.e. family or genus. For example, all juvenile or female *Antichiropus* millipedes would be classified as 'confirmed SRE' as all but two of the 120+ known species in this genus are currently considered SREs (Wojcieszek *et al.* 2011).

Although the different categories of 'SRE-likelihood' may help to set conservation priorities, SRE taxa of all categories should be assessed on their merit, in order to determine appropriate conservation measures that adhere to the Precautionary Principle within environmental impact assessments. That

is, "*where there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason to postpone measures to prevent environmental degradation*" (EPA 2002).

Table 2-1 Phoenix SRE categories reflecting survey, taxonomic and identification uncertainties

SRE category	Criteria	Typical representative
(Confirmed) SRE	Confirmed or almost certainly SRE; taxonomy of the group is well known (but not necessarily published); group well represented in collections, in particular from the region in question; high levels of endemism in documented species; inference is often possible from immature specimens	*Antichiropus* millipedes and araneomorph spiders in the genus *Karaops* (Selenopidae)
Likely	Taxonomically poorly resolved group; unusual morphology for the group (i.e. some form of troglomorphism); often singleton in survey and few, if any, regional records	Opiliones, some pseudoscorpions and slaters, many mygalomorph spiders
Potential	Taxonomically poorly resolved group; often common in certain microhabitats in SRE surveys (i.e. litter dwellers), but no other regional records; congeners often widespread	Cryptopidae, Geophilida

2.2 IDENTIFICATION AND PERSONNEL

All taxa were examined in 70% or 100% ethanol under a Leica M205A stereomicroscope.

The method of identification for each taxon, i.e. by taxonomic literature or comparison with type or other reference material, is indicated in the taxonomic part of this report. Phoenix personnel involved in the identification are listed in Table 2-2.

Table 2-2 Phoenix and external personnel involved in identification

Name	Qualifications
Dr Volker W. Framenau	M.Sc. (Cons. Biol.), Ph.D. (Zool.)
Dr Erich Volschenk	Ph.D. (Zool.)
Dr Simon Judd	Ph.D. (Zool.) – independent Isopoda taxonomist

2.3 TAXONOMY AND NOMENCLATURE

The taxonomic nomenclature of invertebrates follows the references detailed in Table 2-3.

Morphospecies designations of undescribed species are generally adopted from the systems of the scientist(s) working on the group. For mygalomorph spiders, the Western Australian Museum has established a morphological reference collection of males that aids in the identification of spiders. Morphospecies are numbered consecutively with the prefix "MYG", e.g. *Aname* 'MYG001' (Nemesiidae).

Table 2-3 Nomenclatural references, morphospecies designations and reference collections for the invertebrates of Lamb Creek

Taxonomic group	Taxonomic reference for described species and higher taxa	Morphospecies designation and reference collection
Araneae (Mygalomorphae)	Platnick (2012)	"MYG"-numbering system developed by V.W. Framenau (WAM, Phoenix), reference collection at WAM
Araneae (Araneomorphae: Selenopidae)	Platnick (2012)	Morphospecies designations developed by M. Harvey (WAM) and V.W. Framenau (WAM, Phoenix), reference collection at WAM
Pseudoscorpiones	Harvey (2011a)	"PSE"-morphospecies designations developed by M. Harvey (WAM), reference collection at WAM
Diplopoda (Polydesmida: *Antichiropus*)	Mesibov (2006)	"DIP"-morphospecies designations developed by C. Car and M. Harvey (WAM), reference collection at WAM
Chilopoda (Geophilomorpha, Cryptopidae only)	Colloff *et al.* (2005)	Taxonomically poorly studied groups, no reference collection available
Isopoda	Schotte *et al.* (2008)	Morphospecies designations developed by S. Judd, reference material at WAM

2.4 SPECIMEN DEPOSITORY

The EPA guidance statement No. 20 ('*Sampling of short-range invertebrate fauna for environmental impact assessment in Western Australia*') (EPA 2009) recommends that all specimens representing SRE target groups are lodged with the WAM to enhance the knowledge of the distribution of putatively rare species. Phoenix adheres to this recommendation and all of the survey specimens will be lodged with the WA Museum.

3 RESULTS

3.1 SUMMARY

The identification material included 11 morphospecies in 11 genera from nine families (Table 3-1; Appendix 1). These include one likely and five potential SREs.

Table 3-1 Status of SRE target invertebrate from Lamb Creek

Higher taxon	Family	Species	SRE status	Remarks
Araneomorphae (modern spiders)	Zodariidae	Zodariidae sp. indet.	Not SRE	Not SRE target group
Mygalomorphae (trapdoor spiders)	Barychelidae	*Aurecocrypta* 'MYG057'	Not SRE	Widespread in Pilbara
		Synothele 'MYG255'	Potential	Currently only record of species
Pseudoscorpiones (pseudoscorpions)	Atemnidae	*Oratemnus* sp. indet.	Not SRE	Commonly collected in Pilbara, not considered SRE
	Cheiridiidae	Cheiridiidae sp. indet.	Not SRE	Commonly collected in Pilbara, not considered SRE
	Chthoniidae	*Austrochthonius* 'pilbara'	Potential	Possibly representing species complex, under revision at WAM
	Olpiidae	*Beierolpium* '8/2' *Beierolpium* sp. indet.	Not SRE	Commonly collected in Pilbara, not considered SRE
Chilopoda - Geophilomorpha (soil centipedes)	indet.	Geophilomorpha sp. indet.	Potential	Taxonomically poorly resolved
Diplopoda - Spirobolida (millipedes)	Triguniulidae	*Austrostrophus* sp. indet.	Potential	May represent *Austrostrophus* 'DIP018', currently considered potential SRE
Isopoda (slaters)	Armadillidae	*Buddelundia '13'*	Potential	Possibly also found at Wonmunna mining lease
		Spherillo sp. indet.	Likely	Rarely found in the Pilbara

3.2 ARANEAE – ARANEOMORPHAE (MODERN SPIDERS)

With the exception of the Selenopidae (Flat Rock Spiders), modern spiders do not belong to the target groups for SRE surveys and therefore the single male zodariid spider from Lamb Creek (Appendix 1 was not identified beyond family level and is here not commented on.

3.3 ARANEAE – MYGALOMORPHAE (TRAPDOOR SPIDERS)

Trapdoor spiders represent one of the focal groups in surveys of SRE taxa (Harvey 2002). A number of mygalomorph spiders, e.g. *Idiosoma nigrum* Main, 1952, *Kwonkan eboracum* Main, 1983 and *Moggridgea tingle* Main, 1991 are listed on Schedule 1 of the *Wildlife Conservation (Specially Protected Fauna) Notice 2012* (Western Australian Government 2012). The Western Australian mygalomorph fauna is vast and many families and genera remain taxonomically poorly known (e.g. Barychelidae: *Idiommata*; Idiopidae: *Aganippe*; Nemesiidae: *Aname*, *Chenistonia*, *Kwonkan*). A recent molecular study of Pilbara Mygalomorphae based COI sequence data (Helix 2012) provided a new benchmark for diversity estimates in the Pilbara which by far exceeds the species richness of the region documented in during the DEC Pilbara Biological Survey (Durrant *et al.* 2010). Many of these genetic lineages are known from very restricted ranges only (Helix 2012).

3.3.1 Barychelidae (Brush-footed Trapdoor Spiders)

Barychelid spiders, commonly called Brush-footed Trapdoor Spiders, are small to fairly large in size with well-developed claw tufts and short terminal segment of the posterior lateral spinnerets (Raven 1994). Of all trapdoor spiders, few are as cryptic as the Barychelidae. Their burrows tend to be less than 60 cm deep and often lack the firm thick door of the Ctenizidae or the extensive webs of Dipluridae.

In Western Australia, the genera *Aurecocrypta*, *Idiommata*, *Mandjelia* and *Synothele* are known to occur from the Southwest region into the Pilbara region and *Moruga* has been found in the Kimberleys (Raven 1994). The DEC Pilbara survey recovered four species of Brush-footed Trapdoor Spiders in three genera, of which *Synothele* was with four species most diverse (Durrant *et al.* 2010). However, a recent molecular study on Pilbara Barychelidae uncovered a 20 different molecular lineages (putative species) within the family suggesting a much higher diversity in the region; many of these species appear to have restricted ranges (Helix 2012).

3.3.1.1 Genus *Aurecocrypta*

Aurecocrypta males are very similar to those in the genus *Synothele* but differ in the uniformly dark colour of the abdomen (mottled in *Synothele*) and some details of the male pedipalp. Two species are currently described, both only known from Western Australia, *A. katersi* and *A. lugubris* (Raven 1994).

***Aurecocrypta* 'MYG057'**

Aurecocrypta 'MYG057' is not uncommon throughout the Pilbara region of Western Australia (WA Museum database). It is not an SRE.

3.3.1.2 Genus *Synothele*

The genus *Synothele* can be identified by the low number of maxillary cuspules in combination with the lack of lyra (specialised clubbed setae) on the maxillae, and the often mottled abdomen

(uniformly dark in the similar *Aurecocrypta*). The genus is widespread throughout Western Australia (21 species) and South Australia (3 species) with most species known only from very limited ranges (Raven 1994).

***Synothele* 'MYG255'**

Synothele 'MYG255' is a fairly large species within the genus. It is the first representative of this new morphospecies in the WA Museum reference collection. Based on the distribution patterns of the genus in the Pilbara, it is considered a potential SRE. It is recommended to conduct molecular identification against the mygalomorph COI sequence database of the WA Museum to expand the knowledge of the distribution of this species.

3.4 PSEUDOSCORPIONES (FALSE SCORPIONS OR PSEUDOSCORPIONS)

Pseudoscorpiones resemble scorpions in that they possess a pair of long pedipalps with pincers which are directed forward; however, they do not possess the tail or a sting of scorpions. Most species are small to very small in size (most species are less than 1 cm long) (Harvey & Yen 1989). Pseudoscorpions can be found inhabiting a wide variety of habitats including leaf litter, soil, under the bark of trees, under stones, and in rock crevices (Harvey & Yen 1989; Main 1985). In Western Australia, 17 families of pseudoscorpions have been recorded to date (Harvey 2011a). The group contains several SRE species, for example species in the genus *Synsphyronus* (family Garypidae) are often habitat specific SREs on rocky outcrops (Harvey 2011b).

3.4.1 Atemnidae

Atemnids are frequently found under bark of trees in Western Australia, but the systematics of the group, particularly of the genus *Oratemnus*, is uncertain and the taxonomy of individual species unclear (M Harvey personal communication). However, based upon current evidence, it seems that most species will eventually be found to be widely distributed. For this reason, the specimen collected at Lamb Creek is not considered an SRE.

3.4.2 Cheiridiidae

The systematic status of the many populations of Cheiridiidae is currently unknown but it is very unlikely that any represent short-range endemic species (M Harvey personal communication).

3.4.3 Family Chthoniidae

Members of the Chthoniidae are small pseudoscorpions with comparatively large chelicerae. Five indigenous genera have been reported from Australia, and each is widespread (Edward & Harvey 2008). Chthoniidae are especially common in leaf litter and under rocks in high rainfall areas of eastern and south-western Australia.

3.4.3.1 Genus *Austrochthonius*

Species of *Austrochthonius* occur in leaf litter and soil environments throughout much of southwestern Australia, as well as subterranean ecosystems in Cape Range and near Busselton (Harvey 1991; Harvey & Mould 2006). The taxonomy of the Western Australian species is not resolved but there are clearly several species represented in the collections of the WA Museum. Recent molecular analyses showed deep genetic divergences within the genus, but this is not reflected in their morphology and species identification is extremely difficult. The genus

Austrochthonius is currently under revision at the Western Australian Museum (M. Harvey personal communication).

***Austrochthonius* 'pilbara'**

Austrochthonius 'pilbara' is currently poorly defined and may consist of a group of species. It is currently considered a potential SRE.

3.4.3.2 Olpiidae

Systematically, the Olpiidae are poorly defined and lack any uniting characters (Harvey 1992; Murienne *et al.* 2008). In Australia, six genera in the family are listed with valid species, *Austrohorus*, *Beierolpium*, *Euryolpium*, *Linnaeolpium*, *Olpium* and *Xenolpium* (Harvey 2011a). Olpiids are mostly found in xeric habitats, under stones, bark and in leaf litter and frequently belong to the most commonly collected pseudoscorpions in surveys for SRE in these habitats in Western Australia. Most species, as those from the genus *Beierolpium* found at Lamb Creek (Appendix 1) are generally widespread and not considered SREs, although some genera or species may be range-restricted, in particular in subterranean habitats (Harvey & Leng 2008).

3.5 CHILOPODA (CENTIPEDES)

The centipedes represent a diverse group of predatory arthropods. Each pair of legs is attached to a separate body segment which distinguishes this class from the millipedes (Diplopoda; two pairs of legs per segment) (Colloff *et al.* 2005). Adult body length ranges from 4 to 300 mm, with most species measuring 10 to 100 mm long. In most cases, they feed on small live arthropods and other invertebrates, although large scolopendromorphans can take vertebrate prey (Edgecombe & Giribet 2007).

All five orders of centipedes can be found in Australia, of which one, the Craterostigmorpha, only occurs in Tasmania and New Zealand (Colloff *et al.* 2005). Scolopendromorpha and Scutigeromorpha (house centipedes) are the most commonly encountered centipedes in WA. Most species are very fast runners and are highly mobile and therefore, widespread (e. g. Edgecombe & Barrow 2007; Edgecombe & Giribet 2009; Koch 1982, 1983a, b, c; Waldock & Edgecombe 2012). Therefore, they are not considered target groups for SRE surveys. In contrast, Geophilomorpha, Lithobiomorpha and the Cryptopidae (within the Scolopendromorpha) may include Gondwanan refugial SREs based on the habitat preference for moist and deep leaf litter. Geophilomorpha and Cryptopidae have also been found in subterranean environments in the Pilbara where they are limited to very small ranges (e. g. Edgecombe 2005).

3.5.1 Geophilomorpha (Soil Centipedes)

With more than 1,200 described species world-wide, the Geophilomorpha are the most diverse centipede order (Bonato 2011). Their body is conspicuously narrow and elongate, with at least 33 segments (27 to 191 pairs of legs). Thirteen families are known world-wide, of which six are known to occur in Australia, Ballophilidae, Chilenophilidae, Geophilidae, Mecistocephalidae, Oryidae and Schendylidae (Colloff *et al.* 2005). Most recent taxonomic additions to the WA fauna included the description of the genus *Australoschendyla* (family Schendylidae) (Jones 1996) and a new species in the genus *Tuoba* (family Geophilidae) ((Jones 1998).

The taxonomy of the Geophilomorpha is poorly resolved and it is currently impossible to identify the specimen beyond order level. Based on their high diversity in combination for the preference for

moist, deep litter habitats, all undescribed representatives of the Geophilomorpha are here considered potential SREs.

3.6 DIPLOPODA (MILLIPEDES)

The Australian millipedes are poorly studied and biogeographic patterns remain largely unresolved (Black 1997; Shelley & Golovatch 2011). At least eight orders of millipedes are native to Australia; all species in the order Julida are introduced (Mesibov 2006). Millipedes belong to one of the main target groups of SRE surveys. SREs are particularly expected within the orders Sphaerotheriida (rolling millipedes), Polydesmida, and Chordeumatida (not known from WA) (EPA 2009; Harvey 2002). A recent review of Australian *Atelomastix* (order Spirostreptida) found all of 29 species treated were SREs (Edward & Harvey 2010).

3.6.1 Spirobolida - Triguniulidae

The millipede family Triguniulidae represents a conspicuous element of the Southeast Asian and Indonesian faunas where 21 genera are recognised (Hoffman 2003). In Australia, however, the group has few representatives, including two monotypic genera from WA, *Austrostrophus* and *Speleostrophus* (Hoffman 1994, 2003). *Speleostrophus nesiotes*, endemic to caves on Barrow Island, was gazetted on 11 April 2003 under the WA *Wildlife Conservation Act 1950* as a Schedule 1 species. It is the only Australian native millipede on a State endangered list (Mesibov 2006).

3.6.1.1 Genus *Austrostrophus*

The genus *Austrostrophus* was described only fairly recently and includes a single species, *A. stictopygus* (Hoffman 2003). This millipede has been described as a "curious and disjunct spiroboloid" (Hoffman 2003), based on unusual morphological features such as structure of the male gonopods, punctuate paraprocts (anal segments) and fringed edge on the metazonum (posterior unit of segments). Punctuate paraprocts are otherwise only present in the eastern state genus *Ainigmabolus* (Hoffman 2003)

At the time of its description, *A. stictopygus* was thought to have a very narrow distribution and was only known from the Burrup Peninsula. Recent surveys as part of resource developments in the Pilbara have shown that the species is widespread throughout the region (Harvey *et al.* 2011).

***Austrostrophus* sp. indet.**

The specimen submitted for identification was a juvenile and could not be identified to species level. It is possible that it represents a second undescribed species known in addition to *A. stictopygus*, namely *Austrostrophus* 'DIP018' collected from two localities in the southeastern Pilbara and currently considered a potential SRE. Consequently, *Austrostrophus* sp. indet. from Lamb Creek is here also considered a potential SRE.

3.7 ISOPODA (SLATERS)

Almost 200 described species of Oniscidea, a suborder of the Isopoda containing the supralittoral, terrestrial and secondarily aquatic slaters (or woodlice), have been recorded from Australia (DSEWPC 2010). The WA fauna is comparatively poorly known with many undescribed species (Judd & Horwitz 2003). Slaters are an ideal biological model for faunistic and biogeographical studies, due to their reduced dispersal ability and narrow habitat preferences (e.g. Taiti & Argano 2009). Consequently, they belong to one of the target groups of SRE surveys (EPA 2009; Harvey 2002).

3.7.1 Armadillidae

Armadillidae typically have a convex dorsal surface and the animal can roll up into a ball. The family is diverse in Australia, currently 24 genera are described; many species live in litter or under wood and stones in forest or woodland or near the coast (Green *et al.* 2010).

3.7.1.1 Genus *Buddelundia*

Members of the genus *Buddelundia* belong to the most common terrestrial isopods in WA and the genus was well represented in the Rail Corridor. The genus is currently under taxonomic revision by S. Judd. Species of *Buddelundia* often have a very wide distribution and are not expected to have many SRE species (S. Judd personal communication).

***Buddelundia* '13'**

Buddelundia '13' represents a small species-complex of highly convex habit that is restricted to the Pilbara. This species was previously collected at the Wonmunna mining lease 80 km west of Newman (Phoenix 2011). However, the single specimen collected here is not fully mature so a determination is tentative. It is considered a potential SRE (S. Judd personal communication).

3.7.1.2 Genus *Spherillo*

***Spherillo* sp. indet.**

Isopods of the type here collected are only tentatively associated with the genus *Spherillo*. They almost certainly belong to a different, unnamed genus (S. Judd personal communication). There have been very few specimens of this genus collected in the Pilbara, but species diversity appears high. They have some troglobitic characteristics (e.g. reduced eyes and lack of pigment). This genus was also collected at Wonmunna (Phoenix 2011) but both clearly represent different species. It is extremely rare to find these armadillids among the epigean isopods of the Pilbara and they are therefore considered likely SREs (S. Judd personal communication).

Lamb Creek Scorpion Identification Report

Report ID: RA.LC.2012.05
Prepared for: Rapallo
By Dr Erich S. Volschenk
Saturday, 30 June 2012

Rapallo is undertaking a short-range endemic survey at Lamb Creek, and has requested:
- Taxonomic identifications of scorpion from the survey;
- SRE assessment of the species represented in the collection, and;
- Lodgement of these specimens in the Western Australian Museum Arachnology Collection

The collection is comprised of 13 samples.

FAMILY: Buthidae CL Koch, 1837

The family Buthidae is the most diverse and wide spread of all scorpion families (Fet & Lowe 2000). In Australia, Buthidae is represented by the genera *Australobuthus* Locket; *Isometrus* Ehrenberg; *Isometroides* Keyserling , *Lychas* C.L. Koch, and *Hemilychas* Hirst. In Western Australia, only the genera *Isometrus*, *Isometroides* and *Lychas*, have been recorded. The taxonomy of the constituent species of *Isometrus*, *Isometroides* and *Lychas* is very problematic and each genus contains numerous undescribed species, most notably in the genus *Lychas* (Volschenk unpublished data). Most Authors refer to LE Koch (1977) for keys and identification. That revision represents an important study of the Australian scorpions; however, several taxonomic decisions made by Koch (1977) have been rejected by subsequent authors and the taxonomy in that publication is not up to date. Most Australian buthid species appear to have wide distributions; however, a few taxa have confirmed SRE distributions (Volschenk unpublished data).

GENUS: *Lychas* CL Koch, 1845

The genus *Lychas* is widespread across the Australian mainland. The taxonomy of this genus is problematic, with numerous undescribed species known in Australia (Volschenk *et al.* 2010). The situation is further complicated with the genus being also represented in Africa, India and eastern Asia (Fet & Lowe 2000). All of the Australian species are endemic and are currently under revision by ES Volschenk. Most species of Lychas appear to have wide distributions; however, a small number of undescribed species are known to be SRE's.

Species: *Lychas* 'harveyi' Morphospecies

SRE STATUS
Lychas 'harveyi' is not an SRE.

TAXONOMIC RESOLUTION
Lychas 'harveyi' is a well-defined and clearly recognised morphospecies.

DISTRIBUTION
Lychas 'harveyi' is a widespread species. Records are known from the Midwest and Pilbara regions of Western Australia where it is one of the most common scorpion species.

RECOMENDATIONS
Lychas 'harveyi' is not an SRE and no management is recommended.

Species: *Lychas* 'pilbara1' Morphospecies

SRE STATUS
Lychas 'pilbara1' is not an SRE.

TAXONOMIC RESOLUTION
Lychas 'pilbara1' is a well-defined and clearly recognised morphospecies.

DISTRIBUTION
Lychas 'pilbara1' has been recorded throughout the Pilbara region of Western Australia. Despite being widespread, it appears to have a very patchy distribution and is never common.

RECOMENDATIONS
Lychas 'pilbara1' is not an SRE and no management is recommended.

FAMILY: Urodacidae Pocock

The family Urodacidae is endemic to Australia (Fet 2000; Prendini 2000; Prendini 2003; Volschenk *et al.* 2000) where it is represented by the genera *Urodacus* Peters, 1861 and *Aops* Volschenk and Prendini, 2008.

GENUS: Urodacus Peters, 1861

Urodacus has been considered a member of the family Scorpionoidea for many years, but in a revision of the superfamily Scorpionoidea Latreille, Prendini (Prendini 2000) placed *Urodacus* in its own family. Unlike the species designations for Buthidae, LE Koch's (Koch 1977) species' of *Urodacus* have been mostly supported by subsequent authors (Harvey & Volschenk 2002; Volschenk & Prendini 2008; Volschenk *et al.* 2000). The biggest issue confronting Urodacus taxonomy is the number of undescribed species being uncovered through current revisionary work (Volschenk unpublished data). Currently 23 species of *Urodacus* are described; however, this may represent as little as 20% of the real diversity of this genus in Australia. Urodacus appears to be most diverse in Western Australia and few species are recorded east of the Great Dividing Range in eastern Australia. *Urodacus* contains both widespread and SRE species. During a large-scale survey of the Pilbara fauna, Volschenk, et. al. (Volschenk *et al.*) recorded nine undescribed species and only one formerly describes species were reported in that study.

Species: *Urodacus* sp. indet.

SRE STATUS
Urodacus sp. indet. undetermined SRE status.

TAXONOMIC RESOLUTION
Urodacus sp. indet. specimen/s could not be identified owing to incorrect sex and/or life history stage.

DISTRIBUTION
Urodacus sp. indet. cannot be defined as this is not a clear species. See comments for the genus.

RECOMENDATIONS
Urodacus sp. indet. management is impossible since it is not clear which species this is.

EXECUTIVE SUMMARY

Table ES 1 summarises the purpose of the Flora and Vegetation Management Plan (FVMP), including monitoring program within the context of the Western Australia Environmental Protection Authority (EPA) objectives for the key environmental factor of Flora and Vegetation (EPA, 2016). The FVMP and Monitoring Program also aligns with the EPA (2021c) and Commonwealth of Australia (2014) Environmental Management Plan Instructions and Guidelines. The FVMP and Monitoring Program has been prepared for the Mineral Resources Limited (MinRes) Lamb Creek Iron Ore Project and considers all proposed land disturbance for implementation of the Project (i.e. Indicative Footprint (IF)) as referred to in Mining Proposal and EPBC submissions (646.9 ha). Noting that this IF is different to the IF for the EP Act Part IV Section 38 referral (636.3 ha), as the Part IV referral area does not include the area of the proposed Great Northern Highway (GNH) intersection. Ground disturbance and vegetation clearing for the GNH intersection is covered under a separate Native Vegetation Clearing Permit (NVCP) as these works are wholly within Main Roads WA road reserve. This Environmental Management Plan specifically addresses the Flora and Vegetation environmental factor associated with the Project related ground disturbances (under all approvals).

Summary **Table ES 1** below presents the environmental outcomes and objectives for the environmental factor to be met through implementation of this FVMP, as well as the environmental criteria and management targets to measure achievement of the associated environmental outcomes and objectives.

Table ES-1: Flora and Vegetation Management Plan Summary

Project Title	Lamb Creek Iron Ore Project	
Short Description	Open pit iron ore mine located approximately 130 km northwest of Newman to produce up to 10 million tonnes per annum (Mtpa) of crushed and screened iron ore over a period of three to five years. This will comprise a multi-stage crushing and screening process plant and associated mine infrastructure including, but not limited to, site offices, maintenance and equipment service area, water pipelines, fuel storage, power generation, telecommunications and an accommodation village for site personnel. The total disturbance footprint of the Project is 646.9 ha (Indicative Footprint), within a Development Envelope of 874 ha, as referenced in the Mining Proposal and EPBC referral (**Figure 1**). Iron ore product will be loaded onto road trains and transported 16 km on a dedicated private haul road to its intersection with Great Northern Highway, where it will be transported 320 km to ship load-out facilities at the Utah Point berth in Port Hedland.	
Proponent Name	Process Minerals International (PMI) a wholly owned subsidiary of MinRes (ACN 118 549 910)	
Ministerial Statement No.	TBA	
Scope And Purpose Of FVMP	To present a robust and implementable environmental management framework to protect the environmental values of the Project and to demonstrate that the EPA's objective for this factor is met during the construction and operation of the Project.	
Key Environmental Factor And Objective	Flora and Vegetation:	To protect flora and vegetation so that biological diversity and ecological integrity are maintained.
Condition Clauses	TBA	
Key Components In The Flora And Vegetation MP	Key provisions are detailed in **Section 3**	

Outcome-based Management Provisions	Ensure development and operation of the Project meets the objective of protecting flora and vegetation to maintain biological diversity and ecological integrity.
Objective-based Management Provisions	• No clearing of native vegetation shall occur outside of approved area(s) during construction or operation. • No weed species to be introduced into the Development Envelope as a result of construction and operation of the Project. • No significant expansion of known weed populations within the Development Envelope as a result of construction and operation of the Project. • Effective operation of the Project to avoid Project related fire. • Minimise decline of flora and vegetation due to dust, weeds, and hydrocarbon or chemical leaks and altered hydrological regimes as a result of construction and operation of the Project.
Proposed Construction And Operation Dates	The forecast key milestones for construction and commissioning are: • construction Q3 to Q4 2025. • commence commissioning Q1 2026. • commence operation from Q1 2026 to Q2 2026.
Flora And Vegetation Management Required Pre-construction	Yes - this FVMP will be required to be implemented during installation of access tracks and roads into the site, following granting of licensed tenements

Declaration of accuracy

In making this declaration, I am aware that section 491 of the *Environment Protection and Biodiversity Conservation Act 1999* (Cth) (EPBC Act) makes it an offence in certain circumstances to knowingly provide false or misleading information or documents to specified persons who are known to be performing a duty or carrying out a function under the EPBC Act or the *Environment Protection and Biodiversity Conservation Regulations 2000* (Cth). The offence is punishable on conviction by imprisonment or a fine, or both. I am authorised to bind the approval holder to this declaration and that I have no knowledge of that authorisation being revoked at the time of making this declaration.

1. CONTEXT, SCOPE AND RATIONALE

1.1 PROJECT BACKGROUND

Process Minerals International (PMI; the Proponent), a wholly owned subsidiary of Mineral Resources Limited (MinRes), proposes to develop the Lamb Creek Iron Ore Project (the Project), located approximately 130 kilometres (km) northwest of Newman, in the East Pilbara Local Government Authority (LGA) in Western Australia (WA).

Open pit iron ore mine to produce up to 10 million tonnes per annum (Mtpa) of crushed and screened iron ore over a period of three to five years. This will comprise a multi-stage crushing and screening (process plant and associated mine infrastructure including, but not limited to, site offices, maintenance and equipment service area, water pipelines, fuel storage, power generation, telecommunications and an accommodation village for site personnel. The total disturbance footprint of the Project is 646.9 ha (Indicative Footprint), within a Development Envelope of 874 ha (Figure 1), as referenced in the Mining Proposal and EPBC referral. Iron ore product will be loaded onto road trains and transported 16 km on a dedicated private haul road to its intersection with Great Northern Highway, where it will be transported 320 km to ship load-out facilities at the Utah Point berth in Port Hedland.

The Project is being referred under s. 38 of the *Environmental Protection Act 1986* (EP Act) as it has the potential to significantly affect key environmental factors, defined by the WA Environmental Protection Authority (EPA) in its *Statement of environmental principles, factors, objectives and aims of EIA* (Environmental Protection Authority, 2021b). The Project is also being referred under the *Environment Protection and Biodiversity and Conservation Act 1999* (EPBC Act) as it is likely to have a significant impact on Matters of National Significance (MNES). A Native Vegetation Clearing Permit (NVCP) under Part V of the EP Act will also be sought for the area of the Project that intersects the Great Northern Highway Road Reserve.

As a result of the various approvals being sought for the Project, there are subtle differences in the Development Envelopes (DE) and Indicative Footprints, however the overall clearing associated with the Project is the same. The maximum DE or Proposed Action Area for the EPBC referral is 897.5 ha, as the EPBC referral was based on an earlier, now revised, DE footprint. The EPBC referral DE is also slightly larger than that for the s. 38 Referral, due to the splitting of the DE between the approvals under Part IV and Part V of the EP Act. This Flora & Vegetation Management Plan (FVMP) has been prepared to support the submission of the EPBC referral, s. 38 Referral Supporting Document (RSD) and the NVCP application and details the management actions proposed to reduce adverse environmental impacts to the key environmental factor of Flora and Vegetation from all proposed land disturbance.

Key nomenclature used throughout this document is summarised below:

- **The Project:** This refers to the boundary within which the elements of the proposed Lamb Creek Project activities are situated.
- **Project Area (897.5 ha):** Refers to the maximum proposed Development Envelope (as for EPBC) within R47/19 (to be converted to M47/1592) and L47/1008, which overlie the Juna Downs pastoral lease (LPL N050471). A small portion of the access road and Great Northern Highway intersection area is within railway corridor L021124 (Hamersley Iron Pty Ltd- Yandicoogina Rail) that is excised from Juna Downs. This Project Area also includes the area of the intersection with the Great Northern Highway which is entirely within Main Roads WA road reserve.
- **Development Envelope (874 ha):** delineates the area within which the Project components are located (**Figure 1**) and is a combination of the development envelopes included in the Part IV and Part V applications.

- **Indicative Footprint (646.9 ha)**: refers to the area that is proposed to be directly disturbed by the Project (e.g. clearing of native vegetation) (**Figure 1**) and occurs entirely within the Development Envelope. The layout of the Indicative Footprint may be subject to change; however, total disturbance will not exceed the maximum disturbance for the Development Envelope.
- **Flora and Vegetation Survey Area (3,785 ha):** refers to the Umwelt (2022a) field survey boundary (**Figure 2**).
- This FVMP has been prepared in accordance with the *How to prepare Environmental Protection Act 1986 Part IV Environmental Management Plans: Instructions* (Environmental Protection Authority, 2021a).

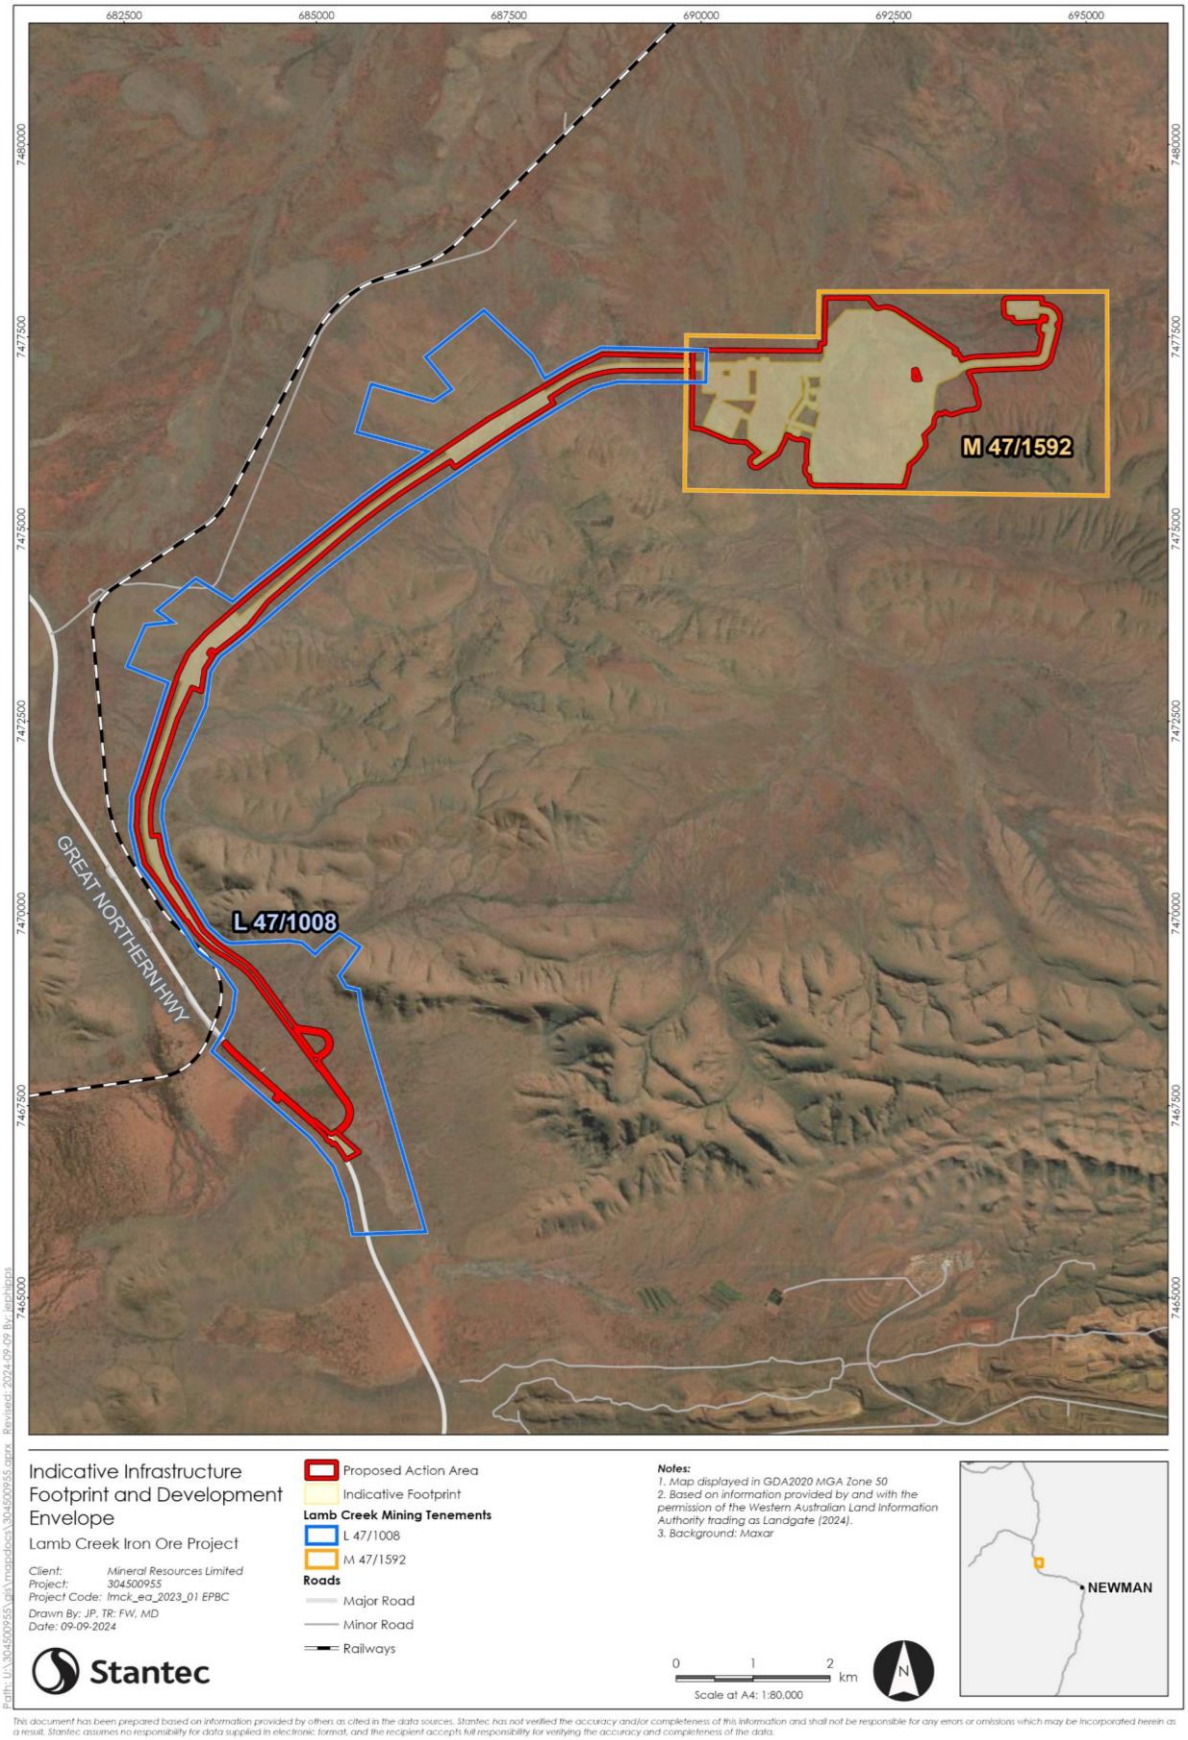

Figure 1: Development Envelope and Indicitive Footprint

1.2 KEY ENVIRONMENTAL FACTOR – FLORA AND VEGETATION

This FVMP demonstrates that the potential impacts to flora and vegetation can be managed to meet the EPA's objective, aided by the conceptual design, planned construction and operational procedures that will be implemented to avoid, mitigate and maintain values. In addition, 646.9 ha of native vegetation in "Good" to "Excellent" condition will be offset through the Pilbara Environmental Offsets Fund (PEOF). Any additional requirements in relation to threatened flora will be managed by the EPBC referral process.

The EPA's objective for the environmental factor of Flora and Vegetation is "*To protect flora and vegetation so that biological diversity and ecological integrity are maintained.*" (Environmental Protection Authority, 2016). In the context of this objective, ecological integrity is the composition, structure, function and processes of ecosystems, and the natural range of variation of these elements. Flora and Vegetation is considered a key environmental factor for the Project due to the potential for direct and indirect impacts during construction and operation activities.

1.2.1 Site Specific Environmental Values

The flora and vegetation values identified as having the potential to be affected by the Project include:

- native vegetation within the Pilbara bioregion comprising 13 identified vegetation types, with clearing of up to 646.9 ha to occur; and
- Conservation significant flora present in the Indicative Footprint; *Aristida lazaridis* (P2), *Rhagodia* sp. Hamersley (M. Trudgen 17794) ("*Rhagodia* sp. Hamersley") (P3) and *Seringia exastia* (T – Commonwealth) recorded within the Indicative Footprint.

1.2.2 Potential Impacts to Flora and Vegetation

The Project may directly and indirectly impact on flora and vegetation, with the potential direct impacts identified as:

- loss of native vegetation due to clearing; and
- loss of significant flora taxa due to clearing.
- The potential indirect impacts have been identified as:
- potential for fragmentation of vegetation as a result of construction of linear corridors.
- introduction and / or spread of introduced flora species.
- degradation or alteration of vegetation as a result of altered fire regimes.
- degradation or alteration of vegetation as a result of altered hydrological regimes.
- degradation of vegetation through dust deposition.
- An assessment of the potential impacts and risks to the flora and vegetation resulting from the Project has been undertaken and is included as **Appendix B**. Results of the risk assessment have been used to develop management measures that form part of this FVMP.

1.3 PURPOSE AND OBJECTIVE

The purpose of this FVMP is to document the Proponent's approach and management measures for avoiding and minimising potential impacts on vegetation and significant flora species from the Project during construction and operation. Successful implementation of these measures will help maintain the biodiversity and ecological integrity of significant flora and vegetation in the Project Area, for aspects within the proponents control. The objective of this FVMP is to meet the EPA's objective for the

environmental factor of Flora and Vegetation using the EPA's mitigation hierarchy of avoid, mitigate, rehabilitate and offset (Government of Western Australia, 2014).

1.4 RATIONALE AND APPROACH

The Proponent is committed to avoiding and minimising potential impacts caused by the operations of the Project to flora and vegetation species of significance to ensure that the biodiversity, ecological integrity and function of vegetation is maintained. The Project has been designed to avoid impacts to key environmental factors located within the Project Area.

The FVMP focuses on outcome-based management provisions including monitoring and evaluating success of management actions with respect to significant flora and vegetation within the Project Area, driven by triggers and thresholds. Assessment of the pathways over which impacts may occur provides the rationale for choice of provisions and choice of appropriate indicators to measure against the environmental outcome and/or objective.

This FVMP is subject to approval by the EPA and Department of Climate Change, Energy, the Environment and Water (DCCEEW) and will subsequently be implemented.

1.5 LEGISLATION, POLICY AND GUIDANCE

This FVMP has been written in accordance with Western Australian (WA) and Commonwealth policies and guidance, including:

- Environmental Impact Assessment (Part IV Divisions 1 and 2) Administrative Procedures 2016; (EPA, 2021a)
- Instructions on how to prepare Environmental Protection Act 1986 Part IV Environmental Management Plans; (EPA, 2021c)
- Environmental Impact Assessment (Divisions 1 and 2) Procedures Manual (EPA, 2021b);
- Environmental Management Plan Guidelines (Commonwealth of Australia, 2014);
- Outcomes-based conditions policy (DoE, 2016b);
- Outcomes-based conditions guidance (DoE, 2016a);
- Environmental Factor Guideline – Terrestrial Flora (EPA, Environmental Protection Authority, 2016);
- Biosecurity and Agriculture Management Act 2007 (WA);
- Biodiversity Conservation Act 2016 (WA); and
- Rights in Water and Irrigation Act 1914 (WA) and
- Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth).

The following management plans and strategies are also relevant to the FVMP, specific to the Project and include:

- Significant Fauna Management Plan (SFMP)

State and Commonwealth plans and management prescriptions that are relevant to flora and vegetation include:

- Matters of National Environmental Significance. Significant impact guidelines 1.1 - Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia, 2013).

2. VEGETATION

2.1 SURVEY AND STUDY FINDINGS

The rationale for the proposed management approach in this FVMP is supported by desktop, detailed and targeted flora and vegetation surveys that have been completed over the Lamb Creek Project area since 2012 (Rapallo, 2012, 2017, 2020, 2021a, 2021c, 2021d, 2022; Umwelt, 2022a). The findings of these surveys are summarised in the following sections and have been used to inform the impact assessment within the RSD and EPBC referral, and to develop mitigation measures detailed in this FVMP (Table 1). Surveys and studies undertaken include:

- Lamb Creek Flora and Vegetation Impact Assessment Report (Umwelt, 2022b)
- Detailed and Targeted Flora and Vegetation Survey (Umwelt, 2022a)
- Targeted conservation significant flora survey of the Lamb Creek project area (Rapallo, 2022)
- Detailed flora and vegetation survey of the Great Northern Highway intersection – Lamb Creek Project (Rapallo, 2021a)
- Lamb Creek Flora mapping update and data review (Rapallo, 2017), and
- Level 2 Flora and Vegetation Survey of the Lamb Creek Project Area (Rapallo, 2012);

Table 1: Summary of Flora and Vegetation Surveys Conducted for the Project

Survey (Reference)	Study Type/ Dates	Proximity to Project Area	Survey / Study Effort	Flora and Vegetation recorded	Key Findings
Lamb Creek Detailed and Targeted Flora and Vegetation Survey (Umwelt, 2022a)	Scope • Detailed and Targeted Flora and Vegetation survey. Timing • 14 – 23 March, 4 – 14 April and 29 June – 1 July 2022 (field surveys). Size • 3785.7 ha.	Over Project area	Desktop assessment • Database searches (max 40 km buffer). • Review of relevant reports. Field survey • 116 quadrats. • 5 relevés. • Targeted searching for all significant flora previously recorded in the Study Area or considered potentially to occur.	328 discreet vascular flora taxa including: • 45 families. • 137 genera including 7 introduced taxa. 10 Vegetation Types were defined. The majority of the vegetation within the Study Area (90.5 %) was rated as Excellent, with no obvious signs of damage caused by human activities. The remainder of the vegetation was rated as Very Good and Good.	One Threatened taxon under the EPBC Act (*Seringia exastia*) was recorded however it is likely to be delisted in the near future. Seven significant flora taxa were recorded within the Study Area including five Department of Biodiversity, Conservation and Attractions (DBCA) listed Priority (P) taxa, and two potentially undescribed taxa, as listed below: • Aristida jerichoensis var. subspinulifera (P3). • Aristida lazaridis (P2). • Corchorus sp. (Potentially undescribed). • Eremophila naaykensii (P3). • Euphorbia ferdinandi. s. lat. (Potentially undescribed). • Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2). • Rhagodia sp. Hamersley (M. Trudgen 17794) (P3).
Detailed flora and vegetation survey of the Great Northern Highway intersection – Lamb Creek Project (Rapallo, 2021b)	Scope • Single phase detailed flora and vegetation survey of the Great Northern Highway intersection. Timing • 12-17 May 2021 (field surveys). Size	Over the Great Northern Highway intersection.	Desktop assessment • Database searches (max 60 km buffer). • Review of relevant reports. Field survey • 19 flora quadrats (50 m by 50 m). • 1 relevé were sampled during the field survey. • Additional flora taxa were recorded opportunistically while traversing between quadrats. Survey also included:	• 187 flora taxa including: • 35 families • 178 genera including 9 introduced taxa • Six vegetation types were mapped and described. • Vegetation condition across the survey area varied from Very Good to	Five conservation significant flora taxa were recorded from the survey area, as listed below: • Aristida lazaridis: (P2). • Rhagodia sp. Hamersley (M. Trudgen 17794): (P3). • Goodenia nuda: (P4). • Seringia exastia: Critically Endangered. • Euphorbia aff. ferdinandi: Potentially undescribed.

Survey (Reference)	Study Type/ Dates	Proximity to Project Area	Survey / Study Effort	Flora and Vegetation recorded	Key Findings
	• 254 ha.		• opportunistic records and field notes. • specimen collection and identification. • vegetation health classification.	Degraded, with most of the quadrats ranked as Good.	
Targeted conservation significant flora survey of the Lamb Creek project area (Rapallo, 2022)	Scope • A targeted significant flora survey was conducted over two phases. Timing • Phase one: 15-29 April 2020. • Phase two: 12-17 May 2021. Size • 872 ha.	The project area at the time of the survey only included R47/19 and L47/736. This footprint has now been superseded, the current footprint extends outside of the survey area by 236 hectares (36%).	Desktop assessment • Review and refine desktop information on conservation significant flora within 30km of the Project Area. Field survey • a flora desktop assessment. • systematic parallel traverses spaced approximately 50 m apart. • additional searches on foot and via helicopter, outside the survey area.		One Threatened taxon under the EPBC Act (*Seringia exastia*) was recorded however it is likely to be delisted in the near future. Six species of priority flora listed by the DBCA were recorded: • Aristida Lazaridis (P2). • Aristida jerichoensis var. subspinulifera (P3). • Eremophila sp. Hamersley Range (P3). • Rostellularia adscendens var. latifolia (P3). • Rhagodia sp. Hamersley (M. Trudgen 17794) (P3) • Euphorbia aff. ferdinandi: Potentially undescribed.
Lamb Creek and Wedge Deposits – Flora and Vegetation Desktop Assessment (Woodman, 2020)	Scope • Desktop Assessment of Lamb Creek Deposit, Wedge Deposit and access road from Great Northern Highway. Size	Over Project Area.	Desktop assessment • Database searches (40km buffer). • Review of relevant reports.	9 significant vegetation communities. 38 introduced taxa.	• 62 significant flora taxa or habitat for significant taxa. • 61 DBCA classified priority flora. • 1 Threatened taxon.

Survey (Reference)	Study Type/ Dates	Proximity to Project Area	Survey / Study Effort	Flora and Vegetation recorded	Key Findings
	• 3,110 ha. •				
Lamb Creek flora mapping update and data review (Rapallo, 2017)	Scope • Level 2 Flora and Vegetation single-phase field survey. Timing • 27 March to 1 April 2012 (6 days). Size • 233 ha.	An extension to the 2012 vegetation mapping to account for a change in alignment of one of the proposed haul road options. (215 ha of L47/736 outside of the previous area mapped in 2012).	Desktop assessment • extrapolation of vegetation mapping into the new haul road corridor. • No field work was conducted within the portion of the new haul road located outside the area surveyed in 2012. • 2012 observations and drawings were utilised.	5 vegetation communities assessed as occurring in the additional study area based on extrapolation.	
Level 2 Flora and Vegetation Survey of Lamb Creek project area for Process Minerals International (Rapallo, 2012)	Scope • Level 2 Flora and Vegetation single-phase field survey. Timing • 27 March to 1 April 2012 (6 days). Size • 2,068 ha.	The survey encompassed the proposed mine site, two alternate haul road routes (nominal 120 m buffer either side), three alternate accommodation camp locations.	Desktop assessment • Review and refine desktop information on conservation significant flora (max 40km) of the Project Area. Field survey • A total of 46 flora quadrats of 50 x 50 m were established within the area within each of the five land systems within the Flora and Vegetation Survey Area as well as opportunistic collections of species.	230 species 110 genera 42 families 5 introduced taxa 6 vegetation communities. Average vegetation condition was excellent to very good.	3 species of priority flora listed by the DBCA were recorded • Aristida Lazaridis (P2) • Brachyscome sp. Wanna Munna Flats (P3) • Aristida calycina var. calycina (P2)

2.2 PRE-EUROPEAN VEGETATION

Pre-European vegetation mapping was originally undertaken by Beard (1975) at various scales across WA and has since been updated to be consistent with the National Vegetation Information System (NVIS) descriptions at a scale of 1:250,000 (Beard et al., 2013). Two vegetation associations have been mapped within the Flora and Vegetation Survey Area; Hamersley 18 and Hamersley 82 (Table 2) described as follows:

- Hammersley 18: Low woodland; continuous Mulga woodland communities over spinifex *Triodia basedowii* and *Triodia epactia* hummock grasslands on stony undulating plains; and
- Hammersley 82: Low scattered tree steppe; Snappy Gum *Eucalyptus leucophloia* over spinifex *Triodia wiseana* hummock grassland on stony undulating plains.

Vegetation associations retaining less than 30% of their pre-European extent generally experience accelerated species loss at an ecosystem level and are regarded as being 'vulnerable', while vegetation types retaining less than 10% of their original extent are regarded as being 'endangered' (Environmental Protection Authority, 2020). The two vegetation associations found to intersect the Flora and Vegetation Survey Area have close to 100% of their original extent remaining and are considered 'least concern'. In addition, at a scale of 1:1,000,000, the vegetation units described by Beard (1975) within the Flora and Vegetation Survey Area are well represented throughout the Pilbara bioregion.

