NVCP SUPPORTING DOCUMENT

LAMB CREEK IRON ORE PROJECT – SITE-WIDE NVCP

M47/1592, L47/1008

11 APRIL 2025 VERSION [00]

DOCUMENT INFORMATION

The purpose of this document is to provide supporting information for PMI's application for a Native Vegetation Clearing Permit (NVCP) and addresses the requirements as prescribed under the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004.*

1. INTRODUCTION

The Proponent, Process Minerals International (PMI), a wholly owned subsidiary of Mineral Resources Limited (MinRes) (ACN 118 549 910), proposes to develop the Lamb Creek Iron Ore Project (LCIOP) (the Proposal) located approximately 130 kilometres (km) northwest of Newman via the Great Northern Highway (**Figure 1**), in the East Pilbara Local Government Authority (LGA) in Western Australia (WA).

PMI seeks approval to clear native vegetation under Part V of the *Environmental Protection Act 1986* (EP Act) on mining tenements M47/1592 (pending conversion from R47/19) and L47/1008 to facilitate the Project's resource development. PMI has applications for mining leases over all tenements and seeks to clear up to 638.4 hectares (ha) within an 860.9 ha Purpose Permit Area located on these tenements.

1.1 Purpose

The purpose of this document is to provide supporting information for PMI's application for a Native Vegetation Clearing Permit (NVCP) and address the requirements as prescribed under the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004.*

This document provides a holistic assessment of the Project based on ecological studies within and in proximity to the Proposed Clearing Footprint and includes assessment of the Project against the 10 Clearing Principles (the Clearing Principles), as defined in Schedule 5 of the *Environmental Protection Act 1986* (EP Act).

This NVCP application supporting document is structured to provide the following information:

- description and map of the area proposed for clearing in regard to location, size and purpose;
- site overview with a brief description of local climate, biogeographic region, geology, land use and land systems, soils, hydrology and hydrogeology;
- description of the area to be cleared in regard to vegetation type, condition and representation in a regional context;
- list of flora species present and their conservation status;
- identification of any Threatened or Priority flora within the proposed clearing area;
- description of broad fauna habitat;
- a list of conservation significant terrestrial fauna species; and
- discussion of the proposed vegetation clearing in relation to the Ten Clearing Principles

1.2 Nomenclature

Key nomenclature used in this document:

- Clearing Permit Area: Development footprint (860.9 ha)
- Proposed Clearing Footprint: Area to be cleared (up to 638.4 ha)

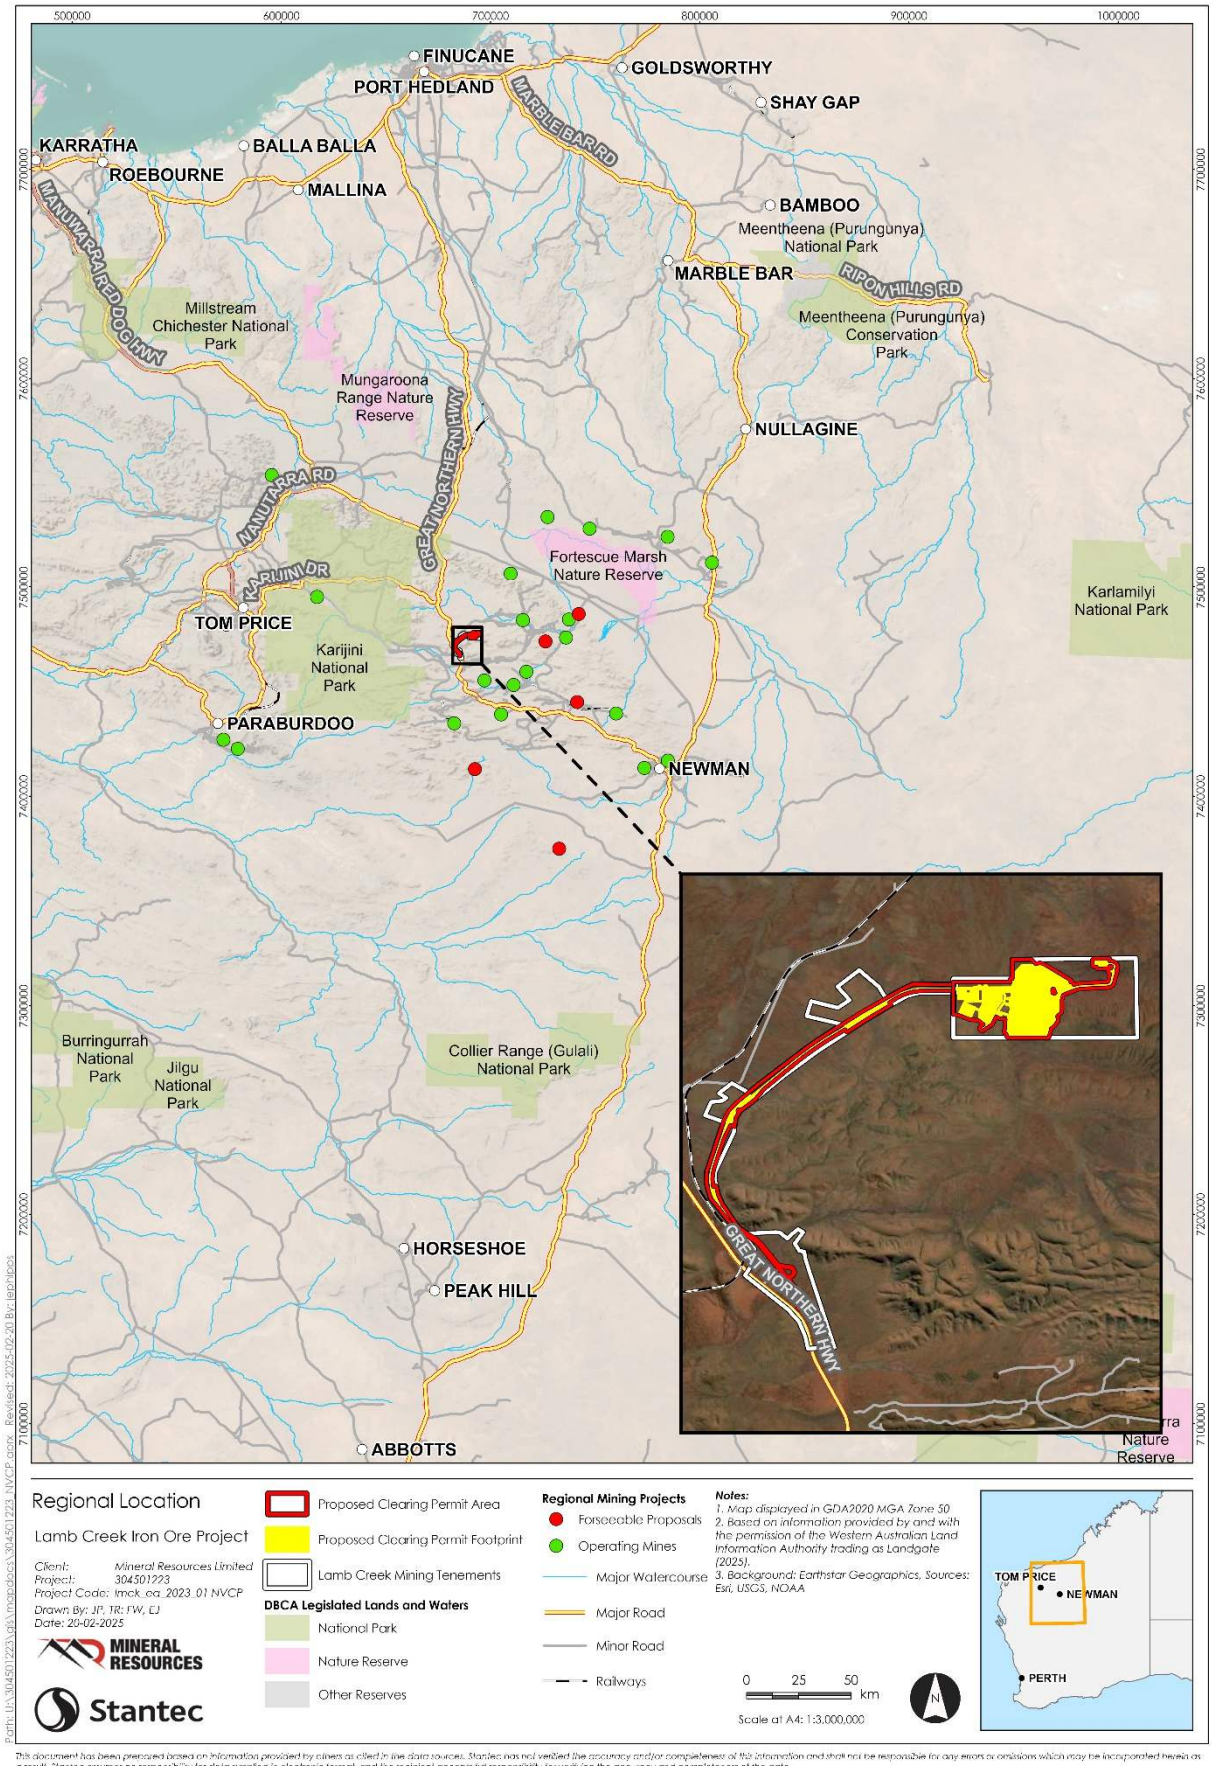

Figure 1: Project Location

1.3 Existing Approvals

The LCIOP was referred to the Environmental Protection Authority (EPA) under Part IV of the EP Act (Section 38 referral, APP-0026940) in December 2024. Following EPA's review of the referral, the scale and nature of potential environmental impacts of the LCIOP were found not to require assessment under Part IV, and a "Not Assessed" decision was reached by the EPA on 11 April 2025 (Ref. APP-0026940). As a result, approval for native vegetation clearing is being sought under Part V of the EP Act which is addressed in this document. Approval of prescribed activities will also be sought under Part V of the EP Act (Table 1).

2. BACKGROUND

2.1 Location, Tenure and Site Layout

The proposed Clearing Permit Area lies within two tenements listed in **Table 2** and shown in **Figure 2.** These two tenements are held by Process Minerals International Pty Ltd, a wholly owned subsidiary of MinRes, and the mining tenure (M47/1592) overlies the Juna Downs pastoral lease held by Rio Tinto.

In addition, L47/1008 encroaches on one or more of the following tenements and land parcels:

- E 47/1329-I – Hamersley Iron Pty Ltd
- E 47/1790-I - Hamersley Iron Pty. Ltd
- ML 281SA - Itochu Minerals & Energy of Australia Pty Ltd, Mitsui Iron Ore Corporation Pty Ltd, BHP Minerals Pty Ltd
- Road - Main Roads Western Australia (Road)
- GE L021124 - (Hamersley Iron Pty Ltd – Yandicoogina Rail)
- PL N050471 – Juna Downs Pastoral Lease

Table 2: Project Tenements

Tenement	Area (Ha)	Holder	Granted	Expiry
M47/1592	1,200.4	Process Minerals International Pty Ltd	Pending	Pending
L47/1008	998.9	Process Minerals International Pty Ltd	16/07/2021	27/03/2044

2.2 Contact Details

The primary person responsible for the Proposal is as follows:

Proponent: Process Minerals International (PMI) a wholly owned subsidiary of Mineral Resources Limited (MinRes) (ACN 118 549 910)
Address: 20 Walters Drive, Osbourne Park, WA, 6017
Postal Address: Locked Bag 13, Osbourne Park DC, WA, 6916
Corporate contact: Celine Mangan – General Manager Environment and Heritage
Phone: +61 8 9315 8774
Email: celine.mangan@mrl.com.au

3. PROPOSED ACTIVITIES

The proposed Project involves the development of an open cut mine to allow the extraction of iron ore from the Lamb Creek deposit. This will comprise a multi-stage crushing and screening process plant and associated mine infrastructure including, but not limited to, site offices, maintenance and equipment service area, water pipelines, fuel storage, power generation, telecommunications, and an accommodation village for site personnel.

3.1 Description of Proposed Activities

The Project will consist of the development of an open cut iron ore mine and two waste rock landforms (WRLs) and supporting mining infrastructure, as detailed below.

The main mining activities that will require vegetation clearing are listed below:

- Mining and processing elements:
- open pit;
- internal haul roads;
- run of mine (RoM) pad;
- two waste rock landforms (WRLs);
- processing facilities;
- explosives storage;
- water storage dam;
- laydown/hardstands;
- ore stockpiles; and
- topsoil stockpiles;
- Infrastructure elements:
- accommodation camps;
- light/heavy vehicle roads;
- workshops;
- power supply infrastructure;
- fuel/hydrocarbon storage;
- potable water storage;
- waste disposal; and
- sewage treatment and disposal.

3.2 Estimated Vegetation Disturbance Requirements

MinRes proposes the removal of up to 638.4 ha of native vegetation within the Proposed Clearing Footprint to allow the works listed in Section 3.1. The Proposed Clearing Footprint (638.4 ha) and proposed Clearing Permit Area (860.9 ha) are shown in **Figure 3**.

MinRes will ensure that clearing is minimised as much as practicable and is maintained within the boundaries of the Clearing Permit Area, which has been designed to avoid and minimise impacts to the eight taxa listed under the *Biodiversity Conservation Act 2016* (BC Act) within and surrounding the Clearing Permit Area.