Table 2: European Vegetation associations within the Flora and Vegetation Survey Area (DBCA, 2019)

Vegetation Association	Scale	Pre-European Extent (Ha)	Current Extent Remaining (Ha)	Pre-European Extent Remaining	Conservation Status	Extent In Survey Area (Ha)
Hammersley 18.11	State Wide	19,892,306	19,843,148	99.75%	Least Concern	1,094.65
	Pilbara Bioregion	676,556	671,843	99.30%	Least Concern	
Hammersley 82.3	State Wide	2,565,901	2,157,841	99.51%	Least Concern	707.24
	Pilbara Bioregion	2,563,583	2,550,888	99.50%	Least Concern	

2.2.1 Vegetation Types

The most recent detailed flora and vegetation survey undertaken by Umwelt (2022a) found a total of 10 vegetation types within the study area with nine of these being within the DE (Table 3; Figure 2). The vegetation types mapped belonged to three broad groups based on soil and topography:

- Group 1 is characterised by Woodlands over sparse shrublands and hummock grasslands on gentle lower to upper slopes on redbrown clay loams.
- Group 2 is charactered by Open Woodlands over sparse shrublands and tussock and hummock grasslands on steep slopes, crests, gullies and gorges with exposed ironstone and skeletal soils.
- Group 3 is characterised by Mulga Woodlands over tussock grasslands and open woodlands over sparse shrublands over hummock grasslands on red-brown clay-loam on plains; and open woodlands over shrublands over hummock grasslands on major and minor drainage lines.

None of these communities were considered representative of any listed threatened ecological communities (TECs) or priority ecological communities (PECs), nor are they considered regionally significant vegetation for any other reason and are likely to be represented elsewhere.

Table 3: Vegetation Types Mapped Within the Flora and Vegetation

Vegetation Type	Description	Extent in Survey Area (ha)	Extent in Development Envelope (ha)
Group 1: Woodlands over sparse shrublands and hummock grasslands on gentle lower to upperslopes on redbrown clay loams			
1	Low Open Woodland of *Eucalyptus leucophloia* subsp. *leucophloia* and/or *E. gamophylla* with isolated *Corymbia deserticola* subsp. *deserticola* over low to mid sparse to open shrubland dominated by species including *Acacia atkinsiana* and A. *ancistrocarpa* over low open hummock grassland of *Triodia pungens*, *T. vanleeuwenii* and *T. wiseana* and low open tussock grassland of *Themeda* sp. Mt Barricade and *Paraneurachne muelleri* on red-brown sandy clay loam to clay loam on gently inclined mid to lower slopes and associated drainage lines	1429.2 (37.8%)	445.8 (51.0%)
2	Low open woodland of *Eucalyptus leucophloia* subsp. *leucophloia* with occasional *Corymbia deserticola* subsp. *deserticola* and C. *hamersleyana* over low sparse shrubland of *Acacia hilliana* and *Hakea chordophylla* over open hummock grassland of *Triodia vanleeuwenii* and *T. wiseana* on red-brown clay loam with ironstone pebbles on gently inclined lower to upper slopes	382.3 (10.1 %)	66.4 (7.6 %)
3	Isolated trees of *Corymbia hamersleyana*, *Eucalyptus leucophloia* subsp. *leucophloia* and *E. gamophylla* over low sparse shrubland of mixed Acacia species over low hummock grassland of *Triodia pungens* and *T. wiseana* on red-brown sandy clay loam on mid to lowerslopes with ironstone pebbles	48.2 (1.3 %)	7.2 (0.8%)
Group 2: Open Woodlands over sparse shrublands and tussock and hummock grasslands on steep slopes, crests, gullies and gorges with exposed ironstone and skeletal soils.			
4	Low open woodland of *Corymbia ferriticola* or *Corymbia hamersleyana* and *Eucalyptus leucophloia* subsp. *leucophloia* with *Ficus brachypoda* occurring on gorge and gully areas, over low sparse shrubland of mixed species dominated by *Corchorus laniflorus*, *Dodonaea viscosa* subsp. *mucronata* and *Gossypium robinsonii* over sparse hummock grassland dominated by *Triodia pungens* with *T. wiseana* and tussock grasses including *Cymbopogon ambiguus* and *Aristida burbidgeae* on red brown clay loam on steep upperslopes, gullies, breakaways and gorges with significant ironstone outcropping	95.3 (2.5 %)	1.6 (0.2%)
5	Occasional *Eucalyptus leucophloia* subsp. *leucophloia* and *Corymbia hamersleyana* over mixed isolated shrubs including *Acacia inaequilatera* and *Senna artemisioides* subsp. *glutinosa* over low hummock grassland of *Triodia wiseana* on steep upperslopes and associated drainage lines on red-brown clay loam with exposed ironstone and dolerite	100.9 (2.7 %)	0
6	Low woodland to open woodland of *Corymbia hamersleyana* and *Eucalyptus leucophloia* subsp. *leucophloia* and occasional *E. kingsmillii* over mid isolated shrubs of *Acacia hamersleyensis* and *Grevillea wickhamii* ?subsp. *hispidula* over low hummock grassland of *Triodia wiseana* on red brown sandy clay loam on steep mid to upperslopes with exposed ironstone	316.6 (8.4 %)	4.0 (0.5%)

Vegetation Type	Description	Extent in Survey Area (ha)	Extent in Development Envelope (ha)
Group 3: Mulga Woodlands over tussock grasslands and open woodlands over sparse shrublands over hummock grasslands on red-brown clay-loam on plains; and open woodlands over shrublands over hummock grasslands on major and minor drainage lines			
7	Isolated trees of *Corymbia hamersleyana*, *Eucalyptus leucophloia* subsp. *leucophloia* and *Eucalyptus xerothermica* over low open to sparse shrubland dominated by *Acacia aptaneura*, *A. aneura* and *A. pruinocarpa* over low tussock grassland to sparse tussock grassland dominated by *Themeda* sp. Mt Barricade (M.E. Trudgen 2471), *Enneapogon polyphyllus*, *Chrysopogon fallax* and *Aristida* spp. with occasional *Triodia pungens* on red brown clay loam with some ironstone pebbles on plains	523.4 (13.8 %)	171.9 (19.7 %)
8	Isolated trees of *Eucalyptus xerothermica* over tall open to sparse shrubland of *Hakea lorea* subsp. *lorea* and *Acacia aptaneura* over low open tussock grassland of *Aristida contorta*, *A. inaequiglumis* and *Themeda triandra* on red-brown sandy clay to clay on plains	68.9 (1.8 %)	3.9 (0.5%)
9	Low open woodland of *Corymbia hamersleyana*, *C. deserticola* subsp. *deserticola*, *Eucalyptus gamophylla* and *Eucalyptus leucophloia* subsp. *leucophloia* over tall sparse shrubland of *Acacia atkinsoniana* and occasional *A. ancistrocarpa* and *A. aptaneura* over low hummock grassland dominated by *Triodia pungens* and occasional *T. wiseana* with *Paraneurachne muelleri* also dominant on red-brown clay loam with ironstone pebbles on plains	600.8 (15.9 %)	103.3 (11.8 %)
10	Low open woodland of *Corymbia hamersleyana* with occasional *Eucalyptus gamophylla*, *E. leucophloia* subsp. *leucophloia* and *E. xerothermica* over tall open shrubland dominated by taxa including *Acacia cowleana*, *A. tumida* var. *pilbarensis*, *Gossypium robinsonii* and *A. pyrifolia* over low open hummock grassland of *Triodia pungens* and tussock grassland dominated by *Themeda* sp. Mt Barricade (M.E. Trudgen 2471) and *Aristida* spp. on red-brown clay loams on major and minor drainage lines	523.4 (13.8 %)	67.1 (7.7 %)
Cleared, rehabilitated, existing roads and tracks (not a vegetation type).		4.6 (0.1%)	2.9 (0.3%)
Total		**3785.7**	**874**

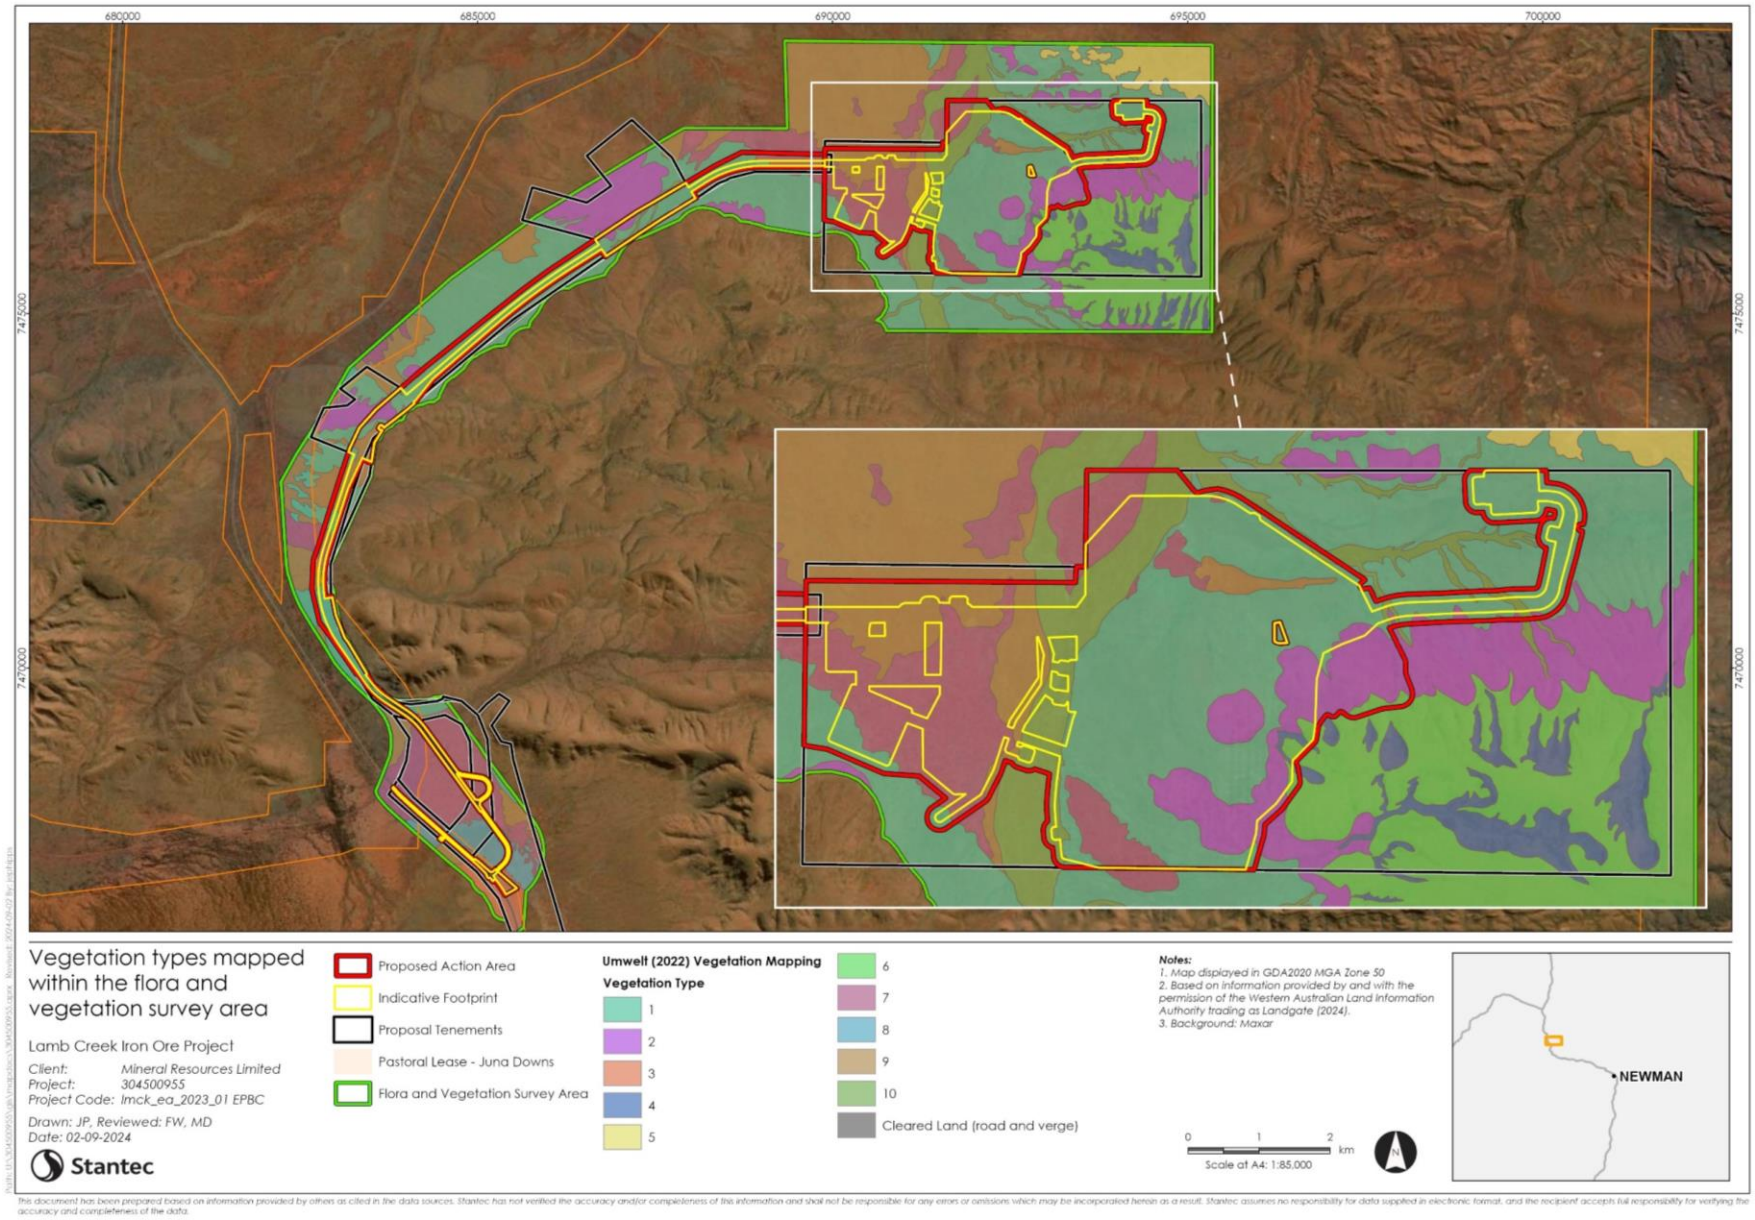

Figure 2: Vegetation Types Mapped Within The Flora And Vegetation Survey Area

2.2.1.1 Vegetation Condition

The condition of the vegetation in the Study Area was rated Good to Excellent (Umwelt, 2022a). The majority of the vegetation (90.5 %) rated as Excellent, with no obvious signs of damage caused by human activities. The remainder of the vegetation was rated as Very Good and Good (8.2 % and 1.2 % respectively), with some historical mechanical disturbance but mostly low levels of introduced flora within the Study Area. Less than 1 % of the Study Area (4.6 ha) was mapped as cleared with no native vegetation remaining.

The vegetation of the Study Area has for the most part been subject to fire in the past 10 years however none of the Study Area has been burnt more recently than four and a half years prior to survey (Umwelt, 2022a).This has resulted in a mosaic of vegetation of different fire ages. Floristic data and site photos collected in 2020 and 2021 indicate that these fires have changed both vegetation structure and floristic composition since 2012 (Rapallo, 2021e).

2.2.1.2 Vegetation of Significance

None of the vegetation types recorded from the Flora and Vegetation Survey Area are consistent with TECs or PECs listed under the *Biodiversity Conservation Act 2016* (BC Act) or EPBC Act for the Pilbara bioregion (Department of Biodiversity Conservation and Attractions, 2021). The nearest PEC to the Flora and Vegetation Survey Area is a subtype of the "Coolibah-lignum flats: *Eucalyptus victrix* over lignum community in the Pilbara". The edge of the PEC's buffer zone is located approximately 5 km south of the Flora and Vegetation Survey Area (Rapallo, 2022). As neither *Eucalyptus victrix* nor *Muehlenbeckia* spp. (lignum) have been recorded within the Flora and Vegetation Survey Area, the Coolibah-lignum flats PEC is considered unlikely to occur.

2.2.1.3 Other Vegetation of Significance

Vegetation may be of significance for reasons other than being listed as a TEC or PEC. This may include, although is not limited to, scarcity, combination of species, role as a refuge, restricted distribution and vegetation extent being below a threshold level (Environmental Protection Authority, 2004). Local significance can be determined where a vegetation type is confined to a specialised habitat and/or landform that is not common in the local area or the vegetation types are supporting significant species or groundwater dependent species. The following vegetation communities are considered to be potentially locally and/or regionally significant; however, they are not listed under the BC Act or EPBC Act.

The closest significant vegetation record to the Study Area is an occurrence of the 'Coolibah-lignum flats: *Eucalyptus victrix* over lignum community in the Pilbara - sub type 2: Coolibah woodlands over lignum (*Duma florulenta*) over swamp wanderrie (Lake Robinson)' PEC (P1); the edge of this PEC's buffer polygon is approximately 3 km south of the Study Area. The vegetation types mapped by Umwelt (2022a) are not considered to represent any listed PEC or TEC nor are they considered to be significant. None of the vegetation types are considered to be providing important functions required to maintain ecological integrity of a significant ecosystem.

2.2.1.4 Groundwater-dependent Vegetation

No groundwater dependent vegetation was recorded within the Flora and Vegetation Survey Area (Rapallo, 2022), consistent with the characterisation of part of the area as a floodplain, as well as an apparent lack of permanent or semi-permanent surface water and a lack of broad incised channels.

2.2.2 Flora

2.2.2.1 Floristic Composition

The Umwelt (2022a) survey recorded 328 vascular flora taxa flora taxa from 45 families and 137 genera, including 7 introduced taxa. The most well-represented families were Fabaceae (64 discrete taxa, three known hybrids), Poaceae (56 taxa), Malvaceae (45 taxa) and Amaranthaceae (16 taxa).

2.2.2.2 Significant Flora

Nine significant flora species were recorded within, and adjacent to, the DE (**Table 4, Figure 3)**. This includes five DBCA-listed Priority flora taxa, one Commonwealth listed taxa and two taxa considered significant under the 'new species or species with anomalous features that indicate a potential new species' which are referred to as "potentially undescribed (Umwelt, 2022a):

- Aristida jerichoensis var. subspinulifera (P3)
- Aristida lazaridis (P2)
- *Corchorus sp*. (Potentially undescribed)
- Eremophila naaykensii (P3)
- *Euphorbia ferdinandi* s. lat. (Potentially undescribed)
- *Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2)
- *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3)
- Rostellularia adscendens var. latiflora (P3)
- *Seringia exastia* (T – Commonwealth)

Three significant taxa were recorded in the Indicative Footprint. These were:

- *Rhagodia* sp. Hamersley (M. Trudgen 17794) was not recorded by Umwelt (2022a) but 3 plants were previously recorded by Rapallo (2022).
- *Aristida lazaridis* (P2) - Umwelt (2022a) recorded three records with a total of four individuals while Rapallo 2022c recorded 58 plants from 44 records; and
- *Seringia exastia* (T) - Umwelt (2022a) recorded 13 records with a total of 221 individuals while Rapallo 2022c recorded none).

A single plant of *Aristida jerichoensis* var. *subspinulifera* has been recorded in the Development Envelope in the indirect impact assessment zone by Umwelt (2022a) but outside of the Indicative Footprint. The Umwelt (2022a) survey recorded locations of *Seringia exastia*, a taxon currently still listed as Threatened under the EPBC Act however it has been delisted under the BC Act. Locations of significant flora taxa recorded in the Study Area by the Umwelt 2022 survey are presented in **Table 4**. The Umwelt (2022a) survey recorded *Goodenia nuda* during the survey however this species has now been delisted from a priority 4 and has therefore been excluded from **Table 4**. All significant flora taxa recorded within the Flora and Vegetation Survey Area also occur within the broader Hamersley subregion. Figure 3: Priority Flora Recorded Within The Flora And Vegetation Survey Area shows the locations of the significant flora in relation to the DE.

Table 4: Significant Flora Recorded in the Flora and Vegetation Survey Area

Species	Conservation Status	Habitat	Vegetation Types	No. of Individuals			Other previous records of species
				Survey Area	DE (excluding IF)	IF	
Seringia exastia	T/Cr	Variety of Mulga woodlands, sometimes with *Eucalyptus* spp., over *Acacia* spp. shrublands over *Triodia pungens* hummock grassland. Gullies and washouts. Red sand/laterite over sandstone.	1~, 2, 3, 6, 9, 10	783 in 37 locations	11	211	The species is currently listed as Critically Endangered under the EPBC Act, but this is due to a taxonomic revision where a threatened and a common species were merged, and the name of the former was adopted as the new name, with the conservation status still attached. The current distribution map published on FloraBase (Western Australian Herbarium 1998) incorporates this revision, showing *Seringia exastia* as widespread across northern Western Australia, ranging from the Coolgardie and Murchison IBRA regions in the south to the Dampierland IBRA region in the north. *Seringia exastia* is no longer listed as Threatened under State legislation and is expected to be de-listed under the EPBC Act in the future. The Rapallo (2022) survey found 2 additional records in their targeted flora survey area of the Lamb Creek site.
Aristida lazaridis	P2	Plain, clay/loam, drainage, slope; often Mulga low open woodland with or without *Eucalyptus* spp., over variety of shrubs and herbs, often over tussock grassland but sometimes with *Triodia* spp. hummock grassland.	7~, 8~, 3, 9	7217 in 3094 locations	12	77	Rapallo (2022) recorded an estimated population of 12773 plants from 6757 point locations over the 2020 and 2021 surveys undertaken. Searches outside the survey area on foot and from helicopter recorded the species extending outside the project area. A significant population of *Aristida lazaridis* (2405 individuals) has been recorded in deep loam soil along an un-incised drainage line north and west of the BHP Packsaddle Village, approximately 7 km south-east of the Proposal. The species has also been recorded from Lake Robinson on the eastern fringe of the Coondewanna Flats. The Western Australian Herbarium (WAH) has 20 specimen records within their database, with collections from locations across approximately 130 km extending from the Rangers Station at Karijini National Park to near Newman (DBCA 2021c). There are 43 records from the Rio Tinto Priority Flora database (Rio Tinto 2018) extending over 60 km. Additionally, this species occurs over a 2,500 km range across the Northern Territory and Queensland (Atlas of Living Australia 2021).

Species	Conservation Status	Habitat	Vegetation Types	No. of Individuals			Other previous records of species
				Survey Area	DE (excluding IF)	IF	
Aristida jerichoensis var. subspinulifera	P3	Plain or flat, clay/loam. Often Mulga woodlands or *Acacia* spp. shrublands over spinifex and/or tussock grassland.	8~	97 in 8 locations	1	0	Locally, there is a WAH record of *Aristida jerichoensis* var. *subspinulifera* from 800 m northwest of the Proposal, from a level plain of orange light clay (DBCA 2021a). There are 39 specimen records within the WAH database, with collections from locations spread across 290 km extending between Nammuldi to Newman, with outliers in the Little Sandy Desert and Murchison, as well as collections from the Northern Territory and Queensland (DBCA 2021c; Atlas of Living Australia 2021).
Eremophila naaykensii previously Eremophila sp. Hamersley Range	P3	Rocky gullies and gorges. Steep rocky hill slopes and summits, high in the landscape.	4~	73 from 37 locations	0	0	This species has been recorded approximately 8 km south of the Proposal (DBCA 2021a) and from Baby Hope Downs approximately 35 km southeast of Proposal from five locations in rocky gullies and gorges (Biota 2014). There are 15 specimen records within Western Australia, with WAH records from locations spread across 220 km from Paraburdoo to Newman (Western Australia Herbarium, 1998) and 345 records, within the Rio Tinto database; recorded from Eastern Range, Channar, Turee Syncline, Karijini National Park, West Angelas, Angelo Central and Hope Downs 1 (Rio Tinto 2016).
Corchorus sp.	Potentially undescribed	The habitat of the recorded population was restricted to drainage lines of sandy loam soils, with no or very few stones, and an open lower stratum of tussock grasses and low shrubs	9~	35 from 23 locations	0	0	This species does not match reference specimens of any published species and has potential taxonomic significance. This entity is distinct in having elongated fruit. Fruiting specimens were collected in April and June 2022, indicating approximately a March-May flowering period. Flowering specimens were also collected in late June, though this could be considered a response to the unseasonably late rains of May 2022 rather than an indicator of usual flowering time. There are no other known populations of this entity, which may indicate that it is geographically restricted. A precautionary approach would see it regarded as a taxon of potential conservation significance, though this is not yet able to be formally assessed (Umwelt, 2022a).

Species	Conservation Status	Habitat	Vegetation Types	No. of Individuals			Other previous records of species
				Survey Area	DE (excluding IF)	IF	
Rhagodia sp. Hamersley (M. Trudgen 17794)	P3	Mulga over mixed grassland. Emergent eucalypts and *Triodia* spp. grassland. Very open Mulga woodland over patchy mixed grasses. Floodplains, hardpan plains.	7~, 8, 9	53 from 49 locations	0	3	This species is widespread on Mulga plains. Fifty plants were recorded near the Great Northern Highway by Rapallo (2022). The Rapallo (2022) survey found 49 additional records in their targeted flora survey area of the Lamb Creek site. Locally, 13 populations of *Rhagodia* sp. Hamersley have been recorded within 3 km of the Proposal Area. There are 63 specimen records in the WAH database, with collection locations spread approximately 290 km extending between Tom Price and Newman (DBCA, 2021). Fifty plants were recorded near the Great Northern Highway by Rapallo (2022). The Rapallo (2022) survey found 49 additional records in their targeted flora survey area of the Lamb Creek site with 3 plants been previously recorded in the Development Envelope. Umwelt (2022a) however did not record any plants in their survey.
Hibiscus sp. Gurrinbiddy Range (M.E. Trudgen MET 15708)	P2	Rocky gullies, drainage lines and gorges with loamy skeletal soil	4~	17 from 2 locations	0	0	This taxon is known from 24 WA Herbarium records across 10 broad regional locations, two of which occur within DBCA-managed tenure within Karijini National Park, no records are within 10km of the Study Area. This record of *Hibiscus* sp. Gurinbiddy Range (M.E. Trudge MET 15708) is a slight range extension of the known range of this taxon to the north.
Euphorbia aff. ferdinandi	Potentially undescribed	Often found in open woodland, *Acacia aneura* woodland, low shrublands, flats, in clay loam soil	8~, 7	60 individuals from 19 locations	0	0	This taxon was recorded from four locations near the Great Northern Highway. It was only recognised as a potentially undescribed species, and different from any known species, when the specimen was compared in detail with other Euphorbia specimens at the WAH. Further advice was sought from Steve Dillon at the WAH, who advised that the specimen differed from *Euphorbia ferdinandi* by having broader seeds and a stigma different from what has been described for this species (S. Dillon pers. comm., September 2021). All locations of this taxon were within the Flora and Vegetation Survey Area, but outside of the Development Envelope. The Rapallo (2022) survey found 4 additional records in their targeted flora survey area of the Lamb Creek site.

Species	Conservation Status	Habitat	Vegetation Types	No. of Individuals			Other previous records of species
				Survey Area	DE (excluding IF)	IF	
Rostellularia adscendens var. latiflora	P3	Acacia shrubland, sometimes with Eucalypts and Corymbias, over shrublands and herblands, over tussock grassland, or *Triodia pungens* hummock grassland.	1	1	0	0	Local population has been assessed to be of low regional significance. The taxon has a distribution of approximately 450 km from west of Tom Price to north east of Meenthena Station. The species is known from 42 WA Herbarium records across more than 280km from near Mt Farquhar (89km north-west of Tom Price) to the Oakover River with at least six locations occur in the Karijini National Park. This taxon has been recorded approximately 20km south-east of the Lamb Creek retention license on the MAC development Envelope (Umwelt, 2022b). A single plant was recorded by Rapallo (2022c) within a minor flowline within the area of the proposed haul road. While the study area is within the known range of the taxon, Umwelt (2022a) however did not record any plants in their survey.

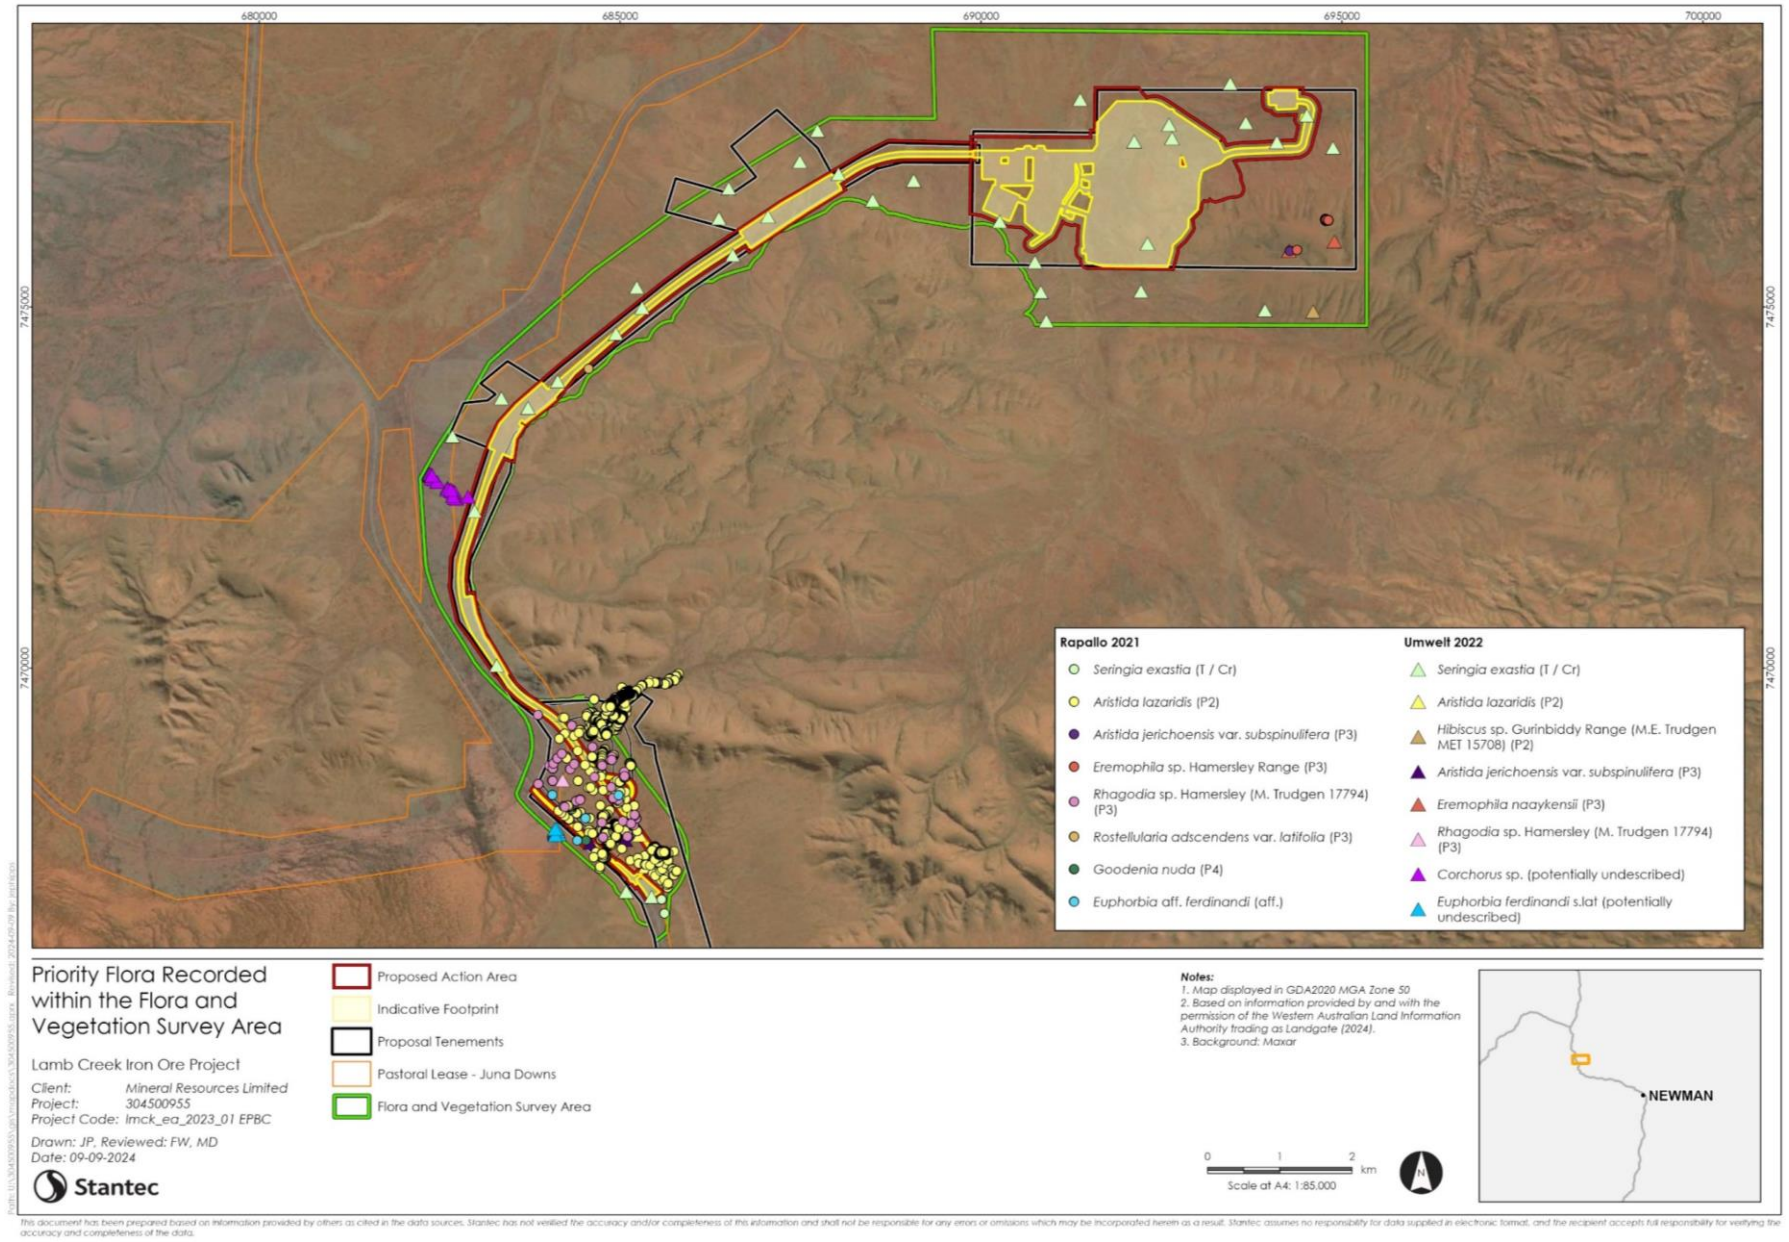

Figure 3: Priority Flora Recorded Within The Flora And Vegetation Survey Area

2.2.2.3 Introduced Flora

In total, seven introduced flora species (weeds) have been recorded within the Flora and Vegetation Study area (Table 5Table 5:, Figure 3). None of these taxa were listed as Declared Pests (DPIRD, 2020) or Weeds of National Significance (Commonwealth of Australia, 2022). *Bidens bipinnata*, *Cenchrus ciliaris* and *C. setigera* were the most common introduced taxa in terms of numbers of locations and individuals recorded. Introduced flora were most commonly recorded in drainage areas (Figure 3Figure 4:). Whilst some of the introduced flora have a High/Rapid ecological impact and invasiveness ratings, no introduced taxa were widespread in the Study Area, and the vegetation was considered to be in mostly Excellent condition (Umwelt, 2022a).

Table 5: Introduced Flora Species Recorded In The Flora And Vegetation Survey Area

Species	Common Name	Number of Locations	Number of individuals	Naturalised Status (Western Australian Herbarium, 2022)	Ecological Impact*	Invasiveness*
Bidens bipinnata	Bipinnate Begger's Tick	31	824	Alien to WA	Unknown	Rapid
Cenchrus ciliaris	Buffel Grass	13	149	Alien to WA	High	Rapid
Cenchrus setiger	Birdwood Grass	17	2,654	Alien to WA	High	Rapid
Malvastrum americanum	Spiked Malvastrum	11	70	Alien to WA	High	Rapid
Portulaca pilosa	Pink Purslane	1	1	Alien to WA	Not rated	Not rated
Setaria verticillata	Whorled Pigeon Grass	6	20	Alien to WA	High	Rapid
Tribulus terrestris	Caltrop	3	5	Alien to WA	Unknown	Moderate

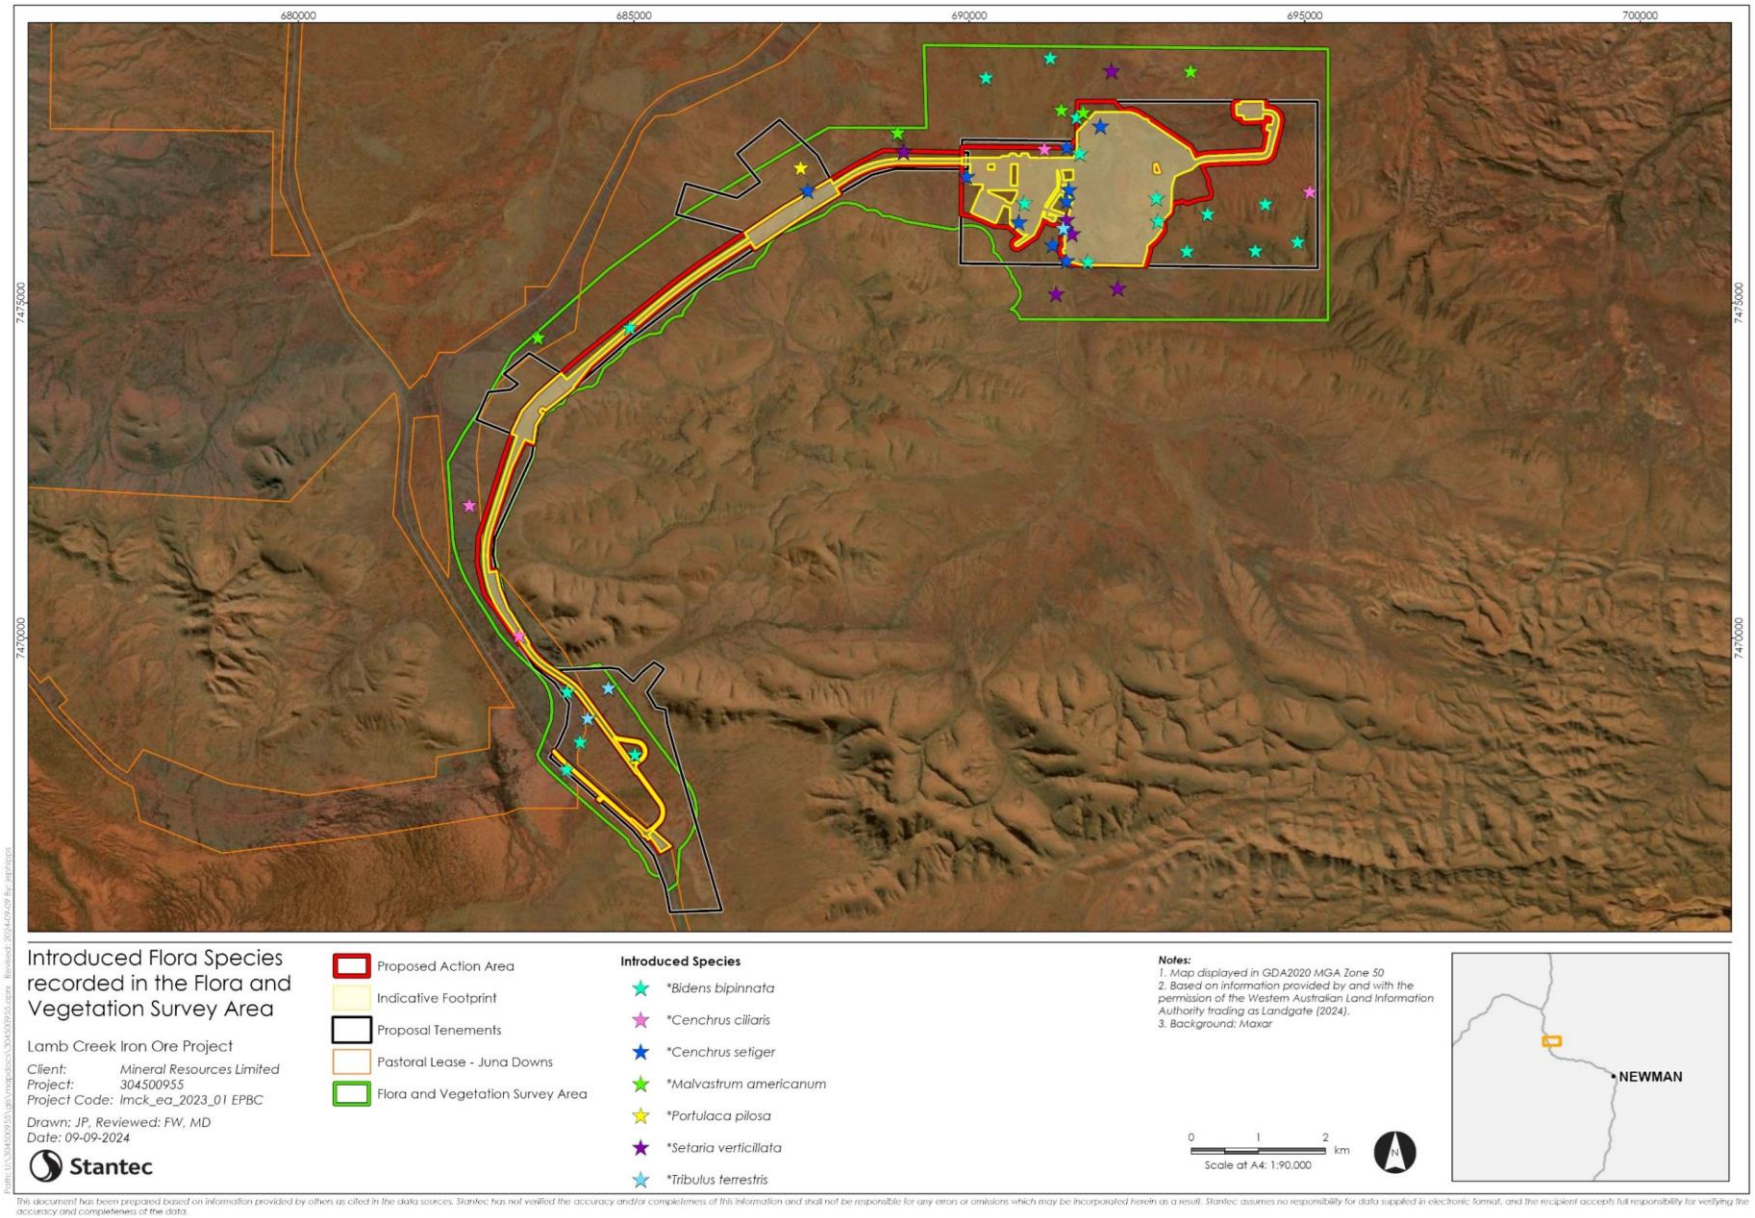

Figure 4: Introduced flora Species recorded in the Flora and Vegetation Survey Are

2.3 KEY ASSUMPTIONS AND UNCERTAINTIES

The limitations and constraints that can affect the adequacy of flora and vegetation management actions are summarised as follows:

- It is assumed that by utilising areas of existing disturbance, minimising clearing, and implementing progressive rehabilitation throughout the life of the Project, the impacts to significant flora and vegetation will be minimised.
- It is assumed that targeted surveys for significant flora have adequately characterised the populations potentially impacted and are of suitable standard to implement proposed management targets.
- Potential survey limitations of the latest Umwelt (2022a) include:
    - Survey timing and weather/season/cycle- partial limitation: All significant flora taxa known to occur or potentially occurring in the Study Area based on the desktop assessment results were considered to be identifiable during the 2022 survey with the exception of two taxa. *Arthropodium vanleeuwenii* (P2) is considered visible only when flowering in September, as it grows up through Triodia. This taxon could occur within the Study Area and Targeted Survey Area based on the habitats present. *Rhodanthe ascendens* (P1) was also potentially unidentifiable at the time of survey based the known flowering time. However, this taxon is unlikely to occur in the Study Area based on a combination of the habitat present, extent of targeted searching undertaken, and that the Study Area is outside of the known range. One significant flora taxon (*Euphorbia clementii*) (P2) is a known fire responder; otherwise, the fire response of other significant flora is unknown or presumed not to be fire responders (from desktop review). The majority of the targeted flora survey area was either long unburnt (>10 years), or otherwise subject to burn approximately 4.5 years ago. Unlikely that *Euphorbia clementii* (P2) is present in Study Area due to being outside of the known range of the taxon.
- Key uncertainties:
    - The extent to which climatic factors outside of the Proponents control will impact on successful rehabilitation.
    - The extent to which climatic factors outside of the Proponents control will impact on the health and extent of populations of significant flora.
    - Variation in soil condition over the Disturbance Envelope and within the revegetation zones.

2.4 POTENTIAL PROJECT IMPACTS

The Project may directly and indirectly impact on flora and vegetation, with the potential direct impacts identified as:

- loss of native vegetation due to clearing.
- loss of significant flora taxa due to clearing.
- unauthorised clearing outside the approved Indicative Footprint.

The potential indirect impacts have been identified as:

potential for fragmentation of vegetation as a result of construction of linear corridors.

- introduction and / or spread of introduced flora species.
- degradation or alteration of vegetation as a result of altered fire regimes.
- degradation or alteration of vegetation as a result of altered hydrological regimes.
- degradation of vegetation through dust deposition.

2.5 APPLICATION OF THE MITIGATION HIERARCHY

Mitigation measures have focused on significant flora, where relevant, aligning with the management provisions.

The Project will **avoid** impacts to significant flora via the following:

- Proposed clearing has been minimised as far as practicable to reduce the extent of disturbance required; the Proponent has revised the Development Envelope from 1,399 ha to 874 ha.
- The area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager. Some heavy equipment used may have in-cab GPS mapping and alarm functions however in the absence of this functionality, other control measures such as the use of spotters and/or restricting clearing to the daylight hours will be undertaken.
- A Land Activity Permit and Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary.
- Significant flora populations and the area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager.
- Off-road driving shall be prohibited unless authorised via a LAP.
- Avoid hot work in fire sensitive areas and during fire risk day.
- Intersection of the haul road with GNH and an additional 100 m past the intersection, will be sealed to reduce the generation of dust.
- Road Train iron ore loads will be covered.
- Ground clearing (including topsoil stripping) shall not be undertaken during periods of high wind (unless soil moisture levels are also elevated enough to inhibit dust formation).

The Project will **minimise** impacts to significant flora via the following:

- Spatially restricted Indicative Footprint and short life of mine.
- Implementation of the FVMP.
- Clearing awareness training undertaken by all personnel involved in clearing activities.
- Vegetation clearing shall be kept to the minimum amount required and as approved.
- Where significant flora taxa populations cannot be avoided, as may be the case with *Seringia exastia* (EN under the EPBC Act), *Aristida lazaridis* (P2) and *Rhagodia* sp. Hamersley (P3), infrastructure will be placed to avoid the highest densities and designed to minimise obstruction of surface water flows.
- Preparing and Implementing a Weed Management Plan (indicative plan attached, **Appendix A**) prior to construction and operation, to control access and movement of vehicles and construction personnel to prevent the introduction and spread of weeds into the Development Envelop, weed free areas, and between work areas.
- Vehicles with ground engaging equipment to be cleaned, inspected and issued with a Weed Hygiene Certificate prior to entry to site or moving between areas of known weed infestation within the site (as per MinRes Weed Management Plan, **Appendix A**).
- Off-road driving shall be prohibited unless authorised under a LAP.
- Weed awareness and weed hygiene shall be delivered to all personnel as part of the induction process.
- Regular inspection and maintenance of vehicles and equipment shall be undertaken (fire and spill prevention).
- Fire management awareness shall be delivered to all personnel as part of the induction process.

- Firebreaks will be incorporated into mine layout planning in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*.
- Smoking will only be permitted in designated areas, which shall be appropriately signed and contain self-arresting cigarette butt disposal containers.
- An Emergency Response Plan shall be prepared and implemented.
- An Emergency Response Team shall be formed, in accordance with requirements regulated by DEMIRS
- The Emergency Response Team will ensure that sufficient fire suppression equipment is located as per the Emergency Response Plan.
- Hot Work shall be completed under a Hot Work Permit and in accordance with MRL-SAF-PRO-0081 Hot Work Procedure.
- Traffic Management Plan shall be prepared and implemented.
- All vehicles and machinery will be fitted with fire extinguishers and/or in-plant fixed water suppression.
- Fire extinguishers will be located at infrastructure/building facilities across the project.
- Implement surface and groundwater management strategies in accordance with the Surface water Management Plan (SWMP) and Groundwater Operating Strategy (GWOS).
- Dust suppression shall be implemented to manage dust emission on cleared areas and iron ore handling areas.
- Speed limits shall be established and apply on unsealed and sealed roads within the Project Area.

The Project will **rehabilitate** impacts to flora via the following:

- Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved MCP.
- Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, in accordance with the approved Mine Closure Plan.
- Seasonal weed control programs shall be implemented, including herbicide spraying or physical removal, as required.
- Weeds which are physically removed will be disposed of at the waste rock landform and buried.
- Salvage and stockpile particular vegetation types, soil, or habitat features (e.g. vegetation, stumps, logs, and boulders) for use in rehabilitation programs.

The Project will **offset** impacts to significant flora via the following:

- The Proponent proposes offsets, whereby financial contributions will be made to the Pilbara Environmental Offset Fund (PEOF) to offset the significant impact to native vegetation from clearing in accordance with *Cumulative environmental impacts of development in the Pilbara region – Advice of the Environmental Protection Authority to the Minister for Environment under Section 16(e) of the Environmental Protection Act 1986* (Department of Water and Environmental Regulation, 2019).

3. MANAGMENT PROVISIONS

3.1 OVERVIEW

The FVMP outlines the requirements to avoid, minimise, manage, monitor, and rehabilitate direct and indirect impacts to significant flora and vegetation from the Project, aligning with the EPA's mitigation hierarchy. The subsequent sections identify the management provisions that will be implemented by the Proponent for the Project to ensure that the environmental objectives, criteria, targets, and outcomes are met for flora and vegetation. Where unacceptable environmental outcomes remain post the implementation of control measures, offset strategies will be proposed. The FVMP will be reviewed and updated as required, following an adaptive management approach (**Section 7**). A detailed Mine Closure Plan (MCP) will be provided and will address the potential impacts of the Project post closure-.

3.2 OUTCOME-BASED PROVISIONS

This FVMP focuses on outcome-based provisions, which are performance-based and can be applied through a variety of means. The objectives developed are measurable, and the success of management actions can be monitored and reported. Outcome-based provisions specify triggers and thresholds (environmental criteria) for direct impacts that are quantifiable and specifically relate to flora and vegetation (Table 6). Two objectives have been developed, with associated triggers and thresholds. Where required, suitable response and corrective actions are also recommended for the environmental criteria. The following outcomes-based provisions have been established:

- Ensure development and operation of the Project meets the objective of protecting flora and vegetation to maintain biological diversity and ecological integrity.

3.3 OBJECTIVE-BASED PROVISIONS

Objective-based provisions relate to environmental management actions that are not specifically measurable. They specify management actions according to management targets, particularly for indirect impacts that are not necessarily quantifiable. Five objective-based management provisions have been outlined in Table 7 to prevent project-related adverse impacts to flora and vegetation (including significant species) within proximity to the Project with appropriate management actions and monitoring actions. The following objectives-based provisions have been established:

- No clearing of native vegetation shall occur outside of the approved, demarcated clearing area(s) during construction or operation.
- No new weed species to be introduced into the Development Envelope as a result of construction and operation of the Project.
- No significant expansion of known weed species in the Development Envelope as a result of construction and operation of the Project.
- Effective operation of the Project to avoid Project related fire.
- Minimise decline of flora and vegetation health, population, due to dust, weeds, and hydrocarbon or chemical leaks and altered hydrological regimes as a result of construction and operation of the Project.

It is also noted that as ongoing monitoring is undertaken and additional population data is gathered, the management targets may be reviewed, and quantifiable outcome-based provision(s) may be established accordingly.

3.4 ENVIRONMENTAL CRITERIA, TARGETS AND JUSTIFICATION

The development of environmental objectives and criteria for outcome-based provisions within the FVMP are based on available data and information and align with the purpose of the FVMP. Outcome-based provisions utilise monitoring and reporting to assess against the measurable environmental criteria. In addition to these, objective-based provisions have been applied with management targets.

During monitoring, where threshold criteria (outcome-based) or management targets (objective-based) are exceeded, and are project-related, response and corrective actions are provided, and will be implemented, where deemed appropriate. Monitoring will inform adaptive management, with the revision of environmental criteria, and response or corrective actions, as required.

Table 7 outlines the objective-based management provisions required to avoid and minimise any direct and indirect impacts on the following flora and vegetation environmental values within the Project Area, in alignment with the EPA's mitigation hierarchy (avoid, minimise, rehabilitate):

- Native vegetation within the Pilbara bioregion comprising 9 identified vegetation types within the IF, with clearing of up to 646.9 ha to occur.
- 77 individuals of *Aristida lazaridis* (P2), three individuals of *Rhagodia* sp. Hamersley (M. Trudgen 17794) and 211 individuals of *Seringia exastia* (EPBC listed only) recorded within the Indicative Footprint.

Where there is the potential for significant environmental impacts remaining, post implementation of control measures, environmental offset strategies are proposed to meet Environmental Protection Authority (2016) guidance for flora and vegetation. For the Project, clearing of up to 646.9 ha of native vegetation within a Development Envelope of 874 ha will occur. The Proponent proposes offsets, whereby financial contributions will be made to the PEOF to offset the significant impact to native vegetation from clearing.

Justification for the management provisions outlined in the FVMP are based on the following:

- Weeds can have a detrimental effect on ecological communities, with certain weeds such as*C*enchrus* spp. leading to an increased risk of fire which is a key threat to a number of significant fauna. Although no weeds identified by the survey were listed as Declared Pests (DPIRD, 2020) or Weeds of National Significance (Commonwealth of Australia, 2022), some species are rated as having 'High' ecological impact or 'Rapid' invasiveness in native vegetation. MinRes is committed to managing the introduction and spread of weeds as a result of the Project, however it is acknowledged that MinRes are unlikely to be able to prevent weeds from spreading from source populations into the Project Area. As a result, the Indicative Weed Management Plan (WMP)(**Appendix A**) focuses on weeds rated as having a high or very high management priority (by DBCA) within the Project Area, through managing the cover/abundance of these weeds throughout the remainder of the Project Area. Appropriate triggers and thresholds have been developed with corrective actions built into the WMP.
- Clearing of vegetation can result in the loss of significant flora and lead to degradation of vegetation types through edge effects. Clearing within the Project Area has been minimised through design and planning and will be kept to within the clearing allowance approved.
- Secondary impacts to vegetation health can occur through altered fire regimes, altered hydrological regimes, dust deposition or hydrocarbon or chemical spills. Management actions have been developed to minimize any potential project related decline in vegetation health as a result of these secondary impacts.

Table 6: Flora and Vegetation Outcome-Based Management Provisions

EPA Factor and Objective		Flora and vegetation: To protect flora and vegetation so that biological diversity and ecological integrity are maintained						
FVMP Purpose		*To avoid adverse project-related impacts to flora and vegetation including significant species.*						
Outcome-Based Management Objectives		Trigger and Threshold Criteria		Trigger and Threshold Response Actions		Monitoring	Timing / Frequency of Monitoring	Reporting
		Trigger Criteria	Threshold Criteria	Trigger Level Actions	Threshold Level Actions and Contingency Actions.			
FV1	Protect flora and vegetation values to maintain biological and ecological diversity in the Project area integrity.	Total clearing reaches 90% of approved clearing value (Ha). Or unplanned clearing occurs within the Development Envelope.	Unauthorised clearing occurs, including exceedance of approved clearing allowance, any clearing outside of the Development Envelope, or any unauthorised clearing within the Development Envelope.	• Report internally as an incident in accordance with internal procedures. • Reconcile clearing to date against approved clearing allowances and review management strategies to ensure authorised limits are not exceeded. The management strategy reviews may include the following: • Increased frequency of clearing tracking and reconciliation against approved clearing allowance. • Audit and review of training and staff inductions (increase staff training and awareness to include information on buffers, legislative requirements, and appropriate clearing procedures). • Review of the potential impact(s) of	• Undertake investigation to determine source of disturbance. If source is project-related, undertake a review to determine if impact can be minimised, develop actions to prevent recurrence and communicate findings to relevant personnel. • Undertake rehabilitation of unauthorised clearing as required, in accordance with rehabilitation procedures. • Report as a non-compliance to appropriate regulator within 10 days of identification. • Investigation report to be submitted to appropriate regulator with remediation	• Monitoring of clearing register for compliance to approvals. • Internal audit and inspection of areas of clearing. • Analysis of clearing undertaken via annual aerial imagery survey to assess whether any unauthorised clearing has occurred. • Monitor significant species populations, as appropriate.	• Post clearing • Post clearing • Annual • As triggered / if required • As triggered / if required	• Annual Environmental Reporting. • Clearing Register. • Internal clearing permits. • Survey data. • Monitoring Program reporting as appropriate. • Incident reports.

EPA Factor and Objective		Flora and vegetation: To protect flora and vegetation so that biological diversity and ecological integrity are maintained

		remaining post closure shall meet recognised Australian drainage design specifications. • The open pit will be backfilled to a minimum of 5 m above the baseline groundwater level. • Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.				Exceedance reporting: • Management action has not been implemented (report in accordance with **Section 5**) • Management target has not been achieved (report in accordance with **Section 5**)
No significant impacts to flora and vegetation from dust deposition.	**Low**	• Intersection of the haul road with Great Northern Highway, and an additional 100 m past the intersection, will be sealed to reduce the generation of dust. • Road haulage iron ore loads will be covered. • Ground clearing (including topsoil stripping) shall not be undertaken during periods of high wind (unless soil moisture levels are also elevated	• Monitoring of daily wind conditions will be taken into consideration when planning clearing or blasting activities. • Visual assessment of dust suppression application and performance	• Daily • Daily	• Construction. • Construction • Operations.	Regular Reporting: • Internal incident reporting, and investigation process in accordance with internal incident reporting procedure for example: • Excessive dust

EPA Factor and Objective		Flora and vegetation: To protect flora and vegetation so that biological diversity and ecological integrity are maintained				
• Environmental Values		• Native vegetation within the Pilbara bioregion comprising 9 identified vegetation types, with clearing of up to 646.9 ha to occur. • Populations of *Aristida lazaridis* (P2), *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) and *Seringia exastia* (T) (EPBC listed only) recorded within the Indicative Footprint.				
FVMP Purpose		To avoid adverse project-related impacts to flora and vegetation including significant flora and vegetation associations.				
Key Impacts and Risks		Potential risk to long term viability of local and regional populations of conservation significant flora and vegetation, due to direct impacts from clearing of native vegetation or direct and indirect impacts from construction or operational mining activities (**Appendix B)**				
Management Targets	**Management Priority**	**Management Actions**	**Monitoring**	**Timing**	**Responsible[1]**	**Reporting**
		enough to inhibit dust formation). • A Land Activity Permit and the Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary. • Spatially restricted Indicative Footprint and short life of mine. • Vehicles and equipment shall be restricted to designated roads, tracks and cleared areas. • Dust suppression shall be implemented to manage dust emission on cleared areas and iron ore handling areas. This will be visually assessed on an ongoing basis. • Reduced speed limits shall apply on unsealed roads (site-specific but typically 40 kph). • Blasting plans will consider meteorological conditions to minimise dust lift off.				• Vehicles reported outside authorised areas/ tracks. • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. Exceedance Reporting: • Management action has not been implemented (refer to **Section 5**) • Management target has not been achieved (refer to Section 5)

EPA Factor and Objective		Flora and vegetation: To protect flora and vegetation so that biological diversity and ecological integrity are maintained				
• Environmental Values		• Native vegetation within the Pilbara bioregion comprising 9 identified vegetation types, with clearing of up to 646.9 ha to occur. • Populations of *Aristida lazaridis* (P2), *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) and *Seringia exastia* (T) (EPBC listed only) recorded within the Indicative Footprint.				
FVMP Purpose		To avoid adverse project-related impacts to flora and vegetation including significant flora and vegetation associations.				
Key Impacts and Risks		Potential risk to long term viability of local and regional populations of conservation significant flora and vegetation, due to direct impacts from clearing of native vegetation or direct and indirect impacts from construction or operational mining activities (**Appendix B)**				
Management Targets	**Management Priority**	**Management Actions**	**Monitoring**	**Timing**	**Responsible[1]**	**Reporting**
		• Dust awareness and dust management training shall be delivered to all personnel as part of the induction process. • Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved MCP. • Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.				

4. MONITORING AND EVALUATION

4.1 ENVIRONMENTAL INSPECTIONS

The Proponent will undertake flora and vegetation environmental inspections within the Development Envelope to monitor the implementation of the Management Actions required to meet the purpose and objectives of this FVMP (**Section 1.3**). Inspection frequency will be based on the inherent risks for different activities and/or work areas, nominally a minimum of monthly in areas with active clearing activities. Inspection frequency will be reviewed based on results of previous inspections, audits or in response to incidents. A monitoring schedule is outlined in Table 6 and Table 7.

4.2 ENVIRONMENTAL AUDITS

In accordance with the Proponent's Environmental Management System (EMS), an audit of the implementation of this FVMP will be completed annually. The key requirements of this FVMP audit include:

- Assessment of compliance of all FVMP components.
- Evaluation of performance against FVMP provisions.
- Assessment of adequacy of management actions, response actions and monitoring.
- Review of management actions, response actions and monitoring as required in order to meet the purpose and objectives of this FVMP.
- Additional audit(s) in response to significant incidents of non-conformance.

A person trained and competent in the use of the audit tool, with expertise in the area being audited shall undertake an audit of the FVMP. Results of all audits will be communicated and discussed at project management review meetings.

5. REPORTING PROVISIONS

5.1 ANNUAL REPORTING

Annual compliance reporting will be undertaken for the Project in line with regulatory requirements and relevant guidance documentation, including the preparation of an Annual Environmental Report (AER) and Compliance Assessment Report (CAR), as/if appropriate. The annual reports will document compliance with Project approval conditions, as well as requirements stipulated in this FVMP.

5.2 EXCEEDANCE REPORTING

The following exceedance reporting will be undertaken if a trigger (**Section 5.3**) or Threshold (**Section 5.4**) exceedance occurs or a management action has not been implemented (**Section 5.5**) or management target has not been achieved (**Section 5.6**) in accordance with the FVMP.

5.3 TRIGGER EXCEEDANCE

- Trigger exceedance will be reported promptly in accordance with internal procedures (prior to the end of shift the following day) and reported to appropriate management staff.
- Investigate to determine the cause of the trigger exceedance.
- Internal reporting and communication of corrective actions to be implemented that eliminate or reduce the likelihood of recurrence.

5.4 THRESHOLD EXCEEDANCE

- Notify the CEO of the DWER (or other regulatory agency if appropriate) in writing within 10 days of identifying and confirming the threshold exceedance, with a report provided via email including any corrective actions identified and investigation initiated.
- Investigate to determine the cause of the threshold exceedance.
- Investigate to determine the potential environmental harm or alteration of the environment that occurred as a result of the threshold exceedance. After finalisation of the investigation, provide a report to appropriate regulator.
- A follow up report detailing the adequacy of the response actions will also be submitted to the DWER within 12 months of the initial notification or within the Compliance Assessment Report (CAR).

5.5 MANAGEMENT ACTION HAS NOT BEEN IMPLEMENTED

- Notify the CEO of the DWER in writing within 10 days of identifying and confirming the failure to implement a management action, with a report provided via email including any corrective actions identified.
- Investigate to determine the cause of the management action not being implemented.
- Investigate to determine the potential environmental harm or alteration of the environment that occurred due to the failure to implement the management action(s).
- Provide a report to the CEO including any corrective actions identified, within 21 days of completing the investigation into the failure to implement a management action.

5.6 MANAGEMENT TARGET HAS NOT BEEN ACHIEVED

- Notify the CEO of DWER in writing within 21 days of identifying and confirming the non-achievement of the target.

- Investigate to determine the cause of the management target not being achieved.
- Provide a report to the CEO within 90 days of the non-achievement of the target being reported.
- Investigate to determine the potential environmental harm or alteration of the environment that occurred due to the failure to meet management target.
- The report shall include:
  - the cause(s) of the management targets not being achieved.
  - assessment of any impacts to the environment resulting from the failure to meet management target.
  - details of revised and/or additional management actions to be implemented to prevent reoccurrence of management target(s) not being met.
  - appropriate changes to Project activities/ corrective actions required.

5.7 INCIDENT REPORTING

Environmental incidents will be promptly reported in accordance with internal procedures and reported to appropriate management staff. Corrective actions, when appropriate, will also be developed and implemented that eliminate or reduce the likelihood of recurrence.

The minimum standards required in respect to non-conformance and corrective actions are to:

- Define and document what classifications of incidents and non-conformances are reportable to:
  - internal management.
  - contractors, suppliers and vendors.
  - regulatory authorities.
  - other external stakeholders.
- Report environmental incidents and non-conformances in line with established procedures and applicable legal and other obligations.
- Investigate incidents and non-conformance such that the root cause can be determined.
- Implement corrective actions that address the root cause(s) of the incidents and non-conformances that aim to eliminate or improve response capabilities to prevent reoccurrence.
- Retain documentation as evidence.

6. ROLES AND RESPONSIBILITIES

MinRes will ensure that all personnel and contractors are responsible for ensuring they comply with the company's environmental management requirements and that any action or inaction on their part does not result in harm to the environment. Delegation of responsibilities may occur to ensure that environmental management activities are coordinated at an appropriate level; however, accountability remains with the person designated those responsibilities. MinRes also expects this general principle of line management accountability to apply to all its contractors. Roles and responsibilities have been designated to ensure that environmental management requirements within this FVMP are met. The key personnel involved in implementation of the FVMP and their roles and responsibilities are listed in **Table 8.**

Table 8: Roles and Responsibilities

Role	Responsibility
MinRes	• Overall responsibility for implementing this FVMP. • Audit and compliance checks. • Engagement with Traditional Owners.
Manager Environment (may delegate all or part responsibility to an appropriately qualified person)	• Obtain relevant approvals from regulatory agencies for disturbance as required. • Monitor and report incidents. • Maintain clearing register to ensure compliance with approvals. • Undertake internal audits and inspections of clearing areas and compliance with FVMP. • Implement and maintain the FVMP, review its effectiveness and review the implementation as required. • Liaise with stakeholders and technical experts for advice and resolution of management aspects/objectives as required. • Ensuring the required resources are allocated to fulfil the requirements of this Management Plan. • Engagement with Traditional Owners. • Providing advice to others about weed hygiene procedures and about the identification of plants that may be weeds. • Undertaking or commission weed control activities. • Undertaking site inspections for weeds. • Keeping records of weed management - weed hygiene certificates, GIS data recording the location and extent of weed populations, control methods used etc. • Presenting ongoing weed management and control awareness training and inductions of personnel in accordance with the FVMP. • Report as required to regulating authorities.
Project Manager (may delegate all or part responsibility to an appropriately qualified person)	• Ensure construction and operational activities are implemented by employees (inclusive of contractors) in accordance with the FVMP
Supervisor	• Ensuring any vehicles or earthmoving equipment leaving a mine is cleaned down so that it is free of vegetation or dirt, and, following an inspection, a Weed Hygiene Certificate (WHC) is issued. • Ensuring that personnel involved in vehicle or equipment transfers are aware of this procedure and can competently meet their responsibilities.

Role	Responsibility
Employees (inclusive of contractors)	• Complete induction prior to commencement of work on site. • Toolbox. • Training. • Comply with requirements in FVMP. • Report potential weed occurrences and poorly cleaned machinery. • Stop works if impact to the environment is suspected or known. • Report any environmental concerns, opportunities for improvement, near misses or incidents to their supervisor ASAP.

7. ADAPTIVE MANAGEMENT AND REVIEW

Adaptive management practices will be implemented where change to management practices and monitoring may lead to more effective environmental outcomes. The adaptive management approach may include the following components:

- Evaluation of the management actions and targets:
  - if monitoring results or audits indicate that management objectives are not being achieved.
  - if new information is discovered during construction, operations or closure.
  - where any significant changes to Project design or operation have occurred.
- Evaluation of assumptions and uncertainties following further flora and vegetation monitoring.
- Review of data and information gathered over the review period that has increased understanding of the environment in the context of the regional ecosystem.
- Review of Management Actions as the Project progresses, and as new management measures and technologies become available that may be more effective for significant flora and vegetation management.
- Assessment of changes which are outside the control of the Proponent (e.g. a new project within the area or region, regional change affecting significant flora and vegetation management) and the revised management measures identified.
- Amendment to the monitoring program.

7.1 REVIEW OF THIS FVMP

This FVMP will be reviewed periodically during the Project phases (construction through operations and into closure), nominally once every 2 years. Other occasions when this FVMP will be reviewed include:

- upon significant changes to the Project activities or upon significant changes to key environmental values identified in this FVMP.
- following non-compliances or environmental incidents related to flora and vegetation management.
- if one or more management targets or performance indicators are not being met and adaptive management is required.
- upon regulatory approval of the Project by the DWER and the Department of Energy, Mines, Industry Regulation and Safety (DEMIRS).

The review process this will ensure this FVMP remains current and adheres to regulatory requirements and the provisions of this FVMP. Any significant changes to this FVMP will be referred to the DWER for approval prior to implementation of such changes.

8. STAKEHOLDER CONSULTATION

The Proponent is committed to ongoing stakeholder engagement and communication through all stages of the Project.

8.1 ENGAGEMENT

Stakeholder engagement commenced in 2012 and specific stakeholder engagement activities undertaken have included:

- briefings and presentations with key regulatory authorities and potentially affected parties (e.g. Banjima People) to provide information on the Project, planned studies and request feedback.
- face to face meetings, telephone calls and written correspondence with potentially affected stakeholders to provide updates on the Project and obtain additional feedback.

Specifically, consultation between MinRes and the Banjima People, through the body corporate Banjima Native Title Aboriginal Corporation (BNTAC) and their consultants, regarding the preparation of various environmental regulatory approvals (State and Commonwealth) has been conducted, including reviews of this FVMP. Feedback from these engagements has been incorporated into the approval submission documents and this FVMP. On-country Social Surrounds engagement with the Banjima People has also been conducted and feedback from these consultations incorporated into management controls for the various environmental and social factors.

Through the variety of engagement forums, the Proponent has been able to identify the required studies and investigations and, importantly, key environmental and socials impacts, and associated mitigation strategies required to support the Project, to ensure the Project aligns with expectations.

8.2 KEY STAKEHOLDERS

The Proponent has identified key Project stakeholders, and these are listed in **Table 9**.

Table 9: Key Stakeholders for the Project

Stakeholder Sector	Organisation
Australian Government Agencies	Department of Climate Change, Energy, the Environment and Water
State Government Agencies & Members of Parliament	Department of Biodiversity, Conservation and Attractions
	Department of Jobs, Tourism, Science and Innovation
	Department of Energy, Mines, Industry Regulation and Safety
	Department of Planning, Lands and Heritage
	Department of the Premier and Cabinet (Ministers for Water and Environment)
	Department of Primary Industries and Regional Development
	Department of Transport
	Department of Water and Environmental Regulation - Environmental Protection Authority
	Department of Water and Environmental Regulation
	Development WA
	Main Roads WA
	Pilbara Port Authority
	Alinta Energy

Stakeholder Sector	Organisation
Local Government	Shire of East Pilbara
Traditional Owners	Banjima Native Title Aboriginal Corporation
	Martidja Banyjima (MIB) – Karijini Development Pty Ltd
Corporate and Community	Rio Tinto/Juna Downs Pastoral Lease
	BHP
	Bird Life Western Australia
	Wildflower Society of Western Australia
	Conservation Council of Western Australia
	Wilderness Society

8.3 STAKEHOLDER CONSULTATION

The Proponent is committed to continued engagement with stakeholders through all development phases of the Project, as documented in the Stakeholder Engagement Plan. The key stakeholder consultation and engagement activities undertaken to date by the Proponent are summarised in referral documentation under the EPBC Act and EP Act. Outcomes of these activities are recorded in a Stakeholder Consultation Register, which is a live document that interconnects with the Stakeholder Engagement Plan.

8.4 ONGOING ENGAGEMENT

Consultation will continue to be undertaken with the respective stakeholders identified in Table 9 to ensure the Project aligns with expectations, as well as in accordance with any approval or licensing conditions.

MINERAL RESOURCES

APPENDIX A
INDICATIVE WEED MANAGEMENT PLAN

Appendix A Indicative Weed Management Plan

A.1 Background

Introduced flora (weeds) have a detrimental effect on ecological values of communities in which they invade. Weeds outcompete native flora, alter the structure of vegetation, have an impact on fire regimes and change habitat characteristics for fauna; often leading to a decline in the quality of fauna habitat.

MinRes is committed to managing the introduction and spread of weeds as a result of Proposal through the development and implementation of a Weed Management Plan (WMP) and in accordance with the MinRes Draft Weed Hygiene and Control Procedure (MRL-EN-PRO-0007) Due to the spread of weeds through vectors such as wind and animal dispersal, it is unlikely that MinRes would be able to stop the introduction and/or spread of weeds entirely in the Proposal Area. As a result, this Plan will focus on the management of weeds rated as having a high or very high management priority (by DBCA) and managing the cover/abundance of these weeds throughout the Proposal Area.

A.2 Purpose

This indicative WMP has been developed to outline the control measures required to manage the potential weed impacts across the Proposal Area. This Plan applies to all exploration, design, construction, operation and decommissioning stages of the Proposal.

The purpose of the Plan is to:

- Ensure that the Proposal is carried out in a manner that minimises the direct and indirect impacts as a result of weeds.

This will be addressed by ensuring potential project-related impacts to flora and vegetation from weeds are avoided to the maximum extent practicable by:

- Identifying the risks and potential impacts from the Proposal in relation to weeds.
- Outlining management provisions for weeds, to avoid and minimise potential impacts to significant flora and vegetation.
- Preparing and implementing monitoring programs for weeds within the Proposal Area.
- Proposing corrective actions and response actions if triggers and thresholds are exceeded to avoid adverse impacts to vegetation resulting from weeds.

A.3 Rationale and Approach

MinRes is committed to avoiding and minimising potential impacts caused by the operations of the Proposal to flora and vegetation and their associated habitats to ensure the biodiversity and ecological integrity and function of flora and vegetation are maintained. The Proposal has been designed to avoid impacts to key environmental factors located within the footprint.

This Plan focuses on outcome-based and objective-based management provisions, including monitoring and evaluating success of management actions with respect to flora and vegetation within the Development Envelope, driven by triggers and thresholds.

A.4 Legislative Requirements

The following legislation is relevant to weed management for the Proposal:

- *Environmental Protection Act 1986.*
- *Agriculture and Related Resources Protection Act 1976.*
- *Biosecurity and Agricultural Management Act 2007.*
- *Biodiversity Conservation Act 2016.*
-

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

- *Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth) (EPBC Act)*

The Department of Primary Industries and Regional Development (DPIRD) regulates weeds under the *Biosecurity and Agriculture Management Act 2007* (BAM Act). Plants that are prevented entry into the State or have control or keeping requirements within the State are declared pests (**Table A 1**). Declared pests can be assigned to a C1, C2 or C3 category under the BAM Act Regulations 2013 (**Table A 2**).

TABLE A 1: PROHIBITED ORGANISMS CAN BE ASSIGNED TO A C1 OR C2 CONTROL CATEGORIES

Category	Description
Permitted organisms under section 11	Organisms that are allowed entry into Western Australia
Prohibited organisms under section 12	Organisms that are prohibited from entry into Western Australia
Unlisted organisms under section 14	If an organism cannot be categorised as either permitted or prohibited the organism will be unlisted
Declared pest under section 22	Pests that may be in the State but are under official containment, control or eradication

TABLE A 2: CATEGORIES OF DECLARED PESTS UNDER THE BAM ACT REGULATIONS

Category	Description
C1 Exclusion	Plants which should be excluded from part or all of Western Australia.
C2 Eradication	Plants which should be eradicated from part or all of Western Australia.
C3 Management	Plants that should have some form of management applied that will alleviate the harmful impact of the plant, reduce the numbers or distribution of the plant or prevent or contain the spread of the plant.

A.5 Weed Classification

Weeds are classified by different government departments based on their invasiveness and the risk they pose to the environment, people or agriculture (**Table A 3**).

TABLE A 3: DEFINITIONS AND CLASSIFICATION OF WEEDS

Term	Definition
Weed	A weed is defined in the Australian Weeds Strategy (NRMMC, 2007) as 'a plant that requires some form of action to reduce its harmful effects on the economy, the environment, human health and amenity'.
Declared Weeds	In order to protect agricultural interests, the Department of Primary Industries and Regional Development maintains a list of "Declared Plants" (weeds): https://www.agric.wa.gov.au/pests-weeds-diseases/weeds/declared-plants 'Declared Weeds', under the Agriculture and Related Resources Protection Act 1976, are those that landowners are required by law to control. They are required to be controlled as they are considered a significant risk to the Western Australian economy. Many weed species, however, are not declared under this Act as they may have an agricultural role. They may, however, be serious environmental weeds with the potential to affect native ecosystems.
Environmental Weeds	The Weed Prioritisation Process for the Department of Biodiversity, Conservation and Attractions (DBCA) prioritise weeds in each Parks and Wildlife region, termed 'environmental weeds'. 'Environmental weeds' is a secondary category of weeds, used to describe "plants that establish themselves in natural ecosystems and proceed to modify natural processes, usually adversely, resulting in the decline of communities they invade" (DEC, 1999); page iii).

Term	Definition
Weeds of National Significance	The Australian and state and territory governments have agreed a list of thirty two Weeds of National Significance (WONS), based on the weed species' invasiveness, The full list of WONS can be accessed at www.weeds.gov.au/weeds/lists/wons/html
Weed hygiene	Prevention of the introduction or spread of weeds through movement of earthmoving machinery, vehicles or soil containing weed seed.

A.6 Weeds Recorded in the Proposal Area

Seven introduced flora species (weeds) have been recorded within the Proposal Area (**Section A.6**). While none of these taxa were listed as Declared Pests (DPIRD, 2020) or Weeds of National Significance (Commonwealth of Australia, 2022), some species are rated as having 'High' ecological impact or 'Rapid' invasiveness in native vegetation. The ecological impact and invasiveness classifications (DPaW, 2013, 2015) for these weed species are provided in **Table A 4.** *Bidens bipinnata*, *Cenchrus ciliaris* and *C. setigera* were the most common introduced taxa in terms of numbers of locations and individuals recorded (**Table A 4**). Despite the High/Rapid ecological impact and invasiveness ratings of introduced taxa, none were widespread in the Study Area, and the vegetation was considered to be in mostly Excellent condition (Umwelt, 2022a).

MINERAL RESOURCES

TABLE A 4: INTRODUCED FLORA SPECIES RECORDED IN THE FLORA AND VEGETATION SURVEY AREA

Species (common name)	Description	Number of Locations (Number of individuals)	DBCA Classification[1]		Control Techniques[2]				Photo ((WAH, 2023)
			Ecological Impact*	Invasiveness*	Chemical Control	Manual Control	Indicative seed set	Optimal timing for weed control	
Bidens bipinnata Bipinnate Begger's Tick	An erect annual, herb, between 0.1-1.5 m high. The species flowers between March and September with yellow flowers. It is found in alluvium, clay, loam over sandstone, limestone and along rivers and creeks as well as coastal areas and rocky hillsides (WAH, 2023)	31 (824)	Unknown	Rapid	Spot spraying with glyphosate generally well before flowering	Hand removal is only useful before seed set and all flowering material must be taken from site	All year	Chemical control year-round when plants not undergoing excessive stress, prior to seed set whenever possible	
Cenchrus ciliaris Buffel Grass	A tufted, or sometimes stoloniferous, perennial herb or grass-like species between 0.2-1.5 m high. The species flowers between February to October with purple flowers. It is found in white/red/ brown sand, stony red loam or black cracking clay (WAH, 2023).	13 (149)	High	Rapid	Spot spray with 1-2% glyphosate and follow-up with seedling control	Hand remove small populations and seedlings; entire plants with dormant buds must be removed	All year. May begin producing seeds from approximately 3 months of age	Wet season (four to six weeks after a rain event) when plants actively growing and not stressed, prior to seed set

Species (common name)	Description	Number of Locations (Number of individuals)	DBCA Classification[1]		Control Techniques[2]				Photo ((WAH, 2023)
			Ecological Impact*	Invasiveness*	Chemical Control	Manual Control	Indicative seed set	Optimal timing for weed control	
Cenchrus setiger Birdwood Grass	An erect, tussocky, stoloniferous perennial herb or grass-like species up to 0.5 m high. The species flowers between April to May with cream-purple flowers. It is often found in brown sands, red loam, pindan spoils in sand dunes, plains, rangelands, stony hillsides or floodplains (WAH, 2023).	17 (2,654)	High	Rapid	Spot spray with 1-2% glyphosate and follow-up with seedling control	Hand remove small populations and seedlings; entire plants with dormant buds must be removed	All year	Wet season (four to six weeks after a rain event) when plants actively growing and not stressed, prior to seed set	 *Cenchrus setiger* Photos: G. Byrne
Malvastrum americanum Spiked Malvastrum	This species is an erect perennial herb or shrub that grows from 0.5 to 1.3 m high. It flowers between April to July and has orange or yellow flowers. It grows in orange, red and yellow sands, gritty alluvial sand, black/brown clay, alluvial cracking clays, limestone or calcrete. It favours stony ridges and hillsides, floodplains and drainage lines (WAH, 2023).	11 (70)	High	Rapid	Spot spray 0.5% glyphosate	Hand remove seedlings and small populations, removing whole plants	April to September	Wet season, when plants actively growing and not stressed, prior to seed set	*Malvastrum americanum* Photo: J.F. Smith & E. Wajon

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

Species (common name)	Description	Number of Locations (Number of individuals)	DBCA Classification[1]		Control Techniques[2]				Photo ((WAH, 2023)
			Ecological Impact*	Invasiveness*	Chemical Control	Manual Control	Indicative seed set	Optimal timing for weed control	
Portulaca pilosa Pink Purslane	This species is a succulent, erect or prostrate annual herb that can grow to 0.2 m high. It flowers from January to July or November and has yellow or pink flowers. It favours sandy, loamy and clayey soils (WAH, 2023).	1 (1)	Not rated	Not rated	Spot spray with 0.5% glyphosate	Hand remove before flowering	Mostly Autumn	Chemical control year-round when plants not undergoing excessive stress, prior to seed set whenever possible	
Setaria verticillata Whorled Pigeon Grass	This species is a loosely tufted annual which is grass-like. It grows from 0.1 to 1.3 m high. It flowers from December or January to June and has green flowers. It grows on sand, clay or loam soils (WAH, 2023).	6 (20)	High	Rapid	Spot spray with 1-2% glyphosate and follow-up with seedling control	Hand remove seedlings and small populations, removing whole plants	All year	Wet season (four to six weeks after a rain event) when plants actively growing and not stressed, prior to seed set	Photo from Weeds Australia

Species (common name)	Description	Number of Locations (Number of individuals)	DBCA Classification[1]		Control Techniques[2]				Photo ((WAH, 2023)
			Ecological Impact*	Invasiveness*	Chemical Control	Manual Control	Indicative seed set	Optimal timing for weed control	
Tribulus terrestris Caltrop	A prostrate annual villous herb with 4-7 paired leaflets distinct divergent cocci and median spines 3-8 mm long. The species flowers between January to December with yellow flowers. It is often found on sandy soils throughout waste places (WAH, 2023).	3 (5)	Unknown	Moderate	Basal bark spray (for stems up to 10 cm in diameter) up to 30 cm above ground level application using 2% Picloram + 2,4-D amine (Enforcer) or cut stump using undiluted chemical	Cut plants at 10 to 20 cm below ground, remove reproductive parts. Remove whole plant if possible	All year	Chemical control year-round when plants not undergoing excessive stress, prior to seed set whenever possible	
Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

A.7 Weed Management

Commitments relating to weeds that have been included in **Table 7** in the FVMP have been incorporated into MinRes's weed management strategy as detailed within this section.

A.7.1 Potential impacts

The Proposal has the potential to spread existing weeds and to introduce new weed species into previously weed free areas. Weeds can impact the ecology and biodiversity of natural systems by out-competing native species for habitat, nutrients and water. Once established, weeds can also alter the composition and structure of vegetation communities.

Weeds may potentially impact natural systems and values through the following examples:

- Competition with native species for natural resources such as sunlight, water, nutrients and space.
- Reduction in natural biodiversity levels from smothering and out-competition (Smyth et al., 2009).
- Reduced resiliency of native species to disturbances, including the ability for regrowth following clearance and fire.
- Limited availability of native plants which provide important habitat and food sources for animals, and
- Alteration of fire regimes, with increased temperatures and intensity (DEC, 2011).

A.7.2 Application of the Mitigation Hierarchy

The Proposal will **avoid** impacts to significant flora and vegetation from project related weeds via the following:

- A Site Disturbance Permit and Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary.

The Proposal will **minimise** impacts to significant flora and vegetation from project related weeds via the following:

- Vehicles with ground engaging equipment to be cleaned, inspected and issued with a Weed Hygiene Certificate prior to entry to site or moving between areas on-site.
- Vehicles and equipment shall be restricted to designated roads and tracks.
- Weed awareness and weed hygiene training shall be delivered to all personnel as part of the induction process.
- Regular inspection and maintenance of vehicles and equipment shall be undertaken.
- Incident reporting of new weed species and new locations.
- Seasonal weed control programs shall be implemented, including herbicide spraying or physical removal, as required.
- Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.

A.7.3 Management Provisions

This WMP focuses on outcome-based provisions, which are performance-based and can be applied. The objectives developed are measurable, and the success of management actions can be monitored and reported. Outcome-based provisions specify triggers and thresholds for direct impacts that are quantifiable and specifically relate to weeds (**Table A 5**). Suitable trigger and threshold actions have been established, with potential corrective actions also recommended.

A.7.4 Outcome-Based Provisions

The following outcome-based management provision to avoid or minimise project related impacts from weeds has been established:

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

- Avoid facilitating the introduction of new weed species or the proliferation of existing weed species in the Proposal Area as a result of the Proposal.

A.7.5 Objective-Based Provisions

Objective-based provisions relate to environmental management actions that are not specifically measurable. They specify management actions according to management targets, particularly for indirect impacts that are not quantifiable. For project related weeds, as ongoing monitoring is undertaken and additional population data is gathered, these management targets may be reviewed, and quantifiable outcome-based provision(s) may be established accordingly. Two objective-based management provisions have been outlined in **Table A 6** to prevent project-related adverse impacts to flora and vegetation (including significant flora species) from weeds within proximity to the Proposal. These are supported by appropriate management targets, management actions, a monitoring approach, reporting requirements and contingency actions.

The following objectives-based provisions for weeds have been established:

- No new weed species introduced into the Proposal Area.
- No project-related adverse impacts to vegetation due to disturbance or a decline in health from the proliferation of existing weed species recorded in the Proposal Area.

A.7.5.1 Environmental Criteria

The development of triggers and thresholds for outcome-based provisions within the WMP are based on available data and information, with justification for these criteria provided in **Table A 5** and **Table A 6**. These criteria can be used to monitor and evaluate performance against the environmental objectives of this WMP. Due to the lack of available data in some instances, the triggers and thresholds are considered preliminary, until sufficient baseline data becomes available from further weed monitoring. During monitoring, where thresholds (outcome-based) or targets (objective-based) are exceeded, appropriate management or corrective actions have also been developed. Monitoring will inform adaptive management, with the revision of triggers and thresholds, or corrective actions where required.

A.7.6 Weed Awareness and Weed Hygiene Training Procedure

Induction and awareness training for weeds will be undertaken through the following procedure:

- All employees and contractors are required to participate in the site induction, which will provide an awareness of weeds, including risk species, and an overview of the weed hygiene process.
- Employees and contractors who are involved in movement or operation of earthworks equipment, off road vehicles, and land clearing will be specifically trained in weed hygiene procedures and documentation. This includes but is not limited to, exploration personnel, surveyors, environmental survey consultants, workshop and logistics personnel.
- Training or technical assistance may be required for site personnel to be able to recognise locally-occurring weed species.
- Specialist training (chemical handling, personal protection etc.) may be required if site personnel are involved in chemical methods of weed control.
- Tool box talks will be presented from time to time to refresh employees and contractors on weed hygiene procedures.

The movement of earthmoving equipment and vehicles may require use of a Weed Hygiene Certificate (WHC). This procedure cannot cover every situation but a WHC would generally be required when there is a medium to high risk. Medium to high-risk situations include:

- Movement of equipment that has been operating in borrow pits or in topsoil stockpiling or recovery operations.
- Light vehicles and drill rigs operating in an area with known weed occurrences.
- Any off-road earthmoving or heavy equipment moving from one mine site to another.

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

WHCs are generally not required for low-risk situations. Low risk situations include:

- Light vehicles and support vehicles remaining on established roads.
- Excavators and dump trucks operating within multiple pits at one mine site.
- Drill rigs operating on overburden or ore within multiple pits after topsoil has been removed.
- Graders operating at one mine site (although regular clean down is recommended).

Where a WHC is required, the following procedure will be adhered to:

- The earthmoving equipment or vehicle must be cleaned to remove any seeds, plant material or mud that could contain seeds.
- Cleaning can be undertaken using wet or dry methods.
- Ensure any material cleaned from equipment and containing weed seed does not itself become a source of weeds. Disposal to landfill or other suitable alternative is required.
- Once the cleaning process has been completed and the Supervisor is satisfied the equipment or vehicle is clean, a WHC can be completed.
- The WHC remains with the equipment until its arrival at its destination.
- At this point, a further inspection is conducted by the ED or delegate to verify the Certificate is accurate, 'sign off' on the Certificate and free the equipment for use at the new location.
- Movement of vehicles or earthmoving equipment that does not comply with this procedure must be reported as an incident.

A.7.7 Weed Control

Weeds found in the Proposal area and their suggested control is outlined in **Table A 4.** The Draft Weed Hygiene and Control Procedure (MRL-EN-PRO-0007) outlines the process for controlling weeds on MinRes sites:

- If populations of declared or pest plants occur on site, control should be undertaken in consultation with DPIRD.
- If populations of environmental weeds occur on site, control should be undertaken where it is practical to do so. Some environmental weeds are so well established that control is not warranted.
- This procedure does not require control of other introduced species but control methods may be used in particular circumstances.
- Control methods may include spraying with herbicide or physical removal.
- Herbicide use will only be undertaken in accordance with the manufacturer's instructions. Users must consider their personal safety, the safety of others (e.g. people potentially exposed to herbicide through wind drift) and sensitive non-target plant species that occur nearby. If the target area is on a pastoral property, liaison with the pastoralist is required.
- Weeds that are physically removed should be disposed of to a landfill or waste rock landform and buried.
- Soil or material movement from areas that have or may have weeds should be done in consultation with the Environmental Advisors or delegates. Areas of risk include topsoil recovery or re-use and recovery of material from borrow pits.

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

TABLE A 5:OUTCOME-BASED MANAGEMENT PROVISIONS FOR WEEDS

EPA Factor and Objective	**Flora and vegetation: To protect flora and vegetation so that biological diversity and ecological integrity are maintained**						
FVMP Purpose	*To avoid adverse project-related impacts to flora and vegetation including significant species.*						
Outcome-Based Management Objectives	Trigger and Threshold Criteria		Trigger and Threshold Response Actions		Monitoring	Timing / Frequency of Monitoring	Reporting
	Trigger Criteria	Threshold Criteria	Trigger Level Actions	Threshold Level Actions and Contingency Actions.			
Avoid facilitating the introduction of new weed species or the proliferation of existing weed species in the Proposal Area as a result of the Proposal.	• Detection of new weed species rated high or very high management priority (by DBCA) at a potential impact site where it was not detected during baseline weed mapping of the Proposal Area and a significant increase in cover or abundance over successive monitoring events.	• Detection of a Declared Pest Plant or Weed of National Significance which was not detected during baseline weed surveys for the Proposal Area. • A significant increase in cover or abundance of an existing* Declared Pest Plant or Weed of National Significance over successive monitoring events. • New weed species rated high or very high management priority (by DBCA) (not detected during baseline weed surveys for the Proposal Area) becomes established** * No Declared Pest Plants or WONS are known to occur within the Proposal Area, however the baseline flora and vegetation surveys were not exhaustive and these species may potentially occur. ** Where 'established' means 'A weed species which has grown to maturity and reproduced. Weeds are producing a viable second generation of individual plants signifying persistence at a given location in spite of treatment.	• Report as incident internally. • Investigate cause of occurrence and review management strategies and implement changes to prevent future weed occurrences, where possible. • If exceedance is attributed to project-related activities, undertake a review of procedures to determine if impact can be minimised, develop corrective actions with consideration of the following: • Consider revising monitoring frequency for weeds; and educate staff on weed identification and weed hygiene practices. • Implement weed control as required. • Undertake weed control in accordance with the identified weed control techniques (**Table A 4**).	• Report any non-compliance to DWER within 7 days of identification. • Undertake investigation to determine source of the exceedance. • If project-related, undertake review to determine if impact can be minimised, develop actions to prevent recurrence and communicate findings to relevant personnel. • If continued increase in exceedance is recorded over three consecutive events, additional targeted weed control will be considered. • Revise weed monitoring schedule accordingly and monitor the success of corrective actions. • Undertake weed control in accordance with the identified weed control techniques (**Table A 4**).	• Biannual monitoring of the presence and abundance of weeds compared to baseline presence and abundance to determine the effectiveness of control programs.	• Bi-annually	• Monitoring reports. • Annual Compliance Assessment Report (ACAR).

TABLE A 6: OBJECTIVE-BASED MANAGEMENT PROVISONS FOR WEEDS

Objective-based Management Targets	Management Actions	Monitoring	Timing	Responsible	Reporting
1. No new weed species introduced into the Development Envelope as a result of construction and operation of the Proposal. 2. No new occurrences of existing weeds within the Development Envelope as a result of construction and operation of the Proposal.	**Avoid:** • A Land Access Permit and Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary. **Minimise:** • A Weed Management Plan shall be prepared and implemented as part of the FVMP, prior to construction and operation, to control access and movement of vehicles and construction personnel to prevent the introduction and spread of weeds into the Development Envelop, weed free areas, and between work areas. • Vehicles and equipment to be cleaned, inspected and issued with a Weed Hygiene Certificate prior to entry to site or moving between areas on-site. • Vehicles and equipment shall be restricted to designated roads and tracks. • Weed awareness and weed hygiene training shall be delivered to all personnel as part of the induction process, in accordance with the training procedure (Section A.7.6), including the environmental implications of the introduction and spread of weeds, identification of weed species, and the process for reporting observations. • Regular inspection and maintenance of vehicles and equipment shall be undertaken. • Restrict movement of topsoil at known weed locations. • Ensure timely response for the management of any declared weed occurrences or other weed infestations occurs. **Rehabilitate:** • Seasonal weed control programs shall be implemented, as required. • Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable. **Contingency Actions (if Management Targets not met):** • Investigate cause or source of infestation. • Inspect surrounding area to assess extent of infestation. • Review weed hygiene measures for efficacy. • Review training and implementation of weed hygiene measures. • Implement control measures (e.g. spraying, removal) at seasonally appropriate time. • Monitor success of control actions. • Review frequency and suitability of weed monitoring and control measures. • Revise areas of restrict access in accordance with occurrence of new weed species and/or new occurrences of existing weed species.	• Biannual monitoring of the presence and abundance of weeds (in accordance with the FVMP) compared to baseline presence and abundance to determine the effectiveness of control programs. • Inspection of cleared and rehabilitated areas to detect presence of new weed species and/or new occurrences of existing weed species to determine success of management actions. • Inspection of vehicles and equipment used for construction activities at entry and exit points. • Post-construction inspection of cleared areas to detect presence of new weed species and/or new occurrences of existing weed species.	• Bi-annually \ • Annually (as a minimum)	• Construction • Operations • Environment Team	• Compliance against these Management Targets will be included within a CAR, submitted as part of the AER for the Proposal. • Complete an incident report if new weed species and/or new occurrences of existing weed species are recorded.

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

A.8 Roles Responsibilities

The key personnel involved in the implementation of the indicative WMP and their roles and responsibilities are listed below.

TABLE A 7: ROLES AND RESPONSIBILITIES FOR WEED MANAGEMENT MEASURES

Role Responsible	Weed Management Measure
Project Manager (may delegate all or part responsibility to an appropriately qualified person)	• Ensuring full compliance with the requirements of this Management Plan. • Ensuring training in weed hygiene requirements is provided to personnel responsible for the transfer of earthmoving equipment and vehicles between sites. • Ensuring the required resources are allocated to fulfil the requirements of this procedure.
Supervisor	• Ensuring any vehicles or earthmoving equipment leaving a mine is cleaned down so that it is free of vegetation or dirt, and, following an inspection, a Weed Hygiene Certificate (WHC) is issued. • Ensuring that personnel involved in vehicle or equipment transfers are aware of this procedure and can competently meet their responsibilities.
Manager Environment (may delegate all or part responsibility to an appropriately qualified person)	• Providing advice to others about weed hygiene procedures and about the identification of plants that may be weeds. • Undertaking or commission weed control activities. • Undertaking site inspections for weeds. • Keeping records of weed management - weed hygiene certificates, GIS data recording the location and extent of weed populations, control methods used etc. • Presenting ongoing weed management and control awareness training.
Employees (inclusive of contractors)	• Understand and meet the obligations of this procedure. • Report potential weed occurrences and poorly cleaned machinery.

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

MINERAL RESOURCES

APPENDIX B
RISK ASSESSMENT

Appendix B Risk Assessment

A qualitative risk assessment was conducted in accordance with the Environmental Management Plan Guidelines (Commonwealth of Australia, 2014) to assess the risks of the proposal and is shown in **Table B 2**. Each environmental risk identified has been provided a likelihood and consequence rating using the criteria in **Table B 1** below to generate a risk rating of low, medium, high or severe.

TABLE B 1: RISK ASSESSMENT CRITERIA

	Consequence				
Likelihood	**Minor**	**Moderate**	**High**	**Major**	**Critical**
Highly likely	Medium	High	High	Severe	Severe
Likely	Low	Medium	High	High	Severe
Possible	Low	Medium	Medium	High	Severe
Unlikely	Low	Low	Medium	High	High
Rare	Low	Low	Low	Medium	High

Likelihood	
The following criteria has been used to determine the likelihood of the risk occurring	
Highly likely	The risk event is expected to occur in most circumstances
Likely	The risk event will probably occur during the life of the project
Possible	The risk event might occur during the life of the project
Unlikely	The risk event could occur but considered unlikely or doubtful
Rare	The risk event may only occur in exceptional circumstances
Consequence	
The following criteria has been used to determine the consequences of a risk occurring	
Minor	Minor incident of environmental damage that can be reversed
Moderate	Isolated but substantial instances of environmental damage that could be reversed with intensive efforts
High	Substantial instances of environmental damage that could be reversed with intensive efforts
Major	Major loss of environmental amenity and real danger of continuing
Critical	Severe widespread loss of environmental amenity and irrecoverable environmental damage

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

TABLE B 2: FLORA AND VEGETATION ENVIRONMENTAL RISK ASSESSMENT

Value	Potential Impacts	Inherent Risk			Management Measures	Residual Risk		
		Likelihood	Consequence	Risk		Likelihood	Consequence	Ranking
Flora and vegetation	Loss of native flora and vegetation due to unauthorised clearing	Unlikely	High	Medium	Management measures are outlined in Table B 2. Any potential loss of native flora and vegetation due to clearing is expected to be managed through suitable design and mitigation measures, with negligible impacts. Loss of native vegetation is considered a **LOW** risk, however due to its value for several significant fauna species it is proposed to be offset.	Rare	High	Low
Flora and vegetation	Take of significant flora taxa due to unauthorised clearing	Highly Likely	Moderate	High	Management measures are outlined in Table B 2. Any take of significant flora due to clearing is expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low
Flora and vegetation	Potential for fragmentation of vegetation as a result of construction of linear corridors.	Likely	Moderate	Medium	Management measures are outlined in Table B 2. It is considered **unlikely** that fragmentation of habitat as a result of the Proposal will cause any significant impact to flora and vegetation, this risk event is considered **LOW**	Unlikely	Minor	Low
Dust	Dust generated as part of construction and operation activities has the potential to impact on local flora and reduced health and viability of a flora and vegetation.	Likely	Moderate	Medium	Management measures are outlined in Table B 2 of the Risk Assessment. Any potential decline or change in the health/composition of flora and vegetation arising from dust are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Slight	Low
Weeds	Introduction and/or spread of weed species leading to reduced flora species and system diversity.	Likely	Moderate	Medium	Management measures are outlined in Table B 2 of the Risk Assessment. Any potential decline or change in the health/composition of flora and vegetation arising from the introduction and/or spread of weeds are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low
Fire	Construction activities have the potential to cause accidental bushfires which may lead to damage or death to surrounding flora and vegetation communities	Likely	High	High	Management measures are outlined in Table B 2 of the Risk Assessment. Any potential decline or change in the health/composition of fauna habitat arising from fire are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **MEDIUM**.	Unlikely	High	Medium
Hydrological change	Potential degradation or alteration of health/composition of vegetation arising from hydrological regime changes.	Likely	Moderate	Medium	Management measures are outlined in Table B 2. Any potential decline or change in the health/composition of fauna habitat arising from hydrological changes are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low

EXECUTIVE SUMMARY

Table ES-1 summarises the purpose of the Significant Fauna Management Plan (SFMP) and Monitoring Program within the context of the Western Australia Environmental Protection Authority (EPA) objectives for the key environmental factor of Terrestrial Fauna (EPA 2016), but is also relevant for EPBC fauna considerations. The SFMP and Monitoring Program also aligns with the EPA (2021c) and Commonwealth of Australia (2014) Environmental Management Plan Instructions and Guidelines. The SFMP and Monitoring Program has been prepared for the Mineral Resources Lamb Creek Iron Ore Project. This Environmental Management Plan specifically addresses the Terrestrial Fauna environmental factor associated with the Project.

Summary Table ES-1 below presents the environmental outcomes and objectives for the environmental factor to be met through implementation of this SFMP, as well as the environmental criteria and management targets to measure achievement of the associated environmental outcomes and objectives.

Table ES-1: Significant fauna Management plan Summary

Project Title	Lamb Creek Iron Ore Mine	
Short Description	Open pit iron ore mine located approximately 130 km northwest of Newman to produce up to 10 million tonnes per annum (Mtpa) of crushed and screened iron ore over a period of three to five years. This will comprise a multi-stage crushing and screening process plant and associated mine infrastructure including, but not limited to, site offices, maintenance and equipment service area, water pipelines, fuel storage, power generation, telecommunications and an accommodation village for site personnel. The total disturbance footprint of the Project is 646.9 ha (Indicative Footprint), within a Development Envelope of 874 ha (**Figure 1**). Iron ore product will be loaded onto road trains and transported 16 km on a dedicated private haul road to its intersection with Great Northern Highway, where it will be transported 320 km to ship load-out facilities at the Utah Point berth in Port Hedland.	
Proponent Name	Process Minerals International (PMI) a wholly owned subsidiary of Mineral Resources Limited (MinRes) (ACN 118 549 910)	
Ministerial Statement No.	TBA	
Scope And Purpose Of SFMP	The purpose of the Significant Fauna Management Plan (SFMP) is to present a robust and implementable environmental management framework to protect the environmental values of the Project and to demonstrate that the EPA's objectives are met during the construction and operation of the Project (also relevant for EPBC fauna considerations).	
Key Environmental Factor and Objective	Terrestrial Fauna:	To protect terrestrial fauna so that biological diversity and ecological integrity are maintained.
Outcome-based Management Provisions	Ensure development and operation of the Project meets the objective of protecting significant fauna and fauna habitat to maintain biological diversity and ecological integrity.	
Objective-based Management Provisions	No clearing of critical fauna habitat shall occur outside of approved, demarcated, clearing area(s) during construction or operations. Feral predator management effectively implemented to avoid increasing impacts on native fauna populations as a result of the Project. Effective operation of the Project to avoid Project related fire. Minimise fauna mortality from construction and operation of Project infrastructure and operations caused by; open water sources, open trenches/excavations, vehicle strike.	

Condition Clauses	TBA
Key Components In the SFMP	Key provisions are detailed in Section 3
Proposed Construction and Operation Dates	The forecast key milestones for construction and commissioning are: construction Q3 to Q4 2025. commence commissioning Q1 2026. commence operation from Q1 2026 to Q2 2026.
SFMP Required Pre-construction	Yes - this SFMP will be required to be implemented during installation of access tracks and roads into the site, following granting of licensed tenements

Declaration of accuracy

In making this declaration, I am aware that section 491 of the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) makes it an offence in certain circumstances to knowingly provide false or misleading information or documents to specified persons who are known to be performing a duty or carrying out a function under the EPBC Act or the Environment Protection and Biodiversity Conservation Regulations 2000 (Cth). The offence is punishable on conviction by imprisonment or a fine, or both. I am authorised to bind the approval holder to this declaration and that I have no knowledge of that authorisation being revoked at the time of making this declaration.