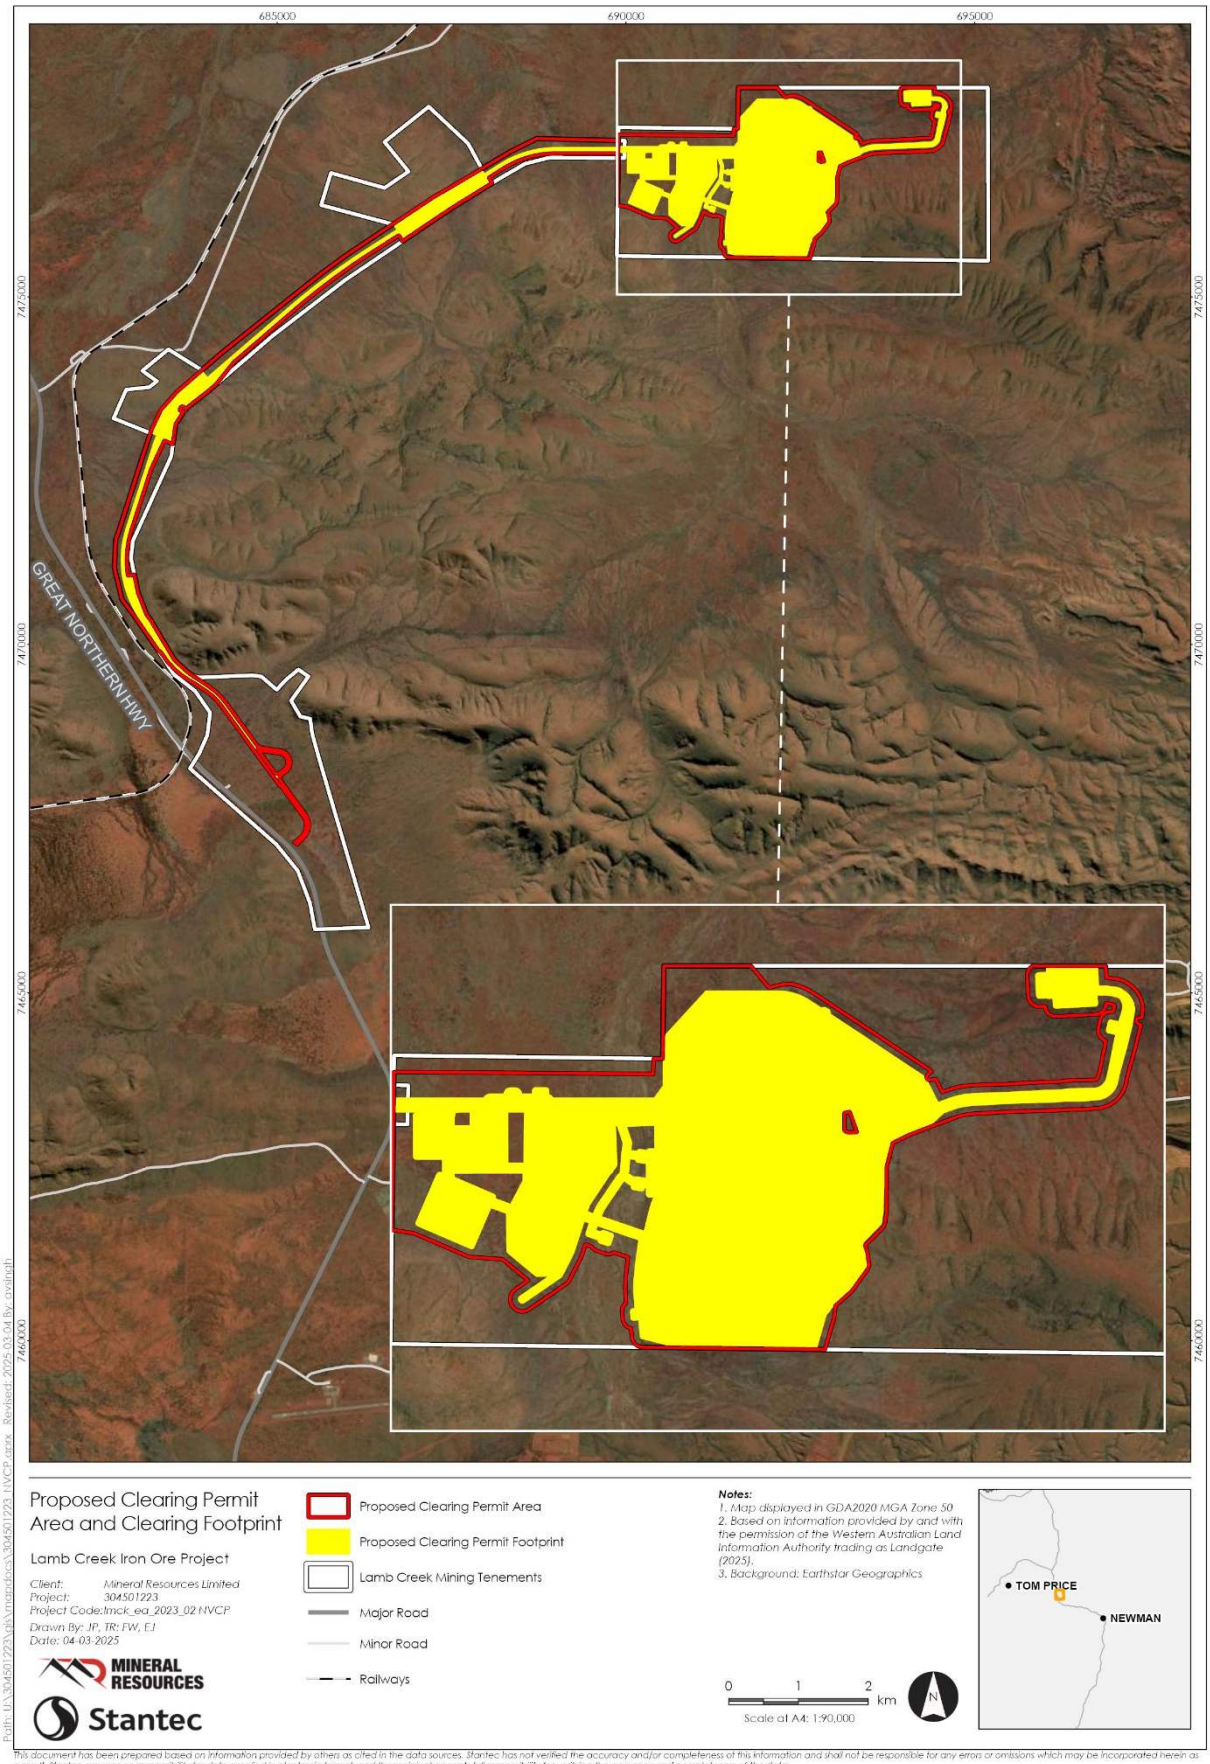

Figure 3: Proposed Clearing Permit Area and Clearing Footprint of this NVCP Application

3.3 Method of Vegetation Disturbance

MinRes will ensure all clearing and ground disturbance is carried out in accordance with the Land Activity Permit Procedure (MRL-EN-PRO-0005) and Land Clearing Procedure (MRL-EN-PRO-0004). Noting this, the following methods of vegetation clearing will be implemented during the construction phase of the Project:

- prior to clearing, a Project specific internal Land Activity Permit (LAP) (MRL-PD-PRO-0001) will be completed and signed off by multi-disciplinary MinRes departments;
- clearing areas will be delineated in accordance with the Project specific internal LAP, the clearing will be surveyed and demarcated with survey pegs and flagging tape;
- vegetation will be removed prior to topsoil striping. Vegetation will generally be cleared 'blade up' with bulldozers or graders within the Clearing Permit Area. Diggers and loaders may be used around drainage lines as required;
- the upper 0.2 m (topsoil) of the soil profile within the proposed disturbance area is stripped (where possible) and placed in stockpiles (paddock dumped not greater than 2m in height with adequate distance between them to create a series of mounds and troughs);
- subsoil may also be stripped and stockpiled separately to ensure adequate capping and growth media is collected;
- any rock fragments and surface litter present within the soil profiles will be collected and stockpiled with the topsoil;
- machinery operators will aim to minimise the frequency and intensity of disturbance, so they do not compromise the structural integrity of the material. Handling of topsoil will be minimised as much as possible, particularly when wet;
- soil stripping is planned to occur as close as possible to the time the proposed disturbance is scheduled to commence.

3.4 Rehabilitation and Maintenance

MinRes will implement a Mine Closure Plan (MCP) (submitted with Mining Proposal Reg ID 500175) in accordance with *Mine Closure Plan Guidance – How to prepare in accordance with Part 1 of the Statutory Guidelines for Mine Closure Plans* ((Department of Mines Industry Regulation and Safety 2020). Progressive rehabilitation will be undertaken over the life of the mine, with progressive backfilling of the pit occurring during all three stages of pit development, to at least 5 m above the pre-mining water table. An appropriate rehabilitation plan incorporating surface treatments and seed selection, collection, storage, and management will be implemented.

Areas disturbed through implementation of the Project will be designed to be safe and non-polluting and constructed so that final shape, size, stability, and ability to support local native vegetation are comparable to natural landforms in the area.

Weed and hygiene management measures will be implemented prior to arrival on site to minimise the risk of spreading or introducing weeds within the proposed Clearing Permit Area.

The following topsoil management measures will be undertaken:

- Available topsoil stripped from all clearing areas and stockpiled for use during rehabilitation;
- Material movement and storage incorporated in mine planning;
- Respreading of stockpiled topsoil and vegetation over rehabilitation areas as soon as they become available;
- Pre-stripping of topsoil not to be undertaken in wet conditions;
- Topsoil stripping depth will be pre-determined;
- Topsoil stockpiled to a height of no more than 2 m in height or other evidence based restrictions;
- Topsoil stockpiles located away from drainage channels and trafficable areas, and appropriately signed and recorded for future reference.

- Consider other growth media, and seed pellets where necessary.

3.5 Indicative Timeline

Subject to approval, construction of the Project is anticipated to commence in quarter three of 2025. The Project is not a staged development, and an indicative implementation schedule is shown in Table 3.

Table 3: Indicative development schedule for the Project

Stage	Indicative Timing
Commence construction	Q3 2025 to Q1 2026
Commence commissioning	Q4 2025 to Q1 2026
Commence operation	Q4 2025
Commence mining, haulage and export	Q4 2025 to Q1 2026
End operations	FY 2029
Commence decommissioning and closure	FY 2030

4. RECEIVING ENVIRONMENT

4.1 Biogeographical Location

The Interim Biogeographic Regionalisation for Australia (IBRA) is a bioregional framework that divides Australia into 89 biogeographic regions and 419 subregions on the basis of climate, geology, landforms, vegetation, and fauna (Thackway and Cresswell 1995). The proposed Clearing Permit Area lies within the Pilbara bioregion and the Hamersley (PIL3) subregion. The Hamersley subregion is described as a mountainous area of Proterozoic sedimentary ranges and plateaux, dissected by gorges of basalt, shale and dolerite (Kendrick 2001). Vegetation of the subregion is typically Mulga (*Acacia aneura*) low woodland over bunched grasses on fine textured soil in valley floors, and *Eucalyptus leucophloia* over *Triodia brizoides* on skeletal soil of the ranges (Kendrick 2001).

4.2 Climate

The climate of the region is typically arid, with hot summers and cool winters. Rainfall can be highly variable, but generally higher in late summer as a result of tropical lows and cyclonic activity moving inland from the north-west coast. The closest Bureau of Meteorology (BOM) weather station to the Project area is Newman Airport (station number 007176), located approximately 130 km south-east. Rainfall data has been recorded since 1971 and temperature data since 1996. At Newman Airport, annual mean rainfall was 325 mm and annual mean maximum temperatures ranged from 23°C in June to 39°C in December (**Figure 4**) (BoM 2022).

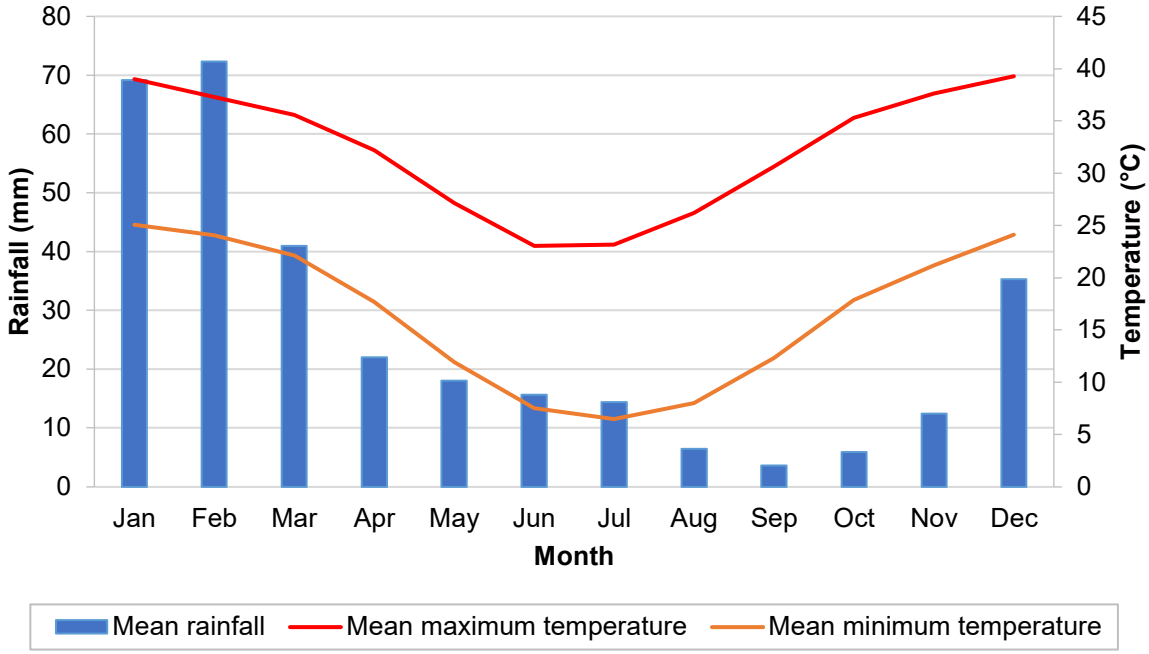

Figure 4: Mean monthly rainfall (1971-2021) and temperature data (1996-2021) recorded at Newman airport (station number 007176)

4.3 Land Use

The Clearing Permit Area is largely within the Juna Downs pastoral lease (LPL N050471). The dominant land uses in the Pilbara bioregion are pastoralism, conservation, mining, agriculture, tourism and urban.

4.4 Land Systems

The proposed Clearing Permit Area intersects five different land systems within the Hamersley subregion: Boolgeeda, McKay, Newman, Platform and Wannamunna. A description of each land system the approximate area of each land system within the proposed Clearing Permit Area are presented in **Table 4**.

Table 4: Land Systems of the Proposed Clearing Permit Area

Land System	Description (Van Vreeswyk *et al.* 2004)	Area within Proposed Clearing Permit Area (ha)(%)	Area within the Clearing Footprint (ha)(%)
Boolgeeda	Stony lower slopes and stony plains and narrow drainage floors and channels, supporting hard and soft spinifex grasslands and mulga shrublands, level stony plains and narrow sub-parallel drainage floors, relief up to 20 m. Often occurs below hill systems such as Newman and Rocklea.	762 (88.5)	562.1 (88.0)
McKay	Hills, ridges, plateaux remnants and minor breakaways of sedimentary and meta sedimentary rocks supporting hard spinifex grasslands; relief up to 100 m.	20.1 (2.3)	12.7 (2.0)

Land System	Description (Van Vreeswyk *et al.* 2004)	Area within Proposed Clearing Permit Area (ha)(%)	Area within the Clearing Footprint (ha)(%)
Newman	Rugged high mountains, ridges and plateaux with near vertical escarpments of jaspilite, chert and shale, supporting hard spinifex grasslands; relief up to 400 m.	53.5 (6.2)	51.2 (8.0)
Platform	Stony upper plains, dissected slopes and drainage floors, supporting hard spinifex grasslands. Erosional surfaces formed by partial dissection of the old tertiary surface. The gently inclined upper plains have extensive marginal dissection zones with gently inclined to steep slopes. Floors incised up to 30m with steep stable marginal slopes becoming wider downslope.	21.4 (2.5)	9.5 (1.5)
Wannamunna	Hardpan plains and internal drainage tracts supporting mulga shrubland and woodlands, and occasionally eucalypt woodlands). Depositional surfaces, level hardpan wash plains subject to overland sheet flow. Broad internal drainage flats receiving run-on from adjacent hardpan surfaces; rare, channelled tracts but moistly no organised through drainage; relief up to 5m.	4 (0.5)	3 (0.5)

4.5 Landform Soil and Geology

4.5.1 Landform

The landform types within the proposed Clearing Permit Area are considered to be extensively represented within the subregion. Gazetted landforms in the region include Iron Ore Ridge, which runs east-west around 12 km south of the Project Area (location of BHP's 'Mining Area C' iron ore mine as shown in **Figure 1**) (MBS Environmental 2021).

4.5.2 Topography

The topography of the subregion is rugged, comprising three small mountain ranges; Packsaddle Range in the centre, Jirrpalpur Range in the south and the Hancock Range to the north (Rapallo 2021b). The proposed Clearing Permit Area is situated within the Hancock Range, which is characterised by low rugged hills. The area ranges in elevation from approximately 700 m RL to 800 m RL on a ridgeline on the east side, although majority of the site is between 700 m RL and 720 m RL, with typical surface slopes of about 1%. The eastern ridge has a maximum height of approximately 1,064 m RL.

4.5.3 Soil

A baseline soil and landform assessment was undertaken in 2021, and the physical and chemical properties of soil in the proposed Clearing Permit Area are summarised below (MBS Environmental 2021):

- Stony soils were dominant, particularly in areas of higher elevation; gravel contents reflected this and were mostly >50% throughout the soil profile. Small pockets of red sandy loam were present in lower-lying areas, particularly in proximity to drainage channels.
- Depth to refusal (hardpan) varied between 700 and 2,000 mm.

- Topsoil and subsoil consisted of sandy loam and loamy sands. The soil contained between 12 and 18% clay and were generally non-dispersive, slightly to moderately acidic (5.6 - 6.6) and non-saline, having EC values of less than 10 mS/m. Consistent with their sandy texture, soils generally had a low cation exchange capacity (ECEC) and exhibited organic carbon and carbon to nitrogen (C: N) ratios typical of soils from northern Western Australian.
- Most nutrients and trace elements were present in adequate concentrations within topsoils with the exception of boron; cobalt; molybdenum and nickel, which may be deficient. Phytoavailable manganese concentrations were classified as elevated in some soils; the concentrations were unlikely to impact plant growth.
- Concentrations of potentially environmentally significant metals and metalloids were below relevant ecological investigation levels and consistent with levels typical of Australian soils, with the exception of selenium. It was found that while pseudo-total selenium concentrations were elevated, phytoavailable concentrations were low, indicating the presence of low levels of soluble forms of selenium and correspondingly a minimal environmental risk or phytotoxicity/ecotoxicity potential.

4.5.4 Geology

The proposed Clearing Permit Area occurs within the Hamersley Ranges which dominate the subregion (Thorne and Tyler 1997). Basement rocks in the region comprise early Proterozoic Brockman Iron Formation and Weeli Wolli Formation within the Hamersley Basin, a late Archaean to early Proterozoic (2,765-2,470 million years) depositional basin which is exposed over most of the southern part of the Pilbara Craton (MBS Environmental 2021). The Brockman Iron Formation, consisting of banded iron formation (BIF) and shale, is the main iron formation within the Hamersley Group (Trendall and Blockley 1970). The geological units found within the Project Area are outlined in **Table 5**.