1. CONTEXT, SCOPE AND RATIONALE

1.1 PROJECT BACKGROUND

Process Minerals International (PMI; the Proponent), a wholly owned subsidiary of Mineral Resources Limited (MinRes) (ACN 118 549 910), proposes to develop the Lamb Creek Iron Ore Project (the Project), located approximately 130 kilometres (km) northwest of Newman, in the East Pilbara Local Government Authority (LGA) in Western Australia (WA).

Open pit iron ore mine located approximately 130 km northwest of Newman to produce up to 10 million tonnes per annum (Mtpa) of crushed and screened iron ore over a period of three to five years. This will comprise a multi-stage crushing and screening (two or three stages) process plant and associated mine infrastructure including, but not limited to, site offices, maintenance and equipment service area, water pipelines, fuel storage, power generation, telecommunications and an accommodation village for site personnel. Project Iron ore product will be loaded onto road trains and transported 16 km on a dedicated private haul road to its intersection with Great Northern Highway, where it will be transported 320 km to ship load-out facilities at the Utah Point berth in Port Hedland.

The Project is being referred under s. 38 of the Environmental Protection Act 1986 (EP Act) as it has the potential to significantly affect key environmental factors, defined by the WA Environmental Protection Authority (EPA) in its Statement of environmental principles, factors, objectives and aims of EIA (Environmental Protection Authority, 2021b). The Project is also being referred under the Environment Protection and Biodiversity and Conservation Act 1999 (EPBC Act) as it is likely to have a significant impact on Matters of National Significance (MNES). A Native Vegetation Clearing Permit (NVCP) under Part V of the EP Act will also be sought for the area of the Project that intersects the Great Northern Highway Road Reserve.

As a result of the various approvals being sought for the Project, there are subtle differences in the Development Envelopes (DE) and Indicative Footprints, however the overall clearing associated with the Project is the same. The maximum DE or Proposed Action Area for the EPBC referral is 897.5 ha, as the EPBC referral was based on an earlier, now revised, DE footprint. The EPBC referral DE is also slightly larger than that for the s. 38 Referral, due to the splitting of the DE between the approvals under Part IV and Part V of the EP Act. This Significant Fauna Management Plan (SFMP) has been prepared to support the submission of the Referral Supporting Document (RSD), Mining Proposal, NVCP and EPBC Referral to detail the management actions proposed to reduce adverse environmental impacts to the key environmental factor of Terrestrial Fauna and MNES.

Key nomenclature used throughout this document is summarised below:

The Project: This refers to the boundary within which the elements of the proposed activities are situated.

Project Area (897.5 ha): Refers to the maximum proposed Development Envelope (as for EPBC) within R47/19 (to be converted to M47/1592) and L47/1008, which overlie the Juna Downs pastoral lease (LPL N050471). A small portion of the access road and Great Northern Highway intersection area is within railway corridor L021124 (Hamersley Iron Pty Ltd- Yandicoogina Rail) that is excised from Juna Downs. This Project Area also includes the area of the intersection with the Great Northern Highway which is entirely within Main Roads WA road reserve.

Development Envelope (874 ha): delineates the area within which the Project components are located (**Figure 1**). and is a combination of the development envelopes included in the Part IV and Part V applications.

Indicative Footprint (646.9 ha): refers to the area that is proposed to be directly disturbed by the Project (e.g. clearing of native vegetation) (**Figure 1**) occurs entirely within the Development Envelope. The

layout of the Indicative Footprint may be subject to change; however, total disturbance will not exceed the maximum disturbance for the Development Envelope.

Terrestrial Fauna Survey Area (1645 ha): refers to the boundary within which all Terrestrial Fauna investigations and field surveys were undertaken.

This SFMP has been prepared in accordance with the *How to prepare Environmental Protection Act 1986 Part IV Environmental Management Plans: Instructions* (Environmental Protection Authority 2021a).

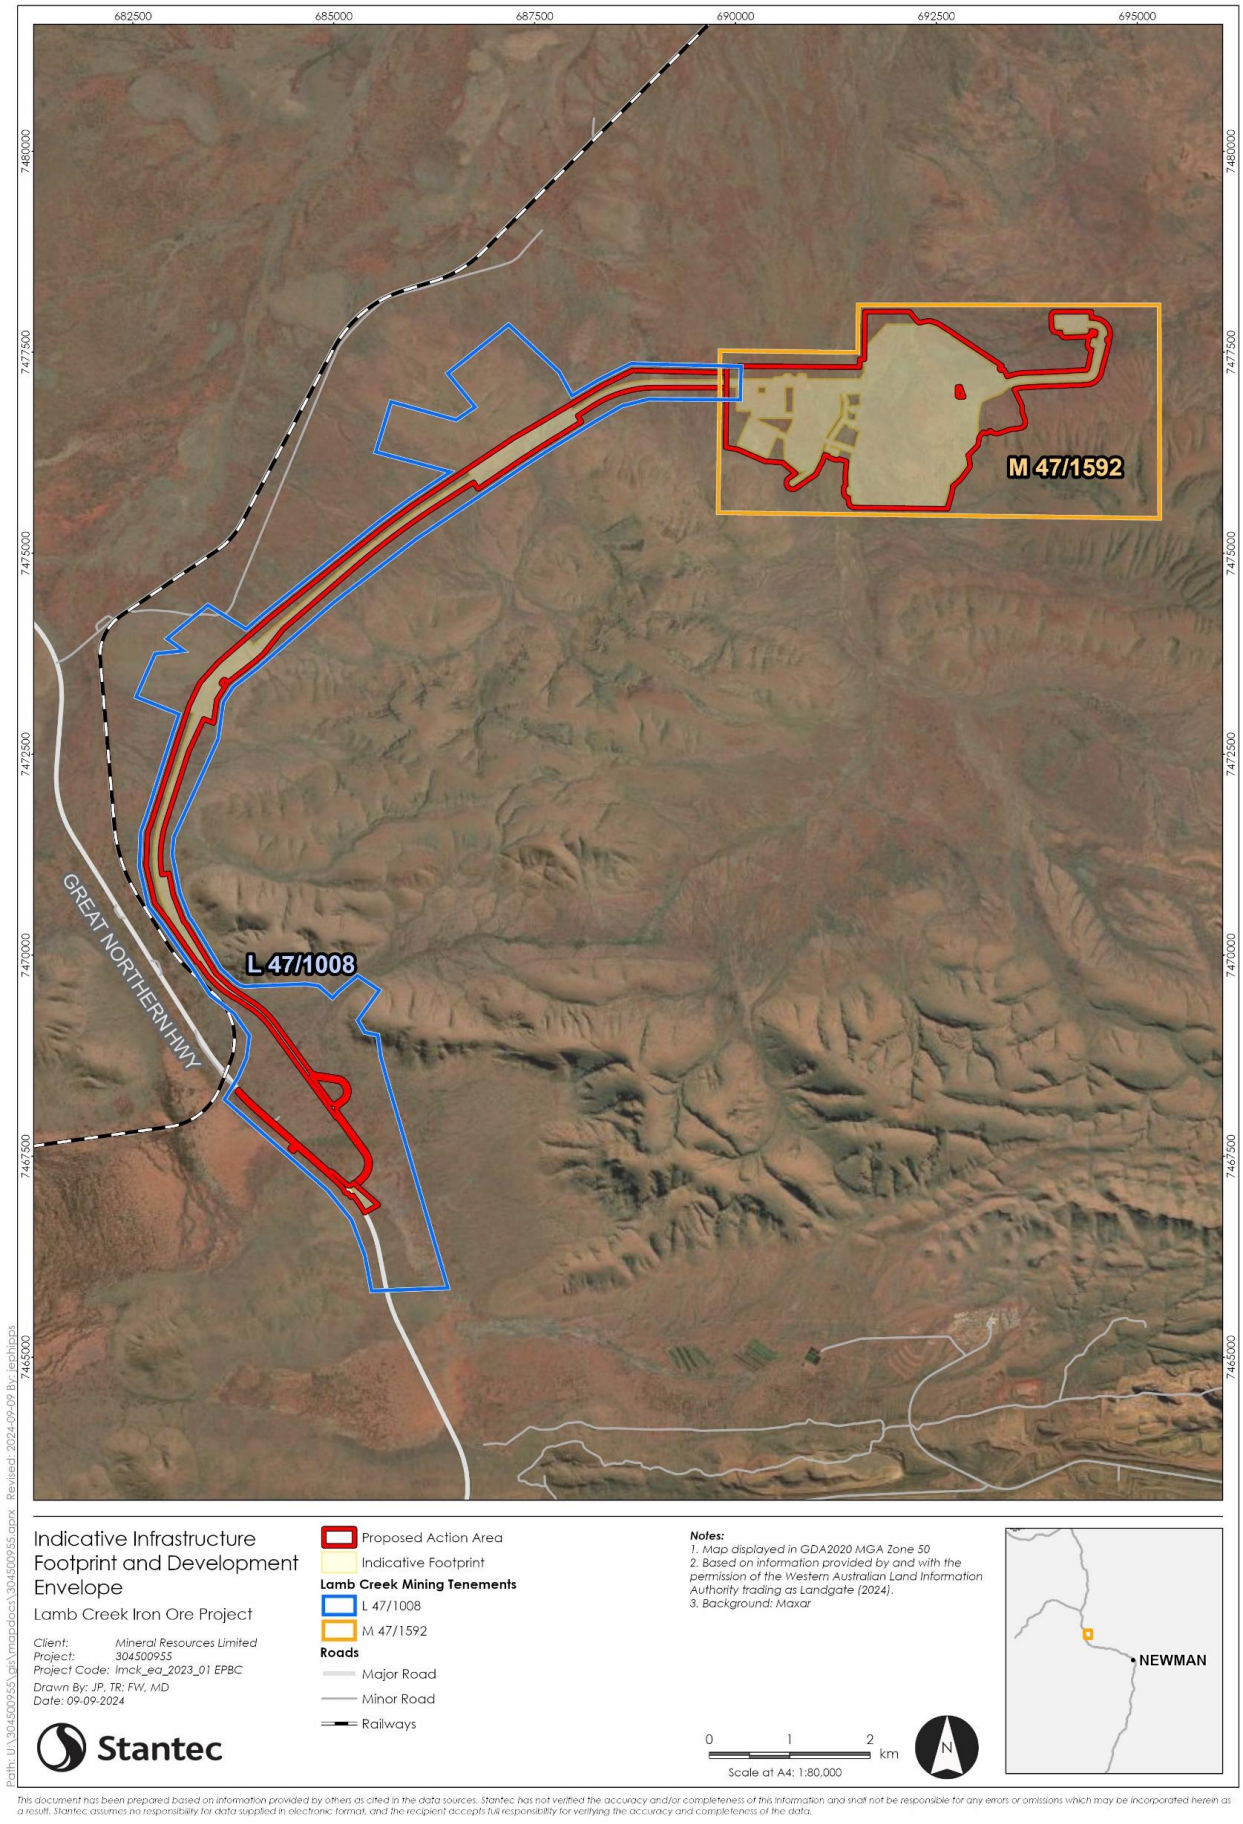

Figure 1: Development Envelope and Indicative Footprint

1.2 KEY ENVIRONMENTAL FACTOR – TERRESTRIAL FAUNA

The EPA's objective for the environmental factor of Terrestrial Fauna is "To protect terrestrial fauna so that biological diversity and ecological integrity are maintained" (Environmental Protection Authority 2016). In the context of this objective, ecological integrity is the composition, structure, function and processes of ecosystems, and the natural range of variation of these elements. Terrestrial Fauna is considered a key environmental factor for the Project due to the potential for direct and indirect impacts during construction and operation activities. Comprehensive surveying identified 21 significant species as occurring within the Study Area. Several of the fauna species are Matters of National Environmental Significance (MNES), listed at the Commonwealth and/or State level. Of the significant fauna with the potential to occur in the Study Area, the following five species were considered likely to occur in the Lamb Creek Project area and one species, the Fork-tailed Swift, was recorded:

- Northern Quoll (Dasyurus hallucatus) – Endangered.
- Ghost Bat (Macroderma gigas) – Vulnerable.
- Pilbara Leaf-nosed Bat (Rhinonicteris aurantia) – Vulnerable.
- Pilbara Olive Python (Liasis olivaceus barroni) – Vulnerable.
- Grey Falcon (Falco hypoleucos) – Vulnerable.
- Fork-tailed Swift (Apus pacificus) – Migratory, recorded.

The Proponent considers the Project can be managed to meet the EPA's objective for Terrestrial Fauna, aided by the conceptual design, planned construction and operational procedures that will be implemented to avoid, mitigate and maintain terrestrial fauna values. In addition, residual impacts from the clearing of supporting habitat for several significant fauna species is proposed to be offset through the Pilbara Environmental Offsets Fund (PEOF), managed via the Native Vegetation Clearing Permit process in accordance with Part V s 51I(2)(b) of the EP Act and in alignment with the native vegetation clearing principles in accordance with Schedule 5 cl 1 of the EP Act. These proposed offsets (to be finalised, agreed with DWER) include 42.0 ha of critical habitat (foraging and dispersal) for Northern Quoll, and 622.3 ha of supporting habitat (foraging) for Ghost Bat, and lesser portions of this 622.3 ha as supporting habitat for the Pilbara leaf-nosed Bat and Pilbara Olive Python .

1.3 PURPOSE AND OBJECTIVE

The purpose of this SFMP is to document the Proponent's approach to managing the potential impacts of construction and operation of the Project on significant fauna species to:

- Ensure that the Project is carried out in a manner that minimises the direct and indirect impacts to significant fauna species; and
- Ensure there is no direct or indirect adverse impacts to significant fauna species within the Project Area and immediate surrounds.

The Proponent is committed to avoiding and minimising potential impacts from the Project during construction and operation to ensure the biodiversity and ecological integrity of terrestrial fauna are maintained.

The objective of this SFMP is to meet the EPA's objective for the environmental factor of Terrestrial Fauna using the EPA's mitigation hierarchy of avoid, minimise, rehabilitate and offset (Government of Western Australia 2014). This will be addressed by ensuring potential impacts to significant fauna from the Project are avoided to the maximum extent practicable by:

- Identifying the risks and potential impacts from the Project on significant fauna species.

- Outlining management provisions for terrestrial fauna, to avoid and minimise potential impacts to significant fauna populations.
- Preparing and implementing monitoring programs for populations recorded within the Development Envelope; and
- Proposing corrective and response actions if triggers and thresholds are exceeded to avoid impact to significant fauna populations.

1.4 RATIONALE AND APPROACH

The SFMP focuses on outcome-based management provisions including monitoring and evaluating success of management actions with respect to significant fauna populations within the Project Area, driven by triggers and thresholds. Assessment of the pathways over which impacts may occur provides the rationale for choice of provisions and choice of appropriate indicators to measure against the environmental outcome and/or objective.

This SFMP is subject to approval by the EPA and Department of Climate Change, Energy, the Environment and Water (DCCEEW) and will subsequently be implemented.

1.5 LEGISLATION, POLICY AND GUIDANCE

This SFMP has been written in accordance with Western Australian (WA) and Commonwealth policies and guidance, including:

- Instructions on how to prepare Environmental Protection Act 1986 Part IV Environmental Management Plans; (EPA 2021b).
- Environmental Impact Assessment (Divisions 1 and 2) Procedures Manual (EPA 2021a).
- Environmental Management Plan Guidelines (Commonwealth of Australia 2014).
- Outcomes-based conditions policy (DoE 2016b).
- Outcomes-based conditions guidance (DoE 2016a).
- National Light Pollution Guidelines for Wildlife (DCCEEW 2023a).
- Biodiversity Conservation Act 2016 (WA).
- Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth).

The following management plans and strategies are also relevant to the SFMP, specific to the Project and include:

- Flora and Vegetation Management Plan (FVMP).

State and Commonwealth plans and management prescriptions that are relevant to the terrestrial fauna include:

- Environmental Factor Guideline – Terrestrial Fauna (EPA 2016);
- Commonwealth Listing Advice on Northern Quoll (Dasyurus hallucatus) (Threatened Species Scientific Committee 2005).
- National Recovery Plan for the Northern Quoll Dasyurus hallucatus (Hill and Ward 2010).
- EPBC Act referral guideline for the endangered Northern Quoll Dasyurus hallucatus (DoE 2016c).
- Conservation Advice Macroderma gigas Ghost Bat (TSSC 2016).
- A review of Ghost Bat ecology, threats and survey requirements (Bat Call WA 2021a).
- Conservation Advice Rhinonicteris aurantia (Pilbara form) Pilbara Leaf-nosed Bat (TSSC 2016).
- A review of Pilbara Leaf-nosed Bat ecology, threats and survey requirements (Bat Call WA 2021c).

- Approved Conservation Advice for Liasis olivaceus barroni (Olive Python – Pilbara subspecies) (TSSC 2008).
- Conservation Advice Falco hypoleucos Grey Falcon (Threatened Species Scientific Committee 2020).
- Referral guideline for 14 birds listed as migratory species under the EPBC Act (Department of the Environment 2015).
- Matters of National Environmental Significance. Significant impact guidelines 1.1 - Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2013).
- Survey Guidelines for Australia's Threatened Birds (DEWHA 2010).
- Survey Guidelines for Australia's Threatened Reptiles (DSEWPaC 2011b).
- Survey Guidelines for Australia's Threatened Mammals (DSEWPaC 2011a).
- Threat Abatement Plan for Competition and Land Degradation by Feral Goats (DEWHA 2008a).
- Threat Abatement Plan for Competition and Land Degradation by Feral Rabbits (DEE 2016).
- Threat Abatement Plan for Predation by Feral Cats (DEWHA 2008b).
- Threat Abatement Plan for Predation by the European Red Fox (DEWHA 2008c).

2. TERRESTRIAL FAUNA

2.1 SURVEY AND STUDY FINDINGS

The rationale for the proposed management approach in this SFMP is supported by desktop, detailed and targeted fauna surveys that have been completed over the Lamb Creek Project area since 2012 (Rapallo 2012;2021;2022a;b; Western Wildlife 2020). The findings of these surveys are summarised in the following sections and have been used to inform the impact assessment within the RSD and EPBC Referral, and to develop mitigation measures detailed in this SFMP (**Table 2**). Surveys and studies undertaken include:

- Level 2 Fauna Survey and Targeted Northern Quoll Survey of the Lamb Creek for Process Minerals International Pty Ltd (Rapallo 2012).
- Lamb Creek and Wedge Project: Vertebrate Fauna Desktop Assessment March (Western Wildlife 2020).
- Baseline Short-range Endemic Invertebrate Survey of the Lamb Creek Iron Ore Project (Rapallo 2022a).
- Detailed Vertebrate Fauna Survey of the Lamb Creek Project (Rapallo 2022b);
- Targeted Ghost Bat Survey for the Lamb Creek Iron Ore Project (Phoenix Environmental Sciences 2023).
- Significance Assessment regarding Ghost bat Prescence at Lamb Creek (Bat Call WA 2023b).
- Ghost Bat Cave Closure at Lamb Creek (Bat Call WA 2023a).

2.2 FAUNA HABITATS

A total of 10 broad habitat types (excluding cleared areas) have been identified by Rapallo (2022b) in the Terrestrial Fauna Survey Area, and are described in detail in Section 4.6 of the EPBC Preliminary Documentation, and includes:

- gorge, gully, and rocky breakaway;
- tussock grassland plain;
- hill crests and hill slopes;
- hummock grassland;
- stony plains;
- rocky ridge and gorge;
- drainage line (minor and medium);
- rocky hills and plateaus;
- Mulga / *Corymbia* spp. plain; and
- Mulga plain.

Fauna habitats of value for significant species within the scope of this SFMP are described in **Table 3** below and shown in **Figure 2.**

Table 2: Summary of Terrestrial Vertebrate Fauna Surveys Conducted for the Project

Survey (Reference)	Study Type / Dates	Proximity to Project Area	Survey Effort	Key Findings	
				Fauna Assemblage	Significant Fauna
Level 2 Fauna Survey and Targeted Northern Quoll Survey of the Lamb Creek for Process Minerals International Pty Ltd (Rapallo 2012);	Scope Level 2 fauna survey of the Terrestrial Fauna Survey Area and adjacent areas of similar habitat. Targeted Northern Quoll survey of the Terrestrial Fauna Survey Area. Timing 19 – 20 March 2012 (reconnaissance survey). 26 March – 12 April 2012 (field surveys).	Location Study Area. Survey Area Not stated.	Desktop assessment Database searches (max 50 km buffer). Review of relevant reports. Field survey Reconnaissance survey (2 days; 10 motion cameras for two weeks). Vertebrate fauna trapping (12 Pitfall traps for 852 nights; 20 Elliot traps for 1420 nights; ten funnel traps for 710 nights). Bird surveys (two-hectare bird surveys each day). Bat surveys (two ultrasonic recorders, and Harp Traps deployed each night) Spotlighting (30-minute surveys in each habitat type). Active searching and habitat assessments (effort not stated). Remote sensing cameras (Ten motion detecting cameras at seven sites for two weeks and at an additional seven sites for six days). Opportunistic records SRE surveys (14 sites were foraged for SRE taxa and leaf litter samples collected). Targeted Northern Quoll survey (six sites of ten cage traps for five nights).	152 taxa including: 22 mammals taxa (including seven species of bats). 58 reptiles taxa. 76 birds taxa.	Fork-tailed Swift (MI, MI).
Lamb Creek and Wedge Project: Vertebrate Fauna Desktop Assessment March	Scope Desktop assessment including database searches and a review of previous fauna surveys in the region.	Location Study Area. Survey Area 3,110 ha.	Desktop assessment Database searches (within 35 km of Proposed Action Area). Review of relevant reports.	296 taxa including: 36 native mammal taxa. Nine introduced mammal taxa. 112 reptile taxa. Nine frog taxa. 130 bird taxa.	Pilbara Olive Python (VU, VU) Grey Falcon (BC Act, VU) Night Parrot (BC Act, CR; EPBC Act, EN), Northern Quoll (EN, EN)

(Western Wildlife 2020)					Bilby (VU, VU) Pilbara Leaf-nose Bat (VU, VU) Ghost Bat (VU, VU)
Baseline Short-range Endemic Invertebrate Survey of the Lamb Creek Iron Ore Project (Rapallo 2022a)	Scope Desktop assessment including invertebrate database searches and review of relevant reports undertaken. Invertebrate field survey. Timing 16 – 25 February 2021.	Location Study Area. Survey Area 1,645 ha.	Desktop assessment Database searches. Review of relevant reports. Field survey (51 sites) Habitat assessment. Spider/scorpion burrow searching. Foraging.	Desktop assessment 13 potential SRE invertebrate taxa within survey area. Field survey 25 potential SRE invertebrate taxa within survey area.	Ten undescribed or previously unsequenced potential SRE taxa.
Detailed Vertebrate Fauna Survey of the Lamb Creek Project (Rapallo 2022b)	Scope Desktop assessment including database searches and review of relevant reports undertaken. Refine 2012 fauna habitat mapping and extend fauna habitat mapping into areas not previously mapped within the Terrestrial Fauna Survey Area. Level 2 fauna survey of Terrestrial Fauna Survey Area. Timing 16 – 28 April 2020 (vertebrate fauna survey). 17 – 23 February 2021 (supplementary field work).	Location Study Area. Survey Area 1,645 ha.	Desktop assessment Five database searches (max 50 km buffer). Review of relevant reports. Field survey Systematic trapping (10 sites - 840 Pitfall trap nights; 1400 Elliot trap nights; 840 funnel trap nights). Bird surveys (500 minutes). Acoustic recording for bats (33 detector nights). Acoustic recording for night parrot (8 detector nights). Active searching (foraging and leaf litter) (2310 minutes). Opportunistic observations. Camera trapping (279 nights at transects, 73 nights at trap sites).	Desktop assessment 301 vertebrate taxa including: 157 bird taxa. 46 mammal taxa. 91 reptile taxa. 7 amphibian taxa. Field survey 128 vertebrate taxa including: 63 bird taxa. 20 mammal taxa. 44 reptile taxa. One amphibian taxa.	Pilbara Olive Python (VU, VU) Northern Quoll (EN, EN) Ghost Bat (VU, VU) Western Pebble-mound Mouse (BC Act, P4) Fork-tailed Swift (MI, MI)

Targeted Ghost Bat Survey for the Lamb Creek Iron Ore Project (Phoenix Environmental Sciences 2023)	Scope Targeted Ghost Bat survey, comprising searches for roost sites, ultrasonic recordings and scat collection and analysis. Timing 12 - 14 September 2022. 18 October 2022.	Location Study Area. Survey Area 4,397 ha.	Desktop assessment Protected Matters Search Tool DCCEEW (2023) (40 km buffer). DBCA Threatened and Priority Fauna Database (2021) (40 km buffer). Atlas of Living Australia (Atlas of Living Australia 2023) (40 km buffer). Review of relevant reports. Field Survey Habitat assessment. Habitat/cave searches (Five caves). Bat echolocation recordings. Scat collection and analysis. Cave status assessment.	Desktop assessment 113 Ghost Bat records including: Three within the survey area; and 110 in wider search extent Field survey Seven bat species including: Ghost Bat (Macroderma gigas). Greater Northern Free-tailed Bat (Chaerephon jobensis). Common Sheathtailed Bat (Taphozous georgianus). Hill's Sheath-tailed Bat (Taphozous hilli). Gould's Wattled Bat (Chalinolobus gouldii). Little Broad-nosed Bat (Scotorepens greyii). Finlayson's Cave Bat (Vespadelus finlaysoni).	Ghost Bat (VU, VU)

Table 3: Vertebrate Fauna Habitat Types in the Study Area and Indicative Footprint, by Value

Habitat Type (Rapallo 2022b)	Description	Value to Significant Fauna	Extent within the Survey Area - ha	Area within Indicative Footprint - ha (% within survey area)
Gorge, gully, and rocky breakaway	Wide rocky gullies and gorges that bisect the hillcrest / hillslopes of the higher elevation areas containing caves, deep cracks, and crevices. Breakaways occur at the rugged edges of hillslopes. Spinifex hummock grassland with mixed shrubland patches or occasional *Ficus* spp. occurring in shaded locations or occasional *Eucalyptus leucophloia*.	High Value: • Potential foraging and dispersal habitat for Pilbara Olive Python, Northern Quoll, Ghost Bat and Peregrine Falcon. • Potential breeding habitat for Pilbara Olive Python, Northern Quoll and Peregrine Falcon. • Potential shelter habitat for Pilbara Olive Python and Northern Quoll. • Potential habitat for Pilbara Barking Gecko (*Underwoodisaurus seorsus*) and Gane's Blind Snake (*Anilios ganei*).	54.64	0.00 (0%)
Hillcrests / hillslope	Slopes and hill crests of higher elevation areas. Spinifex hummock grassland dominated with scattered *Eucalyptus leucophloia* trees and mallee, and *Acacia* spp. and *Grevillea* spp. shrubs on rocky, red skeletal soils (loams to clay/loam).	Moderate Value: • Possible foraging and dispersal habitat for Ghost Bat, Western Pebble-mound Mouse and Northern Quoll. • Possible breeding habitat for Western Pebble-mound Mouse.	318.48	50.42 (15.83%)
Mulga / *Corymbia* spp. plain	Open Mulga shrubland patches over spinifex hummock or tussock grassland on loam to sandy clay loam occurring in areas of sheet flow drainage. The Mulga patches are surrounded by run-off zones of stonier plain with open spinifex / tussock grassland under very open Mulga / *Corymbia deserticola* shrubland.	Moderate Value: • Possible foraging and dispersal habitat for Ghost Bat and Grey Falcon. • Possible habitat for Gane's Blind Snake.	290.88	180.78 (62.15%)
Minor drainage	Smaller narrow drainage channels and shallow gullies that bisect the stony plain habitat and hill slopes, forming flow zones on the valley floor. Mixed open shrubland, to shrubland often over tussock grass and herbs with occasional fringing trees (scattered *Eucalyptus leucophloia*, *Corymbia* spp. or *Eucalyptus gamophylla*).	Moderate Value: • Possible foraging and dispersal habitat for Ghost Bat, Grey Falcon, Peregrine Falcon, Pilbara Olive Python and Northern Quoll.	210.36	75.23 (35.76%)

Habitat Type (Rapallo 2022b)	Description	Value to Significant Fauna	Extent within the Survey Area - ha	Area within Indicative Footprint - ha (% within survey area)
Tussock grassland plain	Tussock grass (*Aristida inaequiglumis*, *Aristida contorta*, *Themeda triandra*) dominated, largely undefined drainage plain. Contains occasional open Mulga woodland stands or scattered Mulga individuals on brown sandy clay loam to loams. Contains patches of spinifex.	Moderate Value: • Possible foraging and dispersal habitat for Ghost Bat, Grey Falcon and Peregrine Falcon. • Potential habitat for Gane's Blind Snake.	137.33	6.08 (4.43%)
Medium drainage	Wide loamy drainage channels to undefined drainage (gravelly) containing occasional emergent *Corymbia hamersleyana* over patches of low mixed shrubs over Buffel Grass and tussock grass dominated understory on low relief. Contains very occasional Mulga stands in loamier soils.	Moderate Value: • Possible foraging and dispersal habitat for Ghost Bat, Grey Falcon, Pilbara Olive Python, Northern Quoll and Peregrine Falcon. • Possible breeding and nesting habitat for Grey Falcon. • Potential habitat for Gane's Blind Snake.	112.97	43.41 (38.43%)
Stony plain	Plains and lower slopes of spinifex hummock grasslands (or in small patches, tussock grass) on red sandy clay loam to loam soil. Typically, with a mantle of gravel (less so on the valley floor adjacent to drainage, where soils are loamier). Little to no overstory aside from scattered trees or patches of mixed shrubs often regenerating from fire. Generally, *Eucalyptus leucophloia* occurs on the slopes and *Eucalyptus gamophylla* on lower slopes, with *Corymbia hamersleyana* typically associated with drainage.	Low Value: • Possible foraging and dispersal habitat for Ghost Bat, Grey Falcon, Western Pebble-mound Mouse and Pilbara Olive Python. • Possible breeding and shelter habitat for Western Pebble-mound Mouse.	517.07	266.35 (51.51%)
Bitumen Road	N/A	N/A	0.83	0.32 (38.55%)
Unmapped*	N/A	N/A	29.94	24.28 (81.10%)
Total			1642.56	646.87 (39.38%)

Figure 2: Fauna Habitat Within the Terrestrial Fauna Survey Area

2.3 FAUNA ASSEMBLAGE

2.3.1 Desktop Study

Desktop assessments indicate a predicted fauna assemblage of up to 301 species of terrestrial vertebrate fauna recorded within 50 kilometres of the survey area (Rapallo 2022b). These included 157 species of birds, 46 mammals, 91 reptiles and 7 amphibians. The Rapallo 2022b desktop study identified 29 taxa of conservation significant fauna, of which 12 were assessed as possible, likely or confirmed to occur within 50 km of the Survey Area (**Table 4:** Desktop Results for Significant Fauna Species Either Confirmed or Considered Possible or Likely to Occur Within 50 Km of the Survey Area.). The other 17 taxa of conservation significant fauna were considered unlikely or highly unlikely to occur in the Study Area due to the absence of suitable habitat and are therefore not addressed further in this SFMP.

Table 4: Desktop Results for Significant Fauna Species Either Confirmed or Considered Possible or Likely to Occur Within 50 Km of the Survey Area.

Common Name	Scientific Name	Likelihood
Fork-tailed Swift	Apus pacificus	Confirmed
Peregrine Falcon	Falco peregrinus	Likely
Night Parrot	Pezoporus occidentalis	Possible
Grey Falcon	Falco hypoleucos	Possible
Letter-winged Kite	Elanus scriptus	Possible
Ghost Bat	Macroderma gigas	Confirmed
Short-tailed Mouse	Leggadina lakedownensis	Possible
Northern Quoll	Dasyurus hallucatus	Confirmed
Western Pebble-mound Mouse	Pseudomys chapmani	Confirmed
Pilbara Olive Python	Liasis olivaceus barroni	Confirmed
Pilbara Barking Gecko	Underwoodisaurus seorsus	Likely
Gane's Blind Snake	Anilios ganei	Likely

2.3.2 Introduced Fauna Species

Rapallo (2022b) identified 10 introduced (feral) fauna as potentially occurring within the Terrestrial Fauna Survey Area. Of these, four were recorded within the Terrestrial Fauna Survey Area during fauna surveys (Rapallo 2012;2022b;Table 4: Desktop Results for Significant Fauna Species Either Confirmed or Considered Possible or Likely to Occur Within 50 Km of the Survey Area.**Table 5:** Desktop Results for Introduced (Feral) Fauna Recorded Within 50 Km of the Survey Area). Introduced fauna species such as foxes and cats are declared pests which present key threats to the native mammals likely to occur within the Development Envelope, such as the Northern Quoll (Department of the Environment 2016).

Table 5: Desktop Results for Introduced (Feral) Fauna Recorded Within 50 Km of the Survey Area

Common Name	Scientific Name	Likelihood
Rock Dove	*Columba livia	Unlikely
European Cattle	*Bos taurus	Confirmed
Dromedary, Camel	*Camelus dromedarius	Confirmed
Dog	*Canis familiaris familiaris	Confirmed
Red Fox	*Vulpes vulpes	Likely
Donkey	*Equus asinus	Unlikely
Horse	*Equus caballus	Unlikely
Cat	*Felis catus	Confirmed
Rabbit	*Oryctolagus cuniculus	Likely
House Mouse	*Mus musculus	Confirmed

2.3.3 Significant Fauna Species

Of the 29 taxa of conservation significant fauna identified by the desktop study (Rapallo 2022b), 10 fauna species of significance were either confirmed from field surveys or considered likely to occur within the Development Envelope based on desktop and habitat assessments undertaken during field surveys (Rapallo 2012;2021; Western Wildlife 2020). These are discussed below. For the Night Parrot, given the lack of suitable habitat, recent fire activity and the absence of any detections within the Study Area, the species is considered unlikely to occur and is therefore not addressed within the SFMP. The Letter-winded Kite is also not addressed as no species were recorded and the Development Envelope is outside of the species known distribution.

2.3.3.1 Significant Fauna Recorded in the Development Envelope

Two fauna species of significance were confirmed within the Development Envelope based on the detailed in-field fauna surveys (Rapallo 2012;2022b). These species are:

- Western Pebble-mound Mouse (Pseudomys chapmani) (P4 under BC Act).
- Fork-tailed Swift (Apus pacificus) (MI, MI).

The Fork-tailed Swift occurs within the Project Area but is almost entirely aerial and will not be impacted by the Project. Therefore, it is not addressed within the SFMP.

2.3.3.2 Significant Fauna Likely to Occur in the Development Envelope

Eight fauna species of significance are considered likely to occur within the Development Envelope, based on desktop assessments and habitat assessments undertaken during field surveys (Rapallo 2012;2021; Western Wildlife 2020), these species are:

- Ghost Bat (Macroderma gigas) (En, En);
- Pilbara Leaf-nosed Bat (Rhinonicteris aurantia) (Vu, Vu);
- Northern Quoll (Dasyurus hallucatus) (En, En);
- Pilbara Olive Python (Liasis olivaceus barroni) (Vu, Vu);

- Gane's Blind Snake (Anilios ganei) (P1 under the BC Act);
- Pilbara Barking Gecko (Underwoodisaurus seorsus) (P2 under the BC Act);
- Grey Falcon (Falco hypoleucos) (Vu, Vu); and
- Peregrine Falcon (Falco peregrinus) (Other specially protected species under the BC Act).

The conservation significant species confirmed or considered likely to occur within the Development Envelope are described in detail in the RSD and are the focus of this SFMP. The six species classed as MNES are discussed in the EPBC Preliminary Documentation (Northern Quoll, Ghost Bat, Pilbara Leaf-nosed Bat, Pilbara Olive Python, Grey Falcon and Fork-tailed Swift). A summary of environmental values and outcomes relevant to these nine species are summarised in **Table 6**. Significant fauna records are shown in Figure 3: Significant Fauna Recorded from Lamb Creek**Figure 3.**

Table 6: Environment Values and Outcomes

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
Ghost Bat (*Macroderma gigas*) - VU / VU	**Description** The Ghost Bat is a large, cave-dwelling, microbat species. **Distribution** The species was once widely distributed across Australia, but is now largely restricted to northern Australia, including parts of the Pilbara and Kimberley regions of WA. **Ecology** Its preferred habitat is within arid spinifex hillsides, black soil grasslands, monsoon forest, open savannah woodland, tall open forest, deciduous vine forest, tropical rainforest, sandstone caves, boulder piles, limestone caves and abandoned mines. The Ghost Bat can forage over large areas up to 12 km from their diurnal roost with a preference for productive plain areas with thin mature woodland over patchy or clumped tussock or hummock grass (*Triodia* spp.) on sandy or stony	Threatening processes: • Habitat loss and degradation (McKenzie and Hall 2008; TSSC 2016). • altered hydrological regimes. • exposure to pollutants. • barbed wire fences. • human visitation / disturbance.	Potential Impacts to Ghost Bats as a result of this Project include: • loss of potential foraging and roost habitat ('rocky ridge' and 'gorge') due to clearing. • loss or abandonment of potential foraging and roost habitat due to blasting. • Direct mortality of individuals if present within the Development Envelope.	• No Ghost Bat caves have been located within the Development Envelope. • Ghost Bats have been recorded within the Terrestrial Fauna Survey Area as have Ghost Bat roosting caves. • No night, diurnal or maternity roosts have been found within the Development Envelope. • Two Ghost Bat roost caves (one Category 2 and one Category 3) are present outside (approximately 750 m to the south) of the Development Envelope. • A cluster of caves occurs in the southern extent of the Project Area close to the proposed haul road near its intersection with the Great Northern Highway intersection (Category 2, Category 3). • The Project will result in clearing of up to 622.3 ha of foraging habitat comprising the following broad fauna habitat types	• The loss of 622.3 ha of foraging habitat for the Ghost Bat as a result of the Project may be considered to be a **significant residual impact within** the Hamersley Bioregion (Environmental Protection Authority 2014). However, the Proponent considers that this impact can be managed via the Native Vegetation Clearing Permit process in accordance with Part V s 51I(2)(b) of the EP Act and in alignment with the native vegetation clearing principles in accordance with Schedule 5 cl 1 of the EP Act. • The proposed removal of 622.3 ha of supporting habitat is considered **likely to have a significant impact** on the Ghost Bat when assessed

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	ground (Bat Call WA 2021a). **Cultural Importance** Cultural importance of this species to Traditional Owners, as well as cultural appropriateness of control/mitigation methods was raised at the June 2024 on Country engagement with Banjima and no specific concerns were raised. Banjima considers all fauna to be important.			occurring within the Indicative Footprint. These comprise the following habitats, and the percentage of the mapped extent of this habitat type mapped within the broader Terrestrial Fauna Survey Area: • hill crests and hill slopes (50.42 ha, 18.83%). • medium drainage (43.41 ha, 38.43%). • minor drainage (75.23 ha, 35.76%). • Mulga/*Corymbia* spp. plain (180.77 ha, 18.83%). • stony plain (266.35 ha, 51.51%). • tussock grassland plain (6.08 ha, 4.43%). • The Project will not result in direct disturbance to or the loss of critical Ghost Bat caves. • Given the distance from known caves to proposed operation and blasting areas, it is unlikely that blasting will cause any	against the DCCEEW criteria and is proposed to be offset as it has the potential to: • adversely affect habitat critical to the survival of a species.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
				physical damage to known Ghost Bat roost caves. It is also considered unlikely that the structural integrity of caves, or roosting site viability, will be adversely impacted by blasting or other operational elements such as vibration from the Project. • Cave 1 will be temporarily closed during construction and operation to prevent impacts to Ghost Bats while the mine is operational (Bat Call WA 2023a).	
Pilbara Leaf-nosed Bat (*Rhinonicteris aurantia*) – VU / VU	**Description** The Pilbara Leaf-nosed Bat is of moderate size, having short fur, relatively small, pointed ears and a fleshy diamond-shaped noseleaf surrounding the nostrils. **Distribution** The Pilbara Leaf-nosed Bat occurs throughout the Pilbara and upper Gascoyne regions of WA, with the Pilbara population considered to be a single interbreeding	Threatening processes: • Habitat loss and degradation. • altered hydrological regimes. • exposure to pollutants. • barbed wire fences.	Potential impacts to Pilbara Leaf-nosed bats as a result of this Project include: • loss of potential foraging and roost habitat ('rocky ridge' and 'gorge') due to clearing. • loss or abandonment of potential foraging and	• This species has not been recorded in the Development Envelope. • No Critical habitat (as defined by (DBCA et al. 2023)) identified within the Development Envelope • No caves or permanent / semi-permanent surface water pools were identified within the Development Envelope; therefore, this species is likely to	No significant residual impact expected to occur to the Pilbara Leaf- nosed Bat: • No Critical habitat (as defined by (DBCA et al. 2023) identified within the Development Envelope • The proposed removal of 622.3 ha of potential foraging habitat (within Development Envelope) for Pilbara Leaf- nosed Bat species

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	population comprising multiple colonies (Threatened Species Scientific Committee 2016). The Pilbara Leaf-nosed Bat population of the Pilbara and Gascoyne regions is considered an important population as it comprises multiple colonies that form one interbreeding population (Threatened Species Scientific Committee 2016). **Ecology** The species requires warm, humid daytime roost sites and forages in gorges along watercourses and over low spinifex-covered hills (Threatened Species Scientific Committee 2016). The breeding cycle for the Pilbara Leaf-nosed Bat occurs over a nine-month period with mating occurring in July, parturition occurring in late December or early January (following a prolonged gestation period), resulting in the young becoming independent between	• human visitation / disturbance.	roost habitat due to blasting. • direct mortality of individuals if present within the Development Envelope.	use the potential foraging habitat for the species within the Development Envelope as a foraging visitor intermittently, only.	is likely to be used as a foraging visitor intermittently, only.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	February and March (Armstrong 2001b). Foraging in a variety of habitats including the characteristic Triodia hummock grasslands of the Pilbara, the Pilbara Leaf-nosed Bat favours the highly productive and structurally complex riparian zones where water is permanently available and insect biomass is sufficiently high (Armstrong 2001a; McKenzie and Bullen 2013). Critical habitat, as defined by (DBCA *et al.* 2023) , includes permanent diurnal (categories 1 and 2) roosts that are essential for the daily and long-term survival of the Pilbara Leaf-nosed Bat; semi-permanent diurnal (category 3) roosts that are essential for the long-term survival of the Pilbara Leaf-nosed Bat; and any permanent pools close to permanent diurnal roosts. **Cultural Importance** A June 2024 on-Country Social Surrounds				

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	engagement with the Banjima People included enquiries on the cultural importance of fauna species as well as cultural appropriateness of control/mitigation methods. No specific information or concerns were raised, other than stating that all fauna are considered important.				
Northern Quoll (*Dasyurus hallucatus*) – EN / EN	**Description** The Northern Quoll is a nocturnal marsupial and the smallest of the four Australian quoll species. **Distribution** It is currently moderately common within the Pilbara and is found scattered across the four subregions of the Pilbara. (Rapallo 2022b). **Ecology** The Northern Quoll favours rocky habitats (e.g., escarpments, mesas, gorges, breakaways, boulder fields and some waterways) for shelter and breeding, with foraging occurring in adjacent vegetation. Northern Quolls have	Threatening processes: • predation by invasive fauna (e.g., feral cats and foxes) (DCCEEW 2023b). • poisoning from cane toads. • loss of suitable habitat. • altered fire regimes.	Potential impacts to the Northern Quoll as a result of this Project include: • loss of potential foraging and dispersal habitat ('medium and minor drainage, and hillcrest/hillslope habitats) due to clearing. • direct mortality of individuals if present within the Development Envelope. Indirect impacts due to increased	• The Northern Quoll has not been recorded in the Development Envelope. • The Northern Quoll was recorded approximately 5 km south of the Development Envelope within the Terrestrial Fauna Survey Area during 2012 (Rapallo 2012) indicating that a low-density population may occur in the Development Envelope surrounds, or that the records to date can be attributed to individuals dispersing from nearby populations. No evidence of the species was found during the 2020 survey (Rapallo 2022c).	The removal of 42 ha of critical habitat and 125.6 ha of supporting habitat for Northern Quoll is considered **likely to have a significant impact,** when assessed against the DCCEEW criteria and is proposed to be offset as it has the potential to: • adversely affect habitat critical to the survival of a species.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	short life spans, with males living for approximately one year and the oldest recorded female in the wild being three years of age. The species breed once each year exhibiting synchronous reproduction within each year at each site. **Cultural Importance** A June 2024 on-Country Social Surrounds engagement with the Banjima People included enquiries on the cultural importance of fauna species as well as cultural appropriateness of control/mitigation methods. No specific information or concerns were raised, other than stating that all fauna are considered important.		predation from feral animals.	• Based on the absence of records and minimal denning habitat (0.06 ha) present within the Development Envelope, it is unlikely that an important high-density population of Northern Quoll as defined by the DoE (2016c) occurs within the Development Envelope. However the Northern Quolls recorded within the Proposed Action Area are considered a low density important population based on the records occurring in habitat which is free from cane toads and is therefore considered important for the long-term survival of the Northern Quoll (Hill and Ward 2010). • No potential denning habitat for the Northern Quoll (gorges, gullies, rocky breakaways) is proposed for clearing. Clearing of up to 43.41 ha of suitable foraging and dispersal habitat (medium drainage lines)	

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
				representing 38% of the mapped extent of this habitat for the species within the broader Terrestrial Fauna Survey Area has the potential to impact this species.	
Pilbara Olive Python (*Liasis olivaceus barroni*) – VU / VU	**Description** The Pilbara Olive Python is a dull olive-brown or rich brown python with a white/cream belly that can grow up to 4 m in length. **Distribution** The subspecies is restricted to ranges in the Pilbara and is known from relatively few localities. **Ecology** The species' preferred habitat is often associated with open water, such as swamps and surface water pools. Typical habitat is found along larger waterways in environments with rocky hills, escarpments, and plains dominated by dense vegetation such grassy mounds of *Triodia*. **Cultural Importance** A June 2024 on-Country Social Surrounds	Threatening processes: • predation by invasive fauna (e.g., feral cats and foxes). • competition for food sources with invasive fauna. • habitat destruction as a result of resource project development (TSSC 2008).	Threats to the Pilbara Olive Python as a result of this Project include: • loss of potential dispersal habitat ('medium drainage system') due to clearing. • direct mortality of individuals if present within the development envelope.	• This species has not been recorded in the Development Envelope but is considered likely to occur in the Development Envelope at least as a foraging visitor. • No clearing of potential denning habitat for the Pilbara Olive Python (gorges, gullies, rocky breakaways) is proposed. • The Project will result in the clearing of up to 118.6 ha of suitable foraging and dispersal habitat (medium and minor drainage lines) representing 36.69% of the mapped extent of this habitat for the species within the broader Terrestrial Fauna Survey Area.	The proposed clearing of 118.6 ha of supporting habitat for Pilbara Olive Python is **likely to have a significant impact,** when assessed against the DCCEEW criteria and is proposed to be offset as it has the potential to adversely affect habitat critical to the survival of a species.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	engagement with the Banjima People included enquiries on the cultural importance of fauna species as well as cultural appropriateness of control/mitigation methods. No specific information or concerns were raised, other than stating that all fauna are considered important.				
Western Pebble-mound Mouse (*Pseudomys chapmani*) – P4	**Description** The Western Pebble-mound Mouse is a small, burrowing and mound building rodent. **Distribution** The species is currently restricted to the non-coastal central, eastern and southern parts of the Pilbara bioregion. **Ecology** The Western Pebble-mound Mouse lives in pebbly soils in arid tussock grassland and Acacia woodland. The species is associated with eroding sands at natural features that expose pebbles. **Cultural Importance**	Threatening processes: • loss of suitable habitat; and • predation by invasive fauna (e.g., feral cats and foxes).	Potential impacts to the Western Pebble-mound Mouse as a result of this Project include: • habitat loss due to clearing; and • direct mortality of individuals.	• This species is commonly recorded within suitable habitat throughout the Hamersley and Chichester subregions of the Pilbara bioregion. • A total of 29 Western Pebble-mound Mouse mounds have been identified within the EPBC Development Envelope and 19 of these are also within the Indicative Footprint. This represents 47.5% of the total number of mounds of this species that have been found during surveys of the area (40 mounds) most of which were deemed to be active (Rapallo 2022c).	**No significant residual impacts** to Western Pebble-mound Mouse due to habitat clearing, fragmentation or direct mortality of individuals are expected.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	The Western Pebble-mound Mouse has been reported to be of special cultural importance to the Banjima People. During the June 2024 on-Country Social Surrounds engagement presented information showing the mouse was relatively common in the area and the Project design footprint had avoided known mounds as much as practicable. Banjima did not have any additional information or further concerns to offer other than that all fauna ae considered important.			• There are numerous records of this species in the surrounding area (Rapallo 2022c). • Threats to the Western Pebble-mound Mouse as a result of this Project include habitat loss resulting from clearing, and direct mortality of individuals. • Stony plain habitat represents preferred habitat for the Western Pebble-mound Mouse; however, this habitat occurs extensively throughout the Hamersley subregion. • The Project will result in the loss of no more than 266.4 ha preferred habitat (stony plain) for this species comprising 51.5% of the mapped extent of this habitat type in the broader Terrestrial Fauna Survey Area.	
Gane's Blind Snake (*Anilios ganei*) – P1	**Description** The species grows to about 30 cm in length. The upper body is a deep	Threatening processes: • loss of suitable habitat.	Potential impacts to the Gane's Blind Snake as a result of this Project include:	• Gane's Blind Snake was not recorded in the Development Envelope during fauna surveys (Rapallo 2022c).	**No significant residual impacts** are expected to occur for this species and the Project is not expected to adversely affect the

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	grey-brown, the belly cream. **Distribution** The species is only known from a few locations and/or specimens. **Ecology** Potential habitat for this species may include the gorge, gully, breakaway, medium drainage, tussock grassland and Mulga / Corymbia spp. plain habitats. **Cultural Importance** A June 2024 on-Country Social Surrounds engagement with the Banjima People included enquiries on the cultural importance of fauna species as well as cultural appropriateness of control/mitigation methods. No specific information or concerns were raised, other than stating that all fauna are considered important.	• predation by invasive fauna (e.g., feral cats and foxes).	• habitat loss due to clearing. • direct mortality of individuals if present within the Development Envelope.	• Potentially suitable habitat for this species occurs within the Development Envelope, comprising gorge, gully, breakaway, medium drainage, tussock grassland and Mulga / Corymbia spp. plain habitats. • Suitable habitat for this species is widespread outside of the Development Envelope within the broader Terrestrial Fauna Survey Area.	conservation status of Gane's Blind Snake.
Pilbara Barking Gecko (*Underwoodisaurus seorsus*) – P2	**Description** The Pilbara Barking Gecko is a large carphodactylid gecko, with a large head, long slender limbs and digits.	Threatening processes: • loss of suitable habitat.	Potential impacts to the Pilbara Barking Gecko as a result of this Project include: • habitat loss due to clearing.	• The Pilbara Barking Gecko has not been recorded within the Development Envelope. • Potentially suitable habitat, such as gorge /	**No significant residual impacts** are expected to occur for this species and the Project is not expected to adversely affect the

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	Distribution The species is known from a few locations and/or specimens within the Hamersley Range area of the Pilbara bioregion. **Ecology** Its preferred habitat is in rocky areas and gullies. **Cultural Importance** A June 2024 on-Country Social Surrounds engagement with the Banjima People included enquiries on the cultural importance of fauna species as well as cultural appropriateness of control/mitigation methods. No specific information or concerns were raised, other than stating that all fauna are considered important.	• predation by invasive fauna (e.g., feral cats and foxes).	• direct mortality of individuals if present within the Development Envelope.	gully and breakaway habitats occur within the Development Envelope and surrounds. • Preferred habitat for this species occurs at higher elevation which would coincide with the location of the proposed pit; however, relatively limited clearing is required in this area of the Indicative Footprint, comprising 15.8% of the total hill crests and hill slopes habitats within the mapped extent in the Terrestrial Fauna Survey Area.	conservation status of the Pilbara Barking Gecko.
Grey Falcon (*Falco hypoleucos*) – VU / VU	**Description** The Grey Falcon is a compact, pale grey falcon with a heavy thick chest, long wings and dark wing tips. **Distribution** The species occurs in arid and semi-arid Australia, including the Murray-Darling Basin, Eyre Basin,	Threatening processes (TSSC 2020): • predation by invasive fauna (e.g., feral cats and foxes).	Potential impacts to the Grey Falcon as a result of this Project include: • habitat loss due to clearing. • direct mortality of individuals if present within the	• The Grey Falcon has not been recorded from the Development Envelope. • This species is considered is likely to occur in the Development Envelope occasionally while foraging (Rapallo 2022c). • Large areas of foraging habitat for this species	**No significant residual impacts** are expected to occur for this species and the Project is not expected to adversely affect the conservation status of the Grey Falcon.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	central Australia and Western Australia. **Ecology** Its preferred habitat is usually restricted to shrubland, grassland and wooded watercourses of arid and semi-arid regions, although it is occasionally found in open woodlands near the coast (Menkhorst *et al.* 2019). The Grey Falcon forages over timbered plains, including *Acacia* shrublands, also ranging out onto treeless plains. It nests in tall trees on watercourses (Threatened Species Scientific Committee 2020) and occasionally on man-made structures such as transmission line towers. **Cultural Importance** Further consultation is required to determine the cultural importance of this species to Traditional Owners, as well as cultural appropriateness of control/mitigation methods, if needed.	• loss of suitable habitat. • Increased temperatures in arid and semi-arid Australia (i.e., climate change).	Development Envelope.	occurs in the Development Envelope and surrounds including hills/ranges, stony plain, and lower slopes/hillslopes habitat. Preferred nesting habitat for this species occurs at higher elevation which would coincide with the location of the proposed pit; however, relatively limited clearing (50.4 ha) is required in this area of the Indicative Footprint, 15.8% of the total hill crests and hill slopes habitats within the mapped extent in the Terrestrial Fauna Survey Area.	
Peregrine Falcon (*Falco peregrinus*)	**Description**	Threatening processes:	Potential impacts to the Peregrine Falcon	• The Peregrine Falcon has not been recorded from	**No significant residual impacts** are expected to

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
Other specially protected species	A large falcon with a blue-grey back, barred white underparts, and a black head. Distribution The species is known to occur across Australia, but not common in any areas of its Australian range. **Ecology** The Peregrine Falcon is found in most habitats, from rainforest to arid habitats, including coastal and alpine regions. It prefers coastal and inland cliffs, or open woodlands near water. In arid areas, it is most often encountered along cliffs above rivers, ranges and wooded watercourses where it hunts birds (Johnstone and Storr 1998). This species typically nests on rocky ledges occurring on tall, vertical cliff faces between 25 m and 50 m high (Olsen and Olsen 1988). **Cultural Importance** Further consultation is required to determine the cultural importance of	• predation by invasive fauna (e.g., feral cats and foxes); • loss of suitable habitat; and • Increased temperatures in arid and semi-arid Australia (i.e., climate change).	as a result of this Project include: • habitat loss due to clearing; and • direct mortality of individuals if present within the Development Envelope.	the Development Envelope. • The Peregrine Falcon is considered uncommon in the Hamersley Range, nesting in cliff type habitat. • Peregrine Falcon forage over a wide area and would use most habitats within the Development Envelope while foraging. • Preferred nesting habitat for this species occurs at higher elevation which would coincide with the location of the proposed pit; however, relatively limited clearing (50.4 ha) is required in this area of the Indicative Footprint, 15.8% of the total hill crests and hill slopes habitats within the mapped extent in the Terrestrial Fauna Survey Area.	occur for this species and the Project is not expected to adversely affect the conservation status of the Peregrine Falcon.

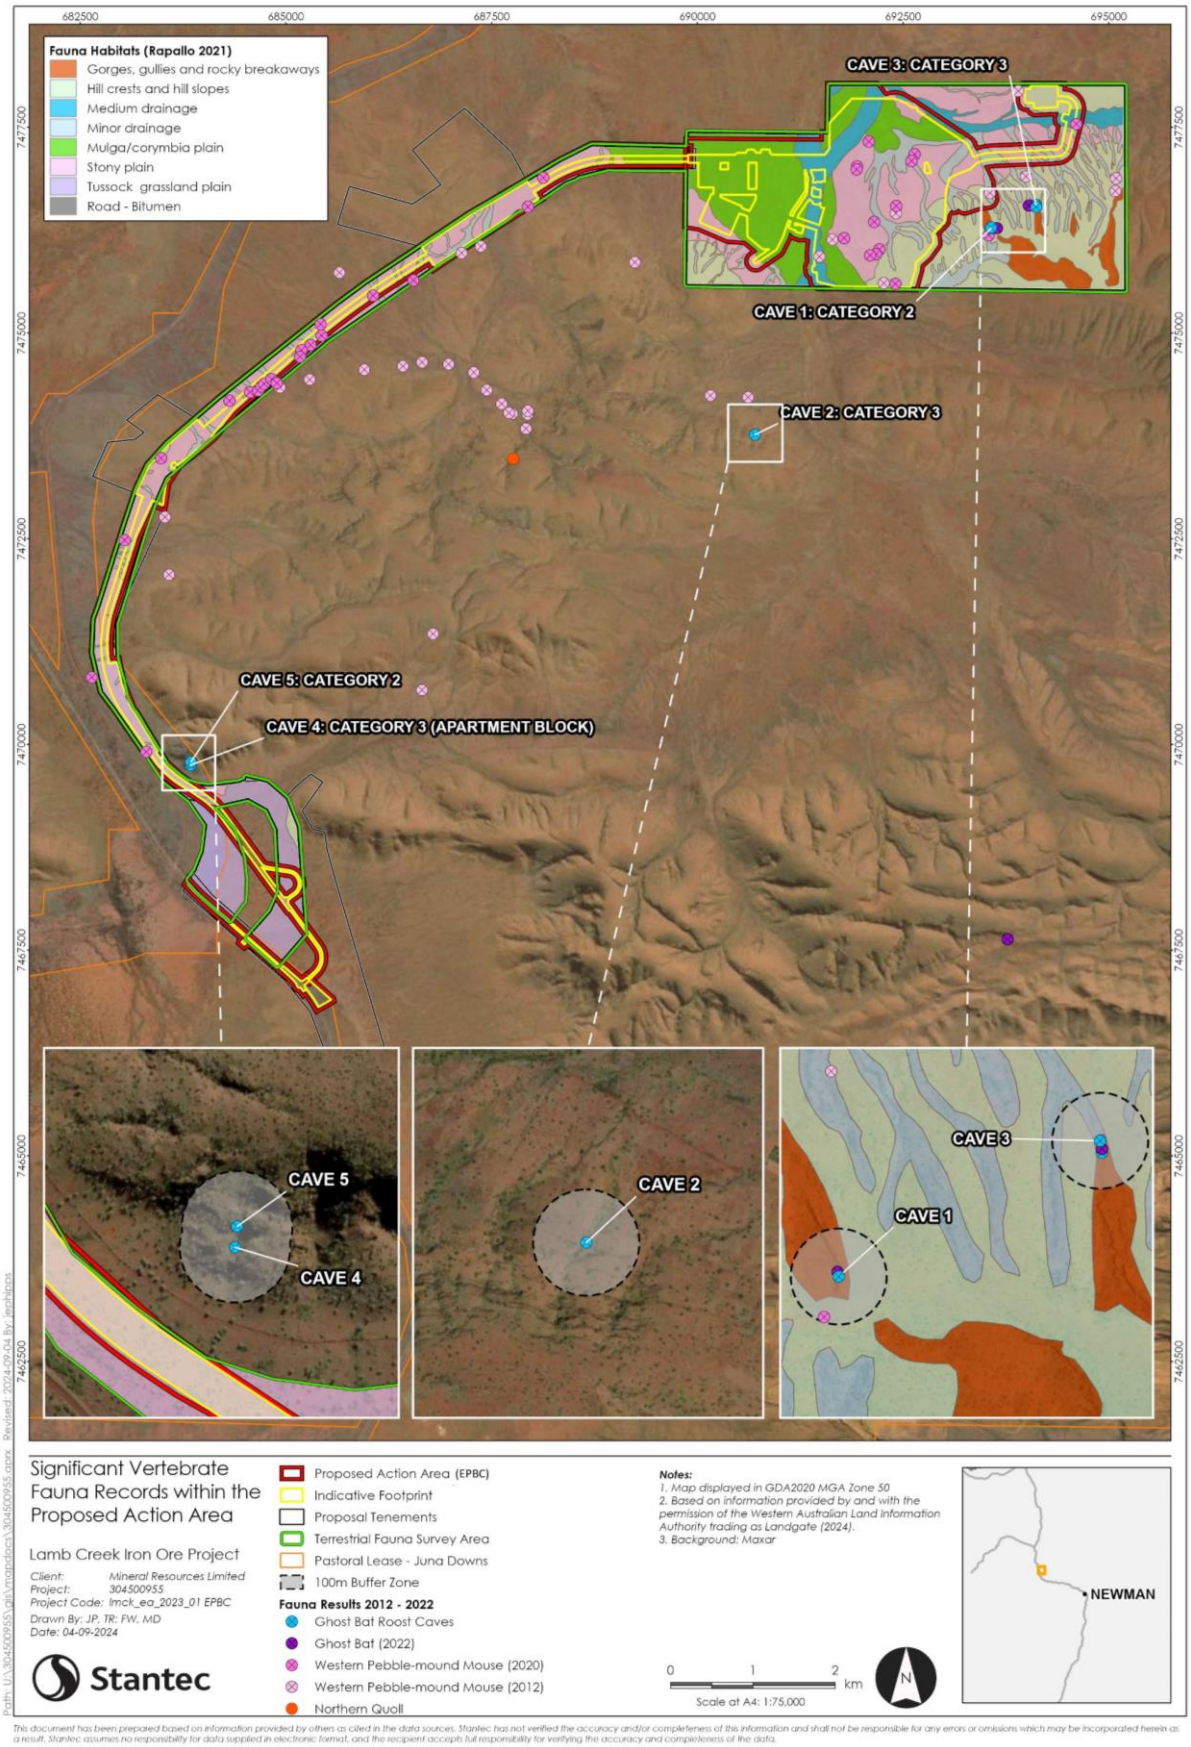

Figure 4: Ghost bat category 2 and category 3 roost caves and associated exclusion zones

2.4 KEY ASSUMPTIONS AND UNCERTAINTIES

The key assumptions and uncertainties that apply to terrestrial fauna are summarised as follows:

- It is assumed that the fauna surveys that were undertaken accurately report the distribution and status of fauna of significance, and their preferred habitats, in the Terrestrial Fauna Survey Area.
- It is assumed that the likelihood and severity of predicted impacts to terrestrial fauna are described accurately.
- The majority of significant fauna species identified are highly mobile with notably large home ranges, such that point location records for individuals represent the usage of available foraging/breeding habitat (rather than fixed permanent locations of individuals).
- It is assumed that, by applying the EPA's mitigation hierarchy (avoid, minimise, rehabilitate, offset) throughout the life of the Project, the impacts of the Project on significant species will be minimised.
- The Terrestrial Fauna Survey Areas experienced fires in recent years prior to the 2020 terrestrial fauna surveys being undertaken, and the vegetation over most of the survey area was regenerating and relatively sparse compared to unburnt conditions. This is likely to have influenced the overall diversity and abundance of species; however, where possible, trap sites were positioned in areas of unburnt habitat within the burn mosaic. Therefore, results may be conservative with regard to the presence and distribution of significant species and their habitat.
- The Project is located in the Pilbara bioregion where the presence, activity and detectability of fauna is driven by climatic conditions, particularly rainfall events. Climatic factors are outside of the Proponent's control and may impact on the health and extent of populations of significant fauna.
- Natural seasonal and spatial fluctuations of populations of significant species make it more difficult to determine whether population changes are due to natural causes or can be attributed to the Project.

2.5 POTENTIAL PROJECT IMPACTS

The Project may directly and indirectly impact on terrestrial fauna and short-range endemic (SRE) invertebrate fauna, with the potential direct impact identified as:

- clearing of native vegetation resulting in habitat loss.
- fragmentation of fauna habitat.
- fauna injury or mortality as a result of ground disturbance, machinery, blasting, vehicle strikes and entrapment.

The potential indirect impacts have been identified as:

- fauna mortality as a result of a potential increase in the prevalence of introduced species and feral predators.
- noise, vibration and/or artificial light disrupting natural foraging and breeding behaviours.
- potential decline or change in the health/composition of fauna habitat arising from dust, weeds, fire regime or hydrological regime changes.'

An assessment of the potential impacts and risks to the MNES resulting from the Project has been undertaken and is included as **Appendix D**. Results of the risk assessment have been used to develop management measures that form part of this SFMP.

2.6 APPLICATION OF THE MITIGATION HIERARCHY

Mitigation measures for potential impacts of the Project on terrestrial fauna are detailed within **Section 5.3** of the EPBC Referral Supporting Document and have been updated and consolidated within this

SFMP. Mitigation measures have focused on significant fauna, where relevant, aligning with the management provisions.

The Project will **avoid** impacts to significant fauna via the following:

- Proposed clearing has been minimised as far as practicable to reduce the extent of disturbance required; the Proponent has revised the Development Envelope from 1,399 ha to 874 ha (898 ha for EPBC).
- Placement of infrastructure in the high significance habitat of gorges, gullies and rocky breakaways has been fully avoided for example through the re-design and relocation/reduction of the northern WRL and northern topsoil stockpile. In addition disturbance of the high significance habitat of hills, ranges and plateaus has been minimised through the re-design of the access road and camp location.
- A Land Access and Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary. This includes requirements for weed hygiene to prevent introduction or spread of weeds.
- The area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager. Some heavy equipment used may have in-cab GPS mapping and alarm functions however in the absence of this functionality, pegging of clearing boundaries supplemented with other control measures such as the use of spotters and/or restricting clearing to the daylight hours will be used to prevent unauthorised clearing.
- Habitat and fauna surveys have been undertaken to identify key areas and species to avoid.
- Cave 1 to be temporarily closed during construction and operation which will eliminate risk of habitation and nursing by Ghost Bats which may be impacted from mining activity (e.g., vibration from blasting, excavation, haulage and overburden stacking). The cave structural integrity should be protected and when reopened after operations Ghost Bats are expected to return to the cave.
- No Barbed wire in new fencing will be used by the Proponent, subject to consultation with the pastoralist. If however, the pastoralist requires use of barbed wire for effective stock management, bat deflectors/reflectors between the top two strands will be used within the Project Area.
- Prohibit feeding of all fauna.
- Prohibit entry to caves, unless authorised.
- Ensure artificial lighting is not directed toward habitat of high significance.
- Demarcate areas that may not be entered by personnel and/or machinery.
- Intersection of the haul road with GNH, and an additional 100 m past the intersection, will be sealed to reduce the generation of dust.
- Road haulage iron ore loads will be covered.
- Ground clearing (including topsoil stripping) shall not be undertaken during periods of high winds (unless soil moisture levels are also elevated enough to inhibit dust formation).
- Off-road driving shall be prohibited unless authorised by management.
- Avoid hot work in fire sensitive areas and during high fire risk days.
- Haul road and Development Envelope design shall consider surface water flow to minimise obstruction to seasonal overland water flow to the loamy drainage flats proximal to the GNH.
- The Project will **minimise** impacts to terrestrial fauna via the following:
- Spatially restricted Indicative Footprint and short life of mine.
- Implement SFMP.
- Where placement of infrastructure such as the pit shell cannot avoid habitat of higher significance (e.g. drainage lines), minimise clearing as far as practicable.

- Minimise noise from vehicles / machinery and blasting etc. to avoid disturbance to roosting bats through appropriate selection of machinery reducing the number and duration of operating machines required to achieve the work.
- Replace the top strands of barbed wire in fences in the Project Area with single-strand wire, subject to consultation with pastoralist. If however the pastoralist requires use of barbed wire for effective stock management, bat deflectors/reflectors between the top two strands will be used within the Project Area
- Implement a 100 m radius exclusion zone around recorded Category 2 and Category 3 Ghost Bat roosts.
- Vehicles and equipment shall be restricted to designated roads, tracks, and cleared areas.
- Laydown areas will be situated in previously disturbed locations.
- Temporary Closure of Cave 1. Closure of Cave 1 is likely to be closed by using a lightweight steel frame fitted to the entrance and bird aviary steel netting or any heavier style with apertures not exceeding 100 mm. This would exclude Ghost bats but smaller species up to 10g such as Pilbara leaf-nosed bats (Rhinonicteris aurantia) or Finlayson's cave bat (Vespadelus finlaysoni) would be able to pass through unharmed. Other small fauna of a similar size including reptiles, frogs and snakes would also be able to access the cave. With regard to larger fauna such as Quolls, Dingoes and/or Macropod species that will be excluded by the closures, Lamb Creek Cave 1 is situated in an area with numerous alternative deep overhangs and shallow caves that are suitable for their foraging and/or resting activities. Each of these species is known to travel significant distances on a daily basis (Bat Call WA 2023a).
- Avoid providing accessible artificial water sources.
- Driving between dusk and dawn shall be minimised and light vehicle use will be limited with crews to be bused to and from camp to minimise traffic during start and end of shift.
- Machinery and vehicle movements that must be undertaken between dusk and dawn will be limited to low speeds on access tracks.
- Excavations and trenches will be kept open only as long as needed to undertake the work and egress points will be provided dependant on depth / morphology of the excavation.
- Any steep-sided holes (e.g., sumps) will be fitted with egress matting or another method of escape to avoid fauna entrapment.
- Regular inspection of all excavations and sumps shall be undertaken to minimise fauna mortality in accordance with **Table 8**.
- Native fauna shall not be fed or intentionally harmed.
- Environmental responsibility awareness training shall be delivered to all personnel as part of the induction process.
- Ensure food waste is disposed of appropriately so it cannot be accessed by fauna.
- Targeted control program to be implemented (e.g., shooting or trapping) where increased presence of feral animals are observed on site.
- Noise, vibration and artificial light awareness shall be delivered to all personnel as part of the induction process.
- Regular inspection and maintenance of vehicles and equipment shall be undertaken to ensure no excessive operating noise is experienced from faulty machinery and noise suppression equipment is operating adequately.
- Ensure blasting is undertaken during daylight hours and is strictly controlled to minimise air blast and ground vibration.
- Minimise the use of artificial lighting needed for safe operation, use directional and / or screened lighting, and when required for safety, avoid light spill onto important habitats (e.g., rocky outcrops).

- Implement the FVMP.
- Dust suppression shall be implemented to manage dust emission on cleared areas and iron ore handling areas.
- Stockyard ore product will be conditioned through addition of water to ensure dust extinguishing moisture limits are maintained (as per export license stipulations)
- Speed limits shall apply on sealed and unsealed roads.
- Blasting plans will consider meteorological conditions to minimise dust lift off.
- Dust awareness and dust management shall be delivered to all personnel as part of the induction process.
- A Weed Management Plan shall be prepared and implemented as part of the FVMP, prior to construction and operation, to control access and movement of vehicles and construction personnel to prevent the introduction and spread of weeds into the Development Envelope, weed free areas, and between work areas.
- Vehicles and equipment to be cleaned, inspected and issued with a Weed Hygiene Certificate prior to entry to site or moving between known weed infested areas on-site, (as per controls in Flora and Vegetation Management Plan).
- Weed awareness and weed hygiene shall be delivered to all personnel as part of the induction process.
- Fire management awareness shall be delivered to all personnel as part of the induction process.
- Firebreaks will be incorporated into mine layout planning in accordance with the local government firebreak notice under s. 33 of the Bush Fires Act 1954.
- Smoking will only be permitted in designated areas, which shall be appropriately signed and contain self-arresting cigarette butt disposal containers.
- An Emergency Response Plan shall be prepared and implemented.
- An Emergency Response Team shall be formed in accordance with requirements regulated by DEMIRS.
- The Emergency Response Team will ensure that sufficient fire suppression equipment is located as per the Emergency Response Plan.
- Hot Work shall be completed under a Hot Work Permit and in accordance with MRL-SAF-PRO-0081 Hot Work Procedure.
- Traffic Management Plan shall be prepared and implemented.
- All vehicles and machinery will be fitted with fire extinguishers and/or in-plant fixed water suppression.
- Implement surface and groundwater management strategies in accordance with the Surface Water Management Plan (SWMP) and Groundwater Operating Strategy (GWOS).
- The Project will **rehabilitate** impacts to terrestrial fauna via the following:
- Progressive rehabilitation of foraging habitat within close proximity of roost habitat (<2 km from Category 2 and Category 3 Ghost Bat caves).
- Drainage management structures identified as remaining post-closure shall meet recognised Australian drainage design specifications.
- The open pit will be backfilled to a minimum of 5 m above the baseline groundwater level.
- Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.
- Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved Mine Closure Plan (MCP).
- Seasonal weed control programs shall be implemented, as required.

- Weeds which are physically removed will be disposed of within the backfilled pit or waste rock landform and buried.
- Salvage and stockpile particular vegetation types, soil, or habitat features (e.g., vegetation, stumps, logs, and boulders) for use in rehabilitation programs.
- Rehabilitation shall include spatially heterogenous habitat with appropriate refuge areas to increase ability for animals to disperse between patches.
- Ensure all drill holes are capped as soon as reasonably practicable.
- The Project will **offset** impacts to terrestrial fauna via the following:
- Impacts to terrestrial fauna associated with the Proposed Action will be managed and mitigated to ensure that potential impacts to terrestrial fauna are managed to an acceptable level. Residual impacts to habitat areas from clearing and construction are proposed to be offset for 42.0 ha of critical habitat for the Northern Quoll, and 622.3 ha of supporting habitat for the Ghost Bat.

3. MANAGEMENT PROVISIONS

3.1 OVERVIEW

The SFMP outlines the requirements to avoid, minimise, manage, monitor, and rehabilitate direct and indirect impacts to significant fauna from the Project, aligning with the EPA's mitigation hierarchy. The subsequent sections identify the management provisions that will be implemented by the Proponent for the Project to ensure that the environmental objectives, criteria, targets, and outcomes are met for terrestrial fauna. Where unacceptable environmental outcomes remain post the implementation to controls measure such as permanent loss of significant species habitat, offset strategies will be proposed. The SFMP will be reviewed and updated as required, following an adaptive management approach (Section 7).

3.2 OUTCOME BASED PROVISIONS

This SFMP focuses on outcome-based provisions, which are performance-based and can be applied. The objectives developed are measurable, and the success of management actions can be monitored and reported. Outcome-based provisions specify triggers and thresholds (environmental criteria) for direct impacts that are quantifiable and specifically relate to terrestrial fauna (**Table 7**). Where required, suitable response and corrective actions are also recommended for the environmental criteria. The following outcomes-based provisions have been established:

- No unauthorised clearing within exclusion zones around recorded Category 2 and Category 3 Ghost Bat roosts.
- No statistically significant project-related increase in feral animal abundance as a result of project-related activities
- No adverse impacts to critical Ghost Bat cave (Cave 1) resulting from vibration levels from blasting activities; and
- Maintain the structural integrity of Cave 1.

3.3 OBJECTIVE-BASED PROVISIONS

Objective-based provisions relate to environmental management actions that are not specifically measurable. They specify management actions according to management targets, particularly for indirect impacts that are not quantifiable. The objective-based management provisions have been outlined in (**Table 8**) and are intended to prevent project-related adverse impacts to terrestrial fauna (including significant fauna species) within proximity to the Project with appropriate management actions and monitoring actions. The following objectives-based provisions have been established:

- No clearing of vegetation shall occur outside of the approved, demarcated clearing area(s) during construction or operation.
- Minimise Project-related direct interactions per year (e.g., vehicle strike, interaction with fencing) for significant fauna resulting in injury or mortality.
- Minimise adverse impacts to significant fauna as a result of increase in feral animal abundance.
- Minimise Project related disturbance of significant fauna from noise, vibration and artificial light.
- Minimise Project related decline to fauna habitat quality (e.g. vegetation health) due to dust, weeds, and hydrocarbon or chemical leaks and altered hydrological regimes.
- Effective operation of the Project to minimise the risk of Project related fire.

3.4 ENVIRONMENTAL CRITERIA, TARGETS AND JUSTIFICATION

The development of environmental objectives and criteria for outcome-based provisions within the SFMP are based on available data and information and align with the purpose of the SFMP. Outcome-based provisions utilise monitoring and reporting to assess against the measurable environmental criteria. In addition to these outcome-based provisions, objective-based provisions have been applied with management targets.

During monitoring, where threshold criteria (outcome-based) or management targets (objective-based) are exceeded, and are project-related, response and corrective actions are provided, and will be implemented, as appropriate. Monitoring will inform adaptive management, with the revision of environmental criteria, and response or corrective actions, as required (**Section 7**).

Justification for the management provisions outlined in the SFMP are based on the following:

- Clearing of critical habitat for significant fauna species has the potential to result in direct impacts to individuals and indirect impacts through habitat loss. The management approach focuses on minimising clearing undertaken where possible through design and the implementation of progressive rehabilitation. In addition to this, exclusion zones will be placed around recorded Category 2 and Category 3 Ghost Bat roosts within proximity to the Development Envelope.
- Feral animals are an existing key threat to significant species in the vicinity of the Project. An indicative Feral Animal Monitoring and Control Plan has been proposed within **Appendix C**. This feral animal monitoring and control program aims to reduce predation pressure on significant fauna for populations that are potentially impacted by the Project for the life of the Project. It is anticipated that monitoring will demonstrate a decrease in feral animal numbers below that of baseline levels over the duration of the control program.
- The Project has the potential to negatively impact upon the occurrence of significant species through indirect impacts, in particular vibration from blasting to bat habitat in proximity to the Development Envelope. The indicative cave closure procedure and vibration monitoring (**Appendix A**, **Appendix B**) aims to reduce potential impacts to roosting Ghost Bats in proximity to the Development Envelope and allow for Ghost Bats to return to roost at viable caves post-operations and removal of any temporary cave closure structures (where structural integrity has been retained) post mining.
- Habitat degradation through altered fire regimes, contamination or the introduction of weeds could negatively impact upon critical habitat for significant species and in some instances may increase the risk of fire. Weed introduction and spread will be managed and monitored as part of the FVMP. Mitigation to minimise the risk of project related fire within the SFMP focuses on avoidance through maintaining equipment, training, and the implementation of fire prevention practices.

Table 7: Significant Fauna Outcome-based Management provisions

EPA Factor and Objective		Terrestrial Fauna: to protect terrestrial fauna so that biological diversity and ecological integrity are maintained.						
SFMP Purpose		*To avoid adverse project-related impacts to terrestrial vertebrate fauna including significant fauna and associated habitat.*						
Outcomes-Based Management Objectives		Trigger and Threshold Criteria		Trigger and Threshold Response Actions		Monitoring	Timing / Frequency of Monitoring	Reporting

TF1	No unauthorised clearing within exclusion zones around recorded Category 2 and Category 3 Ghost Bat roosts.	Clearing occurs within 50 m of the 100 m radius exclusion zone around recorded Category 2 and Category 3 Ghost Bat roosts.	Clearing occurs within 100 m buffer implemented around exclusion zone around recorded Category 2 and Category 3 Ghost Bat roosts.	• If unplanned clearing within 50 m of the 100 m radius exclusion zone, report internally as an incident in accordance with internal procedures.
				• Investigate details of clearing within 50 m of 100 m exclusion zone to confirm activity approved and met conditions (e.g. Land Activity Permit (LAP)).
				• If clearing not approved or conditions not adhered to, review management strategies and implement changes to prevent future occurrences
					• Undertake investigation to determine source of disturbance. If source is project-related, undertake a review to determine if impact can be minimised, develop actions to prevent recurrence and communicate findings to relevant personnel.
					• Suitably qualified person to undertake an assessment of degree of potential impact(s) resulting from the unauthorised clearing incident to significant fauna population and habitat which may include:
					  ○ Area and extent of habitat cleared.
					  ○ Monitor significant fauna population, as appropriate.
					• Undertake rehabilitation of unauthorised clearing as required, in accordance with rehabilitation procedures, with the aim
						• Monitoring of clearing register for compliance to approvals.
						• Internal audit and inspection of areas of clearing.
						• Clearing activities will be audited regularly to ensure compliance with LAP conditions, including prior to LAP close out. This includes confirmation that all clearing has been completed within the LAP boundary).
							• Post clearing
							• Post clearing
							• Post clearing
							• Annual
							•
								Regular reporting:
								• Monitoring reports- clearing register and Internal clearing permits (LAP).
								• Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER.
								• Internal incident reporting and investigation process. Report any non-compliances with the LAP and Land Clearing Procedure.
								Exceedance Reporting:
								• Trigger threshold exceedance (report in accordance with Section 5.3
								• Threshold exceedance (report in accordance with Section 5.4

EPA Factor and Objective	Terrestrial Fauna: to protect terrestrial fauna so that biological diversity and ecological integrity are maintained.						
SFMP Purpose	*To avoid adverse project-related impacts to terrestrial vertebrate fauna including significant fauna and associated habitat.*

		Trigger Criteria	Threshold Criteria	Trigger Level Actions	Threshold Level Actions and Contingency Actions.			
			related structural damage occurs to Cave 1	to the cave (following appropriate safety procedures ensuring that cave structural integrity can be assessed safely by personnel). • Review management strategies and implement changes to prevent future occurrences. • Audit and review of training and staff inductions (increase staff training and awareness). • Revise monitoring schedule, accordingly, for example increase frequency of inspections, photographic monitoring and/ or LiDAR capture/ geotechnical assessment of the cave	• Undertake additional LiDAR and/or photographic recording of the cave. • The appropriate regulator will be notified within 10 days of a confirmed breach of a Management Target(s) being known, with a report provided via email including any corrective actions identified once an investigation has been completed. • A follow up report detailing the adequacy of the response actions will also be submitted to the appropriate regulator within 12 months of the initial notification or within the ACAR. • Review management strategies and implement changes to prevent future occurrences. • Undertake appropriate corrective rehabilitation of the cave in consultation with DBCA/ DWER as soon as practicable			• Internal incident reporting (in accordance with Section 5.7). Exceedance Reporting: • Trigger threshold exceedance (report in accordance with Section 5.3). • Threshold exceedance (report in accordance with Section 5.4).

Table 8: Significant Fauna Objective-based Management provisions

EPA Factor and Objective	Terrestrial Fauna: To protect terrestrial fauna so that biological diversity and ecological integrity are maintained.
Significant Fauna Values	Nine conservation significant fauna species and associated habitat recorded or considered likely to occur in the Development Envelope: • Ghost Bat (Macroderma gigas) (En, En); • Pilbara Leaf-nosed Bat (Rhinonicteris aurantia) (Vu, Vu); • Northern Quoll (Dasyurus hallucatus) (En, En); • Pilbara Olive Python (Liasis olivaceus barroni) (Vu, Vu); • Gane's Blind Snake (Anilios ganei) (P1 under the BC Act); • Pilbara Barking Gecko (Underwoodisaurus seorsus) (P2 under the BC Act); • Grey Falcon (Falco hypoleucos) (Vu, Vu); and • Peregrine Falcon (Falco peregrinus) (Other specially protected species under the BC Act).
SFMP Purpose	To avoid adverse project-related direct and indirect impacts to terrestrial vertebrate fauna including significant fauna and associated habitat.
Key Impacts and Risks	Potential risk to long term viability of local and regional populations of conservation significant fauna, due to direct impacts from clearing of native vegetation or direct and indirect impacts from mining activities (**Appendix D**)

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting

No clearing of vegetation shall occur outside of the approved, demarcated clearing area(s) during construction or operation.	High	• Implement the LAP process and Procedure.
		• Clearing awareness training is to be undertaken by all personnel involved in clearing activities, including specific information on significant fauna within the Development Envelope, the requirements for clearing, and the LAP and Land Clearing Procedure processes.
			• Visual inspections for evidence of:
			  • adherence to boundary demarcation compliance.
			  • unauthorised access or clearing (e.g., observations of vehicles or machinery, vehicle tracks, damage to fencing or vegetation).
				• During construction (pre-clearing clearing and post-clearing activities).
				• Imagery analysis annually, or as required, to monitor clearing extent.
				• As triggered.
					• Project Manager
					• Construction
					• Operations
					• Environment Manager
					• Environment Team.
						Regular reporting:
						• Monitoring reports-clearing register and Internal clearing permits.
						• Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER.
						• Internal incident reporting and investigation process. Report any non-compliances with the

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting

		• Proposed clearing has been minimised as far as practicable to reduce the extent of disturbance required; the Proponent has revised the Development Envelope from 1,399 ha to 874 ha (898 ha for EPBC).
		• A LAP and the Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary.
		• The area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager. Some heavy equipment will have in-cab GPS mapping and alarm functions, however in the absence of this functionality, other control measures such as the use of spotters and/or restricting clearing to the daylight hours could be used to prevent unauthorised clearing.
			• Monitoring of clearing register for compliance to approvals:
			  • Clearing activities will be audited regularly to ensure compliance with LAP conditions, including prior to LAP close out. This includes confirmation that all clearing has been completed within the LAP boundary.
			  • Land disturbance will be reconciled annually, as a minimum, for compliance and reporting purposes.
			• Internal incident reporting and investigation process.
						LAP and Land Clearing Procedure.
						Exceedance Reporting:
						• Management action has not been implemented (report in accordance with Section 5.5).
						• Management target has not been achieved (report in accordance with Section 5.6).

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Delineate clearing boundary areas by qualified surveyors in the field and confirmed cleared areas via survey after clearing. • Coordinates for clearing extents will be provided to the Construction Contractor. • Vehicles and equipment shall be restricted to designated roads, track and cleared areas unless authorised under a LAP.				
No statistically significant increase in feral animal abundance. as a result of project-related activities.	High	• Avoid providing accessible artificial water sources. • Prohibit feeding of all fauna. • Spatially restricted Indicative Footprint and short life of mine. • Environmental responsibility awareness training shall be delivered to all personnel as part of the induction process. • Ensure food waste is disposed of appropriately so it cannot be accessed by fauna. • Feral animal monitoring and subsequent	• Record and monitor the presence and abundance of feral fauna compared to baseline presence and abundance to determine the effectiveness of control programs. • Implement feral animal control at seasonally appropriate time. • Maintain a register of all introduced fauna sightings.	• Baseline monitoring of feral animal presence to be undertaken over 2 year period prior to and during construction and early operational activities. In accordance with (**Appendix C**) • Control programs - Opportunistically.	• Construction personnel. • Operations personnel. • Environment Manager • Environment Team.	Regular reporting: • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. • Feral animal control contractor reports. Exceedance reporting: • Management action has not been implemented (report in accordance with Section 5.5). • Management target has not been achieved (report in accordance with Section 5.6).

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		targeted control program to be implemented (**Appendix C**).				
No significant adverse impacts to significant fauna as a result of project related altered hydrological regimes.	High	Hydrological Regimes: • Haul road and Development Envelope design shall consider surface water flow to minimise obstruction to seasonal overland water flow to the loamy drainage flats proximal to the Great Northern Highway. • Implement surface and groundwater management strategies in accordance with the SWMP and GWOS. • Drainage management structures identified as remaining post closure shall meet recognised Australian drainage design specifications. • The open pit will be backfilled to a minimum of 5 m above the baseline groundwater level. • Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.	• Implement surface and groundwater monitoring as required in accordance with the Surface Water Management Plan (SWMP) and Ground Water Operating Strategy (GWOS).	• In accordance with schedule in the SWMP and GWOS. •	• Project Manager • Construction personnel. • Operations personnel • Environment Manager • Environment Team.	Regular reporting: • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. • SWMP monitoring reports. Exceedance reporting: • Management action has not been implemented (report in accordance with Section 5.5) • Management target has not been achieved (report in accordance with Section 5.6).

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
Effective operation of the Project to minimise the risk of Project related fire.	High	• Off-road driving shall be prohibited unless authorised under a LAP. • Avoid hot work in fire sensitive areas and during fire risk days. • Fire awareness shall be delivered to all personnel as part of the induction process. • Firebreaks will be incorporated into mine layout planning in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*. • Smoking will only be permitted in designated areas, which shall be appropriately signed and contain self-arresting cigarette butt disposal containers. • An Emergency Response Plan shall be prepared and implemented. • An Emergency Response Team shall be formed, in accordance with requirements regulated by DEMIRS. • The Emergency Response Team will ensure that sufficient operational fire suppression equipment is	• Inspection and maintenance of fire breaks in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*. • Regular inspection of vehicles and fire response equipment shall be undertaken.	• As required in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*. • Quarterly	• Project Manager • Construction personnel. • Operations personnel • Environment Manager • Environment Team.	Regular reporting: • Internal incident reporting, emergency response and investigation process in the event of a fire, in accordance with internal incident reporting procedure. • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. Exceedance reporting: • Management action has not been implemented (report in accordance with Section 5.5). • Management target has not been achieved (report in accordance with Section 5.6).

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		located as per the Emergency Response Plan. • A Traffic Management Plan shall be prepared and implemented. • Implement a Hot Work Permit system for high ignition risk work activities. • Regular inspection and maintenance of vehicles and equipment shall be undertaken. • All vehicles and machinery will be fitted with fire extinguishers and/or in-plant fixed water suppression, and water carts will be fitted with firefighting equipment. • All fuel stored on site is to be contained within a secure bund or other facility. • Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved MCP, following fire.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
No significant increase in project-related direct significant fauna interactions per year (e.g., vehicle strike, interaction with fencing) resulting in injury or mortality.	Low	• Develop and implement a Traffic MP. • Maintain a fauna mortality register. • Close Cave 1 prior to the critical female breeding period of October to December. • Temporary closure of Cave 1 during construction and operation to ensure no inadvertent loss of mothers and/or pups will occur in the event of mining activity (e.g., blasting, excavation, haulage, overburden stacking) in proximity to caves. • The area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager. • New fencing shall not use barbed wire, subject to consultation with pastoralist. The Proponent is committed to replacing barbed wire fences with three or four strand wire fencing in the Project area (in consultation with the	• Undertake periodic compliance checks with site speed limits. • In the event that fauna is injured during clearing, construction or operations, the animal shall be taken to an authorised veterinarian or trained wildlife carer, or if not possible, humanely euthanised in accordance with *Standard Operating Procedure: Humane Killing Of Animals Under Field Conditions* (Department of Biodiversity Conservation and Attractions 2018). • Check trenches for trapped fauna and ensuring egress points are functional.	• In accordance with section 4.2. • As triggered. • Twice daily trench inspections	• MinRes • Construction. • Operations • Environment Team.	Regular Reporting: • Record known injuries to, or deaths of, significant fauna species in the internal Conservation Significant Fauna Interaction Register as soon as possible, as the injury or death is identified. • Internal incident reporting, and investigation process in accordance with internal incident reporting procedure. • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. Exceedance Reporting: • Report significant fauna mortalities within 48 hours to DBCA in accordance with legislative requirements. • Management action has not been implemented (report in accordance with Section 5.5) • Management target has not been achieved (report in

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		Juna Downs pastoralist). If however the pastoralist requires use of barbed wire for effective stock management, bat deflectors/reflectors between the top two strands will be used within the Project Area. • Spatially restricted Indicative Footprint and short life of mine. • Implement a 100 m radius exclusion zone around recorded Category 2 and Category 3 Ghost Bat roosts. • Driving between dusk and dawn shall be minimised, for example buses to transport staff between camp and work site at shift changes. Machinery and vehicle movements that must be undertaken between dusk and dawn will be limited to low speeds (site-specific but typically 40km/h) on access tracks. • Excavations and trenches will be kept open only as long as needed to undertake the work and egress points will be provided dependant on depth /				accordance with Section 5.6) •

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		morphology of the excavation. • Any steep-sided holes (e.g., sumps) will be fitted with egress matting or another method of escape to avoid fauna entrapment. • Regular inspection of all excavations (including open trenches) shall be undertaken to minimise fauna mortality. • Environmental responsibility awareness training shall be delivered to all personnel as part of the induction process. • Vehicles and equipment shall be restricted to designated roads, tracks and cleared area, unless authorised under a LAP. • Signage will be installed along access roads to warn road users of areas where they will be entering critical fauna habitat area and will advise of applicable speed reduction. • Ensure all drill holes are capped as soon as reasonably practicable.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
Minimise project related disturbance of significant fauna from noise, vibration and artificial light.	Low	• Implement staff training to enable staff to implement procedures related to minimisation of noise, dust, vibration, and artificial light. • Avoid placement of infrastructure in any habitat of high significance. • Prohibit entry to caves, unless authorised by Management. • Undertale monitoring/inspection of Cave 1 prior to and after the first blast as per Appendix B. • Avoid placing artificial lighting in key significant fauna habitat. • As practicable while providing lighting required for safe operation, implement best practice light management (DCCEEW 2023a) within proximity to significant bat species' habitat through maintaining natural darkness in and near all significant bat species' habitats is the most effective impact mitigation method. Where lighting exists or is introduced, effective management and	• Cave closure (**Appendix A**) and vibration monitoring (**Appendix BAppendix B**). • Undertake Blast vibration monitoring for Cave 1 to ensure no disturbance to significant fauna, or degradation or loss of significant fauna habitat (Cave 1) occurs. • Photo monitoring Cave 1 **(Appendix B**) • Regular inspection and maintenance of vehicles and equipment shall be undertaken.	• In accordance with **Appendix A.** • In accordance with **Appendix B**. • Quarterly during first year, six-monthly thereafter if no change • Daily	• Construction. • Operations. • Environment Team.	Regular Reporting: • Internal incident reporting, and investigation process in accordance with internal incident reporting procedure. • Noise and vibration monitoring reporting. • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. Exceedance Reporting: • Management action has not been implemented (report in accordance with Section 5.5). • Management target has not been achieved (report in accordance with Section 5.6).

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		mitigation approaches to reduce potential impacts to may include: • maintaining dark roost sites. • creating dark corridors from roosts to foraging/watering sites. • keeping light intensities low and redirecting light away from habitats. • longer wavelength (red) artificial light appears to have the least impact on several bat species. • Demarcate areas that may not be entered by personnel and/or machinery. • Noise, vibration and artificial light awareness training shall be delivered to all personnel as part of the induction process. • Regular inspection and maintenance of vehicles and equipment shall be undertaken. • Ensure blasting is undertaken during daylight hours and is strictly controlled to				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		minimise air blast and ground vibration. • Minimise the use of artificial lighting needed for safe operation, use directional and / or screened lighting, and when required for safety, avoid light spill onto important habitats (e.g., rocky outcrops). • As practicable while providing lighting required for safe operation, adhere to DCCEEW (2023a) Light pollution guidelines best practice lighting design to minimise potential impacts from artificial light sources to significant fauna by incorporating the following design principles: • start with natural darkness and only add light for specific purposes. • use adaptive light controls to manage light timing, intensity and colour. • light only the object or area intended – keep lights close to the ground, directed, and shielded to avoid light spill.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• use the lowest intensity lighting appropriate for the task. • use non-reflective, dark-coloured surfaces. • use lights with reduced or filtered blue, violet and ultraviolet wavelengths.				

Minimise project related decline to fauna habitat due to dust, weeds, and hydrocarbon or chemical leaks and altered hydrological regimes.	Low	Dust Management:
		• Intersection of the haul road with Great Northern Highway, and an additional 100 m past the intersection, will be sealed to reduce the generation of dust.
		• Road haulage iron ore loads will be covered.
		• Ground clearing (including topsoil stripping) shall not be undertaken during periods of high wind (unless soil moisture levels are also elevated enough to inhibit dust formation).
		• A LAP and the Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary.
			• Monitoring of daily wind conditions will be taken into consideration when planning clearing or blasting activities.
			• Visual assessment of dust suppression performance
			• Bi-annual monitoring of the presence and abundance of weeds compared to baseline presence and abundance to determine the effectiveness of control programs.
				• Daily
				• Daily
				• Bi-annual
					• Construction.
					• Construction
					• Operations.
						Regular Reporting:
						• Internal incident reporting, and investigation process in accordance with internal incident reporting procedure for example:
						  • Excessive dust
						  • New weed species and/or new occurrences of existing weed species are recorded.
						  • Vehicles reported outside authorised areas/ tracks.
						• Dust monitoring reporting.
						• Biannual weed monitoring reporting.
						• Submit an annual compliance assessment report as part of the Annual

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Spatially restricted Indicative Footprint and short life of mine. • Vehicles and equipment shall be restricted to designated roads, tracks and cleared areas unless authorised under a LAP. • Dust suppression shall be implemented to manage dust emission on cleared areas and iron ore handling areas. This will be visually assessed on an ongoing basis. • Reduced speed limits to be applied on unsealed roads (site-specific but typically 40 kph). • Blasting plans will consider meteorological conditions to minimise dust lift off. • Dust awareness training shall be delivered to all personnel as part of the induction process. • Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved MCP.				Environment Report to the DWER. Exceedance Reporting: • Management action has not been implemented (refer to Section 5.5). • Management target has not been achieved (refer to Section 5.6)

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable. Weed Management: • A LAP and the Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary. • A Weed Management Plan shall be prepared and implemented as part of the FVMP, prior to construction and operation, to control access and movement of vehicles and construction personnel to prevent the introduction and spread of weeds into the Development Envelope, weed free areas, and between work areas. • Vehicles with ground engaging equipment to be cleaned, inspected and issued with a Weed Hygiene Certificate prior to entry to site or moving between areas with known weed infestations on-site.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Vehicles and equipment shall be restricted to designated roads, tracks and cleared areas, unless authorised under a LAP. • Weed awareness and weed hygiene training shall be delivered to all personnel as part of the induction process. • Regular inspection and maintenance of vehicles and equipment shall be undertaken. • Seasonal weed control programs shall be implemented, including herbicide spraying or physical removal, in accordance with the FVMP. • Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable. • Hydrocarbon or chemical spill management: Hydrocarbon and/or chemical leaks and spills (expected to be rare) will be managed using bunding techniques, leak detection mechanisms and spill kits to restrict impacts.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Spill response equipment available (including on all Haul Trucks). • Spill response training for all personnel and contractors. • Dedicated workshop for maintenance. • Maintain high standard of housekeeping around processing plant. • Prevent chemical / hydrocarbon spill from spreading to native vegetation. • Management of sites as per the Contaminated Site Act 2003. • Develop and implement a Hazardous Substances Management Plan (HSMP) and Procedure. • Develop and implement an Emergency Response Plan. • Develop and implement a Spill Response Plan. • Develop and implement a Controlled Waste Management Procedure. • Develop and implement a Contaminated Sites Register. • Develop and implement a Waste Management Procedure.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Routinely check sumps for fauna. •				

4. MONITORING AND EVALUATION

A monitoring schedule has been developed with performance targets (**Table 9**) to assess the effectiveness of the management measures outlined in this SFMP (**Section 4**). The performance targets have been aligned with the outcomes-based objectives and associated environmental criteria, with associated measurement parameters, monitoring frequencies and responsibilities.

In addition to the monitoring schedule, Monitoring Programs have been developed to align with the SFMP and are presented in **Appendix B** and **Appendix C.** Monitoring has been developed to achieve the following objectives:

- Monitor the success of mitigation and management measures in the SFMP and detect potential impacts to significant fauna and habitat.
- Evaluate effectiveness and monitor for exceedance against trigger, threshold, and management target criteria (management provisions).
- Assess the effectiveness of the environmental criteria to inform adaptive management and revision where required.

Table 9: Monitoring Schedule

Management Targets	Monitoring Event	Monitoring Action	Timing	Responsibility
No clearing of vegetation shall occur outside of the approved, demarcated clearing area(s) during construction or operation.	Clearing inspections	Visual inspections for evidence of: • adherence to boundary demarcation compliance. • unauthorised access or clearing (e.g., observations of vehicles or machinery, vehicle tracks, damage to fencing or vegetation).	During clearing, construction, pre-clearing and post-clearing activities.	Manager Environment. Staff and contractors.
		Monitoring of clearing register for compliance to approvals: • clearing activities will be audited regularly to ensure compliance with LAP conditions, including prior to LAP close out. This includes confirmation that all clearing has been completed within the LAP boundary. • Land disturbance will be reconciled annually, as a minimum, for compliance and reporting. •	Imagery analysis annually, or as required, to monitor clearing extent.	
		Internal incident reporting and investigation process	As triggered.	
No significant increase in Project-related direct significant fauna interactions per year (e.g., vehicle strike, interaction with fencing) resulting in injury or mortality.	Signage	Undertake periodic compliance checks with site speed limits.	Quarterly signage inspections.	Manager Environment. All staff and contractors. Suitably qualified persons, as required.
	Fauna mortality or injury register	In the event that fauna is injured during clearing, construction or operations, the animal shall be taken to an authorised veterinarian or trained wildlife carer, or if not possible, humanely euthanised in accordance with Standard Operating Procedure: Humane Killing Of Animals Under	In accordance with Section 4.2	

		Field Conditions (Department of Biodiversity Conservation and Attractions 2018)		
	Trench inspections	Check trenches for trapped fauna and ensuring egress points are functional.	Twice daily trench inspection	
No statistically significant increase in feral animal abundance as a result of Project related activities.	Feral fauna monitoring	Record and monitor the presence and abundance of feral fauna compared to baseline presence and abundance to determine the effectiveness of control programs.	Baseline monitoring undertaken over 2 consecutive years prior to and during early construction activities.	Manager Environment. Environment Team. Suitably qualified person, as required.
	Feral fauna control	Implement feral fauna control at seasonally appropriate time	In accordance with **Appendix C**.	
	Introduced fauna register	Maintain a register of all introduced fauna sightings.	Opportunistically (i.e. when observed).	
Minimise Project related disturbance of significant fauna from noise, vibration and artificial light.	Vibration monitoring	Cave closure (**Appendix A**) and vibration monitoring (**Appendix B**).	In accordance **Appendix A.**	Manager Environment. Environment Team. Project Manager.
		Undertake Blast vibration monitoring for Cave 1 to ensure no disturbance to significant fauna, or degradation or loss of significant fauna habitat (Cave 1) occurs.	In accordance with **Appendix B**.	
	Photo monitoring	Photo monitoring Cave 1	As per **Appendix B.**	
Minimise Project related decline to fauna habitat due to dust, weeds, and hydrocarbon or chemical leaks and altered hydrological regimes.	Dust monitoring	Monitoring of daily wind conditions will be taken into consideration when planning clearing or blasting activities.	Daily.	Manager Environment. Environment Team.
	Weed monitoring	Bi-annual monitoring of the presence and abundance of weeds compared to baseline presence and abundance to determine the effectiveness of control programs.	Biannual. As per Flora and Vegetation Management Plan	

	Surface and groundwater monitoring	Implement surface and groundwater monitoring as required in accordance with the Surface Water Management Plan (SWMP) and Ground Water Operating Strategy (GWOS).	In accordance with schedule in the SWMP and GWOS.	
Effective operation of the Project to minimise the risk of Project related fire.	Routine fire inspection	Inspection and maintenance of fire breaks in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*.	As required in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*.	Manager Environment. Environment Team.
		Regular inspection of vehicles and fire response equipment shall be undertaken.	Quarterly.	
Maintain Structural integrity of Cave 1	Cave monitoring	Photographic, geotechnical assessment monitoring of Cave 1	As per Appendix B.	Manager Environment Environment Team

4.1 ENVIRONMENTAL AUDITS

In accordance with the Proponent's Environmental Management System (EMS), an audit of implementation of this SFMP will be completed annually. The key requirements of this SFMP audit include:

- Assessment of compliance of all SFMP components.
- Evaluation of performance against SFMP provisions.
- Assessment of adequacy of management actions, response actions and monitoring.
- Review of management actions, response actions and monitoring as required in order to meet the purpose and objectives of this SFMP.
- Additional audit(s) in response to significant incidents of non-conformance.

SFMP audits shall be conducted by personnel trained and competent in the use of the audit tool and have expertise in the area being audited. Results of all audits will be communicated and discussed at project management review meetings.

4.2 CAPTURE AND RELEASE

Should capture and release be required, it is important that any capture and release is undertaken by qualified licensed personal in accordance with relevant DBCA standard operating procedures (SOPs) such as:

- Transport and temporary holding of wildlife SOP No: SC22-11 (DBCA 2023b)
- Cage traps for live capture of terrestrial vertebrates SOP No: SC22-07(DBCA 2023a)
- Animal handling and restraint using soft containment SOP No: SC22-12
- Hand capture of wildlife SOP No: SC22-12 (DBCA 2022c)(DBCA 2022)
- Hand restraint of wildlife (DBCA 2017b)
- Care of evicted pouch young SOP No.SC22-16 (DBCA 2023c)

An appropriate DBCA fauna license will be required to undertake capture and release.

4.3 INJURED FAUNA MANAGEMENT FOR SIGNIFICANT FAUNA

In unlikely event that an injured significant fauna individual is found, an assessment needs to be undertaken to determine if the fauna is safe to approach. If capture is necessary, the following management actions will be undertaken by a qualified fauna handler:

- If handling is the preferred method, safely confine (wrap the animal in towel and place in cardboard box) ensuring the animal can breathe.
- Keep box closed but not sealed to allow for ventilation and place box in a dry, warm, dark and quiet place.
- The DBCA (2023b) – Standard Operating Procedure (SOP) Transport and Temporary Holding of Wildlife procedure will be adhered to if the injured animal is to be transported:
  - Where transportation of the injured animal is to occur on foot or vehicle.
  - Individuals shall be kept within a box with ventilation for secure transport.
  - Temperature of vehicle will not exceed 25 degrees Celsius during transportation.
- First response wound management will be undertaken in accordance with DBCA (2017a) - SOP First aid for animals:

- Due to the remote location of the Project any medical attention required to the animal is to be assessed on a case-by-case basis in consultation with the fauna handler, a veterinarian and the Environment Manager.
- In the event the animal is injured (or is dependent young) and is not able to be re-released (based on veterinarian advice), the DBCA shall be consulted for rehabilitation options.
- No relocation of nests or rehabilitated fauna individuals is to occur (unless in extenuating circumstances where prior consultation has occurred with EPA, DCCEEW and DBCA and approval and a permit to handle and move significant fauna has been granted).
- Euthanasia of an animal will only be undertaken under the instruction of a veterinarian, however, DBCA (2018) - SOP Human Killing of Animals under Field Conditions will be considered, where appropriate.