Table 5: Clearing Area Geological Descriptions (Thorne and Tyler 1997)

Geological Unit	Description
Brockman Iron Formation	BIF, chert and pelite.
Quaternary Alluvium	Unconsolidated silt, sand and gravel; in drainage channels and adjacent floodplains
Quaternary Alluvium and Colluvium	Red-brown sandy clayey soil; on low slopes and sheetwash areas.
Cainozoic Colluvium	Partly consolidated quartz and rock fragments in silt and sand matrix; old valley-fill deposits.

4.6 Surface Hydrology and Hydrogeology

Within the Hamersley subregion, drainage runs into either the Fortescue River to the north, the Ashburton River to the south, or the Robe River to the west (Kendrick and McKenzie 2001) (**Figure 5**). There are no permanent or semi-permanent surface water features in the proposed Clearing Permit Area.

The Lamb Creek orebody is located approximately 600 m east of Mine Creek, which drains northward to a confluence with Marillana Creek about 9 km north of the proposed Clearing Permit Area. Marillana Creek flows into Weeli Wolli Creek which supports the Weeli Wolli Spring, listed as a Priority 2 (P2) priority ecological community (PEC), associated with riparian woodland and forest associations of unusual composition, relatively high diversity of stygofauna, and a diverse microbat assemblage (Department of Biodiversity Conservation and Attractions 2022; Kendrick and McKenzie 2001). Weeli Wolli Creek eventually transitions to a channel with an alluvial fan floodplain before discharging to the Fortescue Marshes (approximately 100 km downstream).

The Weeli Wolli Spring is the nearest site (approximately 31 km) considered to be of high ecological and cultural value, as it represents a rare source of permanent water within the region and is located upstream of the confluence of Weeli Wolli Creek and Marillana Creek.

Within the subregion, diffuse recharge to the groundwater system occurs at very low rates, occurring preferentially during rainfall-runoff events along the major creeks and other areas of surface water concentration / inundation (AQ2 2021). The main iron-bearing formation within the Hamersley Group, the Brockman Iron Formation, comprises generally low permeability BIF and shales. However, where mineralised, the BIF has enhanced permeability and storage and can be considered an aquifer.

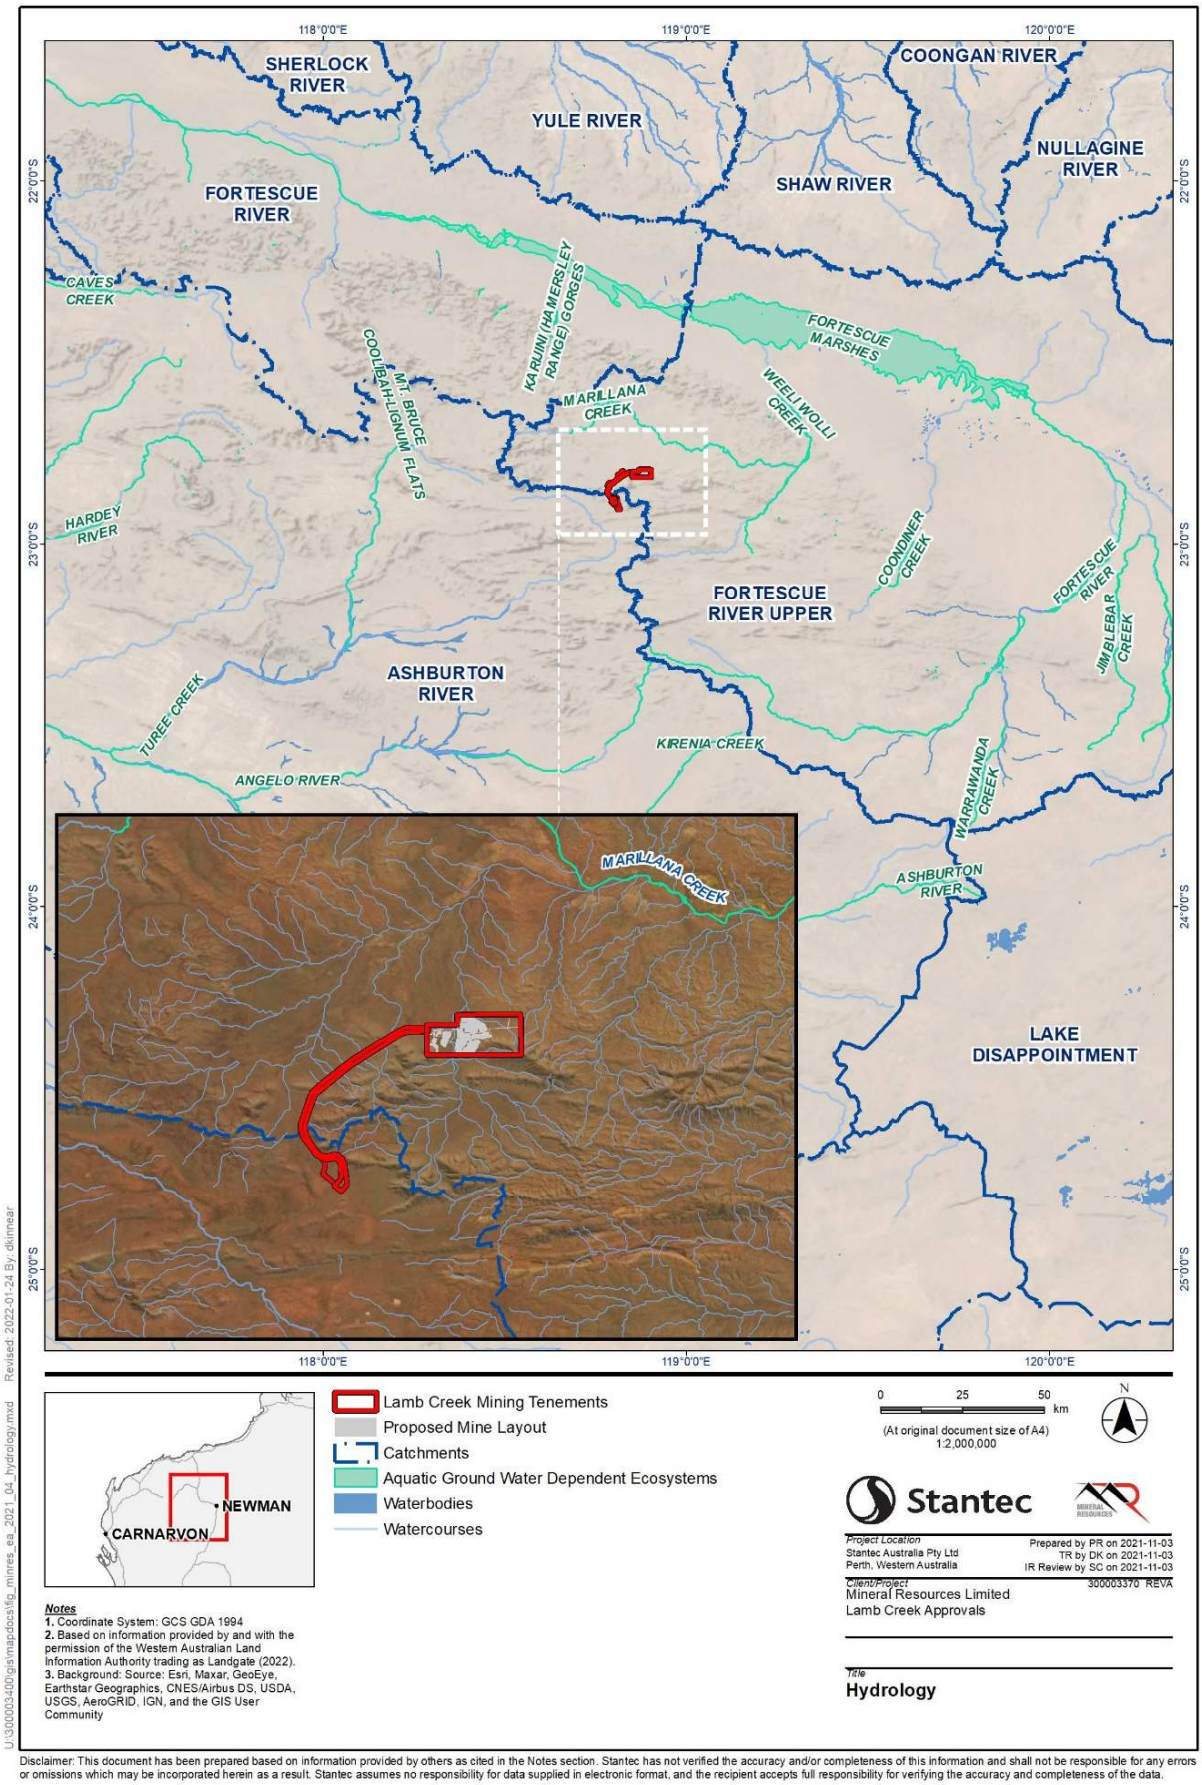

Figure 5: Surface Hydrology in the Vicinity of the Clearing Area

4.7 Flora and Vegetation

4.7.1 Flora and Vegetation Surveys

A search of the NatureMap database within a 40 km buffer of the proposed Clearing Permit Area is shown in **Appendix D**. In addition to the database search, the proposed Clearing Permit Area has been subject to several in-field surveys since 2012. In addition to surveys completed within the Flora and Vegetation Survey Area, regional surveys undertaken in the vicinity of the proposed Clearing Permit Area, were used to provide contextual information and to inform the baseline desktop assessment. There have been three detailed field surveys, one two-phase targeted survey and one desktop vegetation mapping exercise undertaken within, and for, the Flora and Vegetation Survey Area (**Figure 6** and **Appendix B, Appendix C**).

4.7.2 Vegetation

4.7.2.1 Pre-European Vegetation

Pre-European vegetation mapping was originally undertaken by Beard (1975) at various scales across WA and has since been updated to be consistent with the National Vegetation Information System (NVIS) descriptions at a scale of 1:250,000 (Department of Primary Industry and Regional Development 2019). Two vegetation associations have been mapped within the Flora and Vegetation Survey Area; Hamersley 18 and Hamersley 82 (**Table 6**) described as follows:

- Hamersley 18: Low woodland; continuous Mulga woodland communities over spinifex *Triodia basedowii* and *Triodia epactia* hummock grasslands on stony undulating plains; and
- Hamersley 82: Low scattered tree steppe; Snappy Gum *Eucalyptus leucophloia* over spinifex *Triodia wiseana* hummock grassland on stony undulating plains.

Vegetation association retaining less than 30% of their pre-European extent generally experience accelerated species loss at an ecosystem level and are regarded as being ‘vulnerable’, while vegetation types retaining less than 10% of their original extent are regarded as being ‘endangered’ (Authority 2000). The two vegetation associations found to intersect the Clearing Permit Area have close to 100% of their original extent remaining and are considered ‘least concern’. In addition, at a scale of 1:1,000,000, the vegetation units described by Beard (1975) within the Clearing Permit Area are well represented throughout the Pilbara bioregion.

Table 6: Vegetation System Associations within the Proposed Clearing Permit Area

Vegetation Association	Scale	Pre-European Extent (ha)	Current Extent Remaining (ha)	Pre-European Extent Remaining	Conservation Status	Extent In Clearing Permit Area (ha)	Extent in Clearing Footprint (ha)
Hamersley 18.11	State Wide	19,892,306	19,843,148	99.75%	Least Concern	588 (68.4%)	410 (64.3%)
	Pilbara Bioregion	676,556	671,843	99.30%	Least Concern		
Hamersley 82.3	State Wide	2,565,901	2,157,841	99.51%	Least Concern	272 (31.6%)	228 (35.7%)
	Pilbara Bioregion	2,563,583	2,550,888	99.50%	Least Concern		