5. REPORTING PROVISIONS

5.1 ANNUAL REPORTING

Annual compliance reporting will be undertaken for the Project in line with regulatory requirements and relevant guidance documentation, including the preparation of an AER and CAR. The annual reports will document compliance with Project approval conditions, as well as requirements stipulated in this SFMP.

5.2 EXCEEDANCE REPORTING

The following exceedance reporting will be undertaken if a trigger (**Section 5.3**) or Threshold (**Section 5.4**) exceedance occurs or a management action has not been implemented (**Section 5.5**) or management target has not been achieved (**Section 5.6**) in accordance with the SFMP.

5.3 TRIGGER EXCEEDANCE

- Trigger exceedance will be reported promptly in accordance with internal procedures (prior to the end of shift the following day) and reported to appropriate management staff.
- Investigate to determine the cause of the trigger exceedance.
- Internal reporting and communication of corrective actions to be implemented that eliminate or reduce the likelihood of recurrence.

5.4 THRESHOLD EXCEEDANCE

- Notify the CEO of the DWER in writing within 10 days of identifying and confirming the threshold exceedance, with a report provided via email including any corrective actions identified once an investigation has been completed.
- Investigate to determine the cause of the threshold exceedance.
- Investigate to determine the potential environmental harm or alteration of the environment that occurred as a result of the threshold exceedance.
- A follow up report detailing the adequacy of the response actions will also be submitted to the DWER within 12 months of the initial notification or within the ACAR.

5.5 MANAGEMENT ACTION HAS NOT BEEN IMPLEMENTED

- Notify the CEO of the DWER in writing within 10 days of identifying and confirming the failure to implement a management action, with a report provided via email including any corrective actions identified once an investigation has been completed.
- Investigate to determine the cause of the management action not being implemented.
- Investigate to determine the potential environmental harm or alteration of the environment that occurred due to the failure to implement the management action(s).
- Provide a report to the CEO including any corrective actions identified, within 21 days of the initial notification of failure to implement a management action being identified.

5.6 MANAGEMENT TARGET HAS NOT BEEN ACHIEVED

- Notify the CEO of DWER in writing within 21 days of identifying and confirming the non-achievement of the target.
- Investigate to determine the cause of the management target not being achieved.

- Provide a report to the CEO within 90 days of the non-achievement of the target being reported.
- The report shall include:
  - the cause(s) of the management targets not being achieved.
  - details of revised and/or additional management actions to be implemented to prevent reoccurrence of management target(s) not being met.
  - appropriate changes to Project activities/ corrective actions required.

5.7 INCIDENT REPORTING

Environmental incidents will be promptly reported in accordance with internal procedures and reported to appropriate management staff. Corrective actions, when appropriate, will also be developed and implemented that eliminate or reduce the likelihood of recurrence.

The minimum standards required in respect to non-conformance and corrective actions are to:

- Define and document what classifications of incidents and non-conformances are reportable to:
  - internal management.
  - contractors, suppliers and vendors.
  - regulatory authorities.
  - other external stakeholders.
- Report environmental incidents and non-conformances in line with established procedures and applicable legal and other obligations.
- Investigate incidents and non-conformance such that the root cause can be determined.
- Implement corrective actions that address the root cause(s) of the incidents and non-conformances that aim to eliminate or improve response capabilities to prevent reoccurrence.
- Retain documentation as evidence.

6. ROLES AND RESPONSIBILITIES

MinRes will ensure that all personnel and contractors are responsible for ensuring they comply with the company's environmental management requirements and that any action or inaction on their part does not result in harm to the environment. Delegation of responsibilities may occur to ensure that environmental management activities are coordinated at an appropriate level; however, accountability remains with the person designated those responsibilities. MinRes also expects this general principle of line management accountability to apply to all its contractors. Roles and responsibilities have been designated to ensure that environmental management requirements within this SFMP are met. The key personnel involved in implementation of the SFMP, and their roles and responsibilities are listed in Table 10.

Table 10: Roles and Responsibilities

Role	Responsibility

MinRes	• Overall responsibility for implementing this SFMP.
	• Ensure the development and implementation of procedures and plans in the SFMP:
	  • Hazardous Substances Management Plan (HSMP) and Procedure.
	  • Emergency Response Plan.
	  • Spill Response Plan.
	  • Controlled Waste Management Procedure.
	  • Contaminated Sites Register.
	  • Waste Management Procedure.
	  • Traffic Management Plan
	  • Emergency Response Plan
	  • Weed Management Plan
	  • FVMP.
	  • Audit and compliance checks.
	  • Engagement with Traditional Owners.

Project Manager (may delegate all or part responsibility to an appropriately qualified person)	• Ensure construction and operational activities are implemented by employees (inclusive of contractors) in accordance with the SFMP
Manager Environment (may delegate all or part responsibility to an appropriately qualified person)	• Obtain relevant approvals from regulatory agencies for disturbance as required. • Undertake Monitoring in accordance with the SFMP. • Incident Reporting and Monitoring in accordance with the SFMP. • Maintain clearing register to ensure compliance with approvals. • Undertake internal audits and inspections of clearing areas and compliance with SFMP. • Implement and maintain the SFMP, review its effectiveness and review the implementation as required. • Undertake training and inductions of personnel in accordance with the SFMP. • Liaise with stakeholders and technical experts for advice and resolution of management aspects/objectives as required. • Engagement with Traditional Owners. • Report as required to regulating authorities.
Employees (inclusive of contractors)	• Complete induction prior to commencement of work on site. • Toolbox. • Training. • Comply with requirements in SFMP. • Stop works if impact to the environment is suspected or known. • Report any environmental concerns, opportunities for improvement, near misses or incidents to their supervisor ASAP.

7. ADAPTIVE MANAGEMENT AND REVIEW

Adaptive management practices will be implemented where change to management practices and monitoring may lead to more effective environmental outcomes. The adaptive management approach may include the following components:

- Evaluation of the management actions and targets:
  - if monitoring results or audits indicate that management objectives are not being achieved.
  - if new information is discovered during construction, operations or closure.
  - where any significant changes to Project design or operation have occurred.
- Evaluation of assumptions and uncertainties following further significant fauna monitoring and management.
- Review of data and information gathered over the review period that has increased understanding of the environment in the context of the regional ecosystem.
- Review of Management Actions as the Project progresses, and new management measures and technologies become available that may be more effective for significant fauna management.
- Assessment of changes which are outside the control of the Proponent (i.e., a new project within the area or region, regional change affecting significant fauna management) and the revised management measures identified.
- Amendment to the monitoring program.

7.1 REVIEW OF THIS SFMP

This SFMP will be reviewed periodically during the phases (construction, operations and into closure), nominally once every 2 years. Other occasions when this SFMP will be reviewed include:

- Upon significant changes to the Project activities or upon significant changes to key environmental values identified in this SFMP.
- Following non-compliances or environmental incidents related to significant fauna management.
- If one or more management targets or performance indicators are not being met and adaptive management is required.
- Upon regulatory approval of the Project by the DWER and the Department of Mines, Industry Regulation and Safety (DMIRS).

The review process will ensure that this SFMP remains current and adheres to regulatory requirements and the provisions of this SFMP. Any significant changes to this SFMP will be referred to the DWER for approval prior to implementation of such changes.

8. STAKEHOLDER CONSULTATION

The Proponent is committed to ongoing stakeholder engagement and communication through all stages of the Project.

8.1 ENGAGEMENT

Stakeholder engagement for the Project commenced in 2012 and specific stakeholder engagement activities undertaken have included:

- Briefings and presentations with key regulatory authorities and potentially affected parties to provide information on the Project, planned studies and request feedback.
- Face to face meetings, telephone calls and written correspondence with potentially affected stakeholders to provide updates on the Project and obtain additional feedback.
- Specifically, consultation between MinRes and the Banjima People, through the body corporate Banjima Native Title Aboriginal Corporation (BNTAC) and their consultants, regarding the preparation of various environmental regulatory approvals (State and Commonwealth) has been conducted, including reviews of this SFMP. Feedback from these engagements has been incorporated into the approval submission documents and this SFMP.

Through the variety of engagement forums, the Proponent has been able to identify the required studies and investigations and, importantly, key environmental and socials impacts, and associated mitigation strategies required to support the Project, to ensure the Project aligns with expectations. A detailed summary of stakeholder communications is provided in Chapter 3 of the EPBC Preliminary Document.

8.2 KEY STAKEHOLDERS

The Proponent has identified key Project stakeholders, and these are listed in **Table 11.**

Table 11: Key Stakeholders for the Project

Stakeholder Sector	Organisation
Australian Government Agencies	Department of Climate Change, Energy, the Environment and Water
State Government Agencies & Members of Parliament	Department of Biodiversity, Conservation and Attractions
	Department of Jobs, Tourism, Science and Innovation
	Department of Energy, Mines, Industry Regulation and Safety
	Department of Planning, Lands and Heritage
	Department of the Premier and Cabinet (Ministers for Water and Environment)
	Department of Primary Industries and Regional Development
	Department of Transport
	Department of Water and Environmental Regulation - Environmental Protection Authority services
	Department of Water and Environmental Regulation
	Development WA
	Environmental Protection Authority

Stakeholder Sector	Organisation
	Main Roads WA
	Pilbara Port Authority
	Alinta Energy
Local Government	Shire of East Pilbara
Traditional Owners	Banjima Native Title Aboriginal Corporation
	Martidja Banyjima (MIB) – Karijini Development Pty Ltd
Corporate and Community	Rio Tinto/Juna Downs Pastoral Lease
	Bird Life Western Australia
	BHP
	Wildflower Society of Western Australia
	Conservation Council of Western Australia
	Wilderness Society

APPENDIX A
CAVE CLOSURE AND CAVE DISRUPTION PROTOCOL

Appendix A Cave Closure and Cave Disruption Protocol

A.1 Background

A conservative protocol (Cave Closure and Cave Disruption Protocol) is recommended by Bat Call WA (2023a) to protect reproducing Ghost Bat females and their young during the most important part of their reproductive cycle. This covers the periods when:

- Gravid females are subject to premature birth due to either capture and handling or repeated flushing of the bats from their diurnal roost caves.
- Females carrying newborns are subject to dropping them due to capture or disturbance.
- Non-volant young in nurseries are subject to abandonment due to repeated disturbance of the mothers.
- Newly volant young during the early adolescent period are subject to premature abandonment due to repeated disturbance of the mothers and/or young.

For Ghost Bat category 1, category 2, and category 3 roost caves (**Figure 4**) that are part of an important cave grouping, the following cave disturbance protocols will be followed as recommended by Bat Call WA (2023a) :

1. Surveys with higher disturbance to Ghost Bats (i.e., when Ghost Bats are captured, or are present and are disturbed) will be limited to once per cave during August, September, and January.
2. Multiple lower disturbance survey entries per cave are allowed in August, September, and January. The surveys should be done by one ecologist working quietly to minimise stressing the bats present and hopefully not flushing them from the cave. If a Ghost Bat(s) is disturbed and flushed from the cave, the caves and their entrance areas should be vacated to allow the bat(s) to return and settle. Restrictions per item 1 above then apply.
3. No cave entries should be carried out in October, November and December, including entry to inspect caves within the potential impact zone of a drilling/blasting program. Any damage assessments required during blasting operations in this time period should be carried out from the cave entrance.
4. Where category 2 and 3 caves are within the impact zone of a drilling/blasting program (Cave 1 as shown in **Figure 4**), and after it is proven that there are no Ghost Bats inside, the caves may be temporarily sealed prior to 1 October and remain inaccessible to Ghost Bat throughout the female's reproductive period.

A.2 Procedure for Temporary Closure of Cave 1

The methodology for closure of Cave 1 will be developed in consultation with DBCA. However, it is anticipated that the closure of Cave 1 is likely to be temporarily closed by using a lightweight steel frame fitted to the entrance and bird aviary steel netting or any heavier style with apertures not exceeding 100 mm. This would exclude Ghost bats from entering the cave but smaller species up to 10g such as Pilbara leaf-nosed bats (*Rhinonicteris aurantia*) or Finlayson's cave bat (*Vespadelus finlaysoni*) would be able to pass through unharmed. Other small fauna of a similar size including reptiles, frogs and snakes would also be able to access the cave. With regard to larger fauna such as Quolls, Dingoes and/or Macropod species that will be excluded by the closures, Cave 1 is situated in an area with numerous alternative deep overhangs and shallow caves that are suitable for their foraging and/or resting activities. Each of these species is known to travel significant distances on a daily basis (Bat Call WA 2023a).

Cave closure is viable as there is Ghost Bat habitat in close proximity (within 25 km to the east, south and west of the Development Envelope) that will allow the bats to relocate during mining operations and return to the retained caves once mining is complete (Bat Call WA 2023a). Experience at other Iron Ore mines has shown that Ghost Bats return to roost at viable caves that have been (structurally) retained after several years (Bat Call WA 2021b; Bullen and Creese 2014). The cave will remain closed for the life of mine (approximately 3 years) then reopened after completion of mining.

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

MINERAL RESOURCES

APPENDIX B
VIBRATION MONITORING

Appendix B Vibration Monitoring

Ground vibrations as a result of the release of explosive energy from the blasting process can spread through adjacent rock and soil to surrounding structures, slopes, and benches. Vibration monitoring is to be undertaken at Cave 1 to ensure the structural integrity of the cave is maintained during the blasting process.

Methods for vibration monitoring will be determined in consultation with DBCA to ensure that there is no impact to the cave's structural integrity.

Additional noise monitoring will not be required as the cave will be closed in accordance with the procedure outlined in **Appendix A** of this SFMP and no Ghost Bats will be present within the cave during blasting operations.

The following indicative methodology is proposed:

- A permanent location for vibration monitoring will be established at Cave 1 as close as possible to the nearest part of the cave to the pit, as confirmed through survey pickup.
- Vibration will be measured at the monitoring location at Cave 1 prior to and during each blast (monitoring equipment with data logger). Vibration data loggers will be connected via telemetry with appropriate safety procedures and protocols developed and implemented prior to vibration monitoring being undertaken.
- All monitoring equipment used will be in accordance with the Australian Standard for Blast Monitoring (AS2187.2-2006) which provides guidelines for the type of equipment required to monitor ground vibration (peak particle velocity, or PPV).
- The Proponent has conducted a geotechnical assessment, including peak particle velocity (PPV) analysis of Cave 1 indicating that the conservative limit of 25 mm/sec PPV (Bat Call WA 2023a) will ensure that the structural integrity of the cave will not be affected by the modelled vibration from blasting. Modelled predictions will require calibration for actual on-site conditions throughout the blasting process. This will be achieved by the blasting engineer comparing the results of initial blasts with the predictions of the model.
- Cave inspections to be undertaken before and after the first blast in the pit to assess for any signs of instability. This would include a geotechnical photographing structural assessment. Subsequent to these initial visitations drone surveys would be undertaken quarterly to monitor the structural integrity of the cave during the first year and six-monthly thereafter if conditions are unchanged. Additional cave inspections to be conducted if Trigger or Threshold PPV limits exceeded, as per **Table 6** in the SFMP.
- Develop appropriate safety procedures ensuring that cave structural integrity can be assessed safely by personnel.

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

MINERAL RESOURCES

APPENDIX C
FERAL ANIMAL MONITORING AND CONTROL PLAN

Appendix C Feral Animal Monitoring and Control Plan

C.1 Background

Feral and pest fauna, specifically feral cats and foxes have been implicated in the significant decline of multiple species of vertebrate fauna (DEWHA 2008b;c). Feral animal monitoring will be undertaken to monitor for a potential increase in the numbers of feral animals.

A detailed feral animal monitoring plan design will be completed in consultation with DBCA.

C.2 Feral Animal Monitoring

It is anticipated that annual population monitoring of introduced fauna will consist of the following:

- Deployment of cameras to establish baseline numbers. The Proponent proposes to establish baseline feral animal numbers over a two-year period prior to and during construction and early operations.
- Quantitative and systematic recording of introduced animals undertaken through the deployment of cameras at permanent locations within the Project Area will be identified with star pickets as follows:
    - Monitoring for feral animal presence will be undertaken on a quarterly basis.
    - Feral animal monitoring will be undertaken at control sites (those with the potential to be impacted by the Project) and reference locations (not impacted by the Project). Areas with the potential to attract feral animals such as the camp, waste storage facilities and key infrastructure areas will be a focus for monitoring.
    - Opportunistic visual observations whereby site personnel and contractors will be required to record sightings of feral animals at the site, including date, time, location and species. Those observations will be considered in relation to the annual monitoring results, to inform management of site activities.

C.3 Reporting

The results of feral animal monitoring and control activities will be summarised in the Proponent's Annual Environmental Report**.**

The feral animal monitoring report will include a summary of results of systematic monitoring and recording of opportunistic sightings of introduced fauna (e.g. feral cats and foxes), through annual monitoring, feral animal control reports and incident reports.

C.4 Review

Results of the monitoring program will be reviewed annually. Where required, modifications to the program will be implemented to achieve the stated targets. Details of material changes to the feral animal management approach will be described in the Annual Environment Report.

C.5 Feral Animal Control Program

The feral animal control program will be undertaken annually within areas potentially impacted by the Project with a focus on:

- Areas where significant fauna have been recorded in proximity to the Project Area.
- Areas likely to attract feral animals, for example the camp, waste facilities, areas with accessible water and key infrastructure areas.

Feral animal control will include appropriate measures to control feral animals, as required, and may include:

- Baiting.
- Shooting.
- Grooming traps.
- Trapping.

C.6 Licences:

Depending on the method of feral animal control, different licences and permits are likely to be required. This may include, but not be limited to:

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

- Department of Health 1080 landholder application and permit.
- DPIRD License to Use Animals for Scientific Purposes.
- DPIRD Wildlife Animal Ethics Committee animal ethics permit.
- DBCA Fauna Licence approval.
- DBCA 1080 risk assessment and no toxic trial (Grooming traps).

C.7 Measurable outcomes

The success of the feral and pest animal reduction program will be measured by changes (decline) in feral animal presence recorded over time. It is anticipated that the feral animal monitoring and control program will reduce predation pressure of foxes and feral cats within proximity to the Project and should see an increase in the abundance of native vertebrate fauna species.

C.8 Reporting

The specialist contractors undertaking the feral and pest animal reduction program will provide a written report at the conclusion of each control program. The report will include the following sections: methods, results, discussion and recommendations.

This report will quantify the outcomes of feral animal control undertaken. The results of the control activities will be summarised in the annual environmental reports.

Contractor reports will be available upon request.

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

MINERAL RESOURCES

APPENDIX D
RISK ASSESSMENT

Appendix D Risk Assessment

A qualitative risk assessment was conducted in accordance with the Environmental Management Plan Guidelines (Commonwealth of Australia 2014) to assess the risks of the Project and is shown in **Table D 2**. Each environmental risk identified has been provided a likelihood and consequence rating using the criteria in **Table D 1** below to generate a risk rating of low, medium, high or severe.

Table D 1: RISK ASSESSMENT CRITERIA

	Consequence				
Likelihood	**Minor**	**Moderate**	**High**	**Major**	**Critical**
Highly likely	Medium	High	High	Severe	Severe
Likely	Low	Medium	High	High	Severe
Possible	Low	Medium	Medium	High	Severe
Unlikely	Low	Low	Medium	High	High
Rare	Low	Low	Low	Medium	High

Likelihood	
The following criteria has been used to determine the likelihood of the risk occurring	
Highly likely	The risk event is expected to occur in most circumstances
Likely	The risk event will probably occur during the life of the project
Possible	The risk event might occur during the life of the project
Unlikely	The risk event could occur but considered unlikely or doubtful
Rare	The risk event may only occur in exceptional circumstances
Consequence	
The following criteria has been used to determine the consequences of a risk occurring	
Minor	Minor incident of environmental damage that can be reversed
Moderate	Isolated but substantial instances of environmental damage that could be reversed with intensive efforts
High	Substantial instances of environmental damage that could be reversed with intensive efforts
Major	Major loss of environmental amenity and real danger of continuing
Critical	Severe widespread loss of environmental amenity and irrecoverable environmental damage

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

Table B 2: Fauna and Habitat ENVIRONMENTAL RISK ASSESSMENT

Value	Potential Impacts	Inherent Risk			Management Measures	Residual Risk		
		Likelihood	Consequence	Risk		Likelihood	Consequence	Ranking
Fauna and habitat	Unauthorised Clearing in critical habitat.	Possible	High	Medium	Management measures are outlined in **Table 7.** Any potential impacts from fauna habitat fragmentation is expected to be managed through suitable design and mitigation measures, this risk event is considered **MEDIUM**. Loss of habitat is proposed to be offset for: ○ Ghost bats ○ Northern Quoll ○ Pilbabra Olive Python	Unikely	High	Medium
Fauna and habitat	Fragmentation of fauna habitat.	Possible	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential impacts from fauna habitat fragmentation is expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low
Fauna	Fauna injury or mortality as a result of ground disturbance, machinery and blasting.	Possible	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential impacts to fauna as a result of ground disturbance, vehicle interactions, machinery and blasting is expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Unlikely	Moderate	Low

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

Value	Potential Impacts	Inherent Risk			Management Measures	Residual Risk		
		Likelihood	Consequence	Risk		Likelihood	Consequence	Ranking
Fauna	Fauna mortality as a result of a potential increase in the prevalence of introduced species and feral predators.	Likely	High	High	Management measures are outlined in **Table 7.** The potential impacts to terrestrial fauna can be managed such that there are no significant residual impacts, and the biological diversity and ecological integrity of terrestrial fauna will be maintained. Therefore, it is considered **unlikely** that the Project will result in significant impacts from an increase to feral fauna predator activity, this risk event is considered **MEDIUM.**	Possible	High	Medium
Dust	Dust generated as part of construction and operational activities has the potential to impact on local flora and fauna. Reduced health and viability of fauna habitat	Likely	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential decline or change in the health/composition of fauna and fauna habitat arising from dust are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low
Noise and vibration	Noise and vibration disrupting natural foraging and breeding behaviours	Possible	High	Medium	Management measures are outlined in **Table 7.** Any potential disruption to species behaviour from noise and vibration are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Unlikely	Moderate	Low

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

Value	Potential Impacts	Inherent Risk			Management Measures	Residual Risk		
		Likelihood	Consequence	Risk		Likelihood	Consequence	Ranking
Light emissions	Artificial light can potentially disturb species behaviour, cause barriers to movement, cause abandoning of roosts and nests, and expose nocturnal animals to nocturnal predators.	Likely	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential disruption to species behaviour from artificial light are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Likely	Minor	Low
Weeds	Introduction and/or spread of weed species leading to reduced flora species and system diversity.	Likely	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential decline or change in the health/composition of fauna habitat arising from the introduction and/or spread of weeds are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low
Hydrocarbons	Inadequate transport, handling and storage of hydrocarbons and chemicals leading to contamination of the environment	Likely	Minor	Low	Management measures are outlined in **Table 7** Any potential contamination of fauna habitat arising from the inadequate transport, handling and storage of hydrocarbons and chemicals is expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**	Possible	Minor	**Low**

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

Value	Potential Impacts	Inherent Risk			Management Measures	Residual Risk		
		Likelihood	Consequence	Risk		Likelihood	Consequence	Ranking
Fire	Construction activities have the potential to cause accidental bushfires which may lead to damage or death to surrounding flora and fauna communities	Likely	High	High	Management measures are outlined in **Table 7.** Any potential decline or change in the health/composition of fauna habitat arising from fire are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **MEDIUM**.	Unlikely	High	Medium
Hydrological change	Potential decline or change in the health/composition of fauna habitat arising from hydrological regime changes.	Likely	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential decline or change in the health/composition of fauna habitat arising from hydrological changes are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

EXECUTIVE SUMMARY

Table ES-1 summarises the purpose of the Significant Fauna Management Plan (SFMP) and Monitoring Program within the context of the Western Australia Environmental Protection Authority (EPA) objectives for the key environmental factor of Terrestrial Fauna (EPA 2016), but is also relevant for EPBC fauna considerations. The SFMP and Monitoring Program also aligns with the EPA (2021c) and Commonwealth of Australia (2014) Environmental Management Plan Instructions and Guidelines. The SFMP and Monitoring Program has been prepared for the Mineral Resources Lamb Creek Iron Ore Project. This Environmental Management Plan specifically addresses the Terrestrial Fauna environmental factor associated with the Project.

Summary Table ES-1 below presents the environmental outcomes and objectives for the environmental factor to be met through implementation of this SFMP, as well as the environmental criteria and management targets to measure achievement of the associated environmental outcomes and objectives.

Table ES-1: Significant fauna Management plan Summary

Project Title	Lamb Creek Iron Ore Mine	
Short Description	Open pit iron ore mine located approximately 130 km northwest of Newman to produce up to 10 million tonnes per annum (Mtpa) of crushed and screened iron ore over a period of three to five years. This will comprise a multi-stage crushing and screening process plant and associated mine infrastructure including, but not limited to, site offices, maintenance and equipment service area, water pipelines, fuel storage, power generation, telecommunications and an accommodation village for site personnel. The total disturbance footprint of the Project is 646.9 ha (Indicative Footprint), within a Development Envelope of 874 ha (**Figure 1**). Iron ore product will be loaded onto road trains and transported 16 km on a dedicated private haul road to its intersection with Great Northern Highway, where it will be transported 320 km to ship load-out facilities at the Utah Point berth in Port Hedland.	
Proponent Name	Process Minerals International (PMI) a wholly owned subsidiary of Mineral Resources Limited (MinRes) (ACN 118 549 910)	
Ministerial Statement No.	TBA	
Scope And Purpose Of SFMP	The purpose of the Significant Fauna Management Plan (SFMP) is to present a robust and implementable environmental management framework to protect the environmental values of the Project and to demonstrate that the EPA's objectives are met during the construction and operation of the Project (also relevant for EPBC fauna considerations).	
Key Environmental Factor and Objective	Terrestrial Fauna:	To protect terrestrial fauna so that biological diversity and ecological integrity are maintained.
Outcome-based Management Provisions	Ensure development and operation of the Project meets the objective of protecting significant fauna and fauna habitat to maintain biological diversity and ecological integrity.	
Objective-based Management Provisions	No clearing of critical fauna habitat shall occur outside of approved, demarcated, clearing area(s) during construction or operations. Feral predator management effectively implemented to avoid increasing impacts on native fauna populations as a result of the Project. Effective operation of the Project to avoid Project related fire. Minimise fauna mortality from construction and operation of Project infrastructure and operations caused by; open water sources, open trenches/excavations, vehicle strike.	

Condition Clauses	TBA
Key Components In the SFMP	Key provisions are detailed in Section 3
Proposed Construction and Operation Dates	The forecast key milestones for construction and commissioning are: construction Q3 to Q4 2025. commence commissioning Q1 2026. commence operation from Q1 2026 to Q2 2026.
SFMP Required Pre-construction	Yes - this SFMP will be required to be implemented during installation of access tracks and roads into the site, following granting of licensed tenements

Declaration of accuracy

In making this declaration, I am aware that section 491 of the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) makes it an offence in certain circumstances to knowingly provide false or misleading information or documents to specified persons who are known to be performing a duty or carrying out a function under the EPBC Act or the Environment Protection and Biodiversity Conservation Regulations 2000 (Cth). The offence is punishable on conviction by imprisonment or a fine, or both. I am authorised to bind the approval holder to this declaration and that I have no knowledge of that authorisation being revoked at the time of making this declaration.

1. CONTEXT, SCOPE AND RATIONALE

1.1 PROJECT BACKGROUND

Process Minerals International (PMI; the Proponent), a wholly owned subsidiary of Mineral Resources Limited (MinRes) (ACN 118 549 910), proposes to develop the Lamb Creek Iron Ore Project (the Project), located approximately 130 kilometres (km) northwest of Newman, in the East Pilbara Local Government Authority (LGA) in Western Australia (WA).

Open pit iron ore mine located approximately 130 km northwest of Newman to produce up to 10 million tonnes per annum (Mtpa) of crushed and screened iron ore over a period of three to five years. This will comprise a multi-stage crushing and screening (two or three stages) process plant and associated mine infrastructure including, but not limited to, site offices, maintenance and equipment service area, water pipelines, fuel storage, power generation, telecommunications and an accommodation village for site personnel. Project Iron ore product will be loaded onto road trains and transported 16 km on a dedicated private haul road to its intersection with Great Northern Highway, where it will be transported 320 km to ship load-out facilities at the Utah Point berth in Port Hedland.

The Project is being referred under s. 38 of the Environmental Protection Act 1986 (EP Act) as it has the potential to significantly affect key environmental factors, defined by the WA Environmental Protection Authority (EPA) in its Statement of environmental principles, factors, objectives and aims of EIA (Environmental Protection Authority, 2021b). The Project is also being referred under the Environment Protection and Biodiversity and Conservation Act 1999 (EPBC Act) as it is likely to have a significant impact on Matters of National Significance (MNES). A Native Vegetation Clearing Permit (NVCP) under Part V of the EP Act will also be sought for the area of the Project that intersects the Great Northern Highway Road Reserve.

As a result of the various approvals being sought for the Project, there are subtle differences in the Development Envelopes (DE) and Indicative Footprints, however the overall clearing associated with the Project is the same. The maximum DE or Proposed Action Area for the EPBC referral is 897.5 ha, as the EPBC referral was based on an earlier, now revised, DE footprint. The EPBC referral DE is also slightly larger than that for the s. 38 Referral, due to the splitting of the DE between the approvals under Part IV and Part V of the EP Act. This Significant Fauna Management Plan (SFMP) has been prepared to support the submission of the Referral Supporting Document (RSD), Mining Proposal, NVCP and EPBC Referral to detail the management actions proposed to reduce adverse environmental impacts to the key environmental factor of Terrestrial Fauna and MNES.

Key nomenclature used throughout this document is summarised below:

The Project: This refers to the boundary within which the elements of the proposed activities are situated.

Project Area (897.5 ha): Refers to the maximum proposed Development Envelope (as for EPBC) within R47/19 (to be converted to M47/1592) and L47/1008, which overlie the Juna Downs pastoral lease (LPL N050471). A small portion of the access road and Great Northern Highway intersection area is within railway corridor L021124 (Hamersley Iron Pty Ltd- Yandicoogina Rail) that is excised from Juna Downs. This Project Area also includes the area of the intersection with the Great Northern Highway which is entirely within Main Roads WA road reserve.

Development Envelope (874 ha): delineates the area within which the Project components are located (**Figure 1**). and is a combination of the development envelopes included in the Part IV and Part V applications.

Indicative Footprint (646.9 ha): refers to the area that is proposed to be directly disturbed by the Project (e.g. clearing of native vegetation) (**Figure 1**) occurs entirely within the Development Envelope. The

layout of the Indicative Footprint may be subject to change; however, total disturbance will not exceed the maximum disturbance for the Development Envelope.

Terrestrial Fauna Survey Area (1645 ha): refers to the boundary within which all Terrestrial Fauna investigations and field surveys were undertaken.

This SFMP has been prepared in accordance with the *How to prepare Environmental Protection Act 1986 Part IV Environmental Management Plans: Instructions* (Environmental Protection Authority 2021a).

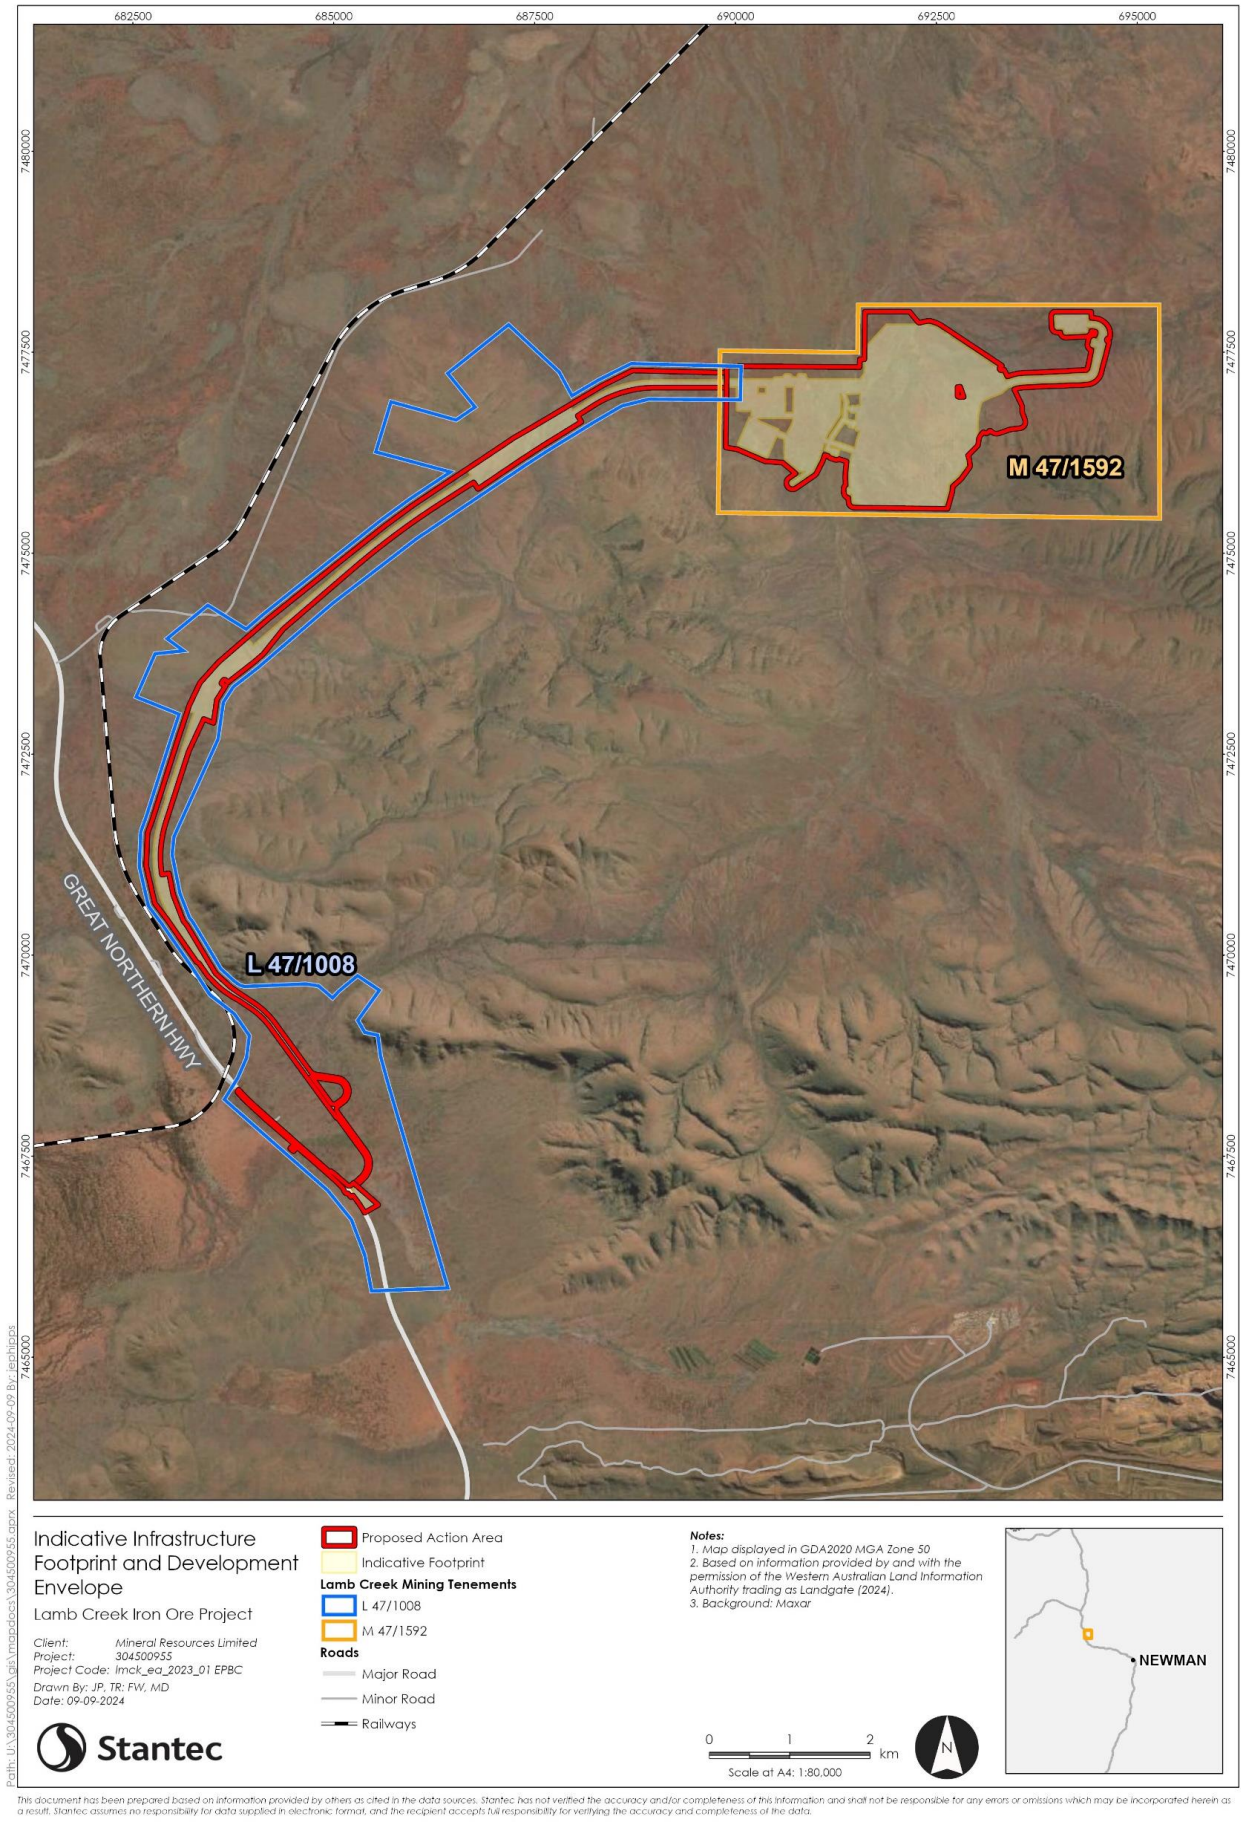

Figure 1: Development Envelope and Indicative Footprint

1.2 KEY ENVIRONMENTAL FACTOR – TERRESTRIAL FAUNA

The EPA's objective for the environmental factor of Terrestrial Fauna is "To protect terrestrial fauna so that biological diversity and ecological integrity are maintained" (Environmental Protection Authority 2016). In the context of this objective, ecological integrity is the composition, structure, function and processes of ecosystems, and the natural range of variation of these elements. Terrestrial Fauna is considered a key environmental factor for the Project due to the potential for direct and indirect impacts during construction and operation activities. Comprehensive surveying identified 21 significant species as occurring within the Study Area. Several of the fauna species are Matters of National Environmental Significance (MNES), listed at the Commonwealth and/or State level. Of the significant fauna with the potential to occur in the Study Area, the following five species were considered likely to occur in the Lamb Creek Project area and one species, the Fork-tailed Swift, was recorded:

- Northern Quoll (Dasyurus hallucatus) – Endangered.
- Ghost Bat (Macroderma gigas) – Vulnerable.
- Pilbara Leaf-nosed Bat (Rhinonicteris aurantia) – Vulnerable.
- Pilbara Olive Python (Liasis olivaceus barroni) – Vulnerable.
- Grey Falcon (Falco hypoleucos) – Vulnerable.
- Fork-tailed Swift (Apus pacificus) – Migratory, recorded.

The Proponent considers the Project can be managed to meet the EPA's objective for Terrestrial Fauna, aided by the conceptual design, planned construction and operational procedures that will be implemented to avoid, mitigate and maintain terrestrial fauna values. In addition, residual impacts from the clearing of supporting habitat for several significant fauna species is proposed to be offset through the Pilbara Environmental Offsets Fund (PEOF), managed via the Native Vegetation Clearing Permit process in accordance with Part V s 51I(2)(b) of the EP Act and in alignment with the native vegetation clearing principles in accordance with Schedule 5 cl 1 of the EP Act. These proposed offsets (to be finalised, agreed with DWER) include 42.0 ha of critical habitat (foraging and dispersal) for Northern Quoll, and 622.3 ha of supporting habitat (foraging) for Ghost Bat, and lesser portions of this 622.3 ha as supporting habitat for the Pilbara leaf-nosed Bat and Pilbara Olive Python .

1.3 PURPOSE AND OBJECTIVE

The purpose of this SFMP is to document the Proponent's approach to managing the potential impacts of construction and operation of the Project on significant fauna species to:

- Ensure that the Project is carried out in a manner that minimises the direct and indirect impacts to significant fauna species; and
- Ensure there is no direct or indirect adverse impacts to significant fauna species within the Project Area and immediate surrounds.

The Proponent is committed to avoiding and minimising potential impacts from the Project during construction and operation to ensure the biodiversity and ecological integrity of terrestrial fauna are maintained.

The objective of this SFMP is to meet the EPA's objective for the environmental factor of Terrestrial Fauna using the EPA's mitigation hierarchy of avoid, minimise, rehabilitate and offset (Government of Western Australia 2014). This will be addressed by ensuring potential impacts to significant fauna from the Project are avoided to the maximum extent practicable by:

- Identifying the risks and potential impacts from the Project on significant fauna species.

- Outlining management provisions for terrestrial fauna, to avoid and minimise potential impacts to significant fauna populations.
- Preparing and implementing monitoring programs for populations recorded within the Development Envelope; and
- Proposing corrective and response actions if triggers and thresholds are exceeded to avoid impact to significant fauna populations.

1.4 RATIONALE AND APPROACH

The SFMP focuses on outcome-based management provisions including monitoring and evaluating success of management actions with respect to significant fauna populations within the Project Area, driven by triggers and thresholds. Assessment of the pathways over which impacts may occur provides the rationale for choice of provisions and choice of appropriate indicators to measure against the environmental outcome and/or objective.

This SFMP is subject to approval by the EPA and Department of Climate Change, Energy, the Environment and Water (DCCEEW) and will subsequently be implemented.

1.5 LEGISLATION, POLICY AND GUIDANCE

This SFMP has been written in accordance with Western Australian (WA) and Commonwealth policies and guidance, including:

- Instructions on how to prepare Environmental Protection Act 1986 Part IV Environmental Management Plans; (EPA 2021b).
- Environmental Impact Assessment (Divisions 1 and 2) Procedures Manual (EPA 2021a).
- Environmental Management Plan Guidelines (Commonwealth of Australia 2014).
- Outcomes-based conditions policy (DoE 2016b).
- Outcomes-based conditions guidance (DoE 2016a).
- National Light Pollution Guidelines for Wildlife (DCCEEW 2023a).
- Biodiversity Conservation Act 2016 (WA).
- Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth).

The following management plans and strategies are also relevant to the SFMP, specific to the Project and include:

- Flora and Vegetation Management Plan (FVMP).

State and Commonwealth plans and management prescriptions that are relevant to the terrestrial fauna include:

- Environmental Factor Guideline – Terrestrial Fauna (EPA 2016);
- Commonwealth Listing Advice on Northern Quoll (Dasyurus hallucatus) (Threatened Species Scientific Committee 2005).
- National Recovery Plan for the Northern Quoll Dasyurus hallucatus (Hill and Ward 2010).
- EPBC Act referral guideline for the endangered Northern Quoll Dasyurus hallucatus (DoE 2016c).
- Conservation Advice Macroderma gigas Ghost Bat (TSSC 2016).
- A review of Ghost Bat ecology, threats and survey requirements (Bat Call WA 2021a).
- Conservation Advice Rhinonicteris aurantia (Pilbara form) Pilbara Leaf-nosed Bat (TSSC 2016).
- A review of Pilbara Leaf-nosed Bat ecology, threats and survey requirements (Bat Call WA 2021c).

- Approved Conservation Advice for Liasis olivaceus barroni (Olive Python – Pilbara subspecies) (TSSC 2008).
- Conservation Advice Falco hypoleucos Grey Falcon (Threatened Species Scientific Committee 2020).
- Referral guideline for 14 birds listed as migratory species under the EPBC Act (Department of the Environment 2015).
- Matters of National Environmental Significance. Significant impact guidelines 1.1 - Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2013).
- Survey Guidelines for Australia's Threatened Birds (DEWHA 2010).
- Survey Guidelines for Australia's Threatened Reptiles (DSEWPaC 2011b).
- Survey Guidelines for Australia's Threatened Mammals (DSEWPaC 2011a).
- Threat Abatement Plan for Competition and Land Degradation by Feral Goats (DEWHA 2008a).
- Threat Abatement Plan for Competition and Land Degradation by Feral Rabbits (DEE 2016).
- Threat Abatement Plan for Predation by Feral Cats (DEWHA 2008b).
- Threat Abatement Plan for Predation by the European Red Fox (DEWHA 2008c).

2. TERRESTRIAL FAUNA

2.1 SURVEY AND STUDY FINDINGS

The rationale for the proposed management approach in this SFMP is supported by desktop, detailed and targeted fauna surveys that have been completed over the Lamb Creek Project area since 2012 (Rapallo 2012;2021;2022a;b; Western Wildlife 2020). The findings of these surveys are summarised in the following sections and have been used to inform the impact assessment within the RSD and EPBC Referral, and to develop mitigation measures detailed in this SFMP (**Table 2**). Surveys and studies undertaken include:

- Level 2 Fauna Survey and Targeted Northern Quoll Survey of the Lamb Creek for Process Minerals International Pty Ltd (Rapallo 2012).
- Lamb Creek and Wedge Project: Vertebrate Fauna Desktop Assessment March (Western Wildlife 2020).
- Baseline Short-range Endemic Invertebrate Survey of the Lamb Creek Iron Ore Project (Rapallo 2022a).
- Detailed Vertebrate Fauna Survey of the Lamb Creek Project (Rapallo 2022b);
- Targeted Ghost Bat Survey for the Lamb Creek Iron Ore Project (Phoenix Environmental Sciences 2023).
- Significance Assessment regarding Ghost bat Prescence at Lamb Creek (Bat Call WA 2023b).
- Ghost Bat Cave Closure at Lamb Creek (Bat Call WA 2023a).

2.2 FAUNA HABITATS

A total of 10 broad habitat types (excluding cleared areas) have been identified by Rapallo (2022b) in the Terrestrial Fauna Survey Area, and are described in detail in Section 4.6 of the EPBC Preliminary Documentation, and includes:

- gorge, gully, and rocky breakaway;
- tussock grassland plain;
- hill crests and hill slopes;
- hummock grassland;
- stony plains;
- rocky ridge and gorge;
- drainage line (minor and medium);
- rocky hills and plateaus;
- Mulga / *Corymbia* spp. plain; and
- Mulga plain.