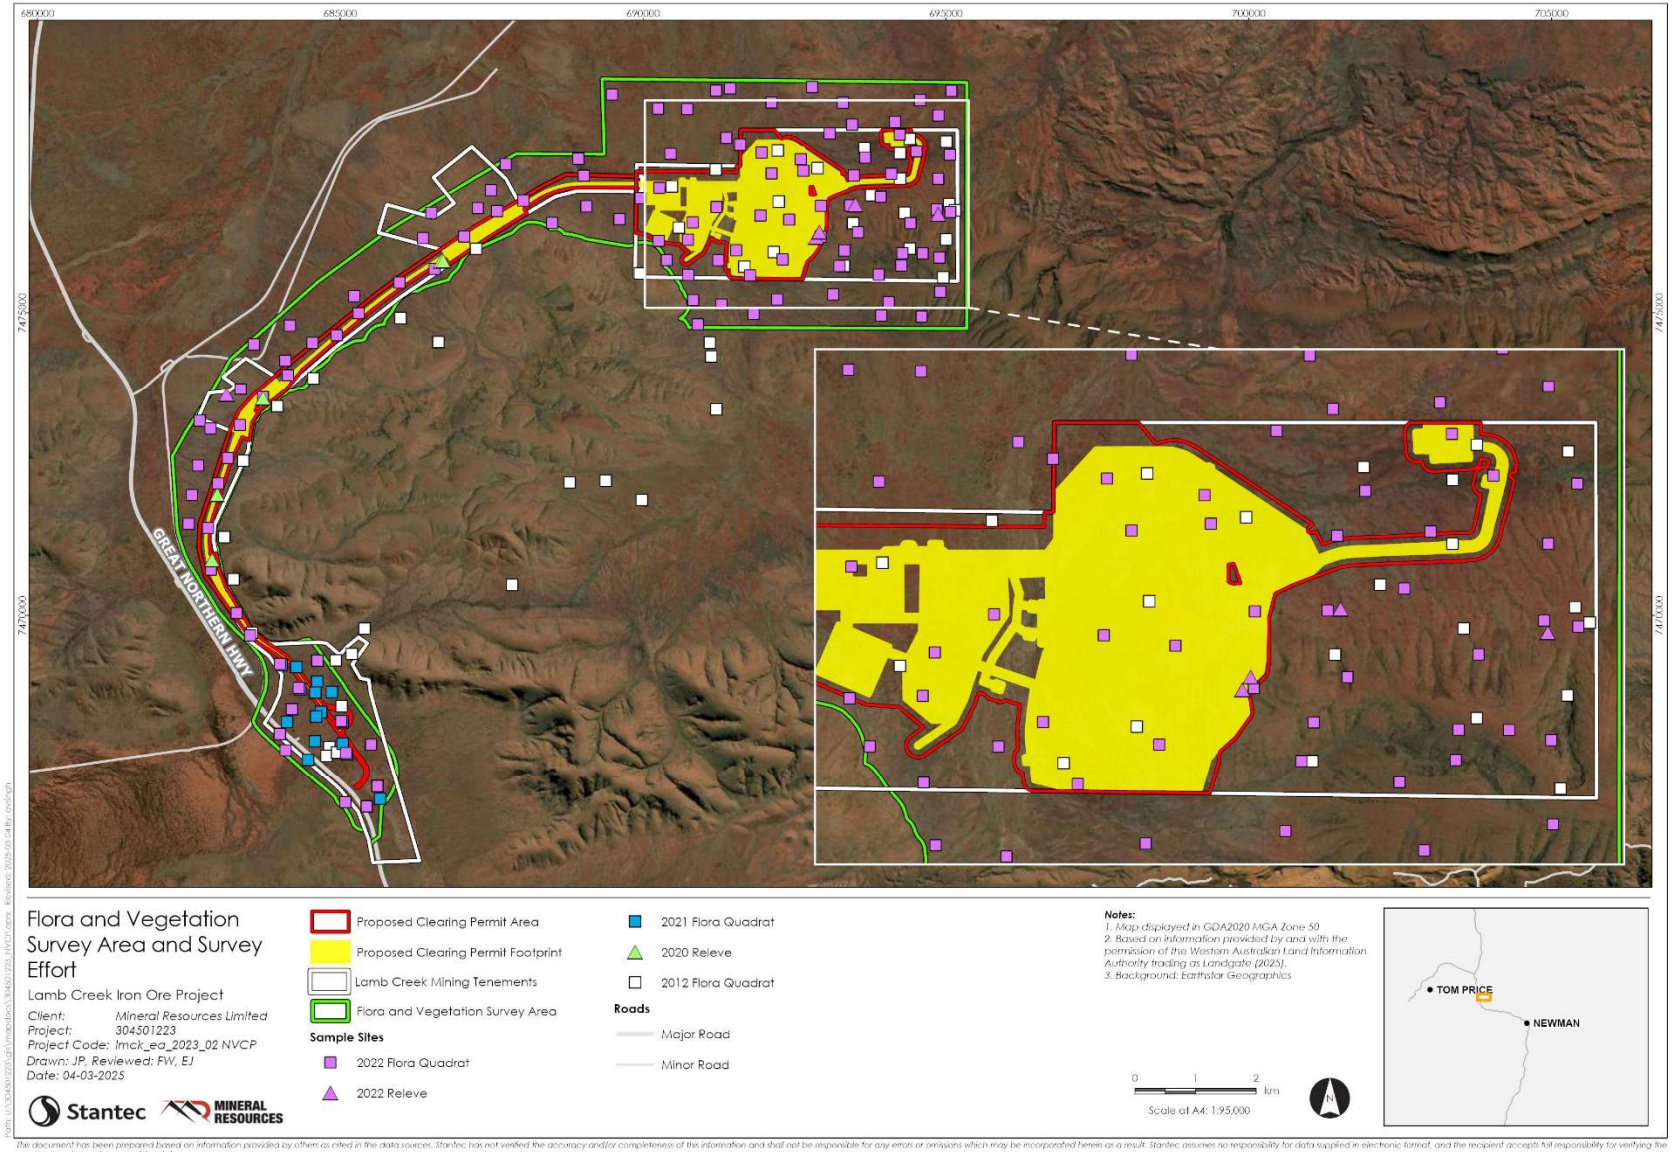

Figure 6: Flora and Vegetation Survey Area and Survey Effort

4.7.2.2 Vegetation Types

The most recent detailed flora and vegetation survey undertaken by Umwelt (2022a) found a total of 10 vegetation types within the study area with nine of these being within the Clearing Permit Area (**Table 7**, **Figure 7**, **Appendix B**). The vegetation types mapped belonged to three broad groups based on soil and topography. Group 1 is characterised by Woodlands over sparse shrublands and hummock grasslands on gentle lower to upperslopes on redbrown clay loams. Group 2 is charactered by Open Woodlands over sparse shrublands and tussock and hummock grasslands on steep slopes, crests, gullies and gorges with exposed ironstone and skeletal soils. Group 3 is characterised by Mulga Woodlands over tussock grasslands and open woodlands over sparse shrublands over hummock grasslands on red-brown clay-loam on plains; and open woodlands over shrublands over hummock grasslands on major and minor drainage lines. None of these communities were considered representative of any listed Priority Ecological Community (PEC) or Threatened Ecological Community (TEC), nor are they considered regionally significant vegetation for any other reason and are likely to be represented elsewhere.

4.7.2.3 Vegetation Condition

The condition of the vegetation in the Study Area was rated Good to Excellent (Umwelt 2022a). The majority of the vegetation (90.5 %) rated as Excellent, with no obvious signs of damage caused by human activities. The remainder of the vegetation was rated as Very Good and Good (8.2 % and 1.2 % respectively), with some historical mechanical disturbance but mostly low levels of introduced flora within the Study Area. Less than 1 % of the Study Area (5 ha) was mapped as cleared with no native vegetation remaining.

The vegetation of the Study Area has for the most part been subject to fire in the past 10 years however none of the Study Area has been burnt more recently than four and a half years prior to survey (Umwelt 2022). This has resulted in a mosaic of vegetation of different fire ages. Floristic data and site photos collected in 2020 and 2021 indicate that these fires have changed both vegetation structure and floristic composition since 2012 (Rapallo 2021b).