Fauna habitats of value for significant species within the scope of this SFMP are described in **Table 3** below and shown in **Figure 2.**

Table 2: Summary of Terrestrial Vertebrate Fauna Surveys Conducted for the Project

Survey (Reference)	Study Type / Dates	Proximity to Project Area	Survey Effort	Key Findings	
				Fauna Assemblage	Significant Fauna
Level 2 Fauna Survey and Targeted Northern Quoll Survey of the Lamb Creek for Process Minerals International Pty Ltd (Rapallo 2012);	Scope Level 2 fauna survey of the Terrestrial Fauna Survey Area and adjacent areas of similar habitat. Targeted Northern Quoll survey of the Terrestrial Fauna Survey Area. Timing 19 – 20 March 2012 (reconnaissance survey). 26 March – 12 April 2012 (field surveys).	Location Study Area. Survey Area Not stated.	Desktop assessment Database searches (max 50 km buffer). Review of relevant reports. Field survey Reconnaissance survey (2 days; 10 motion cameras for two weeks). Vertebrate fauna trapping (12 Pitfall traps for 852 nights; 20 Elliot traps for 1420 nights; ten funnel traps for 710 nights). Bird surveys (two-hectare bird surveys each day). Bat surveys (two ultrasonic recorders, and Harp Traps deployed each night) Spotlighting (30-minute surveys in each habitat type). Active searching and habitat assessments (effort not stated). Remote sensing cameras (Ten motion detecting cameras at seven sites for two weeks and at an additional seven sites for six days). Opportunistic records SRE surveys (14 sites were foraged for SRE taxa and leaf litter samples collected). Targeted Northern Quoll survey (six sites of ten cage traps for five nights).	152 taxa including: 22 mammals taxa (including seven species of bats). 58 reptiles taxa. 76 birds taxa.	Fork-tailed Swift (MI, MI).
Lamb Creek and Wedge Project: Vertebrate Fauna Desktop Assessment March	Scope Desktop assessment including database searches and a review of previous fauna surveys in the region.	Location Study Area. Survey Area 3,110 ha.	Desktop assessment Database searches (within 35 km of Proposed Action Area). Review of relevant reports.	296 taxa including: 36 native mammal taxa. Nine introduced mammal taxa. 112 reptile taxa. Nine frog taxa. 130 bird taxa.	Pilbara Olive Python (VU, VU) Grey Falcon (BC Act, VU) Night Parrot (BC Act, CR; EPBC Act, EN), Northern Quoll (EN, EN)

(Western Wildlife 2020)					Bilby (VU, VU) Pilbara Leaf-nose Bat (VU, VU) Ghost Bat (VU, VU)
Baseline Short-range Endemic Invertebrate Survey of the Lamb Creek Iron Ore Project (Rapallo 2022a)	Scope Desktop assessment including invertebrate database searches and review of relevant reports undertaken. Invertebrate field survey. Timing 16 – 25 February 2021.	Location Study Area. Survey Area 1,645 ha.	Desktop assessment Database searches. Review of relevant reports. Field survey (51 sites) Habitat assessment. Spider/scorpion burrow searching. Foraging.	Desktop assessment 13 potential SRE invertebrate taxa within survey area. Field survey 25 potential SRE invertebrate taxa within survey area.	Ten undescribed or previously unsequenced potential SRE taxa.
Detailed Vertebrate Fauna Survey of the Lamb Creek Project (Rapallo 2022b)	Scope Desktop assessment including database searches and review of relevant reports undertaken. Refine 2012 fauna habitat mapping and extend fauna habitat mapping into areas not previously mapped within the Terrestrial Fauna Survey Area. Level 2 fauna survey of Terrestrial Fauna Survey Area. Timing 16 – 28 April 2020 (vertebrate fauna survey). 17 – 23 February 2021 (supplementary field work).	Location Study Area. Survey Area 1,645 ha.	Desktop assessment Five database searches (max 50 km buffer). Review of relevant reports. Field survey Systematic trapping (10 sites - 840 Pitfall trap nights; 1400 Elliot trap nights; 840 funnel trap nights). Bird surveys (500 minutes). Acoustic recording for bats (33 detector nights). Acoustic recording for night parrot (8 detector nights). Active searching (foraging and leaf litter) (2310 minutes). Opportunistic observations. Camera trapping (279 nights at transects, 73 nights at trap sites).	Desktop assessment 301 vertebrate taxa including: 157 bird taxa. 46 mammal taxa. 91 reptile taxa. 7 amphibian taxa. Field survey 128 vertebrate taxa including: 63 bird taxa. 20 mammal taxa. 44 reptile taxa. One amphibian taxa.	Pilbara Olive Python (VU, VU) Northern Quoll (EN, EN) Ghost Bat (VU, VU) Western Pebble-mound Mouse (BC Act, P4) Fork-tailed Swift (MI, MI)

Targeted Ghost Bat Survey for the Lamb Creek Iron Ore Project (Phoenix Environmental Sciences 2023)	Scope Targeted Ghost Bat survey, comprising searches for roost sites, ultrasonic recordings and scat collection and analysis. Timing 12 - 14 September 2022. 18 October 2022.	Location Study Area. Survey Area 4,397 ha.	Desktop assessment Protected Matters Search Tool DCCEEW (2023) (40 km buffer). DBCA Threatened and Priority Fauna Database (2021) (40 km buffer). Atlas of Living Australia (Atlas of Living Australia 2023) (40 km buffer). Review of relevant reports. Field Survey Habitat assessment. Habitat/cave searches (Five caves). Bat echolocation recordings. Scat collection and analysis. Cave status assessment.	Desktop assessment 113 Ghost Bat records including: Three within the survey area; and 110 in wider search extent Field survey Seven bat species including: Ghost Bat (Macroderma gigas). Greater Northern Free-tailed Bat (Chaerephon jobensis). Common Sheathtailed Bat (Taphozous georgianus). Hill's Sheath-tailed Bat (Taphozous hilli). Gould's Wattled Bat (Chalinolobus gouldii). Little Broad-nosed Bat (Scotorepens greyii). Finlayson's Cave Bat (Vespadelus finlaysoni).	Ghost Bat (VU, VU)

Table 3: Vertebrate Fauna Habitat Types in the Study Area and Indicative Footprint, by Value

Habitat Type (Rapallo 2022b)	Description	Value to Significant Fauna	Extent within the Survey Area - ha	Area within Indicative Footprint - ha (% within survey area)
Gorge, gully, and rocky breakaway	Wide rocky gullies and gorges that bisect the hillcrest / hillslopes of the higher elevation areas containing caves, deep cracks, and crevices. Breakaways occur at the rugged edges of hillslopes. Spinifex hummock grassland with mixed shrubland patches or occasional *Ficus* spp. occurring in shaded locations or occasional *Eucalyptus leucophloia*.	High Value: • Potential foraging and dispersal habitat for Pilbara Olive Python, Northern Quoll, Ghost Bat and Peregrine Falcon. • Potential breeding habitat for Pilbara Olive Python, Northern Quoll and Peregrine Falcon. • Potential shelter habitat for Pilbara Olive Python and Northern Quoll. • Potential habitat for Pilbara Barking Gecko (*Underwoodisaurus seorsus*) and Gane's Blind Snake (*Anilios ganei*).	54.64	0.00 (0%)
Hillcrests / hillslope	Slopes and hill crests of higher elevation areas. Spinifex hummock grassland dominated with scattered *Eucalyptus leucophloia* trees and mallee, and *Acacia* spp. and *Grevillea* spp. shrubs on rocky, red skeletal soils (loams to clay/loam).	Moderate Value: • Possible foraging and dispersal habitat for Ghost Bat, Western Pebble-mound Mouse and Northern Quoll. • Possible breeding habitat for Western Pebble-mound Mouse.	318.48	50.42 (15.83%)
Mulga / *Corymbia* spp. plain	Open Mulga shrubland patches over spinifex hummock or tussock grassland on loam to sandy clay loam occurring in areas of sheet flow drainage. The Mulga patches are surrounded by run-off zones of stonier plain with open spinifex / tussock grassland under very open Mulga / *Corymbia deserticola* shrubland.	Moderate Value: • Possible foraging and dispersal habitat for Ghost Bat and Grey Falcon. • Possible habitat for Gane's Blind Snake.	290.88	180.78 (62.15%)
Minor drainage	Smaller narrow drainage channels and shallow gullies that bisect the stony plain habitat and hill slopes, forming flow zones on the valley floor. Mixed open shrubland, to shrubland often over tussock grass and herbs with occasional fringing trees (scattered *Eucalyptus leucophloia*, *Corymbia* spp. or *Eucalyptus gamophylla*).	Moderate Value: • Possible foraging and dispersal habitat for Ghost Bat, Grey Falcon, Peregrine Falcon, Pilbara Olive Python and Northern Quoll.	210.36	75.23 (35.76%)

Habitat Type (Rapallo 2022b)	Description	Value to Significant Fauna	Extent within the Survey Area - ha	Area within Indicative Footprint - ha (% within survey area)
Tussock grassland plain	Tussock grass (*Aristida inaequiglumis*, *Aristida contorta*, *Themeda triandra*) dominated, largely undefined drainage plain. Contains occasional open Mulga woodland stands or scattered Mulga individuals on brown sandy clay loam to loams. Contains patches of spinifex.	Moderate Value: • Possible foraging and dispersal habitat for Ghost Bat, Grey Falcon and Peregrine Falcon. • Potential habitat for Gane's Blind Snake.	137.33	6.08 (4.43%)
Medium drainage	Wide loamy drainage channels to undefined drainage (gravelly) containing occasional emergent *Corymbia hamersleyana* over patches of low mixed shrubs over Buffel Grass and tussock grass dominated understory on low relief. Contains very occasional Mulga stands in loamier soils.	Moderate Value: • Possible foraging and dispersal habitat for Ghost Bat, Grey Falcon, Pilbara Olive Python, Northern Quoll and Peregrine Falcon. • Possible breeding and nesting habitat for Grey Falcon. • Potential habitat for Gane's Blind Snake.	112.97	43.41 (38.43%)
Stony plain	Plains and lower slopes of spinifex hummock grasslands (or in small patches, tussock grass) on red sandy clay loam to loam soil. Typically, with a mantle of gravel (less so on the valley floor adjacent to drainage, where soils are loamier). Little to no overstory aside from scattered trees or patches of mixed shrubs often regenerating from fire. Generally, *Eucalyptus leucophloia* occurs on the slopes and *Eucalyptus gamophylla* on lower slopes, with *Corymbia hamersleyana* typically associated with drainage.	Low Value: • Possible foraging and dispersal habitat for Ghost Bat, Grey Falcon, Western Pebble-mound Mouse and Pilbara Olive Python. • Possible breeding and shelter habitat for Western Pebble-mound Mouse.	517.07	266.35 (51.51%)
Bitumen Road	N/A	N/A	0.83	0.32 (38.55%)
Unmapped*	N/A	N/A	29.94	24.28 (81.10%)
Total			1642.56	646.87 (39.38%)

Figure 2: Fauna Habitat Within the Terrestrial Fauna Survey Area

2.3 FAUNA ASSEMBLAGE

2.3.1 Desktop Study

Desktop assessments indicate a predicted fauna assemblage of up to 301 species of terrestrial vertebrate fauna recorded within 50 kilometres of the survey area (Rapallo 2022b). These included 157 species of birds, 46 mammals, 91 reptiles and 7 amphibians. The Rapallo 2022b desktop study identified 29 taxa of conservation significant fauna, of which 12 were assessed as possible, likely or confirmed to occur within 50 km of the Survey Area (**Table 4:** Desktop Results for Significant Fauna Species Either Confirmed or Considered Possible or Likely to Occur Within 50 Km of the Survey Area.). The other 17 taxa of conservation significant fauna were considered unlikely or highly unlikely to occur in the Study Area due to the absence of suitable habitat and are therefore not addressed further in this SFMP.

Table 4: Desktop Results for Significant Fauna Species Either Confirmed or Considered Possible or Likely to Occur Within 50 Km of the Survey Area.

Common Name	Scientific Name	Likelihood
Fork-tailed Swift	Apus pacificus	Confirmed
Peregrine Falcon	Falco peregrinus	Likely
Night Parrot	Pezoporus occidentalis	Possible
Grey Falcon	Falco hypoleucos	Possible
Letter-winged Kite	Elanus scriptus	Possible
Ghost Bat	Macroderma gigas	Confirmed
Short-tailed Mouse	Leggadina lakedownensis	Possible
Northern Quoll	Dasyurus hallucatus	Confirmed
Western Pebble-mound Mouse	Pseudomys chapmani	Confirmed
Pilbara Olive Python	Liasis olivaceus barroni	Confirmed
Pilbara Barking Gecko	Underwoodisaurus seorsus	Likely
Gane's Blind Snake	Anilios ganei	Likely

2.3.2 Introduced Fauna Species

Rapallo (2022b) identified 10 introduced (feral) fauna as potentially occurring within the Terrestrial Fauna Survey Area. Of these, four were recorded within the Terrestrial Fauna Survey Area during fauna surveys (Rapallo 2012;2022b;Table 4: Desktop Results for Significant Fauna Species Either Confirmed or Considered Possible or Likely to Occur Within 50 Km of the Survey Area.**Table 5:** Desktop Results for Introduced (Feral) Fauna Recorded Within 50 Km of the Survey Area). Introduced fauna species such as foxes and cats are declared pests which present key threats to the native mammals likely to occur within the Development Envelope, such as the Northern Quoll (Department of the Environment 2016).

Table 5: Desktop Results for Introduced (Feral) Fauna Recorded Within 50 Km of the Survey Area

Common Name	Scientific Name	Likelihood
Rock Dove	*Columba livia	Unlikely
European Cattle	*Bos taurus	Confirmed
Dromedary, Camel	*Camelus dromedarius	Confirmed
Dog	*Canis familiaris familiaris	Confirmed
Red Fox	*Vulpes vulpes	Likely
Donkey	*Equus asinus	Unlikely
Horse	*Equus caballus	Unlikely
Cat	*Felis catus	Confirmed
Rabbit	*Oryctolagus cuniculus	Likely
House Mouse	*Mus musculus	Confirmed

2.3.3 Significant Fauna Species

Of the 29 taxa of conservation significant fauna identified by the desktop study (Rapallo 2022b), 10 fauna species of significance were either confirmed from field surveys or considered likely to occur within the Development Envelope based on desktop and habitat assessments undertaken during field surveys (Rapallo 2012;2021; Western Wildlife 2020). These are discussed below. For the Night Parrot, given the lack of suitable habitat, recent fire activity and the absence of any detections within the Study Area, the species is considered unlikely to occur and is therefore not addressed within the SFMP. The Letter-winded Kite is also not addressed as no species were recorded and the Development Envelope is outside of the species known distribution.

2.3.3.1 Significant Fauna Recorded in the Development Envelope

Two fauna species of significance were confirmed within the Development Envelope based on the detailed in-field fauna surveys (Rapallo 2012;2022b). These species are:

- Western Pebble-mound Mouse (Pseudomys chapmani) (P4 under BC Act).
- Fork-tailed Swift (Apus pacificus) (MI, MI).

The Fork-tailed Swift occurs within the Project Area but is almost entirely aerial and will not be impacted by the Project. Therefore, it is not addressed within the SFMP.

2.3.3.2 Significant Fauna Likely to Occur in the Development Envelope

Eight fauna species of significance are considered likely to occur within the Development Envelope, based on desktop assessments and habitat assessments undertaken during field surveys (Rapallo 2012;2021; Western Wildlife 2020), these species are:

- Ghost Bat (Macroderma gigas) (En, En);
- Pilbara Leaf-nosed Bat (Rhinonicteris aurantia) (Vu, Vu);
- Northern Quoll (Dasyurus hallucatus) (En, En);
- Pilbara Olive Python (Liasis olivaceus barroni) (Vu, Vu);

- Gane's Blind Snake (Anilios ganei) (P1 under the BC Act);
- Pilbara Barking Gecko (Underwoodisaurus seorsus) (P2 under the BC Act);
- Grey Falcon (Falco hypoleucos) (Vu, Vu); and
- Peregrine Falcon (Falco peregrinus) (Other specially protected species under the BC Act).

The conservation significant species confirmed or considered likely to occur within the Development Envelope are described in detail in the RSD and are the focus of this SFMP. The six species classed as MNES are discussed in the EPBC Preliminary Documentation (Northern Quoll, Ghost Bat, Pilbara Leaf-nosed Bat, Pilbara Olive Python, Grey Falcon and Fork-tailed Swift). A summary of environmental values and outcomes relevant to these nine species are summarised in **Table 6**. Significant fauna records are shown in Figure 3: Significant Fauna Recorded from Lamb Creek**Figure 3.**

Table 6: Environment Values and Outcomes

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
Ghost Bat (*Macroderma gigas*) - VU / VU	**Description** The Ghost Bat is a large, cave-dwelling, microbat species. **Distribution** The species was once widely distributed across Australia, but is now largely restricted to northern Australia, including parts of the Pilbara and Kimberley regions of WA. **Ecology** Its preferred habitat is within arid spinifex hillsides, black soil grasslands, monsoon forest, open savannah woodland, tall open forest, deciduous vine forest, tropical rainforest, sandstone caves, boulder piles, limestone caves and abandoned mines. The Ghost Bat can forage over large areas up to 12 km from their diurnal roost with a preference for productive plain areas with thin mature woodland over patchy or clumped tussock or hummock grass (*Triodia* spp.) on sandy or stony	Threatening processes: • Habitat loss and degradation (McKenzie and Hall 2008; TSSC 2016). • altered hydrological regimes. • exposure to pollutants. • barbed wire fences. • human visitation / disturbance.	Potential Impacts to Ghost Bats as a result of this Project include: • loss of potential foraging and roost habitat ('rocky ridge' and 'gorge') due to clearing. • loss or abandonment of potential foraging and roost habitat due to blasting. • Direct mortality of individuals if present within the Development Envelope.	• No Ghost Bat caves have been located within the Development Envelope. • Ghost Bats have been recorded within the Terrestrial Fauna Survey Area as have Ghost Bat roosting caves. • No night, diurnal or maternity roosts have been found within the Development Envelope. • Two Ghost Bat roost caves (one Category 2 and one Category 3) are present outside (approximately 750 m to the south) of the Development Envelope. • A cluster of caves occurs in the southern extent of the Project Area close to the proposed haul road near its intersection with the Great Northern Highway intersection (Category 2, Category 3). • The Project will result in clearing of up to 622.3 ha of foraging habitat comprising the following broad fauna habitat types	• The loss of 622.3 ha of foraging habitat for the Ghost Bat as a result of the Project may be considered to be a **significant residual impact within** the Hamersley Bioregion (Environmental Protection Authority 2014). However, the Proponent considers that this impact can be managed via the Native Vegetation Clearing Permit process in accordance with Part V s 51I(2)(b) of the EP Act and in alignment with the native vegetation clearing principles in accordance with Schedule 5 cl 1 of the EP Act. • The proposed removal of 622.3 ha of supporting habitat is considered **likely to have a significant impact** on the Ghost Bat when assessed

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	ground (Bat Call WA 2021a). **Cultural Importance** Cultural importance of this species to Traditional Owners, as well as cultural appropriateness of control/mitigation methods was raised at the June 2024 on Country engagement with Banjima and no specific concerns were raised. Banjima considers all fauna to be important.			occurring within the Indicative Footprint. These comprise the following habitats, and the percentage of the mapped extent of this habitat type mapped within the broader Terrestrial Fauna Survey Area: • hill crests and hill slopes (50.42 ha, 18.83%). • medium drainage (43.41 ha, 38.43%). • minor drainage (75.23 ha, 35.76%). • Mulga/*Corymbia* spp. plain (180.77 ha, 18.83%). • stony plain (266.35 ha, 51.51%). • tussock grassland plain (6.08 ha, 4.43%). • The Project will not result in direct disturbance to or the loss of critical Ghost Bat caves. • Given the distance from known caves to proposed operation and blasting areas, it is unlikely that blasting will cause any	against the DCCEEW criteria and is proposed to be offset as it has the potential to: • adversely affect habitat critical to the survival of a species.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
				physical damage to known Ghost Bat roost caves. It is also considered unlikely that the structural integrity of caves, or roosting site viability, will be adversely impacted by blasting or other operational elements such as vibration from the Project. • Cave 1 will be temporarily closed during construction and operation to prevent impacts to Ghost Bats while the mine is operational (Bat Call WA 2023a).	
Pilbara Leaf-nosed Bat (*Rhinonicteris aurantia*) – VU / VU	**Description** The Pilbara Leaf-nosed Bat is of moderate size, having short fur, relatively small, pointed ears and a fleshy diamond-shaped noseleaf surrounding the nostrils. **Distribution** The Pilbara Leaf-nosed Bat occurs throughout the Pilbara and upper Gascoyne regions of WA, with the Pilbara population considered to be a single interbreeding	Threatening processes: • Habitat loss and degradation. • altered hydrological regimes. • exposure to pollutants. • barbed wire fences.	Potential impacts to Pilbara Leaf-nosed bats as a result of this Project include: • loss of potential foraging and roost habitat ('rocky ridge' and 'gorge') due to clearing. • loss or abandonment of potential foraging and	• This species has not been recorded in the Development Envelope. • No Critical habitat (as defined by (DBCA et al. 2023)) identified within the Development Envelope • No caves or permanent / semi-permanent surface water pools were identified within the Development Envelope; therefore, this species is likely to	No significant residual impact expected to occur to the Pilbara Leaf- nosed Bat: • No Critical habitat (as defined by (DBCA et al. 2023) identified within the Development Envelope • The proposed removal of 622.3 ha of potential foraging habitat (within Development Envelope) for Pilbara Leaf- nosed Bat species

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	population comprising multiple colonies (Threatened Species Scientific Committee 2016). The Pilbara Leaf-nosed Bat population of the Pilbara and Gascoyne regions is considered an important population as it comprises multiple colonies that form one interbreeding population (Threatened Species Scientific Committee 2016). **Ecology** The species requires warm, humid daytime roost sites and forages in gorges along watercourses and over low spinifex-covered hills (Threatened Species Scientific Committee 2016). The breeding cycle for the Pilbara Leaf-nosed Bat occurs over a nine-month period with mating occurring in July, parturition occurring in late December or early January (following a prolonged gestation period), resulting in the young becoming independent between	• human visitation / disturbance.	roost habitat due to blasting. • direct mortality of individuals if present within the Development Envelope.	use the potential foraging habitat for the species within the Development Envelope as a foraging visitor intermittently, only.	is likely to be used as a foraging visitor intermittently, only.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	February and March (Armstrong 2001b). Foraging in a variety of habitats including the characteristic Triodia hummock grasslands of the Pilbara, the Pilbara Leaf-nosed Bat favours the highly productive and structurally complex riparian zones where water is permanently available and insect biomass is sufficiently high (Armstrong 2001a; McKenzie and Bullen 2013). Critical habitat, as defined by (DBCA *et al.* 2023) , includes permanent diurnal (categories 1 and 2) roosts that are essential for the daily and long-term survival of the Pilbara Leaf-nosed Bat; semi-permanent diurnal (category 3) roosts that are essential for the long-term survival of the Pilbara Leaf-nosed Bat; and any permanent pools close to permanent diurnal roosts. **Cultural Importance** A June 2024 on-Country Social Surrounds				

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	engagement with the Banjima People included enquiries on the cultural importance of fauna species as well as cultural appropriateness of control/mitigation methods. No specific information or concerns were raised, other than stating that all fauna are considered important.				
Northern Quoll (*Dasyurus hallucatus*) – EN / EN	**Description** The Northern Quoll is a nocturnal marsupial and the smallest of the four Australian quoll species. **Distribution** It is currently moderately common within the Pilbara and is found scattered across the four subregions of the Pilbara. (Rapallo 2022b). **Ecology** The Northern Quoll favours rocky habitats (e.g., escarpments, mesas, gorges, breakaways, boulder fields and some waterways) for shelter and breeding, with foraging occurring in adjacent vegetation. Northern Quolls have	Threatening processes: • predation by invasive fauna (e.g., feral cats and foxes) (DCCEEW 2023b). • poisoning from cane toads. • loss of suitable habitat. • altered fire regimes.	Potential impacts to the Northern Quoll as a result of this Project include: • loss of potential foraging and dispersal habitat ('medium and minor drainage, and hillcrest/hillslope habitats) due to clearing. • direct mortality of individuals if present within the Development Envelope. Indirect impacts due to increased	• The Northern Quoll has not been recorded in the Development Envelope. • The Northern Quoll was recorded approximately 5 km south of the Development Envelope within the Terrestrial Fauna Survey Area during 2012 (Rapallo 2012) indicating that a low-density population may occur in the Development Envelope surrounds, or that the records to date can be attributed to individuals dispersing from nearby populations. No evidence of the species was found during the 2020 survey (Rapallo 2022c).	The removal of 42 ha of critical habitat and 125.6 ha of supporting habitat for Northern Quoll is considered **likely to have a significant impact,** when assessed against the DCCEEW criteria and is proposed to be offset as it has the potential to: • adversely affect habitat critical to the survival of a species.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	short life spans, with males living for approximately one year and the oldest recorded female in the wild being three years of age. The species breed once each year exhibiting synchronous reproduction within each year at each site. **Cultural Importance** A June 2024 on-Country Social Surrounds engagement with the Banjima People included enquiries on the cultural importance of fauna species as well as cultural appropriateness of control/mitigation methods. No specific information or concerns were raised, other than stating that all fauna are considered important.		predation from feral animals.	• Based on the absence of records and minimal denning habitat (0.06 ha) present within the Development Envelope, it is unlikely that an important high-density population of Northern Quoll as defined by the DoE (2016c) occurs within the Development Envelope. However the Northern Quolls recorded within the Proposed Action Area are considered a low density important population based on the records occurring in habitat which is free from cane toads and is therefore considered important for the long-term survival of the Northern Quoll (Hill and Ward 2010). • No potential denning habitat for the Northern Quoll (gorges, gullies, rocky breakaways) is proposed for clearing. Clearing of up to 43.41 ha of suitable foraging and dispersal habitat (medium drainage lines)	

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
				representing 38% of the mapped extent of this habitat for the species within the broader Terrestrial Fauna Survey Area has the potential to impact this species.	
Pilbara Olive Python (*Liasis olivaceus barroni*) – VU / VU	**Description** The Pilbara Olive Python is a dull olive-brown or rich brown python with a white/cream belly that can grow up to 4 m in length. **Distribution** The subspecies is restricted to ranges in the Pilbara and is known from relatively few localities. **Ecology** The species' preferred habitat is often associated with open water, such as swamps and surface water pools. Typical habitat is found along larger waterways in environments with rocky hills, escarpments, and plains dominated by dense vegetation such grassy mounds of *Triodia*. **Cultural Importance** A June 2024 on-Country Social Surrounds	Threatening processes: • predation by invasive fauna (e.g., feral cats and foxes). • competition for food sources with invasive fauna. • habitat destruction as a result of resource project development (TSSC 2008).	Threats to the Pilbara Olive Python as a result of this Project include: • loss of potential dispersal habitat ('medium drainage system') due to clearing. • direct mortality of individuals if present within the development envelope.	• This species has not been recorded in the Development Envelope but is considered likely to occur in the Development Envelope at least as a foraging visitor. • No clearing of potential denning habitat for the Pilbara Olive Python (gorges, gullies, rocky breakaways) is proposed. • The Project will result in the clearing of up to 118.6 ha of suitable foraging and dispersal habitat (medium and minor drainage lines) representing 36.69% of the mapped extent of this habitat for the species within the broader Terrestrial Fauna Survey Area.	The proposed clearing of 118.6 ha of supporting habitat for Pilbara Olive Python is **likely to have a significant impact,** when assessed against the DCCEEW criteria and is proposed to be offset as it has the potential to adversely affect habitat critical to the survival of a species.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	engagement with the Banjima People included enquiries on the cultural importance of fauna species as well as cultural appropriateness of control/mitigation methods. No specific information or concerns were raised, other than stating that all fauna are considered important.				
Western Pebble-mound Mouse (*Pseudomys chapmani*) – P4	**Description** The Western Pebble-mound Mouse is a small, burrowing and mound building rodent. **Distribution** The species is currently restricted to the non-coastal central, eastern and southern parts of the Pilbara bioregion. **Ecology** The Western Pebble-mound Mouse lives in pebbly soils in arid tussock grassland and Acacia woodland. The species is associated with eroding sands at natural features that expose pebbles. **Cultural Importance**	Threatening processes: • loss of suitable habitat; and • predation by invasive fauna (e.g., feral cats and foxes).	Potential impacts to the Western Pebble-mound Mouse as a result of this Project include: • habitat loss due to clearing; and • direct mortality of individuals.	• This species is commonly recorded within suitable habitat throughout the Hamersley and Chichester subregions of the Pilbara bioregion. • A total of 29 Western Pebble-mound Mouse mounds have been identified within the EPBC Development Envelope and 19 of these are also within the Indicative Footprint. This represents 47.5% of the total number of mounds of this species that have been found during surveys of the area (40 mounds) most of which were deemed to be active (Rapallo 2022c).	**No significant residual impacts** to Western Pebble-mound Mouse due to habitat clearing, fragmentation or direct mortality of individuals are expected.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	The Western Pebble-mound Mouse has been reported to be of special cultural importance to the Banjima People. During the June 2024 on-Country Social Surrounds engagement presented information showing the mouse was relatively common in the area and the Project design footprint had avoided known mounds as much as practicable. Banjima did not have any additional information or further concerns to offer other than that all fauna ae considered important.			• There are numerous records of this species in the surrounding area (Rapallo 2022c). • Threats to the Western Pebble-mound Mouse as a result of this Project include habitat loss resulting from clearing, and direct mortality of individuals. • Stony plain habitat represents preferred habitat for the Western Pebble-mound Mouse; however, this habitat occurs extensively throughout the Hamersley subregion. • The Project will result in the loss of no more than 266.4 ha preferred habitat (stony plain) for this species comprising 51.5% of the mapped extent of this habitat type in the broader Terrestrial Fauna Survey Area.	
Gane's Blind Snake (*Anilios ganei*) – P1	**Description** The species grows to about 30 cm in length. The upper body is a deep	Threatening processes: • loss of suitable habitat.	Potential impacts to the Gane's Blind Snake as a result of this Project include:	• Gane's Blind Snake was not recorded in the Development Envelope during fauna surveys (Rapallo 2022c).	**No significant residual impacts** are expected to occur for this species and the Project is not expected to adversely affect the

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	grey-brown, the belly cream. **Distribution** The species is only known from a few locations and/or specimens. **Ecology** Potential habitat for this species may include the gorge, gully, breakaway, medium drainage, tussock grassland and Mulga / Corymbia spp. plain habitats. **Cultural Importance** A June 2024 on-Country Social Surrounds engagement with the Banjima People included enquiries on the cultural importance of fauna species as well as cultural appropriateness of control/mitigation methods. No specific information or concerns were raised, other than stating that all fauna are considered important.	• predation by invasive fauna (e.g., feral cats and foxes).	• habitat loss due to clearing. • direct mortality of individuals if present within the Development Envelope.	• Potentially suitable habitat for this species occurs within the Development Envelope, comprising gorge, gully, breakaway, medium drainage, tussock grassland and Mulga / Corymbia spp. plain habitats. • Suitable habitat for this species is widespread outside of the Development Envelope within the broader Terrestrial Fauna Survey Area.	conservation status of Gane's Blind Snake.
Pilbara Barking Gecko (*Underwoodisaurus seorsus*) – P2	**Description** The Pilbara Barking Gecko is a large carphodactylid gecko, with a large head, long slender limbs and digits.	Threatening processes: • loss of suitable habitat.	Potential impacts to the Pilbara Barking Gecko as a result of this Project include: • habitat loss due to clearing.	• The Pilbara Barking Gecko has not been recorded within the Development Envelope. • Potentially suitable habitat, such as gorge /	**No significant residual impacts** are expected to occur for this species and the Project is not expected to adversely affect the

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	Distribution The species is known from a few locations and/or specimens within the Hamersley Range area of the Pilbara bioregion. **Ecology** Its preferred habitat is in rocky areas and gullies. **Cultural Importance** A June 2024 on-Country Social Surrounds engagement with the Banjima People included enquiries on the cultural importance of fauna species as well as cultural appropriateness of control/mitigation methods. No specific information or concerns were raised, other than stating that all fauna are considered important.	• predation by invasive fauna (e.g., feral cats and foxes).	• direct mortality of individuals if present within the Development Envelope.	gully and breakaway habitats occur within the Development Envelope and surrounds. • Preferred habitat for this species occurs at higher elevation which would coincide with the location of the proposed pit; however, relatively limited clearing is required in this area of the Indicative Footprint, comprising 15.8% of the total hill crests and hill slopes habitats within the mapped extent in the Terrestrial Fauna Survey Area.	conservation status of the Pilbara Barking Gecko.
Grey Falcon (*Falco hypoleucos*) – VU / VU	**Description** The Grey Falcon is a compact, pale grey falcon with a heavy thick chest, long wings and dark wing tips. **Distribution** The species occurs in arid and semi-arid Australia, including the Murray-Darling Basin, Eyre Basin,	Threatening processes (TSSC 2020): • predation by invasive fauna (e.g., feral cats and foxes).	Potential impacts to the Grey Falcon as a result of this Project include: • habitat loss due to clearing. • direct mortality of individuals if present within the	• The Grey Falcon has not been recorded from the Development Envelope. • This species is considered is likely to occur in the Development Envelope occasionally while foraging (Rapallo 2022c). • Large areas of foraging habitat for this species	**No significant residual impacts** are expected to occur for this species and the Project is not expected to adversely affect the conservation status of the Grey Falcon.

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
	central Australia and Western Australia. **Ecology** Its preferred habitat is usually restricted to shrubland, grassland and wooded watercourses of arid and semi-arid regions, although it is occasionally found in open woodlands near the coast (Menkhorst *et al.* 2019). The Grey Falcon forages over timbered plains, including *Acacia* shrublands, also ranging out onto treeless plains. It nests in tall trees on watercourses (Threatened Species Scientific Committee 2020) and occasionally on man-made structures such as transmission line towers. **Cultural Importance** Further consultation is required to determine the cultural importance of this species to Traditional Owners, as well as cultural appropriateness of control/mitigation methods, if needed.	• loss of suitable habitat. • Increased temperatures in arid and semi-arid Australia (i.e., climate change).	Development Envelope.	occurs in the Development Envelope and surrounds including hills/ranges, stony plain, and lower slopes/hillslopes habitat. Preferred nesting habitat for this species occurs at higher elevation which would coincide with the location of the proposed pit; however, relatively limited clearing (50.4 ha) is required in this area of the Indicative Footprint, 15.8% of the total hill crests and hill slopes habitats within the mapped extent in the Terrestrial Fauna Survey Area.	
Peregrine Falcon (*Falco peregrinus*)	**Description**	Threatening processes:	Potential impacts to the Peregrine Falcon	• The Peregrine Falcon has not been recorded from	**No significant residual impacts** are expected to

Conservation Significant Species	Habitat Requirements, Cultural importance, Ecology and Distribution	Key Threats	Potential Project Related Impacts	Status within Development Envelope	Expected Outcome
Other specially protected species	A large falcon with a blue-grey back, barred white underparts, and a black head. Distribution The species is known to occur across Australia, but not common in any areas of its Australian range. **Ecology** The Peregrine Falcon is found in most habitats, from rainforest to arid habitats, including coastal and alpine regions. It prefers coastal and inland cliffs, or open woodlands near water. In arid areas, it is most often encountered along cliffs above rivers, ranges and wooded watercourses where it hunts birds (Johnstone and Storr 1998). This species typically nests on rocky ledges occurring on tall, vertical cliff faces between 25 m and 50 m high (Olsen and Olsen 1988). **Cultural Importance** Further consultation is required to determine the cultural importance of	• predation by invasive fauna (e.g., feral cats and foxes); • loss of suitable habitat; and • Increased temperatures in arid and semi-arid Australia (i.e., climate change).	as a result of this Project include: • habitat loss due to clearing; and • direct mortality of individuals if present within the Development Envelope.	the Development Envelope. • The Peregrine Falcon is considered uncommon in the Hamersley Range, nesting in cliff type habitat. • Peregrine Falcon forage over a wide area and would use most habitats within the Development Envelope while foraging. • Preferred nesting habitat for this species occurs at higher elevation which would coincide with the location of the proposed pit; however, relatively limited clearing (50.4 ha) is required in this area of the Indicative Footprint, 15.8% of the total hill crests and hill slopes habitats within the mapped extent in the Terrestrial Fauna Survey Area.	occur for this species and the Project is not expected to adversely affect the conservation status of the Peregrine Falcon.

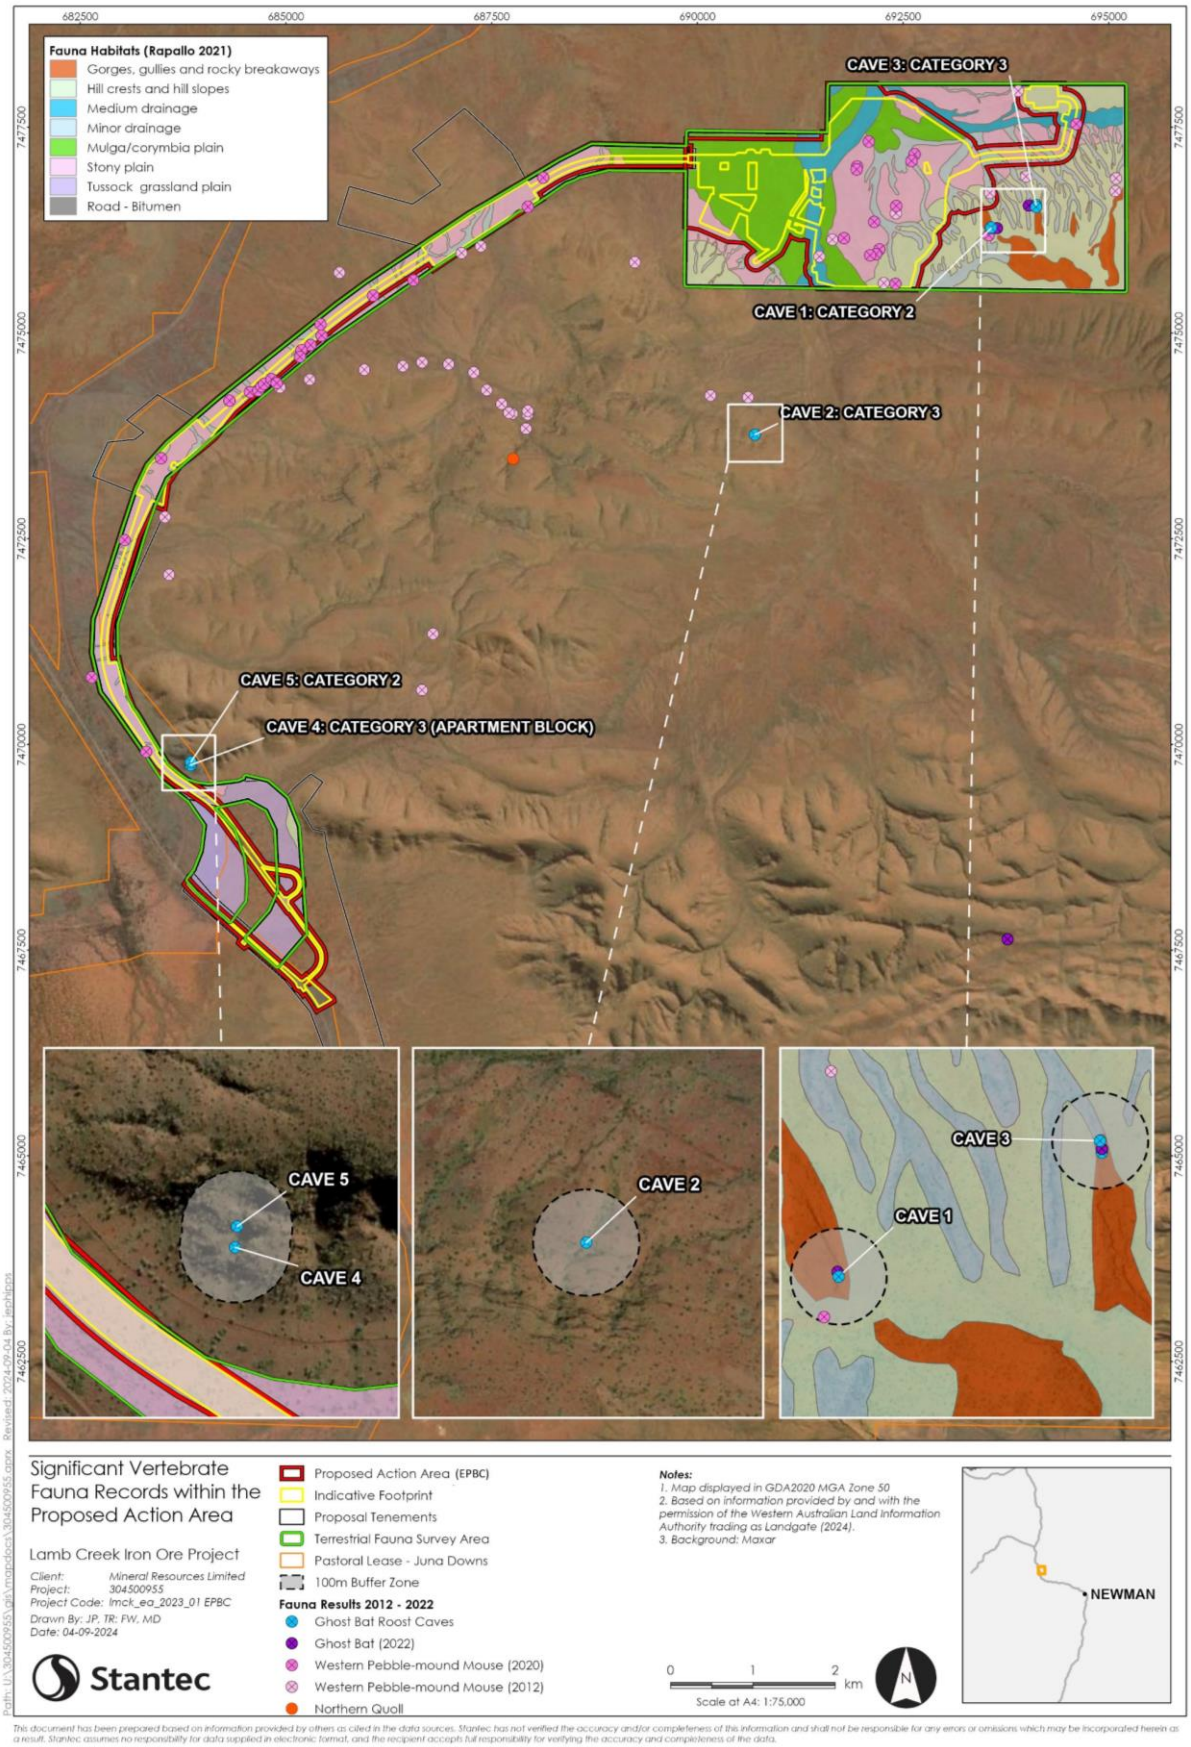

Figure 4: Ghost bat category 2 and category 3 roost caves and associated exclusion zones

2.4 KEY ASSUMPTIONS AND UNCERTAINTIES

The key assumptions and uncertainties that apply to terrestrial fauna are summarised as follows:

- It is assumed that the fauna surveys that were undertaken accurately report the distribution and status of fauna of significance, and their preferred habitats, in the Terrestrial Fauna Survey Area.
- It is assumed that the likelihood and severity of predicted impacts to terrestrial fauna are described accurately.
- The majority of significant fauna species identified are highly mobile with notably large home ranges, such that point location records for individuals represent the usage of available foraging/breeding habitat (rather than fixed permanent locations of individuals).
- It is assumed that, by applying the EPA's mitigation hierarchy (avoid, minimise, rehabilitate, offset) throughout the life of the Project, the impacts of the Project on significant species will be minimised.
- The Terrestrial Fauna Survey Areas experienced fires in recent years prior to the 2020 terrestrial fauna surveys being undertaken, and the vegetation over most of the survey area was regenerating and relatively sparse compared to unburnt conditions. This is likely to have influenced the overall diversity and abundance of species; however, where possible, trap sites were positioned in areas of unburnt habitat within the burn mosaic. Therefore, results may be conservative with regard to the presence and distribution of significant species and their habitat.
- The Project is located in the Pilbara bioregion where the presence, activity and detectability of fauna is driven by climatic conditions, particularly rainfall events. Climatic factors are outside of the Proponent's control and may impact on the health and extent of populations of significant fauna.
- Natural seasonal and spatial fluctuations of populations of significant species make it more difficult to determine whether population changes are due to natural causes or can be attributed to the Project.

2.5 POTENTIAL PROJECT IMPACTS

The Project may directly and indirectly impact on terrestrial fauna and short-range endemic (SRE) invertebrate fauna, with the potential direct impact identified as:

- clearing of native vegetation resulting in habitat loss.
- fragmentation of fauna habitat.
- fauna injury or mortality as a result of ground disturbance, machinery, blasting, vehicle strikes and entrapment.

The potential indirect impacts have been identified as:

- fauna mortality as a result of a potential increase in the prevalence of introduced species and feral predators.
- noise, vibration and/or artificial light disrupting natural foraging and breeding behaviours.
- potential decline or change in the health/composition of fauna habitat arising from dust, weeds, fire regime or hydrological regime changes.'

An assessment of the potential impacts and risks to the MNES resulting from the Project has been undertaken and is included as **Appendix D**. Results of the risk assessment have been used to develop management measures that form part of this SFMP.

2.6 APPLICATION OF THE MITIGATION HIERARCHY

Mitigation measures for potential impacts of the Project on terrestrial fauna are detailed within **Section 5.3** of the EPBC Referral Supporting Document and have been updated and consolidated within this

SFMP. Mitigation measures have focused on significant fauna, where relevant, aligning with the management provisions.

The Project will **avoid** impacts to significant fauna via the following:

- Proposed clearing has been minimised as far as practicable to reduce the extent of disturbance required; the Proponent has revised the Development Envelope from 1,399 ha to 874 ha (898 ha for EPBC).
- Placement of infrastructure in the high significance habitat of gorges, gullies and rocky breakaways has been fully avoided for example through the re-design and relocation/reduction of the northern WRL and northern topsoil stockpile. In addition disturbance of the high significance habitat of hills, ranges and plateaus has been minimised through the re-design of the access road and camp location.
- A Land Access and Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary. This includes requirements for weed hygiene to prevent introduction or spread of weeds.
- The area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager. Some heavy equipment used may have in-cab GPS mapping and alarm functions however in the absence of this functionality, pegging of clearing boundaries supplemented with other control measures such as the use of spotters and/or restricting clearing to the daylight hours will be used to prevent unauthorised clearing.
- Habitat and fauna surveys have been undertaken to identify key areas and species to avoid.
- Cave 1 to be temporarily closed during construction and operation which will eliminate risk of habitation and nursing by Ghost Bats which may be impacted from mining activity (e.g., vibration from blasting, excavation, haulage and overburden stacking). The cave structural integrity should be protected and when reopened after operations Ghost Bats are expected to return to the cave.
- No Barbed wire in new fencing will be used by the Proponent, subject to consultation with the pastoralist. If however, the pastoralist requires use of barbed wire for effective stock management, bat deflectors/reflectors between the top two strands will be used within the Project Area.
- Prohibit feeding of all fauna.
- Prohibit entry to caves, unless authorised.
- Ensure artificial lighting is not directed toward habitat of high significance.
- Demarcate areas that may not be entered by personnel and/or machinery.
- Intersection of the haul road with GNH, and an additional 100 m past the intersection, will be sealed to reduce the generation of dust.
- Road haulage iron ore loads will be covered.
- Ground clearing (including topsoil stripping) shall not be undertaken during periods of high winds (unless soil moisture levels are also elevated enough to inhibit dust formation).
- Off-road driving shall be prohibited unless authorised by management.
- Avoid hot work in fire sensitive areas and during high fire risk days.
- Haul road and Development Envelope design shall consider surface water flow to minimise obstruction to seasonal overland water flow to the loamy drainage flats proximal to the GNH.
- The Project will **minimise** impacts to terrestrial fauna via the following:
- Spatially restricted Indicative Footprint and short life of mine.
- Implement SFMP.
- Where placement of infrastructure such as the pit shell cannot avoid habitat of higher significance (e.g. drainage lines), minimise clearing as far as practicable.

- Minimise noise from vehicles / machinery and blasting etc. to avoid disturbance to roosting bats through appropriate selection of machinery reducing the number and duration of operating machines required to achieve the work.
- Replace the top strands of barbed wire in fences in the Project Area with single-strand wire, subject to consultation with pastoralist. If however the pastoralist requires use of barbed wire for effective stock management, bat deflectors/reflectors between the top two strands will be used within the Project Area
- Implement a 100 m radius exclusion zone around recorded Category 2 and Category 3 Ghost Bat roosts.
- Vehicles and equipment shall be restricted to designated roads, tracks, and cleared areas.
- Laydown areas will be situated in previously disturbed locations.
- Temporary Closure of Cave 1. Closure of Cave 1 is likely to be closed by using a lightweight steel frame fitted to the entrance and bird aviary steel netting or any heavier style with apertures not exceeding 100 mm. This would exclude Ghost bats but smaller species up to 10g such as Pilbara leaf-nosed bats (Rhinonicteris aurantia) or Finlayson's cave bat (Vespadelus finlaysoni) would be able to pass through unharmed. Other small fauna of a similar size including reptiles, frogs and snakes would also be able to access the cave. With regard to larger fauna such as Quolls, Dingoes and/or Macropod species that will be excluded by the closures, Lamb Creek Cave 1 is situated in an area with numerous alternative deep overhangs and shallow caves that are suitable for their foraging and/or resting activities. Each of these species is known to travel significant distances on a daily basis (Bat Call WA 2023a).
- Avoid providing accessible artificial water sources.
- Driving between dusk and dawn shall be minimised and light vehicle use will be limited with crews to be bused to and from camp to minimise traffic during start and end of shift.
- Machinery and vehicle movements that must be undertaken between dusk and dawn will be limited to low speeds on access tracks.
- Excavations and trenches will be kept open only as long as needed to undertake the work and egress points will be provided dependant on depth / morphology of the excavation.
- Any steep-sided holes (e.g., sumps) will be fitted with egress matting or another method of escape to avoid fauna entrapment.
- Regular inspection of all excavations and sumps shall be undertaken to minimise fauna mortality in accordance with **Table 8**.
- Native fauna shall not be fed or intentionally harmed.
- Environmental responsibility awareness training shall be delivered to all personnel as part of the induction process.
- Ensure food waste is disposed of appropriately so it cannot be accessed by fauna.
- Targeted control program to be implemented (e.g., shooting or trapping) where increased presence of feral animals are observed on site.
- Noise, vibration and artificial light awareness shall be delivered to all personnel as part of the induction process.
- Regular inspection and maintenance of vehicles and equipment shall be undertaken to ensure no excessive operating noise is experienced from faulty machinery and noise suppression equipment is operating adequately.
- Ensure blasting is undertaken during daylight hours and is strictly controlled to minimise air blast and ground vibration.
- Minimise the use of artificial lighting needed for safe operation, use directional and / or screened lighting, and when required for safety, avoid light spill onto important habitats (e.g., rocky outcrops).

- Implement the FVMP.
- Dust suppression shall be implemented to manage dust emission on cleared areas and iron ore handling areas.
- Stockyard ore product will be conditioned through addition of water to ensure dust extinguishing moisture limits are maintained (as per export license stipulations)
- Speed limits shall apply on sealed and unsealed roads.
- Blasting plans will consider meteorological conditions to minimise dust lift off.
- Dust awareness and dust management shall be delivered to all personnel as part of the induction process.
- A Weed Management Plan shall be prepared and implemented as part of the FVMP, prior to construction and operation, to control access and movement of vehicles and construction personnel to prevent the introduction and spread of weeds into the Development Envelope, weed free areas, and between work areas.
- Vehicles and equipment to be cleaned, inspected and issued with a Weed Hygiene Certificate prior to entry to site or moving between known weed infested areas on-site, (as per controls in Flora and Vegetation Management Plan).
- Weed awareness and weed hygiene shall be delivered to all personnel as part of the induction process.
- Fire management awareness shall be delivered to all personnel as part of the induction process.
- Firebreaks will be incorporated into mine layout planning in accordance with the local government firebreak notice under s. 33 of the Bush Fires Act 1954.
- Smoking will only be permitted in designated areas, which shall be appropriately signed and contain self-arresting cigarette butt disposal containers.
- An Emergency Response Plan shall be prepared and implemented.
- An Emergency Response Team shall be formed in accordance with requirements regulated by DEMIRS.
- The Emergency Response Team will ensure that sufficient fire suppression equipment is located as per the Emergency Response Plan.
- Hot Work shall be completed under a Hot Work Permit and in accordance with MRL-SAF-PRO-0081 Hot Work Procedure.
- Traffic Management Plan shall be prepared and implemented.
- All vehicles and machinery will be fitted with fire extinguishers and/or in-plant fixed water suppression.
- Implement surface and groundwater management strategies in accordance with the Surface Water Management Plan (SWMP) and Groundwater Operating Strategy (GWOS).
- The Project will **rehabilitate** impacts to terrestrial fauna via the following:
- Progressive rehabilitation of foraging habitat within close proximity of roost habitat (<2 km from Category 2 and Category 3 Ghost Bat caves).
- Drainage management structures identified as remaining post-closure shall meet recognised Australian drainage design specifications.
- The open pit will be backfilled to a minimum of 5 m above the baseline groundwater level.
- Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.
- Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved Mine Closure Plan (MCP).
- Seasonal weed control programs shall be implemented, as required.

- Weeds which are physically removed will be disposed of within the backfilled pit or waste rock landform and buried.
- Salvage and stockpile particular vegetation types, soil, or habitat features (e.g., vegetation, stumps, logs, and boulders) for use in rehabilitation programs.
- Rehabilitation shall include spatially heterogenous habitat with appropriate refuge areas to increase ability for animals to disperse between patches.
- Ensure all drill holes are capped as soon as reasonably practicable.
- The Project will **offset** impacts to terrestrial fauna via the following:
- Impacts to terrestrial fauna associated with the Proposed Action will be managed and mitigated to ensure that potential impacts to terrestrial fauna are managed to an acceptable level. Residual impacts to habitat areas from clearing and construction are proposed to be offset for 42.0 ha of critical habitat for the Northern Quoll, and 622.3 ha of supporting habitat for the Ghost Bat.

3. MANAGEMENT PROVISIONS

3.1 OVERVIEW

The SFMP outlines the requirements to avoid, minimise, manage, monitor, and rehabilitate direct and indirect impacts to significant fauna from the Project, aligning with the EPA's mitigation hierarchy. The subsequent sections identify the management provisions that will be implemented by the Proponent for the Project to ensure that the environmental objectives, criteria, targets, and outcomes are met for terrestrial fauna. Where unacceptable environmental outcomes remain post the implementation to controls measure such as permanent loss of significant species habitat, offset strategies will be proposed. The SFMP will be reviewed and updated as required, following an adaptive management approach (Section 7).

3.2 OUTCOME BASED PROVISIONS

This SFMP focuses on outcome-based provisions, which are performance-based and can be applied. The objectives developed are measurable, and the success of management actions can be monitored and reported. Outcome-based provisions specify triggers and thresholds (environmental criteria) for direct impacts that are quantifiable and specifically relate to terrestrial fauna (**Table 7**). Where required, suitable response and corrective actions are also recommended for the environmental criteria. The following outcomes-based provisions have been established:

- No unauthorised clearing within exclusion zones around recorded Category 2 and Category 3 Ghost Bat roosts.
- No statistically significant project-related increase in feral animal abundance as a result of project-related activities
- No adverse impacts to critical Ghost Bat cave (Cave 1) resulting from vibration levels from blasting activities; and
- Maintain the structural integrity of Cave 1.

3.3 OBJECTIVE-BASED PROVISIONS

Objective-based provisions relate to environmental management actions that are not specifically measurable. They specify management actions according to management targets, particularly for indirect impacts that are not quantifiable. The objective-based management provisions have been outlined in (**Table 8**) and are intended to prevent project-related adverse impacts to terrestrial fauna (including significant fauna species) within proximity to the Project with appropriate management actions and monitoring actions. The following objectives-based provisions have been established:

- No clearing of vegetation shall occur outside of the approved, demarcated clearing area(s) during construction or operation.
- Minimise Project-related direct interactions per year (e.g., vehicle strike, interaction with fencing) for significant fauna resulting in injury or mortality.
- Minimise adverse impacts to significant fauna as a result of increase in feral animal abundance.
- Minimise Project related disturbance of significant fauna from noise, vibration and artificial light.
- Minimise Project related decline to fauna habitat quality (e.g. vegetation health) due to dust, weeds, and hydrocarbon or chemical leaks and altered hydrological regimes.
- Effective operation of the Project to minimise the risk of Project related fire.

3.4 ENVIRONMENTAL CRITERIA, TARGETS AND JUSTIFICATION

The development of environmental objectives and criteria for outcome-based provisions within the SFMP are based on available data and information and align with the purpose of the SFMP. Outcome-based provisions utilise monitoring and reporting to assess against the measurable environmental criteria. In addition to these outcome-based provisions, objective-based provisions have been applied with management targets.

During monitoring, where threshold criteria (outcome-based) or management targets (objective-based) are exceeded, and are project-related, response and corrective actions are provided, and will be implemented, as appropriate. Monitoring will inform adaptive management, with the revision of environmental criteria, and response or corrective actions, as required (**Section 7**).

Justification for the management provisions outlined in the SFMP are based on the following:

- Clearing of critical habitat for significant fauna species has the potential to result in direct impacts to individuals and indirect impacts through habitat loss. The management approach focuses on minimising clearing undertaken where possible through design and the implementation of progressive rehabilitation. In addition to this, exclusion zones will be placed around recorded Category 2 and Category 3 Ghost Bat roosts within proximity to the Development Envelope.
- Feral animals are an existing key threat to significant species in the vicinity of the Project. An indicative Feral Animal Monitoring and Control Plan has been proposed within **Appendix C**. This feral animal monitoring and control program aims to reduce predation pressure on significant fauna for populations that are potentially impacted by the Project for the life of the Project. It is anticipated that monitoring will demonstrate a decrease in feral animal numbers below that of baseline levels over the duration of the control program.
- The Project has the potential to negatively impact upon the occurrence of significant species through indirect impacts, in particular vibration from blasting to bat habitat in proximity to the Development Envelope. The indicative cave closure procedure and vibration monitoring (**Appendix A**, **Appendix B**) aims to reduce potential impacts to roosting Ghost Bats in proximity to the Development Envelope and allow for Ghost Bats to return to roost at viable caves post-operations and removal of any temporary cave closure structures (where structural integrity has been retained) post mining.
- Habitat degradation through altered fire regimes, contamination or the introduction of weeds could negatively impact upon critical habitat for significant species and in some instances may increase the risk of fire. Weed introduction and spread will be managed and monitored as part of the FVMP. Mitigation to minimise the risk of project related fire within the SFMP focuses on avoidance through maintaining equipment, training, and the implementation of fire prevention practices.

Table 7: Significant Fauna Outcome-based Management provisions

EPA Factor and Objective		Terrestrial Fauna: to protect terrestrial fauna so that biological diversity and ecological integrity are maintained.

		Trigger Criteria	Threshold Criteria	Trigger Level Actions	Threshold Level Actions and Contingency Actions.			

TF1	No unauthorised clearing within exclusion zones around recorded Category 2 and Category 3 Ghost Bat roosts.	Clearing occurs within 50 m of the 100 m radius exclusion zone around recorded Category 2 and Category 3 Ghost Bat roosts.	Clearing occurs within 100 m buffer implemented around exclusion zone around recorded Category 2 and Category 3 Ghost Bat roosts.	• If unplanned clearing within 50 m of the 100 m radius exclusion zone, report internally as an incident in accordance with internal procedures.
				• Investigate details of clearing within 50 m of 100 m exclusion zone to confirm activity approved and met conditions (e.g. Land Activity Permit (LAP)).
				• If clearing not approved or conditions not adhered to, review management strategies and implement changes to prevent future occurrences
					• Undertake investigation to determine source of disturbance. If source is project-related, undertake a review to determine if impact can be minimised, develop actions to prevent recurrence and communicate findings to relevant personnel.
					• Suitably qualified person to undertake an assessment of degree of potential impact(s) resulting from the unauthorised clearing incident to significant fauna population and habitat which may include:
					  ○ Area and extent of habitat cleared.
					  ○ Monitor significant fauna population, as appropriate.
					• Undertake rehabilitation of unauthorised clearing as required, in accordance with rehabilitation procedures, with the aim
						• Monitoring of clearing register for compliance to approvals.
						• Internal audit and inspection of areas of clearing.
						• Clearing activities will be audited regularly to ensure compliance with LAP conditions, including prior to LAP close out. This includes confirmation that all clearing has been completed within the LAP boundary).
							• Post clearing
							• Post clearing
							• Post clearing
							• Annual
							•
								Regular reporting:
								• Monitoring reports- clearing register and Internal clearing permits (LAP).
								• Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER.
								• Internal incident reporting and investigation process. Report any non-compliances with the LAP and Land Clearing Procedure.
								Exceedance Reporting:
								• Trigger threshold exceedance (report in accordance with Section 5.3
								• Threshold exceedance (report in accordance with Section 5.4

EPA Factor and Objective	Terrestrial Fauna: to protect terrestrial fauna so that biological diversity and ecological integrity are maintained.

		Trigger Criteria	Threshold Criteria	Trigger Level Actions	Threshold Level Actions and Contingency Actions.			
			related structural damage occurs to Cave 1	to the cave (following appropriate safety procedures ensuring that cave structural integrity can be assessed safely by personnel). • Review management strategies and implement changes to prevent future occurrences. • Audit and review of training and staff inductions (increase staff training and awareness). • Revise monitoring schedule, accordingly, for example increase frequency of inspections, photographic monitoring and/ or LiDAR capture/ geotechnical assessment of the cave	• Undertake additional LiDAR and/or photographic recording of the cave. • The appropriate regulator will be notified within 10 days of a confirmed breach of a Management Target(s) being known, with a report provided via email including any corrective actions identified once an investigation has been completed. • A follow up report detailing the adequacy of the response actions will also be submitted to the appropriate regulator within 12 months of the initial notification or within the ACAR. • Review management strategies and implement changes to prevent future occurrences. • Undertake appropriate corrective rehabilitation of the cave in consultation with DBCA/ DWER as soon as practicable			• Internal incident reporting (in accordance with Section 5.7). Exceedance Reporting: • Trigger threshold exceedance (report in accordance with Section 5.3). • Threshold exceedance (report in accordance with Section 5.4).

Table 8: Significant Fauna Objective-based Management provisions

EPA Factor and Objective	Terrestrial Fauna: To protect terrestrial fauna so that biological diversity and ecological integrity are maintained.
Significant Fauna Values	Nine conservation significant fauna species and associated habitat recorded or considered likely to occur in the Development Envelope: • Ghost Bat (Macroderma gigas) (En, En); • Pilbara Leaf-nosed Bat (Rhinonicteris aurantia) (Vu, Vu); • Northern Quoll (Dasyurus hallucatus) (En, En); • Pilbara Olive Python (Liasis olivaceus barroni) (Vu, Vu); • Gane's Blind Snake (Anilios ganei) (P1 under the BC Act); • Pilbara Barking Gecko (Underwoodisaurus seorsus) (P2 under the BC Act); • Grey Falcon (Falco hypoleucos) (Vu, Vu); and • Peregrine Falcon (Falco peregrinus) (Other specially protected species under the BC Act).
SFMP Purpose	To avoid adverse project-related direct and indirect impacts to terrestrial vertebrate fauna including significant fauna and associated habitat.
Key Impacts and Risks	Potential risk to long term viability of local and regional populations of conservation significant fauna, due to direct impacts from clearing of native vegetation or direct and indirect impacts from mining activities (**Appendix D**)

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting

No clearing of vegetation shall occur outside of the approved, demarcated clearing area(s) during construction or operation.	High	• Implement the LAP process and Procedure.
		• Clearing awareness training is to be undertaken by all personnel involved in clearing activities, including specific information on significant fauna within the Development Envelope, the requirements for clearing, and the LAP and Land Clearing Procedure processes.
			• Visual inspections for evidence of:
			  • adherence to boundary demarcation compliance.
			  • unauthorised access or clearing (e.g., observations of vehicles or machinery, vehicle tracks, damage to fencing or vegetation).
				• During construction (pre-clearing clearing and post-clearing activities).
				• Imagery analysis annually, or as required, to monitor clearing extent.
				• As triggered.
					• Project Manager
					• Construction
					• Operations
					• Environment Manager
					• Environment Team.
						Regular reporting:
						• Monitoring reports-clearing register and Internal clearing permits.
						• Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER.
						• Internal incident reporting and investigation process. Report any non-compliances with the

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting

		• Proposed clearing has been minimised as far as practicable to reduce the extent of disturbance required; the Proponent has revised the Development Envelope from 1,399 ha to 874 ha (898 ha for EPBC).
		• A LAP and the Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary.
		• The area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager. Some heavy equipment will have in-cab GPS mapping and alarm functions, however in the absence of this functionality, other control measures such as the use of spotters and/or restricting clearing to the daylight hours could be used to prevent unauthorised clearing.
			• Monitoring of clearing register for compliance to approvals:
			  • Clearing activities will be audited regularly to ensure compliance with LAP conditions, including prior to LAP close out. This includes confirmation that all clearing has been completed within the LAP boundary.
			  • Land disturbance will be reconciled annually, as a minimum, for compliance and reporting purposes.
			• Internal incident reporting and investigation process.
						LAP and Land Clearing Procedure.
						Exceedance Reporting:
						• Management action has not been implemented (report in accordance with Section 5.5).
						• Management target has not been achieved (report in accordance with Section 5.6).

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Delineate clearing boundary areas by qualified surveyors in the field and confirmed cleared areas via survey after clearing. • Coordinates for clearing extents will be provided to the Construction Contractor. • Vehicles and equipment shall be restricted to designated roads, track and cleared areas unless authorised under a LAP.				
No statistically significant increase in feral animal abundance. as a result of project-related activities.	High	• Avoid providing accessible artificial water sources. • Prohibit feeding of all fauna. • Spatially restricted Indicative Footprint and short life of mine. • Environmental responsibility awareness training shall be delivered to all personnel as part of the induction process. • Ensure food waste is disposed of appropriately so it cannot be accessed by fauna. • Feral animal monitoring and subsequent	• Record and monitor the presence and abundance of feral fauna compared to baseline presence and abundance to determine the effectiveness of control programs. • Implement feral animal control at seasonally appropriate time. • Maintain a register of all introduced fauna sightings.	• Baseline monitoring of feral animal presence to be undertaken over 2 year period prior to and during construction and early operational activities. In accordance with (**Appendix C**) • Control programs - Opportunistically.	• Construction personnel. • Operations personnel. • Environment Manager • Environment Team.	Regular reporting: • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. • Feral animal control contractor reports. Exceedance reporting: • Management action has not been implemented (report in accordance with Section 5.5). • Management target has not been achieved (report in accordance with Section 5.6).

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		targeted control program to be implemented (**Appendix C**).				
No significant adverse impacts to significant fauna as a result of project related altered hydrological regimes.	High	Hydrological Regimes: • Haul road and Development Envelope design shall consider surface water flow to minimise obstruction to seasonal overland water flow to the loamy drainage flats proximal to the Great Northern Highway. • Implement surface and groundwater management strategies in accordance with the SWMP and GWOS. • Drainage management structures identified as remaining post closure shall meet recognised Australian drainage design specifications. • The open pit will be backfilled to a minimum of 5 m above the baseline groundwater level. • Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.	• Implement surface and groundwater monitoring as required in accordance with the Surface Water Management Plan (SWMP) and Ground Water Operating Strategy (GWOS).	• In accordance with schedule in the SWMP and GWOS. •	• Project Manager • Construction personnel. • Operations personnel • Environment Manager • Environment Team.	Regular reporting: • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. • SWMP monitoring reports. Exceedance reporting: • Management action has not been implemented (report in accordance with Section 5.5) • Management target has not been achieved (report in accordance with Section 5.6).

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
Effective operation of the Project to minimise the risk of Project related fire.	High	• Off-road driving shall be prohibited unless authorised under a LAP. • Avoid hot work in fire sensitive areas and during fire risk days. • Fire awareness shall be delivered to all personnel as part of the induction process. • Firebreaks will be incorporated into mine layout planning in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*. • Smoking will only be permitted in designated areas, which shall be appropriately signed and contain self-arresting cigarette butt disposal containers. • An Emergency Response Plan shall be prepared and implemented. • An Emergency Response Team shall be formed, in accordance with requirements regulated by DEMIRS. • The Emergency Response Team will ensure that sufficient operational fire suppression equipment is	• Inspection and maintenance of fire breaks in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*. • Regular inspection of vehicles and fire response equipment shall be undertaken.	• As required in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*. • Quarterly	• Project Manager • Construction personnel. • Operations personnel • Environment Manager • Environment Team.	Regular reporting: • Internal incident reporting, emergency response and investigation process in the event of a fire, in accordance with internal incident reporting procedure. • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. Exceedance reporting: • Management action has not been implemented (report in accordance with Section 5.5). • Management target has not been achieved (report in accordance with Section 5.6).

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		located as per the Emergency Response Plan. • A Traffic Management Plan shall be prepared and implemented. • Implement a Hot Work Permit system for high ignition risk work activities. • Regular inspection and maintenance of vehicles and equipment shall be undertaken. • All vehicles and machinery will be fitted with fire extinguishers and/or in-plant fixed water suppression, and water carts will be fitted with firefighting equipment. • All fuel stored on site is to be contained within a secure bund or other facility. • Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved MCP, following fire.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
No significant increase in project-related direct significant fauna interactions per year (e.g., vehicle strike, interaction with fencing) resulting in injury or mortality.	Low	• Develop and implement a Traffic MP. • Maintain a fauna mortality register. • Close Cave 1 prior to the critical female breeding period of October to December. • Temporary closure of Cave 1 during construction and operation to ensure no inadvertent loss of mothers and/or pups will occur in the event of mining activity (e.g., blasting, excavation, haulage, overburden stacking) in proximity to caves. • The area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager. • New fencing shall not use barbed wire, subject to consultation with pastoralist. The Proponent is committed to replacing barbed wire fences with three or four strand wire fencing in the Project area (in consultation with the	• Undertake periodic compliance checks with site speed limits. • In the event that fauna is injured during clearing, construction or operations, the animal shall be taken to an authorised veterinarian or trained wildlife carer, or if not possible, humanely euthanised in accordance with *Standard Operating Procedure: Humane Killing Of Animals Under Field Conditions* (Department of Biodiversity Conservation and Attractions 2018). • Check trenches for trapped fauna and ensuring egress points are functional.	• In accordance with section 4.2. • As triggered. • Twice daily trench inspections	• MinRes • Construction. • Operations • Environment Team.	Regular Reporting: • Record known injuries to, or deaths of, significant fauna species in the internal Conservation Significant Fauna Interaction Register as soon as possible, as the injury or death is identified. • Internal incident reporting, and investigation process in accordance with internal incident reporting procedure. • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. Exceedance Reporting: • Report significant fauna mortalities within 48 hours to DBCA in accordance with legislative requirements. • Management action has not been implemented (report in accordance with Section 5.5) • Management target has not been achieved (report in

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		Juna Downs pastoralist). If however the pastoralist requires use of barbed wire for effective stock management, bat deflectors/reflectors between the top two strands will be used within the Project Area. • Spatially restricted Indicative Footprint and short life of mine. • Implement a 100 m radius exclusion zone around recorded Category 2 and Category 3 Ghost Bat roosts. • Driving between dusk and dawn shall be minimised, for example buses to transport staff between camp and work site at shift changes. Machinery and vehicle movements that must be undertaken between dusk and dawn will be limited to low speeds (site-specific but typically 40km/h) on access tracks. • Excavations and trenches will be kept open only as long as needed to undertake the work and egress points will be provided dependant on depth /				accordance with Section 5.6) •

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		morphology of the excavation. • Any steep-sided holes (e.g., sumps) will be fitted with egress matting or another method of escape to avoid fauna entrapment. • Regular inspection of all excavations (including open trenches) shall be undertaken to minimise fauna mortality. • Environmental responsibility awareness training shall be delivered to all personnel as part of the induction process. • Vehicles and equipment shall be restricted to designated roads, tracks and cleared area, unless authorised under a LAP. • Signage will be installed along access roads to warn road users of areas where they will be entering critical fauna habitat area and will advise of applicable speed reduction. • Ensure all drill holes are capped as soon as reasonably practicable.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
Minimise project related disturbance of significant fauna from noise, vibration and artificial light.	Low	• Implement staff training to enable staff to implement procedures related to minimisation of noise, dust, vibration, and artificial light. • Avoid placement of infrastructure in any habitat of high significance. • Prohibit entry to caves, unless authorised by Management. • Undertale monitoring/inspection of Cave 1 prior to and after the first blast as per Appendix B. • Avoid placing artificial lighting in key significant fauna habitat. • As practicable while providing lighting required for safe operation, implement best practice light management (DCCEEW 2023a) within proximity to significant bat species' habitat through maintaining natural darkness in and near all significant bat species' habitats is the most effective impact mitigation method. Where lighting exists or is introduced, effective management and	• Cave closure (**Appendix A**) and vibration monitoring (**Appendix BAppendix B**). • Undertake Blast vibration monitoring for Cave 1 to ensure no disturbance to significant fauna, or degradation or loss of significant fauna habitat (Cave 1) occurs. • Photo monitoring Cave 1 **(Appendix B**) • Regular inspection and maintenance of vehicles and equipment shall be undertaken.	• In accordance with **Appendix A.** • In accordance with **Appendix B**. • Quarterly during first year, six-monthly thereafter if no change • Daily	• Construction. • Operations. • Environment Team.	Regular Reporting: • Internal incident reporting, and investigation process in accordance with internal incident reporting procedure. • Noise and vibration monitoring reporting. • Submit an annual compliance assessment report as part of the Annual Environment Report to the DWER. Exceedance Reporting: • Management action has not been implemented (report in accordance with Section 5.5). • Management target has not been achieved (report in accordance with Section 5.6).

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		mitigation approaches to reduce potential impacts to may include: • maintaining dark roost sites. • creating dark corridors from roosts to foraging/watering sites. • keeping light intensities low and redirecting light away from habitats. • longer wavelength (red) artificial light appears to have the least impact on several bat species. • Demarcate areas that may not be entered by personnel and/or machinery. • Noise, vibration and artificial light awareness training shall be delivered to all personnel as part of the induction process. • Regular inspection and maintenance of vehicles and equipment shall be undertaken. • Ensure blasting is undertaken during daylight hours and is strictly controlled to				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		minimise air blast and ground vibration. • Minimise the use of artificial lighting needed for safe operation, use directional and / or screened lighting, and when required for safety, avoid light spill onto important habitats (e.g., rocky outcrops). • As practicable while providing lighting required for safe operation, adhere to DCCEEW (2023a) Light pollution guidelines best practice lighting design to minimise potential impacts from artificial light sources to significant fauna by incorporating the following design principles: • start with natural darkness and only add light for specific purposes. • use adaptive light controls to manage light timing, intensity and colour. • light only the object or area intended – keep lights close to the ground, directed, and shielded to avoid light spill.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• use the lowest intensity lighting appropriate for the task. • use non-reflective, dark-coloured surfaces. • use lights with reduced or filtered blue, violet and ultraviolet wavelengths.				

Minimise project related decline to fauna habitat due to dust, weeds, and hydrocarbon or chemical leaks and altered hydrological regimes.	Low	Dust Management:
		• Intersection of the haul road with Great Northern Highway, and an additional 100 m past the intersection, will be sealed to reduce the generation of dust.
		• Road haulage iron ore loads will be covered.
		• Ground clearing (including topsoil stripping) shall not be undertaken during periods of high wind (unless soil moisture levels are also elevated enough to inhibit dust formation).
		• A LAP and the Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary.
			• Monitoring of daily wind conditions will be taken into consideration when planning clearing or blasting activities.
			• Visual assessment of dust suppression performance
			• Bi-annual monitoring of the presence and abundance of weeds compared to baseline presence and abundance to determine the effectiveness of control programs.
				• Daily
				• Daily
				• Bi-annual
					• Construction.
					• Construction
					• Operations.
						Regular Reporting:
						• Internal incident reporting, and investigation process in accordance with internal incident reporting procedure for example:
						  • Excessive dust
						  • New weed species and/or new occurrences of existing weed species are recorded.
						  • Vehicles reported outside authorised areas/ tracks.
						• Dust monitoring reporting.
						• Biannual weed monitoring reporting.
						• Submit an annual compliance assessment report as part of the Annual

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Spatially restricted Indicative Footprint and short life of mine. • Vehicles and equipment shall be restricted to designated roads, tracks and cleared areas unless authorised under a LAP. • Dust suppression shall be implemented to manage dust emission on cleared areas and iron ore handling areas. This will be visually assessed on an ongoing basis. • Reduced speed limits to be applied on unsealed roads (site-specific but typically 40 kph). • Blasting plans will consider meteorological conditions to minimise dust lift off. • Dust awareness training shall be delivered to all personnel as part of the induction process. • Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved MCP.				Environment Report to the DWER. Exceedance Reporting: • Management action has not been implemented (refer to Section 5.5). • Management target has not been achieved (refer to Section 5.6)

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable. Weed Management: • A LAP and the Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary. • A Weed Management Plan shall be prepared and implemented as part of the FVMP, prior to construction and operation, to control access and movement of vehicles and construction personnel to prevent the introduction and spread of weeds into the Development Envelope, weed free areas, and between work areas. • Vehicles with ground engaging equipment to be cleaned, inspected and issued with a Weed Hygiene Certificate prior to entry to site or moving between areas with known weed infestations on-site.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Vehicles and equipment shall be restricted to designated roads, tracks and cleared areas, unless authorised under a LAP. • Weed awareness and weed hygiene training shall be delivered to all personnel as part of the induction process. • Regular inspection and maintenance of vehicles and equipment shall be undertaken. • Seasonal weed control programs shall be implemented, including herbicide spraying or physical removal, in accordance with the FVMP. • Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable. • Hydrocarbon or chemical spill management: Hydrocarbon and/or chemical leaks and spills (expected to be rare) will be managed using bunding techniques, leak detection mechanisms and spill kits to restrict impacts.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Spill response equipment available (including on all Haul Trucks). • Spill response training for all personnel and contractors. • Dedicated workshop for maintenance. • Maintain high standard of housekeeping around processing plant. • Prevent chemical / hydrocarbon spill from spreading to native vegetation. • Management of sites as per the Contaminated Site Act 2003. • Develop and implement a Hazardous Substances Management Plan (HSMP) and Procedure. • Develop and implement an Emergency Response Plan. • Develop and implement a Spill Response Plan. • Develop and implement a Controlled Waste Management Procedure. • Develop and implement a Contaminated Sites Register. • Develop and implement a Waste Management Procedure.				

Management Targets	Management Priority	Management Actions	Monitoring	Timing	Responsible	Reporting
		• Routinely check sumps for fauna. •				

4. MONITORING AND EVALUATION

A monitoring schedule has been developed with performance targets (**Table 9**) to assess the effectiveness of the management measures outlined in this SFMP (**Section 4**). The performance targets have been aligned with the outcomes-based objectives and associated environmental criteria, with associated measurement parameters, monitoring frequencies and responsibilities.

In addition to the monitoring schedule, Monitoring Programs have been developed to align with the SFMP and are presented in **Appendix B** and **Appendix C.** Monitoring has been developed to achieve the following objectives:

- Monitor the success of mitigation and management measures in the SFMP and detect potential impacts to significant fauna and habitat.
- Evaluate effectiveness and monitor for exceedance against trigger, threshold, and management target criteria (management provisions).
- Assess the effectiveness of the environmental criteria to inform adaptive management and revision where required.

Table 9: Monitoring Schedule

Management Targets	Monitoring Event	Monitoring Action	Timing	Responsibility
No clearing of vegetation shall occur outside of the approved, demarcated clearing area(s) during construction or operation.	Clearing inspections	Visual inspections for evidence of: • adherence to boundary demarcation compliance. • unauthorised access or clearing (e.g., observations of vehicles or machinery, vehicle tracks, damage to fencing or vegetation).	During clearing, construction, pre-clearing and post-clearing activities.	Manager Environment. Staff and contractors.
		Monitoring of clearing register for compliance to approvals: • clearing activities will be audited regularly to ensure compliance with LAP conditions, including prior to LAP close out. This includes confirmation that all clearing has been completed within the LAP boundary. • Land disturbance will be reconciled annually, as a minimum, for compliance and reporting. •	Imagery analysis annually, or as required, to monitor clearing extent.	
		Internal incident reporting and investigation process	As triggered.	
No significant increase in Project-related direct significant fauna interactions per year (e.g., vehicle strike, interaction with fencing) resulting in injury or mortality.	Signage	Undertake periodic compliance checks with site speed limits.	Quarterly signage inspections.	Manager Environment. All staff and contractors. Suitably qualified persons, as required.
	Fauna mortality or injury register	In the event that fauna is injured during clearing, construction or operations, the animal shall be taken to an authorised veterinarian or trained wildlife carer, or if not possible, humanely euthanised in accordance with Standard Operating Procedure: Humane Killing Of Animals Under	In accordance with Section 4.2	

		Field Conditions (Department of Biodiversity Conservation and Attractions 2018)		
	Trench inspections	Check trenches for trapped fauna and ensuring egress points are functional.	Twice daily trench inspection	
No statistically significant increase in feral animal abundance as a result of Project related activities.	Feral fauna monitoring	Record and monitor the presence and abundance of feral fauna compared to baseline presence and abundance to determine the effectiveness of control programs.	Baseline monitoring undertaken over 2 consecutive years prior to and during early construction activities.	Manager Environment. Environment Team. Suitably qualified person, as required.
	Feral fauna control	Implement feral fauna control at seasonally appropriate time	In accordance with **Appendix C**.	
	Introduced fauna register	Maintain a register of all introduced fauna sightings.	Opportunistically (i.e. when observed).	
Minimise Project related disturbance of significant fauna from noise, vibration and artificial light.	Vibration monitoring	Cave closure (**Appendix A**) and vibration monitoring (**Appendix B**).	In accordance **Appendix A.**	Manager Environment. Environment Team. Project Manager.
		Undertake Blast vibration monitoring for Cave 1 to ensure no disturbance to significant fauna, or degradation or loss of significant fauna habitat (Cave 1) occurs.	In accordance with **Appendix B**.	
	Photo monitoring	Photo monitoring Cave 1	As per **Appendix B.**	
Minimise Project related decline to fauna habitat due to dust, weeds, and hydrocarbon or chemical leaks and altered hydrological regimes.	Dust monitoring	Monitoring of daily wind conditions will be taken into consideration when planning clearing or blasting activities.	Daily.	Manager Environment. Environment Team.
	Weed monitoring	Bi-annual monitoring of the presence and abundance of weeds compared to baseline presence and abundance to determine the effectiveness of control programs.	Biannual. As per Flora and Vegetation Management Plan	

	Surface and groundwater monitoring	Implement surface and groundwater monitoring as required in accordance with the Surface Water Management Plan (SWMP) and Ground Water Operating Strategy (GWOS).	In accordance with schedule in the SWMP and GWOS.	
Effective operation of the Project to minimise the risk of Project related fire.	Routine fire inspection	Inspection and maintenance of fire breaks in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*.	As required in accordance with the local government firebreak notice under s. 33 of the *Bush Fires Act 1954*.	Manager Environment. Environment Team.
		Regular inspection of vehicles and fire response equipment shall be undertaken.	Quarterly.	
Maintain Structural integrity of Cave 1	Cave monitoring	Photographic, geotechnical assessment monitoring of Cave 1	As per Appendix B.	Manager Environment Environment Team

4.1 ENVIRONMENTAL AUDITS

In accordance with the Proponent's Environmental Management System (EMS), an audit of implementation of this SFMP will be completed annually. The key requirements of this SFMP audit include:

- Assessment of compliance of all SFMP components.
- Evaluation of performance against SFMP provisions.
- Assessment of adequacy of management actions, response actions and monitoring.
- Review of management actions, response actions and monitoring as required in order to meet the purpose and objectives of this SFMP.
- Additional audit(s) in response to significant incidents of non-conformance.

SFMP audits shall be conducted by personnel trained and competent in the use of the audit tool and have expertise in the area being audited. Results of all audits will be communicated and discussed at project management review meetings.

4.2 CAPTURE AND RELEASE

Should capture and release be required, it is important that any capture and release is undertaken by qualified licensed personal in accordance with relevant DBCA standard operating procedures (SOPs) such as:

- Transport and temporary holding of wildlife SOP No: SC22-11 (DBCA 2023b)
- Cage traps for live capture of terrestrial vertebrates SOP No: SC22-07(DBCA 2023a)
- Animal handling and restraint using soft containment SOP No: SC22-12
- Hand capture of wildlife SOP No: SC22-12 (DBCA 2022c)(DBCA 2022)
- Hand restraint of wildlife (DBCA 2017b)
- Care of evicted pouch young SOP No.SC22-16 (DBCA 2023c)

An appropriate DBCA fauna license will be required to undertake capture and release.

4.3 INJURED FAUNA MANAGEMENT FOR SIGNIFICANT FAUNA

In unlikely event that an injured significant fauna individual is found, an assessment needs to be undertaken to determine if the fauna is safe to approach. If capture is necessary, the following management actions will be undertaken by a qualified fauna handler:

- If handling is the preferred method, safely confine (wrap the animal in towel and place in cardboard box) ensuring the animal can breathe.
- Keep box closed but not sealed to allow for ventilation and place box in a dry, warm, dark and quiet place.
- The DBCA (2023b) – Standard Operating Procedure (SOP) Transport and Temporary Holding of Wildlife procedure will be adhered to if the injured animal is to be transported:
  - Where transportation of the injured animal is to occur on foot or vehicle.
  - Individuals shall be kept within a box with ventilation for secure transport.
  - Temperature of vehicle will not exceed 25 degrees Celsius during transportation.
- First response wound management will be undertaken in accordance with DBCA (2017a) - SOP First aid for animals:

- Due to the remote location of the Project any medical attention required to the animal is to be assessed on a case-by-case basis in consultation with the fauna handler, a veterinarian and the Environment Manager.
- In the event the animal is injured (or is dependent young) and is not able to be re-released (based on veterinarian advice), the DBCA shall be consulted for rehabilitation options.
- No relocation of nests or rehabilitated fauna individuals is to occur (unless in extenuating circumstances where prior consultation has occurred with EPA, DCCEEW and DBCA and approval and a permit to handle and move significant fauna has been granted).
- Euthanasia of an animal will only be undertaken under the instruction of a veterinarian, however, DBCA (2018) - SOP Human Killing of Animals under Field Conditions will be considered, where appropriate.

5. REPORTING PROVISIONS

5.1 ANNUAL REPORTING

Annual compliance reporting will be undertaken for the Project in line with regulatory requirements and relevant guidance documentation, including the preparation of an AER and CAR. The annual reports will document compliance with Project approval conditions, as well as requirements stipulated in this SFMP.

5.2 EXCEEDANCE REPORTING

The following exceedance reporting will be undertaken if a trigger (**Section 5.3**) or Threshold (**Section 5.4**) exceedance occurs or a management action has not been implemented (**Section 5.5**) or management target has not been achieved (**Section 5.6**) in accordance with the SFMP.

5.3 TRIGGER EXCEEDANCE

- Trigger exceedance will be reported promptly in accordance with internal procedures (prior to the end of shift the following day) and reported to appropriate management staff.
- Investigate to determine the cause of the trigger exceedance.
- Internal reporting and communication of corrective actions to be implemented that eliminate or reduce the likelihood of recurrence.

5.4 THRESHOLD EXCEEDANCE

- Notify the CEO of the DWER in writing within 10 days of identifying and confirming the threshold exceedance, with a report provided via email including any corrective actions identified once an investigation has been completed.
- Investigate to determine the cause of the threshold exceedance.
- Investigate to determine the potential environmental harm or alteration of the environment that occurred as a result of the threshold exceedance.
- A follow up report detailing the adequacy of the response actions will also be submitted to the DWER within 12 months of the initial notification or within the ACAR.

5.5 MANAGEMENT ACTION HAS NOT BEEN IMPLEMENTED

- Notify the CEO of the DWER in writing within 10 days of identifying and confirming the failure to implement a management action, with a report provided via email including any corrective actions identified once an investigation has been completed.
- Investigate to determine the cause of the management action not being implemented.
- Investigate to determine the potential environmental harm or alteration of the environment that occurred due to the failure to implement the management action(s).
- Provide a report to the CEO including any corrective actions identified, within 21 days of the initial notification of failure to implement a management action being identified.

5.6 MANAGEMENT TARGET HAS NOT BEEN ACHIEVED

- Notify the CEO of DWER in writing within 21 days of identifying and confirming the non-achievement of the target.
- Investigate to determine the cause of the management target not being achieved.

- Provide a report to the CEO within 90 days of the non-achievement of the target being reported.
- The report shall include:
  - the cause(s) of the management targets not being achieved.
  - details of revised and/or additional management actions to be implemented to prevent reoccurrence of management target(s) not being met.
  - appropriate changes to Project activities/ corrective actions required.

5.7 INCIDENT REPORTING

Environmental incidents will be promptly reported in accordance with internal procedures and reported to appropriate management staff. Corrective actions, when appropriate, will also be developed and implemented that eliminate or reduce the likelihood of recurrence.

The minimum standards required in respect to non-conformance and corrective actions are to:

- Define and document what classifications of incidents and non-conformances are reportable to:
  - internal management.
  - contractors, suppliers and vendors.
  - regulatory authorities.
  - other external stakeholders.
- Report environmental incidents and non-conformances in line with established procedures and applicable legal and other obligations.
- Investigate incidents and non-conformance such that the root cause can be determined.
- Implement corrective actions that address the root cause(s) of the incidents and non-conformances that aim to eliminate or improve response capabilities to prevent reoccurrence.
- Retain documentation as evidence.

6. ROLES AND RESPONSIBILITIES

MinRes will ensure that all personnel and contractors are responsible for ensuring they comply with the company's environmental management requirements and that any action or inaction on their part does not result in harm to the environment. Delegation of responsibilities may occur to ensure that environmental management activities are coordinated at an appropriate level; however, accountability remains with the person designated those responsibilities. MinRes also expects this general principle of line management accountability to apply to all its contractors. Roles and responsibilities have been designated to ensure that environmental management requirements within this SFMP are met. The key personnel involved in implementation of the SFMP, and their roles and responsibilities are listed in Table 10.

Table 10: Roles and Responsibilities

Role	Responsibility

MinRes	• Overall responsibility for implementing this SFMP.
	• Ensure the development and implementation of procedures and plans in the SFMP:
	  • Hazardous Substances Management Plan (HSMP) and Procedure.
	  • Emergency Response Plan.
	  • Spill Response Plan.
	  • Controlled Waste Management Procedure.
	  • Contaminated Sites Register.
	  • Waste Management Procedure.
	  • Traffic Management Plan
	  • Emergency Response Plan
	  • Weed Management Plan
	  • FVMP.
	  • Audit and compliance checks.
	  • Engagement with Traditional Owners.

Project Manager (may delegate all or part responsibility to an appropriately qualified person)	• Ensure construction and operational activities are implemented by employees (inclusive of contractors) in accordance with the SFMP
Manager Environment (may delegate all or part responsibility to an appropriately qualified person)	• Obtain relevant approvals from regulatory agencies for disturbance as required. • Undertake Monitoring in accordance with the SFMP. • Incident Reporting and Monitoring in accordance with the SFMP. • Maintain clearing register to ensure compliance with approvals. • Undertake internal audits and inspections of clearing areas and compliance with SFMP. • Implement and maintain the SFMP, review its effectiveness and review the implementation as required. • Undertake training and inductions of personnel in accordance with the SFMP. • Liaise with stakeholders and technical experts for advice and resolution of management aspects/objectives as required. • Engagement with Traditional Owners. • Report as required to regulating authorities.
Employees (inclusive of contractors)	• Complete induction prior to commencement of work on site. • Toolbox. • Training. • Comply with requirements in SFMP. • Stop works if impact to the environment is suspected or known. • Report any environmental concerns, opportunities for improvement, near misses or incidents to their supervisor ASAP.

7. ADAPTIVE MANAGEMENT AND REVIEW

Adaptive management practices will be implemented where change to management practices and monitoring may lead to more effective environmental outcomes. The adaptive management approach may include the following components:

- Evaluation of the management actions and targets:
  - if monitoring results or audits indicate that management objectives are not being achieved.
  - if new information is discovered during construction, operations or closure.
  - where any significant changes to Project design or operation have occurred.
- Evaluation of assumptions and uncertainties following further significant fauna monitoring and management.
- Review of data and information gathered over the review period that has increased understanding of the environment in the context of the regional ecosystem.
- Review of Management Actions as the Project progresses, and new management measures and technologies become available that may be more effective for significant fauna management.
- Assessment of changes which are outside the control of the Proponent (i.e., a new project within the area or region, regional change affecting significant fauna management) and the revised management measures identified.
- Amendment to the monitoring program.

7.1 REVIEW OF THIS SFMP

This SFMP will be reviewed periodically during the phases (construction, operations and into closure), nominally once every 2 years. Other occasions when this SFMP will be reviewed include:

- Upon significant changes to the Project activities or upon significant changes to key environmental values identified in this SFMP.
- Following non-compliances or environmental incidents related to significant fauna management.
- If one or more management targets or performance indicators are not being met and adaptive management is required.
- Upon regulatory approval of the Project by the DWER and the Department of Mines, Industry Regulation and Safety (DMIRS).

The review process will ensure that this SFMP remains current and adheres to regulatory requirements and the provisions of this SFMP. Any significant changes to this SFMP will be referred to the DWER for approval prior to implementation of such changes.

8. STAKEHOLDER CONSULTATION

The Proponent is committed to ongoing stakeholder engagement and communication through all stages of the Project.

8.1 ENGAGEMENT

Stakeholder engagement for the Project commenced in 2012 and specific stakeholder engagement activities undertaken have included:

- Briefings and presentations with key regulatory authorities and potentially affected parties to provide information on the Project, planned studies and request feedback.
- Face to face meetings, telephone calls and written correspondence with potentially affected stakeholders to provide updates on the Project and obtain additional feedback.
- Specifically, consultation between MinRes and the Banjima People, through the body corporate Banjima Native Title Aboriginal Corporation (BNTAC) and their consultants, regarding the preparation of various environmental regulatory approvals (State and Commonwealth) has been conducted, including reviews of this SFMP. Feedback from these engagements has been incorporated into the approval submission documents and this SFMP.

Through the variety of engagement forums, the Proponent has been able to identify the required studies and investigations and, importantly, key environmental and socials impacts, and associated mitigation strategies required to support the Project, to ensure the Project aligns with expectations. A detailed summary of stakeholder communications is provided in Chapter 3 of the EPBC Preliminary Document.

8.2 KEY STAKEHOLDERS

The Proponent has identified key Project stakeholders, and these are listed in **Table 11.**

Table 11: Key Stakeholders for the Project

Stakeholder Sector	Organisation
Australian Government Agencies	Department of Climate Change, Energy, the Environment and Water
State Government Agencies & Members of Parliament	Department of Biodiversity, Conservation and Attractions
	Department of Jobs, Tourism, Science and Innovation
	Department of Energy, Mines, Industry Regulation and Safety
	Department of Planning, Lands and Heritage
	Department of the Premier and Cabinet (Ministers for Water and Environment)
	Department of Primary Industries and Regional Development
	Department of Transport
	Department of Water and Environmental Regulation - Environmental Protection Authority services
	Department of Water and Environmental Regulation
	Development WA
	Environmental Protection Authority

Stakeholder Sector	Organisation
	Main Roads WA
	Pilbara Port Authority
	Alinta Energy
Local Government	Shire of East Pilbara
Traditional Owners	Banjima Native Title Aboriginal Corporation
	Martidja Banyjima (MIB) – Karijini Development Pty Ltd
Corporate and Community	Rio Tinto/Juna Downs Pastoral Lease
	Bird Life Western Australia
	BHP
	Wildflower Society of Western Australia
	Conservation Council of Western Australia
	Wilderness Society

APPENDIX A
CAVE CLOSURE AND CAVE DISRUPTION PROTOCOL

Appendix A Cave Closure and Cave Disruption Protocol

A.1 Background

A conservative protocol (Cave Closure and Cave Disruption Protocol) is recommended by Bat Call WA (2023a) to protect reproducing Ghost Bat females and their young during the most important part of their reproductive cycle. This covers the periods when:

- Gravid females are subject to premature birth due to either capture and handling or repeated flushing of the bats from their diurnal roost caves.
- Females carrying newborns are subject to dropping them due to capture or disturbance.
- Non-volant young in nurseries are subject to abandonment due to repeated disturbance of the mothers.
- Newly volant young during the early adolescent period are subject to premature abandonment due to repeated disturbance of the mothers and/or young.

For Ghost Bat category 1, category 2, and category 3 roost caves (**Figure 4**) that are part of an important cave grouping, the following cave disturbance protocols will be followed as recommended by Bat Call WA (2023a) :

1. Surveys with higher disturbance to Ghost Bats (i.e., when Ghost Bats are captured, or are present and are disturbed) will be limited to once per cave during August, September, and January.
2. Multiple lower disturbance survey entries per cave are allowed in August, September, and January. The surveys should be done by one ecologist working quietly to minimise stressing the bats present and hopefully not flushing them from the cave. If a Ghost Bat(s) is disturbed and flushed from the cave, the caves and their entrance areas should be vacated to allow the bat(s) to return and settle. Restrictions per item 1 above then apply.
3. No cave entries should be carried out in October, November and December, including entry to inspect caves within the potential impact zone of a drilling/blasting program. Any damage assessments required during blasting operations in this time period should be carried out from the cave entrance.
4. Where category 2 and 3 caves are within the impact zone of a drilling/blasting program (Cave 1 as shown in **Figure 4**), and after it is proven that there are no Ghost Bats inside, the caves may be temporarily sealed prior to 1 October and remain inaccessible to Ghost Bat throughout the female's reproductive period.

A.2 Procedure for Temporary Closure of Cave 1

The methodology for closure of Cave 1 will be developed in consultation with DBCA. However, it is anticipated that the closure of Cave 1 is likely to be temporarily closed by using a lightweight steel frame fitted to the entrance and bird aviary steel netting or any heavier style with apertures not exceeding 100 mm. This would exclude Ghost bats from entering the cave but smaller species up to 10g such as Pilbara leaf-nosed bats (*Rhinonicteris aurantia*) or Finlayson's cave bat (*Vespadelus finlaysoni*) would be able to pass through unharmed. Other small fauna of a similar size including reptiles, frogs and snakes would also be able to access the cave. With regard to larger fauna such as Quolls, Dingoes and/or Macropod species that will be excluded by the closures, Cave 1 is situated in an area with numerous alternative deep overhangs and shallow caves that are suitable for their foraging and/or resting activities. Each of these species is known to travel significant distances on a daily basis (Bat Call WA 2023a).

Cave closure is viable as there is Ghost Bat habitat in close proximity (within 25 km to the east, south and west of the Development Envelope) that will allow the bats to relocate during mining operations and return to the retained caves once mining is complete (Bat Call WA 2023a). Experience at other Iron Ore mines has shown that Ghost Bats return to roost at viable caves that have been (structurally) retained after several years (Bat Call WA 2021b; Bullen and Creese 2014). The cave will remain closed for the life of mine (approximately 3 years) then reopened after completion of mining.

APPENDIX B
VIBRATION MONITORING

Appendix B Vibration Monitoring

Ground vibrations as a result of the release of explosive energy from the blasting process can spread through adjacent rock and soil to surrounding structures, slopes, and benches. Vibration monitoring is to be undertaken at Cave 1 to ensure the structural integrity of the cave is maintained during the blasting process.

Methods for vibration monitoring will be determined in consultation with DBCA to ensure that there is no impact to the cave's structural integrity.

Additional noise monitoring will not be required as the cave will be closed in accordance with the procedure outlined in **Appendix A** of this SFMP and no Ghost Bats will be present within the cave during blasting operations.

The following indicative methodology is proposed:

- A permanent location for vibration monitoring will be established at Cave 1 as close as possible to the nearest part of the cave to the pit, as confirmed through survey pickup.
- Vibration will be measured at the monitoring location at Cave 1 prior to and during each blast (monitoring equipment with data logger). Vibration data loggers will be connected via telemetry with appropriate safety procedures and protocols developed and implemented prior to vibration monitoring being undertaken.
- All monitoring equipment used will be in accordance with the Australian Standard for Blast Monitoring (AS2187.2-2006) which provides guidelines for the type of equipment required to monitor ground vibration (peak particle velocity, or PPV).
- The Proponent has conducted a geotechnical assessment, including peak particle velocity (PPV) analysis of Cave 1 indicating that the conservative limit of 25 mm/sec PPV (Bat Call WA 2023a) will ensure that the structural integrity of the cave will not be affected by the modelled vibration from blasting. Modelled predictions will require calibration for actual on-site conditions throughout the blasting process. This will be achieved by the blasting engineer comparing the results of initial blasts with the predictions of the model.
- Cave inspections to be undertaken before and after the first blast in the pit to assess for any signs of instability. This would include a geotechnical photographing structural assessment. Subsequent to these initial visitations drone surveys would be undertaken quarterly to monitor the structural integrity of the cave during the first year and six-monthly thereafter if conditions are unchanged. Additional cave inspections to be conducted if Trigger or Threshold PPV limits exceeded, as per **Table 6** in the SFMP.
- Develop appropriate safety procedures ensuring that cave structural integrity can be assessed safely by personnel.

APPENDIX C
FERAL ANIMAL MONITORING AND CONTROL PLAN

Appendix C Feral Animal Monitoring and Control Plan

C.1 Background

Feral and pest fauna, specifically feral cats and foxes have been implicated in the significant decline of multiple species of vertebrate fauna (DEWHA 2008b;c). Feral animal monitoring will be undertaken to monitor for a potential increase in the numbers of feral animals.

A detailed feral animal monitoring plan design will be completed in consultation with DBCA.

C.2 Feral Animal Monitoring

It is anticipated that annual population monitoring of introduced fauna will consist of the following:

- Deployment of cameras to establish baseline numbers. The Proponent proposes to establish baseline feral animal numbers over a two-year period prior to and during construction and early operations.
- Quantitative and systematic recording of introduced animals undertaken through the deployment of cameras at permanent locations within the Project Area will be identified with star pickets as follows:
    - Monitoring for feral animal presence will be undertaken on a quarterly basis.
    - Feral animal monitoring will be undertaken at control sites (those with the potential to be impacted by the Project) and reference locations (not impacted by the Project). Areas with the potential to attract feral animals such as the camp, waste storage facilities and key infrastructure areas will be a focus for monitoring.
    - Opportunistic visual observations whereby site personnel and contractors will be required to record sightings of feral animals at the site, including date, time, location and species. Those observations will be considered in relation to the annual monitoring results, to inform management of site activities.

C.3 Reporting

The results of feral animal monitoring and control activities will be summarised in the Proponent's Annual Environmental Report**.**

The feral animal monitoring report will include a summary of results of systematic monitoring and recording of opportunistic sightings of introduced fauna (e.g. feral cats and foxes), through annual monitoring, feral animal control reports and incident reports.

C.4 Review

Results of the monitoring program will be reviewed annually. Where required, modifications to the program will be implemented to achieve the stated targets. Details of material changes to the feral animal management approach will be described in the Annual Environment Report.

C.5 Feral Animal Control Program

The feral animal control program will be undertaken annually within areas potentially impacted by the Project with a focus on:

- Areas where significant fauna have been recorded in proximity to the Project Area.
- Areas likely to attract feral animals, for example the camp, waste facilities, areas with accessible water and key infrastructure areas.

Feral animal control will include appropriate measures to control feral animals, as required, and may include:

- Baiting.
- Shooting.
- Grooming traps.
- Trapping.

C.6 Licences:

Depending on the method of feral animal control, different licences and permits are likely to be required. This may include, but not be limited to:

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

- Department of Health 1080 landholder application and permit.
- DPIRD License to Use Animals for Scientific Purposes.
- DPIRD Wildlife Animal Ethics Committee animal ethics permit.
- DBCA Fauna Licence approval.
- DBCA 1080 risk assessment and no toxic trial (Grooming traps).

C.7 Measurable outcomes

The success of the feral and pest animal reduction program will be measured by changes (decline) in feral animal presence recorded over time. It is anticipated that the feral animal monitoring and control program will reduce predation pressure of foxes and feral cats within proximity to the Project and should see an increase in the abundance of native vertebrate fauna species.

C.8 Reporting

The specialist contractors undertaking the feral and pest animal reduction program will provide a written report at the conclusion of each control program. The report will include the following sections: methods, results, discussion and recommendations.

This report will quantify the outcomes of feral animal control undertaken. The results of the control activities will be summarised in the annual environmental reports.

Contractor reports will be available upon request.

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

APPENDIX D
RISK ASSESSMENT

Appendix D Risk Assessment

A qualitative risk assessment was conducted in accordance with the Environmental Management Plan Guidelines (Commonwealth of Australia 2014) to assess the risks of the Project and is shown in **Table D 2**. Each environmental risk identified has been provided a likelihood and consequence rating using the criteria in **Table D 1** below to generate a risk rating of low, medium, high or severe.

Table D 1: RISK ASSESSMENT CRITERIA

	Consequence				
Likelihood	**Minor**	**Moderate**	**High**	**Major**	**Critical**
Highly likely	Medium	High	High	Severe	Severe
Likely	Low	Medium	High	High	Severe
Possible	Low	Medium	Medium	High	Severe
Unlikely	Low	Low	Medium	High	High
Rare	Low	Low	Low	Medium	High

Likelihood	
The following criteria has been used to determine the likelihood of the risk occurring	
Highly likely	The risk event is expected to occur in most circumstances
Likely	The risk event will probably occur during the life of the project
Possible	The risk event might occur during the life of the project
Unlikely	The risk event could occur but considered unlikely or doubtful
Rare	The risk event may only occur in exceptional circumstances
Consequence	
The following criteria has been used to determine the consequences of a risk occurring	
Minor	Minor incident of environmental damage that can be reversed
Moderate	Isolated but substantial instances of environmental damage that could be reversed with intensive efforts
High	Substantial instances of environmental damage that could be reversed with intensive efforts
Major	Major loss of environmental amenity and real danger of continuing
Critical	Severe widespread loss of environmental amenity and irrecoverable environmental damage

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

Table B 2: Fauna and Habitat ENVIRONMENTAL RISK ASSESSMENT

Value	Potential Impacts	Inherent Risk			Management Measures	Residual Risk		
		Likelihood	Consequence	Risk		Likelihood	Consequence	Ranking
Fauna and habitat	Unauthorised Clearing in critical habitat.	Possible	High	Medium	Management measures are outlined in **Table 7.** Any potential impacts from fauna habitat fragmentation is expected to be managed through suitable design and mitigation measures, this risk event is considered **MEDIUM**. Loss of habitat is proposed to be offset for: ○ Ghost bats ○ Northern Quoll ○ Pilbabra Olive Python	Unikely	High	Medium
Fauna and habitat	Fragmentation of fauna habitat.	Possible	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential impacts from fauna habitat fragmentation is expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low
Fauna	Fauna injury or mortality as a result of ground disturbance, machinery and blasting.	Possible	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential impacts to fauna as a result of ground disturbance, vehicle interactions, machinery and blasting is expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Unlikely	Moderate	Low

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

Value	Potential Impacts	Inherent Risk			Management Measures	Residual Risk		
		Likelihood	Consequence	Risk		Likelihood	Consequence	Ranking
Fauna	Fauna mortality as a result of a potential increase in the prevalence of introduced species and feral predators.	Likely	High	High	Management measures are outlined in **Table 7.** The potential impacts to terrestrial fauna can be managed such that there are no significant residual impacts, and the biological diversity and ecological integrity of terrestrial fauna will be maintained. Therefore, it is considered **unlikely** that the Project will result in significant impacts from an increase to feral fauna predator activity, this risk event is considered **MEDIUM.**	Possible	High	Medium
Dust	Dust generated as part of construction and operational activities has the potential to impact on local flora and fauna. Reduced health and viability of fauna habitat	Likely	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential decline or change in the health/composition of fauna and fauna habitat arising from dust are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low
Noise and vibration	Noise and vibration disrupting natural foraging and breeding behaviours	Possible	High	Medium	Management measures are outlined in **Table 7.** Any potential disruption to species behaviour from noise and vibration are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Unlikely	Moderate	Low

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

Value	Potential Impacts	Inherent Risk			Management Measures	Residual Risk		
		Likelihood	Consequence	Risk		Likelihood	Consequence	Ranking
Light emissions	Artificial light can potentially disturb species behaviour, cause barriers to movement, cause abandoning of roosts and nests, and expose nocturnal animals to nocturnal predators.	Likely	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential disruption to species behaviour from artificial light are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Likely	Minor	Low
Weeds	Introduction and/or spread of weed species leading to reduced flora species and system diversity.	Likely	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential decline or change in the health/composition of fauna habitat arising from the introduction and/or spread of weeds are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low
Hydrocarbons	Inadequate transport, handling and storage of hydrocarbons and chemicals leading to contamination of the environment	Likely	Minor	Low	Management measures are outlined in **Table 7** Any potential contamination of fauna habitat arising from the inadequate transport, handling and storage of hydrocarbons and chemicals is expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**	Possible	Minor	**Low**

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.

Value	Potential Impacts	Inherent Risk			Management Measures	Residual Risk		
		Likelihood	Consequence	Risk		Likelihood	Consequence	Ranking
Fire	Construction activities have the potential to cause accidental bushfires which may lead to damage or death to surrounding flora and fauna communities	Likely	High	High	Management measures are outlined in **Table 7.** Any potential decline or change in the health/composition of fauna habitat arising from fire are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **MEDIUM**.	Unlikely	High	Medium
Hydrological change	Potential decline or change in the health/composition of fauna habitat arising from hydrological regime changes.	Likely	Moderate	Medium	Management measures are outlined in **Table 7.** Any potential decline or change in the health/composition of fauna habitat arising from hydrological changes are expected to be managed through suitable design and mitigation measures, with negligible impacts. Due to the limited nature of impacts and short life of mine, this risk event is considered **LOW**.	Possible	Minor	Low

Printed copies of this document are not controlled. Please ensure that this is the latest available version before use.