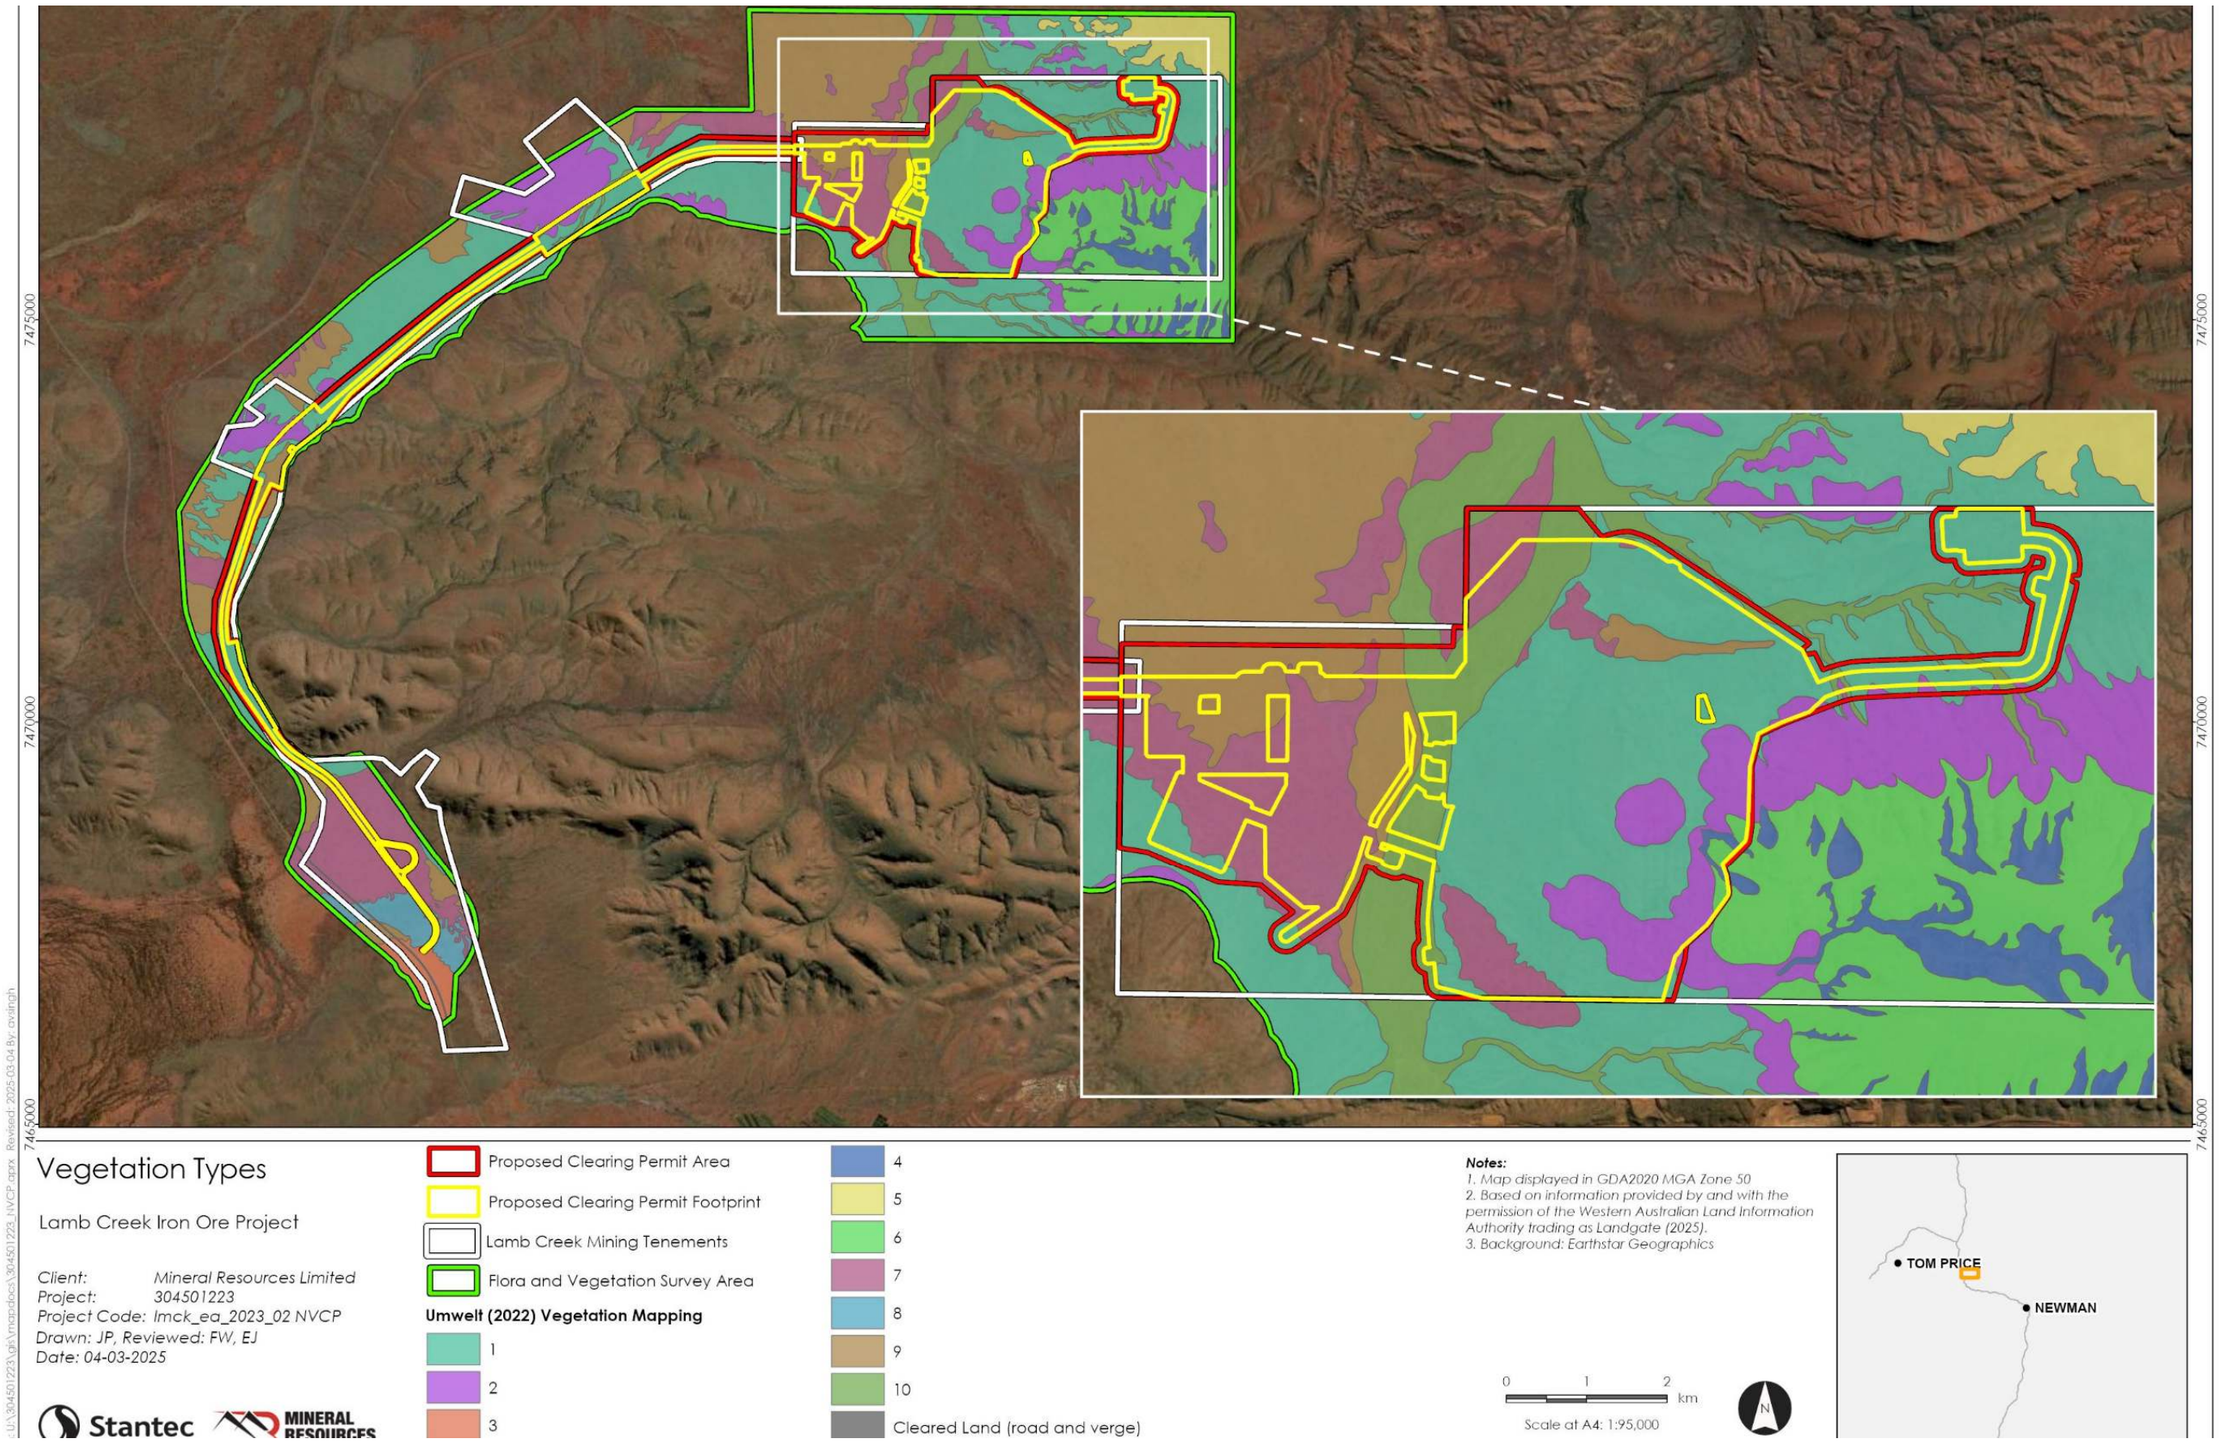

Figure 7: Vegetation Types mapped within the Flora and Vegetation Survey Area

Table 7: Vegetation Types Mapped Within the Proposed Clearing Permit Area

Vegetation Type	Description	Extent in Survey Area (ha)	Extent in Clearing Permit Area (ha)	Extent in the Clearing Footprint (ha)
Group 1: Woodlands over sparse shrublands and hummock grasslands on gentle lower to upperslopes on redbrown clay loams				
1	Low Open Woodland of *Eucalyptus leucophloia* subsp. *leucophloia* and/or *E. gamophylla* with isolated *Corymbia deserticola* subsp. *deserticola* over low to mid sparse to open shrubland dominated by species including *Acacia atkinsiana* and *A. ancistrocarpa* over low open hummock grassland of *Triodia pungens*, *T. vanleeuwenii* and *T. wiseana* and low open tussock grassland of *Themeda* sp. Mt Barricade and *Paraneurachne muelleri* on red-brown sandy clay loam to clay loam on gently inclined mid to lower slopes and associated drainage lines	1429.2 (37.75%)	445.79 (51.8%)	342.68 (53.7%)
2	Low open woodland of *Eucalyptus leucophloia* subsp. *leucophloia* with occasional *Corymbia deserticola* subsp. *deserticola* and *C. hamersleyana* over low sparse shrubland of *Acacia hilliana* and *Hakea chordophylla* over open hummock grassland of *Triodia vanleeuwenii* and *T. wi*seana on red-brown clay loam with ironstone pebbles on gently inclined lower to upper slopes	382.3 (10.1%)	66.36 (7.7 %)	62.37 (9.8%)
3	Isolated trees of *Corymbia hamersleyana*, *Eucalyptus leucophloia* subsp. *leucophloia* and *E. gamophylla* over low sparse shrubland of mixed Acacia species over low hummock grassland of *Triodia pungens* and *T. wiseana* on red-brown sandy clay loam on mid to lowerslopes with ironstone pebbles	48.2 (1.27 %)	0.21 (0.02%)	0.16 (0.03%)
Group 2: Open Woodlands over sparse shrublands and tussock and hummock grasslands on steep slopes, crests, gullies and gorges with exposed ironstone and skeletal soils.				
4	Low open woodland of *Corymbia ferriticola* or *Corymbia hamersleyana* and *Eucalyptus leucophloia* subsp. *leucophloia* with *Ficus brachypoda* occurring on gorge and gully areas, over low sparse shrubland of mixed species dominated by *Corchorus laniflorus*, *Dodonaea viscosa* subsp. *mucronata* and *Gossypium robinsonii* over sparse hummock grassland dominated by *Triodia pungens* with *T. wiseana* and tussock grasses including *Cymbopogon ambiguus* and *Aristida burbidgeae* on red brown clay loam on steep upperslopes, gullies, breakaways and gorges with significant ironstone outcropping.	95.3 (2.52 %)	1.57 (0.2%)	1.46 (0.2%)
5	Occasional *Eucalyptus leucophloia* subsp. *leucophloia* and *Corymbia hamersleyana* over mixed isolated shrubs including *Acacia inaequilatera* and *Senna artemisioides* subsp. *glutinosa* over low hummock grassland of *Triodia wiseana* on steep upperslopes and associated drainage lines on red-brown clay loam with exposed ironstone and dolerite	100.9 (2.44 %)	0	0
6	Low woodland to open woodland of *Corymbia hamersleyana* and *Eucalyptus leucophloia* subsp. *leucophloia* and occasional *E. kingsmillii* over mid isolated shrubs of *Acacia hamersleyensis* and *Grevillea wickhamii* ?subsp. *hispidula* over low hummock grassland of *Triodia wiseana* on red brown sandy clay loam on steep mid to upperslopes with exposed ironstone	316.6 (8.36 %)	3.98 (0.5%)	3.41 (0.5%)
Group 3: Mulga Woodlands over tussock grasslands and open woodlands over sparse shrublands over hummock grasslands on red-brown clay-loam on plains; and open woodlands over shrublands over hummock grasslands on major and minor drainage lines				
7	Isolated trees of *Corymbia hamersleyana*, *Eucalyptus leucophloia* subsp. *leucophloia* and *Eucalyptus xerothermica* over low open to sparse shrubland dominated by *Acacia aptaneura*, *A. aneura* and *A. pruinocarpa* over low tussock grassland to sparse tussock grassland dominated by *Themeda* sp. Mt Barricade (M.E. Trudgen 2471), *Enneapogon polyphyllus*, *Chrysopogon fallax* and *Aristida* spp. with occasional *Triodia pungens* on red brown clay loam with some ironstone pebbles on plains	523.4 (13.83%)	170.22 (19.8 %)	117.63 (18.4%)
8	Isolated trees of *Eucalyptus xerothermica* over tall open to sparse shrubland of *Hakea lorea* subsp. *Lorea* and *Acacia aptaneura* over low open tussock grassland of *Aristida contorta*, *A. inaequiglumis* and *Themeda triandra* on red-brown sandy clay to clay on plains	68.9 (1.82 %)	2.96 (0.3%)	2.22 (0.4%)
9	Low open woodland of *Corymbia hamersleyana*, *C. deserticola* subsp. *deserticola*, *Eucalyptus gamophylla* and *Eucalyptus leucophloia* subsp. *leucophloia* over tall sparse shrubland of *Acacia atkinsoniana* and occasional *A. ancistrocarpa* and *A. aptaneura* over low hummock grassland dominated by *Triodia pungens* and occasional *T. wiseana* with *Paraneurachne muelleri* also dominant on red-brown clay loam with ironstone pebbles on plains	600.8 (15.87 %)	102.64 (11.9%)	67.81 (10.6%)
10	Low open woodland of *Corymbia hamersleyana* with occasional *Eucalyptus gamophylla*, *E. leucophloia* subsp. *leucophloia* and *E. xerothermica* over tall open shrubland dominated by taxa including *Acacia cowleana*, *A. tumida* var. *pilbarensis*, *Gossypium robinsonii* and *A. pyrifolia* over low open hummock grassland of *Triodia pungens* and tussock grassland dominated by *Themeda* sp. Mt Barricade (M.E. Trudgen 2471) and *Aristida* spp. on red-brown clay loams on major and minor drainage lines	215.5 (4.6 %)	67.13 (7.8 %)	40.67 (6.4%)
Cleared, rehabilitated, existing roads and tracks (not a vegetation type.)				
	Cleared	4.6 (0.12%)	0	0
Total		**3785.7**	**860.9**	**638.4**

4.7.3 Flora

4.7.3.1 Floristic composition

The Umwelt (2022a) survey recorded 328 vascular flora taxa from 45 families and 137 genera, including 7 introduced taxa (**Appendix B**). The most well-represented families were Fabaceae (64 discrete taxa, three known hybrids), Poaceae (56 taxa), Malvaceae (45 taxa) and Amaranthaceae (16 taxa).

4.7.3.2 Conservation Significant Flora

Nine significant flora species were recorded within, and adjacent to, the Clearing Permit Area (Umwelt 2022b). This includes six DBCA-listed Priority flora taxa, one Commonwealth listed taxa and two taxa considered significant under the 'new species or species with anomalous features that indicate a potential new species' which are referred to as "potentially undescribed (Umwelt 2022a):

- *Aristida jerichoensis* var. *subspinulifera* (P3)
- *Aristida lazaridis* (P2)
- *Corchorus sp*. (Potentially undescribed)
- *Eremophila naaykensii* (P3)
- *Euphorbia ferdinandi* s. lat. (Potentially undescribed)
- *Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2)
- *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3)
- *Rostellularia adscendens* var. *latiflora* (P3)
- *Seringia exastia* (T – Commonwealth)

Three significant taxa were recorded in the Indicative Footprint. These were:

- *Rhagodia* sp. Hamersley (M. Trudgen 17794) was not recorded Umwelt (2022a) but 3 plants were previously recorded by Rapallo (2022c).
- *Aristida lazaridis* (P2) - Umwelt (2022a) recorded three records with a total of four individuals while Rapallo 2022c recorded 58 plants from 44 records; and
- *Seringia exastia* (T) - Umwelt (2022a) recorded 13 records with a total of 221 individuals while Rapallo 2022c recorded none).

A single plant of *Aristida jerichoensis* var. *subspinulifera* has been recorded in the Clearing Permit Area in the indirect impact assessment zone by Umwelt (2022a) but outside of the Indicative Footprint. The Umwelt (2022a) survey recorded locations of *Seringia exastia*, a taxon currently still listed as Threatened under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) however it has been delisted under the BC Act. Locations of significant flora taxa recorded in the Study Area by the Umwelt 2022 survey are presented in **Table 8** and **Figure 8.** The Umwelt survey recorded *Goodenia nuda* during the survey however this species has now been delisted from a priority 4 to not threatened and therefore has been excluded from **Table 8.** All significant flora taxa recorded within the Flora and Vegetation Survey Area also occur within the broader Hamersley subregion.

Table 8: Significant Flora Recorded in the Rapallo (2022c) and Umwelt (2022a) Flora and Vegetation Survey Area

Species	Conservation Status	Habitat	Vegetation Types	No. of Individuals: Survey Area (both surveys)	No. of Individuals: Clearing Footprint (Umwelt 2022a)	Other previous records of species
Seringia exastia	T/Cr	Variety of Mulga woodlands, sometimes with *Eucalyptus* spp., over *Acacia* spp. shrublands over *Triodia pungens* hummock grassland. Gullies and washouts. Red sand/laterite over sandstone.	1~,˜ 2, 3, 6, 9, 10	783 in 37 locations	221 from 13 records	The species is currently listed as Critically Endangered under the EPBC Act, but this is due to a taxonomic revision where a threatened and a common species were merged, and the name of the former was adopted as the new name, with the conservation status still attached. The current distribution map published on FloraBase (Western Australian Herbarium 1998) incorporates this revision, showing *Seringia exastia* as widespread across northern Western Australia, ranging from the Coolgardie and Murchison IBRA regions in the south to the Dampierland IBRA region in the north. *Seringia exastia* is no longer listed as Threatened under State legislation and is expected to be de-listed under the EPBC Act in the future. The Rapallo (2022c) survey found 2 additional records in their targeted flora survey area of the Lamb Creek site.
Aristida lazaridis	P2	Plain, clay/loam, drainage, slope; often Mulga low open woodland with or without *Eucalyptus* spp., over variety of shrubs and herbs, often over tussock grassland but sometimes with *Triodia* spp. hummock grassland.	7~, 8~, 3, 9	7217 in 3094 locations	4 from 3 records (58 recorded by Rapallo (2022c)	Rapallo (2022c) recorded an estimated population of 12773 plants from 6757 point locations over the 2020 and 2021 surveys undertaken. Searches outside the survey area on foot and from helicopter recorded the species extending outside the project area. A significant population of *Aristida lazaridis* (2405 individuals) has been recorded in deep loam soil along an un-incised drainage line north and west of the BHP Packsaddle Village, approximately 7 km south-east of the Clearing Permit Area. The species has also been recorded from Lake Robinson on the eastern fringe of the Coondewanna Flats. The Western Australian Herbarium (WAH) has 20 specimen records within their database, with collections from locations across approximately 130 km extending from the Rangers Station at Karijini National Park to near Newman (DBCA 2021c). There are 43 records from the Rio Tinto Priority Flora database (Rio Tinto 2018) extending over 60 km. Additionally, this species occurs over a 2,500 km range across the Northern Territory and Queensland (Atlas of Living Australia 2021).
Aristida jerichoensis var. *subspinulifera*	P3	Plain or flat, clay/loam. Often Mulga woodlands or *Acacia* spp. shrublands over spinifex and/or tussock grassland.	8~	97 in 8 locations	0	Locally, there is a WAH record of *Aristida jerichoensis* var. *subspinulifera* from 800 m northwest of the Clearing Permit Area, from a level plain of orange light clay (DBCA 2021a). There are 39 specimen records within the WAH database, with collections from locations spread across 290 km extending between Nammuldi to Newman, with outliers in the Little Sandy Desert and Murchison, as well as collections from the Northern Territory and Queensland (DBCA 2021c; Atlas of Living Australia 2021).
Eremophila naaykensii previously *Eremophila* sp. Hamersley Range	P3	Rocky gullies and gorges. Steep rocky hill slopes and summits, high in the landscape.	4~	73 from 37 locations	0	This species has been recorded approximately 8 km south of the Clearing Permit Area (DBCA 2021a) and from Baby Hope Downs approximately 35 km southeast of Proposal from five locations in rocky gullies and gorges (Biota 2014). There are 15 specimen records within Western Australia, with WAH records from locations spread across 220 km from Paraburdoo to Newman (Western Australia Herbarium 1998) and 345 records, within the Rio Tinto database; recorded from Eastern Range, Channar, Turee Syncline, Karijini National Park, West Angelas, Angelo Central and Hope Downs 1 (Rio Tinto 2016).
Corchorus sp.	Potentially undescribed	The habitat of the recorded population was restricted to drainage lines of sandy loam soils, with no or very few stones, and an open lower stratum of tussock grasses and low shrubs	9~	35 from 23 locations	0	This species does not match reference specimens of any published species and has potential taxonomic significance. This entity is distinct in having elongated fruit. Fruiting specimens were collected in April and June 2022, indicating approximately a March-May flowering period. Flowering specimens were also collected in late June, though this could be considered a response to the unseasonably late rains of May 2022 rather than an indicator of usual flowering time. There are no other known populations of this entity, which may indicate that it is geographically restricted. A precautionary approach would see it regarded as a taxon of potential conservation significance, though this is not yet able to be formally assessed (Umwelt 2022a).
Rhagodia sp. Hamersley (M. Trudgen 17794)	P3	Mulga over mixed grassland. Emergent eucalypts and *Triodia* spp. grassland. Very open Mulga woodland over patchy mixed grasses. Floodplains, hardpan plains.	7~, 8, 9	53 from 49 locations	0 (3 recorded by Rapallo (2022c))	This species is widespread on Mulga plains. Locally, 13 populations of *Rhagodia* sp. Hamersley have been recorded within 3 km of the Proposal Area. There are 63 specimen records in the WAH database, with collection locations spread approximately 290 km extending between Tom Price and Newman (DBCA 2021). Fifty plants were recorded near the Great Northern Highway by Rapallo (2022c). The Rapallo (2022c) survey found 49 additional records in their targeted flora survey area of the Lamb Creek site with 3 plants been previously recorded in the Clearing Permit Area. Umwelt (2022a) however did not record any plants in their survey.
Hibiscus sp. Gurrinbiddy Range (M.E. Trudgen MET 15708)	P2	Rocky gullies, drainage lines and gorges with loamy skeletal soil	4~	17 from 2 locations	0	This taxon is known from 24 WA Herbarium records across 10 broad regional locations, two of which occur within DBCA-managed tenure within Karijini National Park, no records are within 10 km of the Study Area. This record of *Hibiscus* sp. Gurinbiddy Range (M.E. Trudge MET 15708) is a slight range extension of the known range of this taxon to the north.
Euphorbia aff. f*erdinandi*	Potentially undescribed	Often found in open woodland, *Acacia aneura* woodland, low shrublands, flats, in clay loam soil	8~, 7	60 individuals from 19 locations	0	This taxon was recorded from four locations near the Great Northern Highway. It was only recognised as a potentially undescribed species, and different from any known species, when the specimen was compared in detail with other Euphorbia specimens at the WAH. Further advice was sought from Steve Dillon at the WAH, who advised that the specimen differed from *Euphorbia ferdinandi* by having broader seeds and a stigma different from what has been described for this species (S. Dillon pers. comm., September 2021). All locations of this taxon were within the Flora and Vegetation Survey Area, but outside of the Development Envelope. The Rapallo (2022c) survey found 4 additional records in their targeted flora survey area of the Lamb Creek site.

˜ Designates preferred habitat based on proportional location representative and landforms/soils.

Species	Conservation Status	Habitat	Vegetation Types	No. of Individuals: Survey Area (both surveys)	No. of Individuals: Clearing Footprint (Umwelt 2022a)	Other previous records of species
Rostellularia adscendens var. latiflora	P3	Acacia shrubland, sometimes with Eucalypts and Corymbias, over shrublands and herblands, over tussock grassland, or *Triodia pungens* hummock grassland.	1	1	0	Local population has been assessed to be of low regional significance. The taxon has a distribution of approximately 450 km from west of Tom Price to north east of Meenthena Station. The species is known from 42 WA Herbarium records across more than 280 km from near Mt Farquhar (89 km north-west of Tom Price) to the Oakover River with at least six locations occur in the Karijini National Park. This taxon has been recorded approximately 20 km south-east of the Lamb Creek retention license on the MAC development Envelope (Umwelt 2022b). A single plant was recorded by Rapallo (2022c) within a minor flowline within the area of the proposed haul road. While the study area is within the known range of the taxon, Umwelt (2022a) however did not record any plants in their survey.

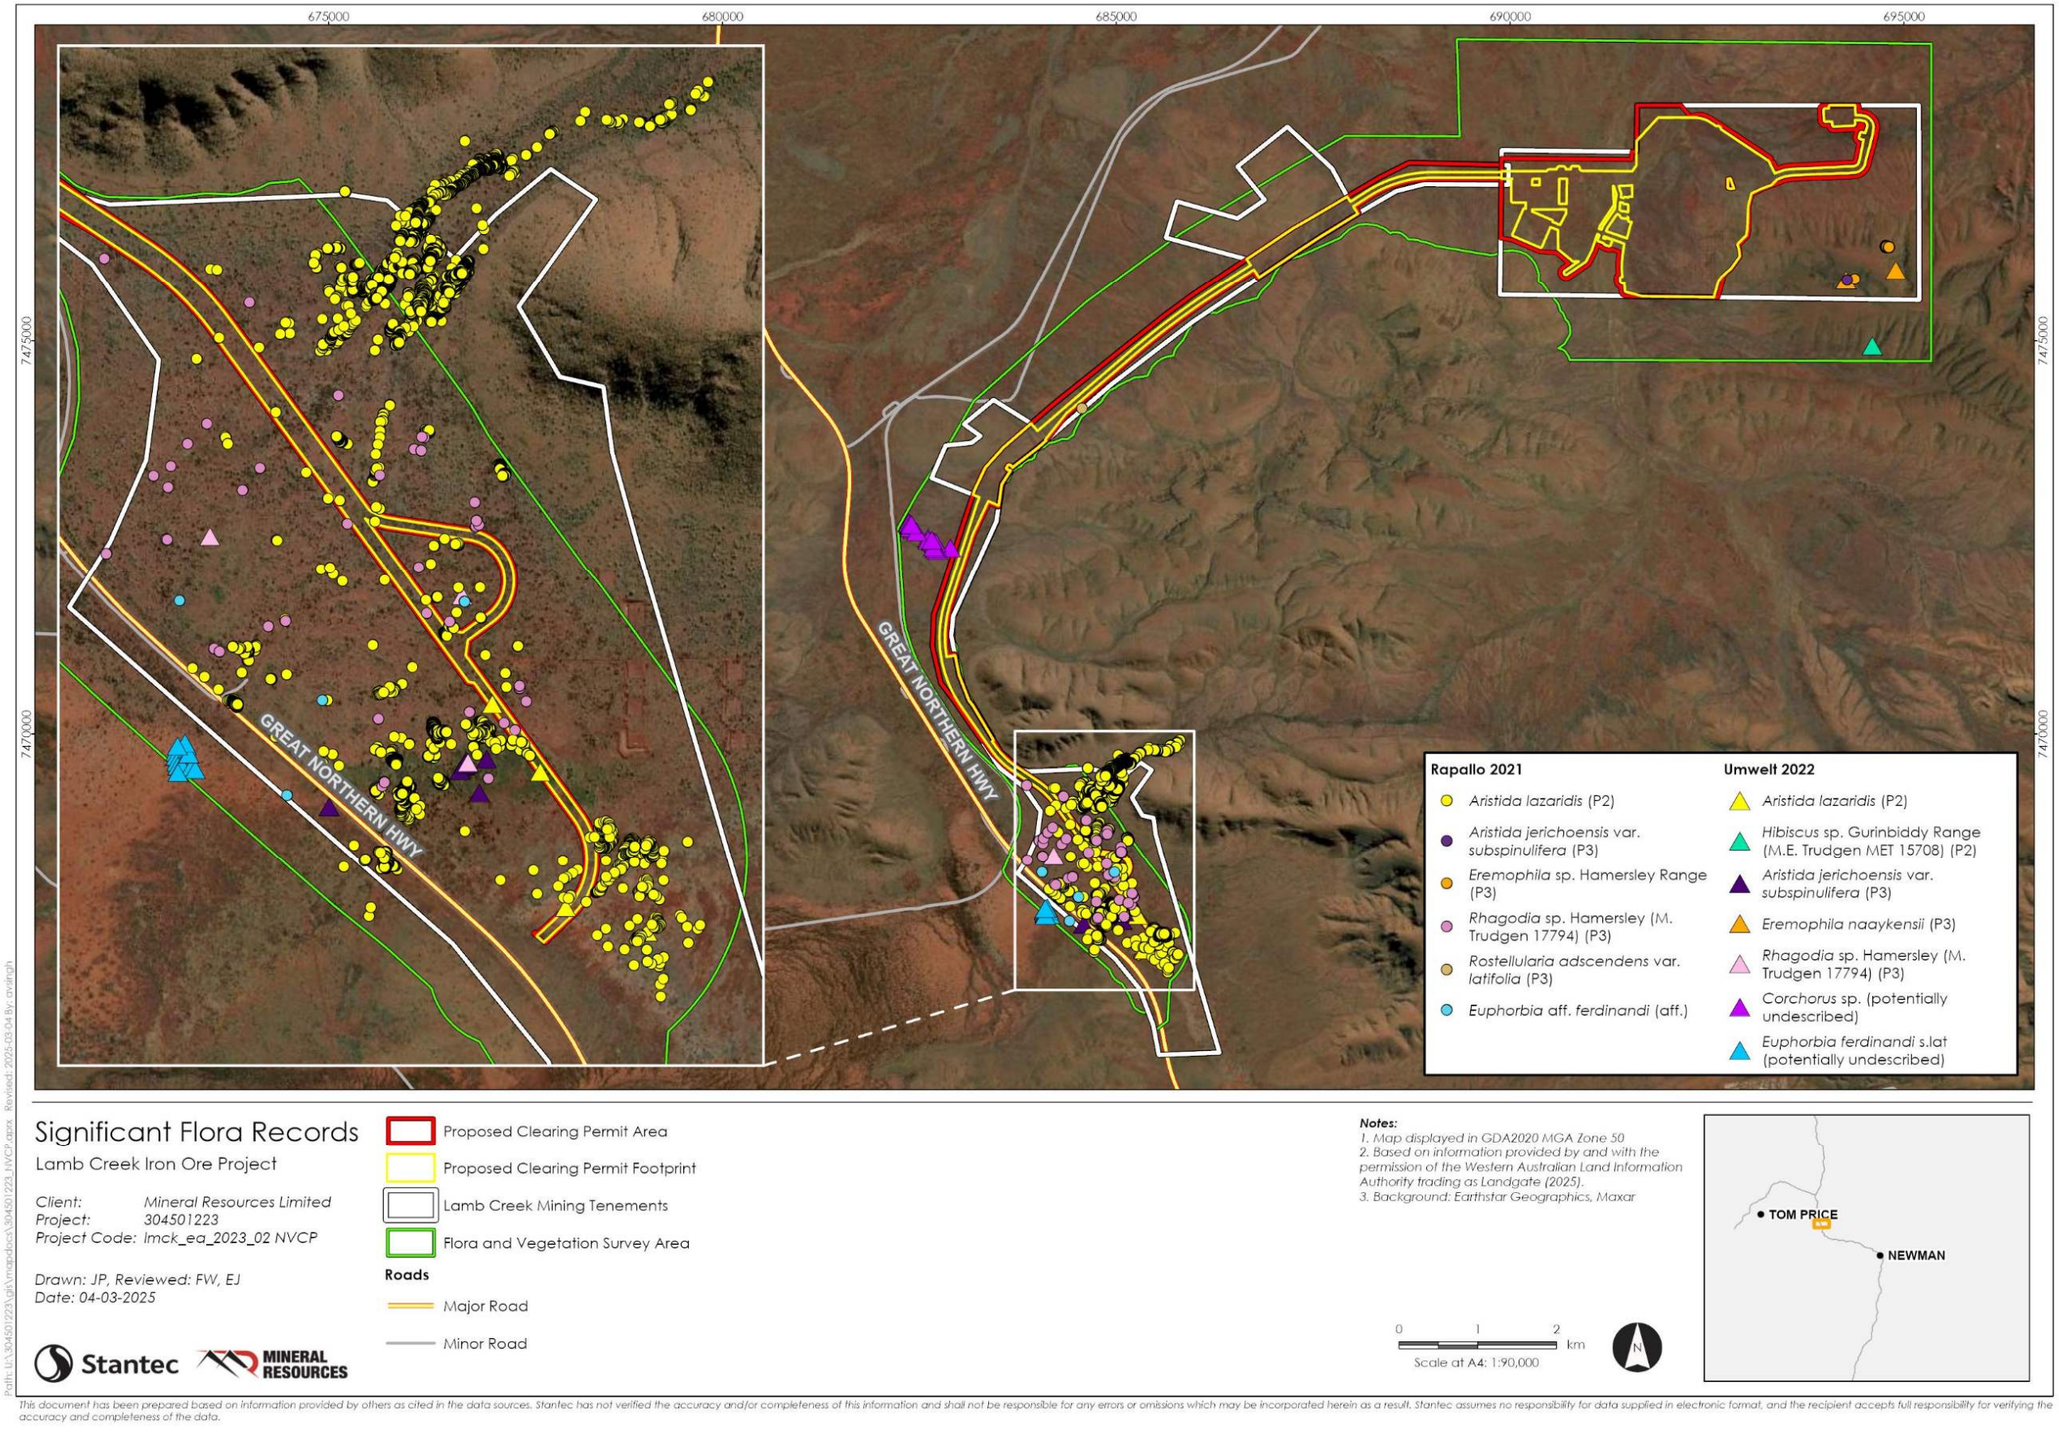

Figure 8: Conservation Significant Flora Records

4.7.3.3 Introduced Flora

In total, seven introduced flora species (weeds) have been recorded within the Study area (**Table 9**). None of these taxa were listed as Declared Pests (DPIRD 2020) or Weeds of National Significance (Commonwealth of Australia 2022). *Bidens bipinnata*, *Cenchrus ciliaris* and *C. setiger* were the most common introduced taxa in terms of numbers of locations and individuals recorded. Introduced flora were most commonly recorded in drainage areas (**Figure 9**). Whilst some of the introduced flora have a High/Rapid ecological impact and invasiveness ratings, no introduced taxa were widespread in the Study Area, and the vegetation was considered to be in mostly Excellent condition (Umwelt 2022a).

Table 9: Introduced Flora Recorded in the Umwelt (2022a) Flora and Vegetation Survey Area

Species	Common Name	Number of Locations	Number of individuals	Vegetation Type	Ecological Impact*	Invasiveness*
Bidens bipinnata	Bipinnate Begger's Tick	31	824	1, 2, 4, 6, 7, 9, 10	Unknown	Rapid
Cenchrus ciliaris	Buffel Grass	13	149	1, 4, 7, 10	High	Rapid
Cenchrus setiger	Birdwood Grass	17	2,654	1, 7, 10	High	Rapid
Malvastrum americanum	Spiked Malvastrum	11	70	1, 7, 10	High	Rapid
Portulaca pilosa	Pink Purslane	1	1	2	Not rated	Not rated
Setaria verticillata	Whorled Pigeon Grass	6	20	1, 7, 10	High	Rapid
Tribulus terrestris	Caltrop	3	5	7, 10	Unknown	Moderate

* Data from (Department of Biodiversity 2014)

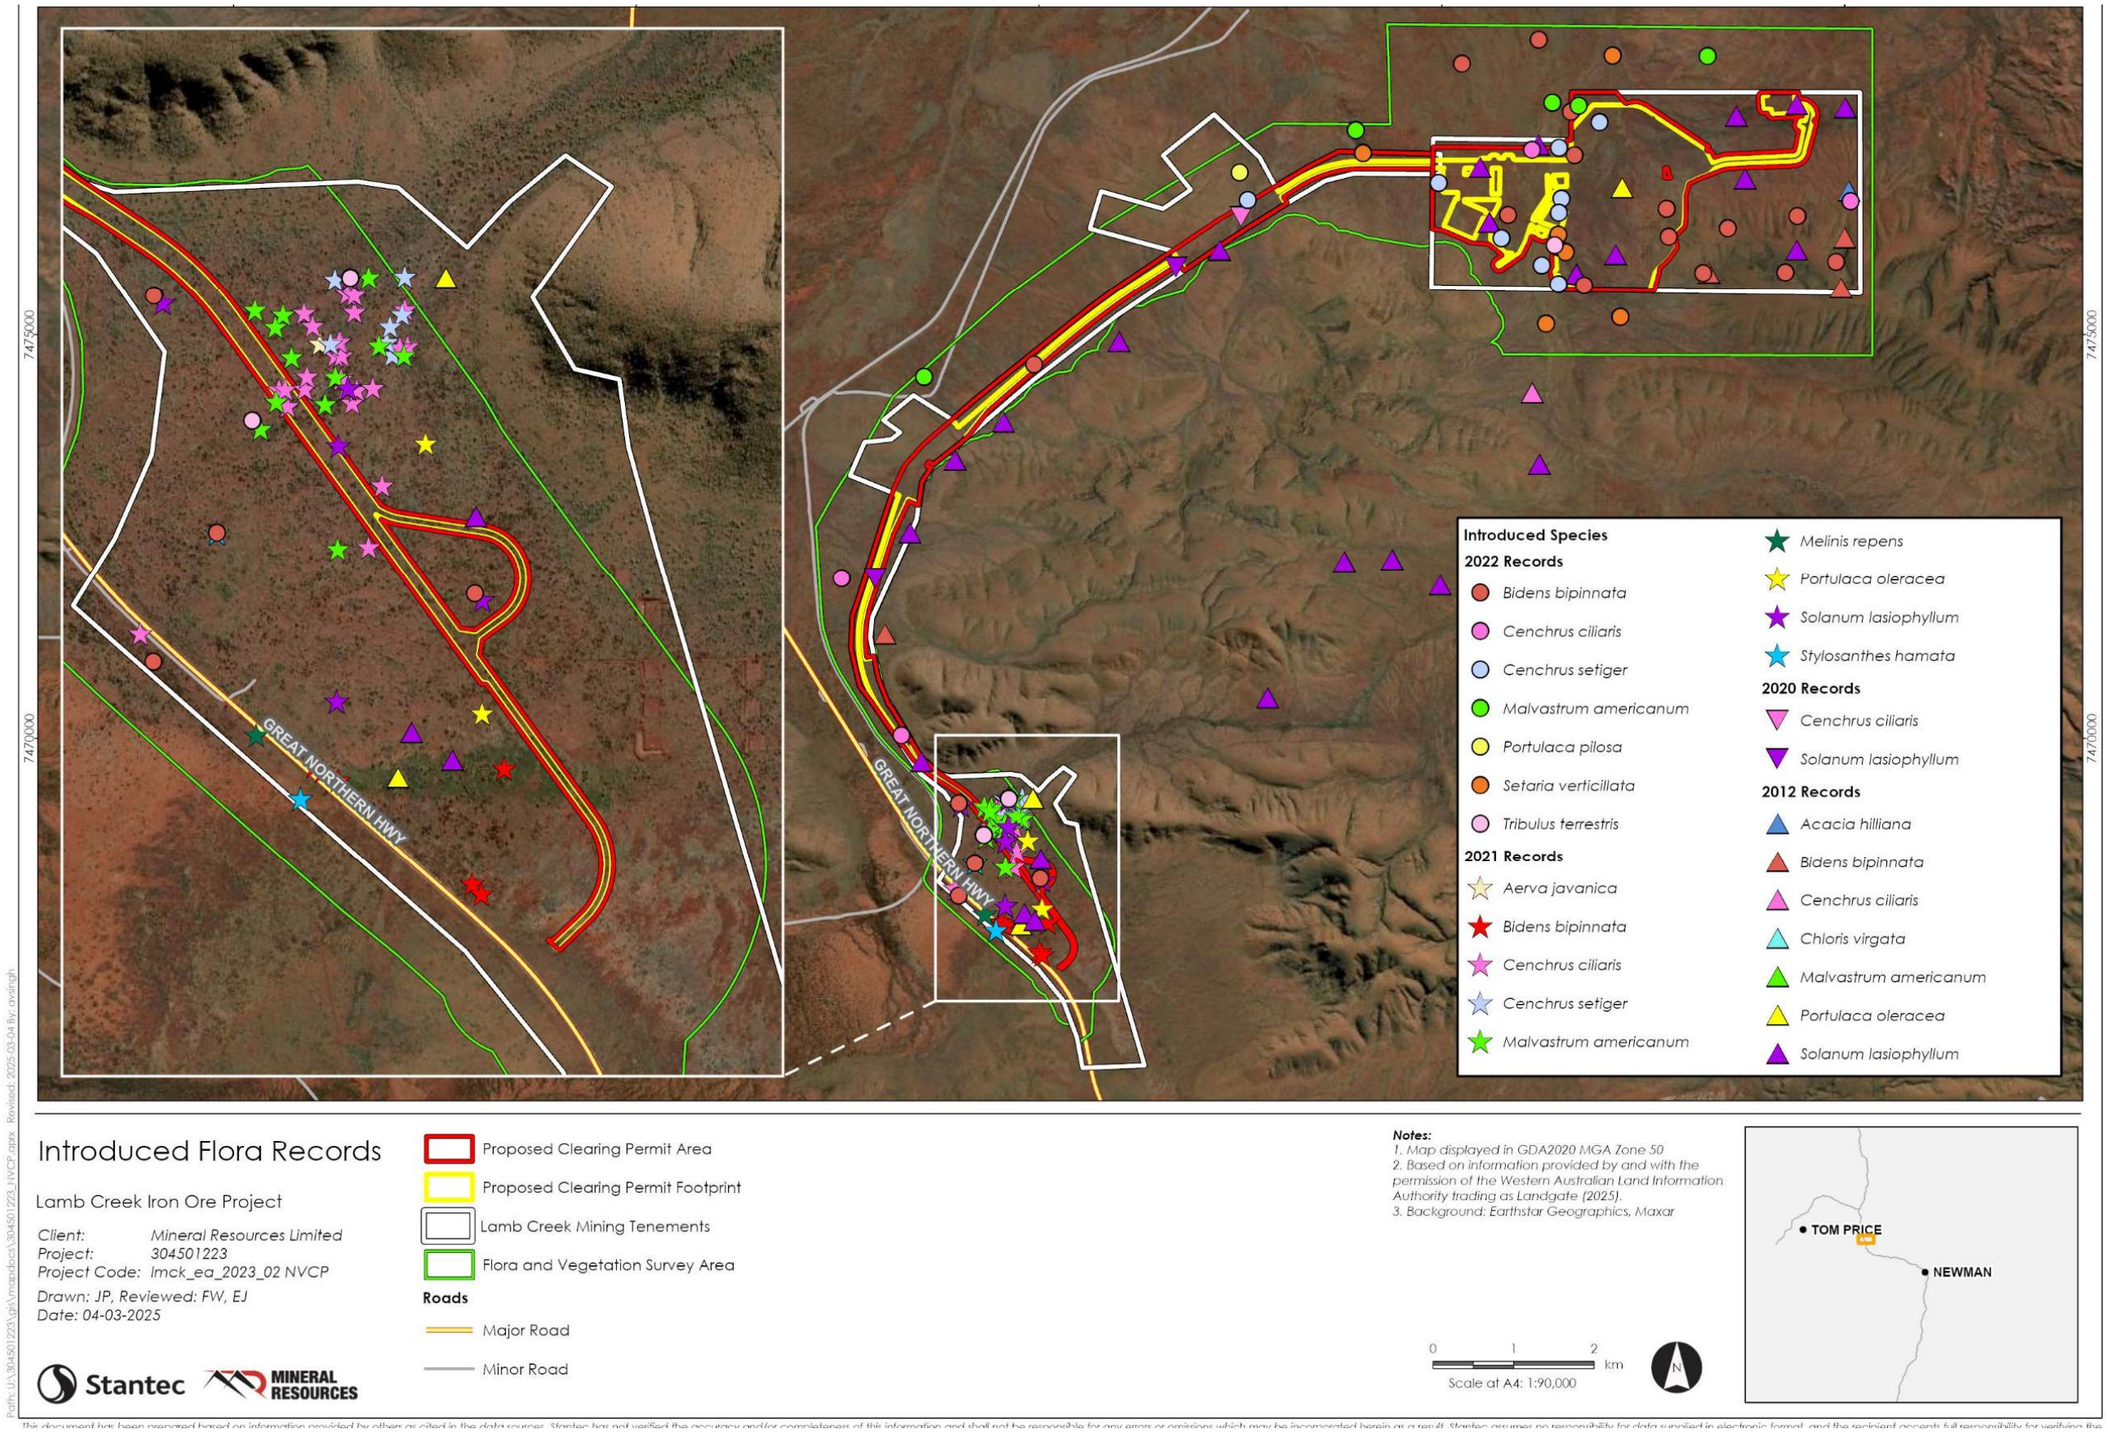

Figure 9: Introducted Flora Species Recorded in the Umwelt 2022 Flora and Vegetation Survey Area

4.8 Terrestrial Fauna

The proposed Clearing Permit Area has been subject to two detailed in-field surveys between 2012 and 2020 for terrestrial vertebrate fauna, and one detailed in-field survey in 2021 for Short Range Endemic (SRE) invertebrate fauna (**Appendix D**). In addition to this work, regional surveys undertaken in the vicinity of the Clearing Permit Footprint were collated to provide further contextual information. In total, two desktop assessments, two detailed terrestrial fauna surveys and one detailed SRE survey have been completed within the Clearing Permit Area.

4.8.1 Fauna Habitat

A total of 10 broad habitat types (excluding cleared areas) have been identified in the proposed clearing footprint (**Table 10**) (**Appendix D**) including:

• gorge, gully, and rocky breakaway;	• tussock grassland plain;
• hill crests and hill slopes;	• hummock grassland;
• stony plains;	• rocky ridge and gorge;
• drainage line (minor and medium);	• rocky hills and plateaus; and
• Mulga/*Corymbia* spp. plain;	• Mulga plain.

The following habitat features within the Terrestrial Fauna Survey Area are likely to be of importance to significant fauna and other fauna species in the region:

- gorges with surface water pools;
- caves (both deep and shallow for diurnal, nocturnal, and maternity roosts);
- rocky/pebble substrate;
- gullies;
- rocky outcrops;
- major watercourses; and
- open grassland and woodland.

Of the habitats recorded within the proposed Clearing Permit Area (**Table 10**), the rocky ridge and gorge habitat is considered to be important, however none of this occurs within the proposed Clearing Permit Area. The rocky ridge and gorge habitat may comprise caves and crevices for shelter, as well as breeding and roosting sites for several significant fauna species. This habitat is limited in its extent in the region, compared with other more widely occurring fauna habitats, such as stony plain. The drainage line habitat is also important habitat, although it is widespread in the region. The drainage line habitat is likely to support a greater abundance and diversity of fauna than surrounding habitats, and may provide a corridor for fauna movement. Any water present within drainage line habitats within the Clearing Permit Footprint would be ephemeral; therefore, is present only following major rainfall events.

Table 10: Broad habitat types within the Proposed Clearing Permit Area (Rapallo 2022b)

Habitat Type	Description	Value To Significant Fauna	Suitability for SRE Fauna	Extent In Terrestrial Fauna Survey Area (ha)(%)	Proposed Clearing Permit Area (ha)(%)	Indicative Clearing Footprint (ha)(%)
Gorge, gully, and rocky breakaway	Wide rocky gullies and gorges that bisect the hillcrest / hillslopes of the higher elevation areas containing caves, deep cracks, and crevices. Breakaways occur at the rugged edges of hillslopes. Spinifex hummock grassland with mixed shrubland patches or occasional *Ficus* spp. occurring in shaded locations or occasional *Eucalyptus leucophloia*.	**High value** • Potential foraging and dispersal habitat for Pilbara Olive Python, Northern Quoll, Ghost Bat and Peregrine Falcon. • Potential breeding habitat for Pilbara Olive Python, Northern Quoll and Peregrine Falcon. • Potential shelter habitat for Pilbara Olive Python and Northern Quoll. • Potential habitat for Pilbara Barking Gecko (*Underwoodisaurus seorsus*) and Gane's Blind Snake (*Anilios ganei*).	moderate to high	54.68 (3.32%)	0.0 (0.0%)	0.0 (0.0%)
Hillcrests / hillslope	Slopes and hill crests of higher elevation areas. Spinifex hummock grassland dominated with scattered *Eucalyptus leucophloia* trees and mallee, and *Acacia* spp. and *Grevillea* spp. shrubs on rocky, red skeletal soils (loams to clay/loam).	**Moderate value:** • Possible foraging and dispersal habitat for Ghost Bat, Western Pebble-mound Mouse and Northern Quoll. • Possible breeding habitat for Western Pebble-mound Mouse.	low	319.01 (19.39%)	61.63 (7.2%)	52.49 (8.2%)
Mulga / *Corymbia* spp. plain	Open Mulga shrubland patches over spinifex hummock or tussock grassland on loam to sandy clay loam occurring in areas of sheet flow drainage. The Mulga patches are surrounded by run-off zones of stonier plain with open spinifex / tussock grassland under very open Mulga / *Corymbia deserticola* shrubland.	**Moderate value:** • Possible foraging and dispersal habitat for Ghost Bat and Grey Falcon. • Possible habitat for Gane's Blind Snake.	medium	291.15 (17.70%)	252.65 (29.3%)	180.77 (28.3%)
Minor drainage	Smaller narrow drainage channels and shallow gullies that bisect the stony plain habitat and hill slopes, forming flow zones on the valley floor. Mixed open shrubland, to shrubland often over tussock grass and herbs with occasional fringing trees (scattered *Eucalyptus leucophloia*, *Corymbia* spp. or *Eucalyptus gamophylla*).	**Moderate value:** • Possible foraging and dispersal habitat for Ghost Bat, Grey Falcon, Peregrine Falcon, Pilbara Olive Python and Northern Quoll.	low	210.61 (12.80%)	92.21 (10.7%)	75.25 (11.8%)
Tussock grassland plain	Tussock grass (*Aristida inaequiglumis*, *Aristida contorta, Themeda triandra*) dominated, largely undefined drainage plain. Contains occasional open Mulga woodland stands or scattered Mulga individuals on brown sandy clay loam to loams. Contains patches of spinifex.	**Moderate value:** • Potential foraging and dispersal habitat for Ghost Bat, Grey Falcon and Peregrine Falcon. • Potential habitat for Gane's Blind Snake.	medium	137.93 (8.38%)	6.80 (0.8%)	5.34 (0.8%)
Medium drainage	Wide loamy drainage channels to undefined drainage (gravelly) containing occasional emergent *Corymbia hamersleyana* over patches of low mixed shrubs over Buffel Grass and tussock grass dominated understory on low relief. Contains very occasional Mulga stands in loamier soils.	**Moderate value:** • Potential foraging and dispersal habitat for Ghost Bat, Grey Falcon, Pilbara Olive Python, Northern Quoll and Peregrine Falcon. • Potential breeding and nesting habitat for Grey Falcon. • Potential habitat for Gane's Blind Snake.	moderate to low	113.06 (6.87%)	69.06 (8.0%)	43.41 (6.8%)
Stony plain	Plains and lower slopes of spinifex hummock grasslands (or in small patches, tussock grass) on red sandy clay loam to loam soil. Typically, with a mantle of gravel (less so on the valley floor adjacent to drainage, where soils are loamier). Little to no overstory aside from scattered trees or patches of mixed shrubs often regenerating from fire. Generally, *Eucalyptus leucophloia* occurs on the slopes and *Eucalyptus gamophylla* on lower slopes, with *Corymbia hamersleyana* typically associated with drainage.	**Low value:** • Foraging and dispersal habitat for Ghost Bat, Grey Falcon, Western Pebble-mound Mouse and Pilbara Olive Python. • Possible breeding and shelter habitat for Western Pebble-mound Mouse.	Moderate to low	517.94 (31.48%)	360.45 (41.9%)	266.35 (41.7%)

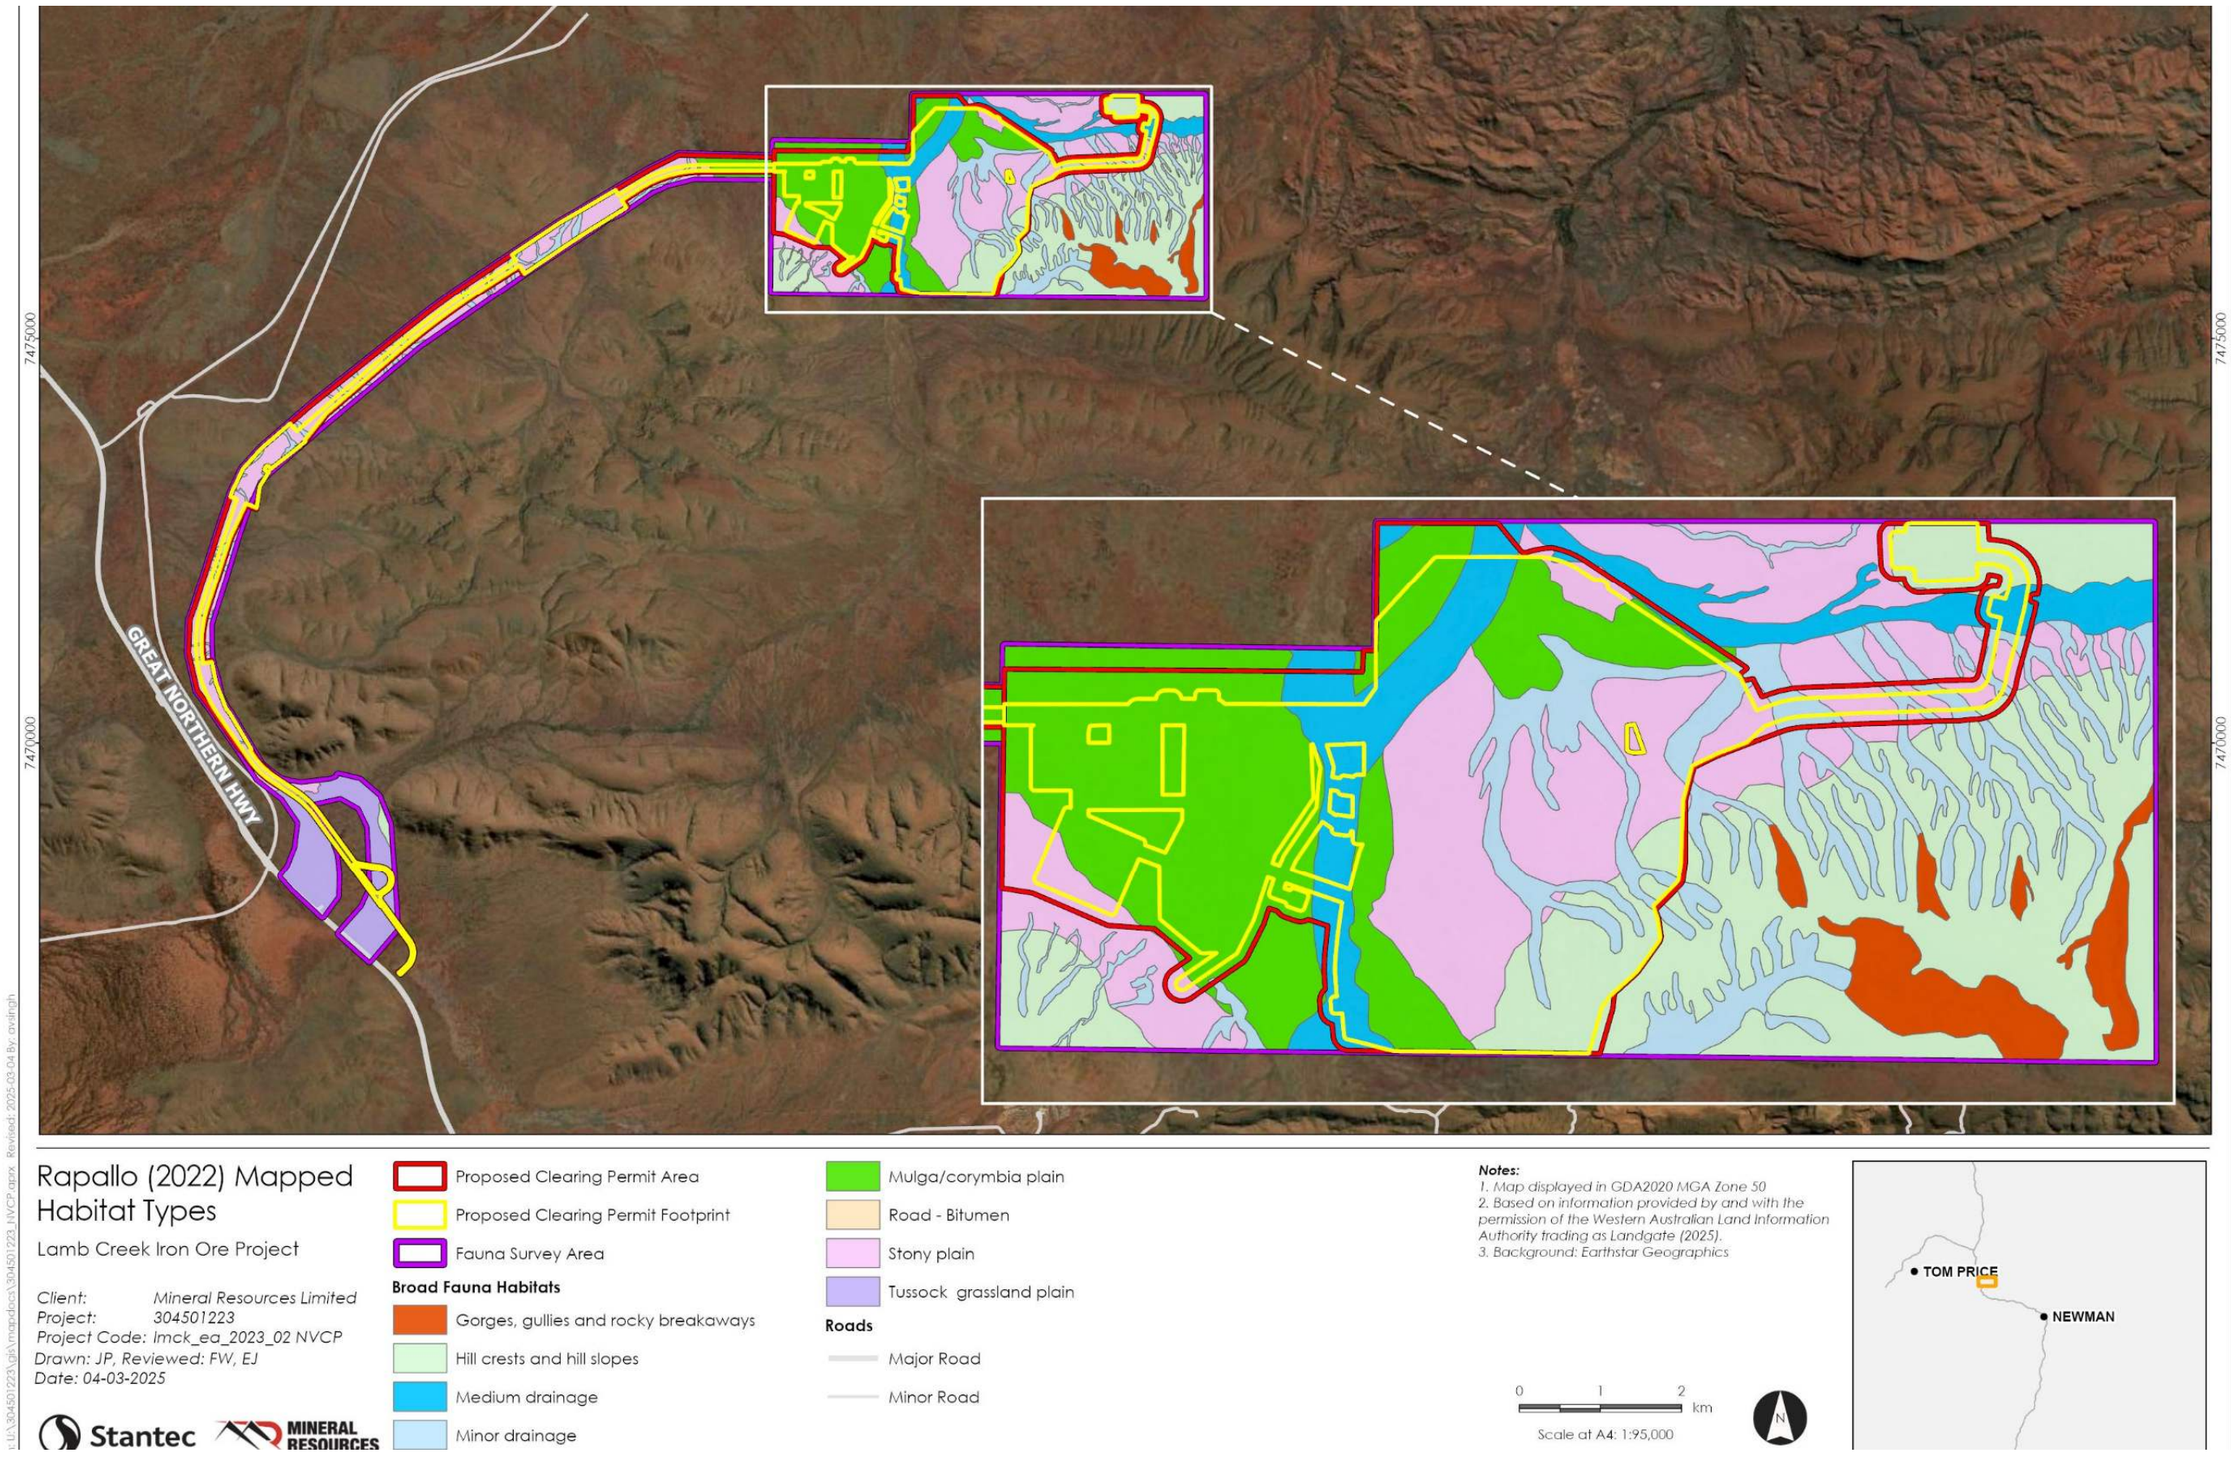

Figure 10: Fauna Habitats in the Clearing Permit Area

4.8.2 Fauna assemblage

There are 29 conservation significant fauna species listed under the WA BC Act and the Commonwealth's EPBC Act that have been identified as potentially occurring within the proposed Clearing Permit Area (Rapallo 2012a;2021b). Of these 29 species, one mammal and one bird species have been confirmed to occur (**Figure 11**).

4.8.3 Conservation Significant Fauna recorded in Clearing Permit Area

Two fauna species of significance were confirmed as occurring within the Clearing Permit Area based on the fauna identified in the field surveys (Rapallo 2012a;2021b):

- Western Pebble-mound Mouse (*Pseudomys chapmani*); and
- Fork-tailed Swift (*Apus pacificus*).

4.8.3.1 Western Pebble-mound Mouse

The Western Pebble-mound Mouse is listed as P4 under the BC Act. The species is currently restricted to the non-coastal central, eastern and southern parts of the Pilbara bioregion, occurring in ranges containing gentle stony slopes, often associated with *Acacia* spp. lined minor drainage areas (van Dyck and Strahan 2008). The tussock grasslands and stony plains habitats are most likely to support this species. This habitat is considered common within the proposed Clearing Permit Area, and there is widespread occurrence of suitable habitat for the species within the region (Woinarski *et al.* 2014).(Mitchell *et al.* 2002).

The Western Pebble-mound mouse was recorded during both Rapallo (Rapallo 2012a;2021b) in-field surveys, with 40 mounds recorded across the broader proposed Clearing Permit Area from within stony plains habitat (**Figure 11**). This species is widespread in the broader region and has also been recorded numerous times at Mining Area C (Biologic 2017) situated approximately 15 km from the proposed Clearing Permit Area (**Figure 1**).

4.8.3.2 Fork-tailed Swift

The Fork-tailed Swift is listed as Migratory under the BC Act and the EPBC Act. The species has been recorded within the proposed Clearing Permit Area and it is likely to forage above the proposed Clearing Area during summer (Johnstone and Storr 1998). As the species is entirely aerial, the Project is not expected to impact the species; therefore, the Fork-tailed Swift has not been considered further.

4.8.4 Conservation Significant Fauna likely to occur in Clearing Permit Area

In addition to the two species of significance recorded from the detailed in-field surveys, another eight fauna species of significance are considered likely to occur within the Clearing Permit Area, namely:

- Ghost Bat (*Macroderma gigas*) – Vulnerable (BC Act and EPBC Act);
- Northern Quoll (Dasyurus hallucatus) – Endangered (BC Act and EPBC Act);
- Pilbara Leaf-nosed Bat (*Rhinonicteris aurantia*) – Vulnerable (BC Act and EPBC Act);
- Pilbara Olive Python (*Liasis olivaceus barroni*) – Vulnerable (BC Act and EPBC Act);
- Gane's Blind Snake (*Anilios ganei*) – Priority 1 (BC Act);
- Pilbara Barking Gecko (*Underwoodisaurus seorsus*) – Priority 2 (BC Act);
- Grey Falcon (*Falco hypoleucos*) – Vulnerable (BC Act and EPBC Act); and
- Peregrine Falcon (*Falco peregrinus*) – Other Specially Protected (BC Act).

Fauna habitats are not restricted to the Clearing Permit Area and all habitats recorded in the broader Terrestrial Fauna Survey Area extend the Survey Area boundary. Suitable habitat for the Gane's Blind Snake Pilbara Barking Gecko, Grey Falcon and Peregrine Falcon occur in the Clearing Permit Area. The habitat within the proposed clearing area is not likely to be significant habitat or necessary for the maintenance of a significant habitat for these species and they are therefore not considered further.

4.8.4.1 Ghost Bat

The Ghost Bat is listed as Vulnerable under the BC Act and the EPBC Act. The Pilbara population of the Ghost Bat is considered an important population as it is genetically distinct and divergent (TSSC 2016). No Ghost Bat roosts were identified within the Clearing Permit Area during the in-field fauna surveys although five caves were being utilised by the Ghost bat outside of the Clearing Permit Area, but within the Terrestrial Fauna Survey Area (Rapallo 2012a;2022b). Bat Call WA in Rapallo (2022b) assigned the five Ghost Bat caves as the following cave type and habitat classification (Phoenix Environmental Services 2022):

- Ghost Bat roost cave recorded within the Terrestrial Fauna Survey Area:
  - Cave 1 (LC002) – Category 2 (situated approximately 730 m from the proposed pit); and
  - Cave 3 (LC001) – Category 3 (situated >1 km from proposed pit).
- Ghost Bat roost cave recorded outside of the Terrestrial Fauna Survey Area:
  - Cave 2 – Category 3;
  - Cave 4 – Category 3 (apartment block); and
  - Cave 5 – Category 2.

The closest distance from the proposed pit to a Ghost Bat cave is 729 m (Cave 1; Category 2). The same cave is located 350 m from a WRL and diversion bund. The remaining caves in proximity to the proposed pit are greater than 1 km away. Cave 4 and Cave 5 are located 202 m and 237 m, respectively, from the haul road (**Figure 11**). All caves will be retained.

Although the Ghost Bat has not been recorded within the Clearing Permit Area, the Ghost Bat will likely forage over all habitats present within the area. All areas of broad fauna habitats within the Clearing Permit Area are considered supporting habitat for Ghost Bat (of which 638.4 ha occurs in the Clearing Footprint.).

4.8.4.2 Northern Quoll

The Northern Quoll is listed as Endangered under the EPBC Act and BC Act. It is currently moderately common within the Pilbara and is found within 150 km of the coast where suitable rocky habitat occurs. The Pilbara population of Northern Quoll is genetically distinct from the nearest Kimberley population and is considered as important population as these are outside of the predicted range of cane toads (Hill and Ward 2010).

The Northern Quoll was recorded within the Terrestrial Fauna Survey Area during 2012 (Rapallo 2012a); however, no evidence of the species was found during the 2020 survey (Rapallo 2022b). The Northern Quoll has not been recorded within the Clearing Permit Area despite systematic trapping and active searches for Northern Quoll in 2012 and 2022 (Rapallo 2012a;2022b). However, Northern Quoll has been recorded on a motion camera approximately 5 km southwest of the proposed pit, and has been recorded infrequently at Mining Area C (show in **Figure 1)**, with all records being from scats (Biologic 2017).

The paucity of records within the Clearing Permit Area, and adjacent areas, combined with the lack of confirmed records (i.e. observations of individuals), suggests that the species is likely to occur in low numbers, if a permanent population occurs, or that the records to date have been made by individuals dispersing from nearby populations. The Pilbara population of Northern Quolls is considered to be an important population based on the records occurring in habitat which is free from cane toads and is therefore considered important for the long-term survival of the Northern Quoll (Hill and Ward 2010).

4.8.4.3 Pilbara Leaf-nosed Bat

The Pilbara Leaf-nosed Bat is listed as Vulnerable under the BC Act and the EPBC Act. The Pilbara Leaf-nosed Bat population of the Pilbara and Gascoyne regions is considered an important population as it comprises multiple colonies that form one interbreeding population (Threatened Species Scientific Committee 2016). No Pilbara Leaf-nosed Bat individuals have been recorded in surveys of the Terrestrial Fauna Survey Area; however, the species is considered likely to occur as a foraging visitor throughout the Clearing Permit Area, particularly along major creeks.

The Clearing Permit Area is unlikely to contain important roost habitat for this species and no roosts for this species were recorded in the rocky ridge and gorge habitat in the Clearing Permit Area. Despite extensive survey effort completed at Mining Area C (15 km from the Proposed Action Area as shown in **Figure 1**) the species was only recorded twice as a foraging visitor (Biologic 2017). The nearest high concentration of records for this species

occurs at Gudai-Darri, approximately 29 km north of the Clearing Permit Area, which is thought to contain a potential roost site in an old mine adit.

4.8.4.4 Pilbara Olive Python

The Pilbara Olive Python is listed as Vulnerable under the BC Act and the EPBC Act. Suitable denning habitat for this species within the Terrestrial Fauna Survey Area comprises gorges, gullies and rocky breakaways, with drainage line habitat used for foraging and dispersal. The Pilbara Olive Python was not recorded in the Clearing Permit Area during field surveys but was recorded approximately 3 km south of the proposed pit (**Figure 11**). Biologic (2017) recorded Pilbara Olive Python from Mining Area C from four records (15 km from the Proposed Action Area as shown in **Figure 1**). This species favours areas with permanent water holes (which are absent from the Clearing Permit Area) in rocky ranges or along rivers and is considered likely to occur in the Proposed Action Area at least as a foraging visitor (Rapallo 2022b).

4.8.5 Short Range Endemics

The following seven broad habitat types were identified as having the potential to support SRE invertebrate fauna and were assessed during the SRE invertebrate fauna survey (**Appendix D**):

- gorges, gullies, and rocky breakaways;
- minor drainage lines:
- medium drainage lines
- hillcrests and hillslopes;
- stony plain;
- tussock grassland plain; and
- Mulga/Corymbia spp. plain.

Table 11 shows the breakdown of these habitats within the Terrestrial survey area. Of the SRE habitats assessed, the stony plain habitat type is the most extensive habitat within the proposed Clearing Permit Area, covering 360.5 ha (41.9%). Factors that contribute to the presence of suitable microhabitats for SREs include southeast facing slopes, moisture, rocky areas, habitat isolates, deep leaf litter, mountainous areas, deep gullies or gorges and riparian vegetation. Within the proposed Clearing Permit Area, suitable microhabitats with a high probability of supporting SRE species include gorges, gullies, and rocky breakaways (**Figure 11**). Some habitats assessed within the proposed Clearing Permit Area have also experienced disturbance through selective clearing for tracks, drill pads, and laydown areas associated with exploration activities (Rapallo 2022a). No SRE habitats identified are confined or restricted to the proposed Clearing Permit Area.

Table 11: SRE Habitat Suitability within the Terrestrial Fauna Survey Area

SRE Habitat Type	Extent in Terrestrial Fauna Survey Area (ha)(%)	SRE Habitat Suitability
Gorges, gullies, and rocky breakaways	54.68 (3.32%)	• The deepest gullies in the Terrestrial Fauna Survey Area occur on the south-eastern corner within a north-west and northern-facing slope. Within the Terrestrial Fauna Survey Area, this habitat type is not isolated with no gorges, terminal gorges or gullies. • Suitability for SRE is rated as moderate to high. This broad habitat type is not restricted to the Terrestrial Fauna Survey Area, and the habitat type contains at least two microhabitat factors.
Minor drainage lines	210.61 (12.80%)	• Despite some patchy shading from vegetation, the minor drainage lines assessed had low soil moisture levels, low accumulated litter, and generally gravelly soils. Connectivity of minor drainage is high as the drainage lines flow fast after significant rainfall into a network of drainage. • Suitability for SRE is low based on low protection and low isolation. This broad habitat type is not restricted to the survey area.

SRE Habitat Type	Extent in Terrestrial Fauna Survey Area (ha)(%)	SRE Habitat Suitability
Medium drainage lines	113.06 (6.87%)	• In the Terrestrial Fauna Survey Area, detritus and litter within this habitat was sparse or in piles without accumulated soil-indicating recent fast flow and little opportunity for soil and fine detritus to accumulate. • Suitability for SRE is moderate to low based on medium to low protection and low isolation. This broad habitat type is not restricted to the Terrestrial Fauna Survey Area.
Hillcrests and hillslopes	319.01 (19.39%)	• Steep, south-facing hill slopes can provide a degree of protection; however, within the Terrestrial Fauna Survey Area there are no areas of high elevation that are steep, south facing and constantly shaded. Within the Terrestrial Fauna Survey Area, this habitat type is continuous (not isolated). • Suitability for SRE is low based on low protection and low isolation and this broad habitat type is not restricted to the survey area.
Stony plain	517.94 (31.48%)	• In the Terrestrial Fauna Survey Area, there are no areas of continuous shade occurring within this habitat due to topography. Within the Terrestrial Fauna Survey Area, this habitat type is continuous not isolated. • Suitability for SRE is moderate to low suitability based on low - medium protection and low isolation. This broad habitat type is not restricted to the Terrestrial Fauna Survey Area.
Tussock grassland plain	137.93 (8.38%)	• Mulga stands within the Terrestrial Fauna Survey Area provide shade; however, the stands are not extensive or thick, therefore the shade is patchy as is the accumulated litter. The soils are loamier than the surrounding habitats, so there are areas of higher soil moisture under the bigger mulga stands. • Suitability for SRE is medium based on low isolation and medium protection. This broad habitat type is unlikely to be restricted to the Terrestrial Fauna Survey Area.
Mulga/*Corymbia* spp. plain	291.15 (17.70%)	• Mulga stands within the Terrestrial Fauna Survey Area provide shade; however, the stands are not extensive or thick, therefore the shade is patchy as is the accumulated litter. • Suitability for SRE is medium based on low isolation and medium protection. This broad habitat type is unlikely to be restricted to the Terrestrial Fauna Survey Area.

A total of 25 possible SRE taxa were collected from within the Terrestrial Fauna Survey Area during field surveys and 16 possible SRE taxa were recorded in the Clearing Permit Area (Rapallo 2012a; 2022a). These potential SRE taxa are presented in **Appendix E**. The Mulga shrubland patches within the Mulga / Corymbia spp. plain habitat yielded the highest abundance and taxa richness of SREs, followed by stony plain, although survey effort was not uniform across habitats (Rapallo, 2022a).

No confirmed SRE invertebrate taxa were collected from the Terrestrial Fauna Survey Area or the Clearing Permit Area (Rapallo 2022a). Despite 16 possible SRE taxa being recorded in the Clearing Permit Area (**Appendix E**), habitat connectivity across the landscape suggests that the potential SRE taxa found in these habitats are likely to have their distributions extending outside the Clearing Permit Area (Rapallo 2022a).

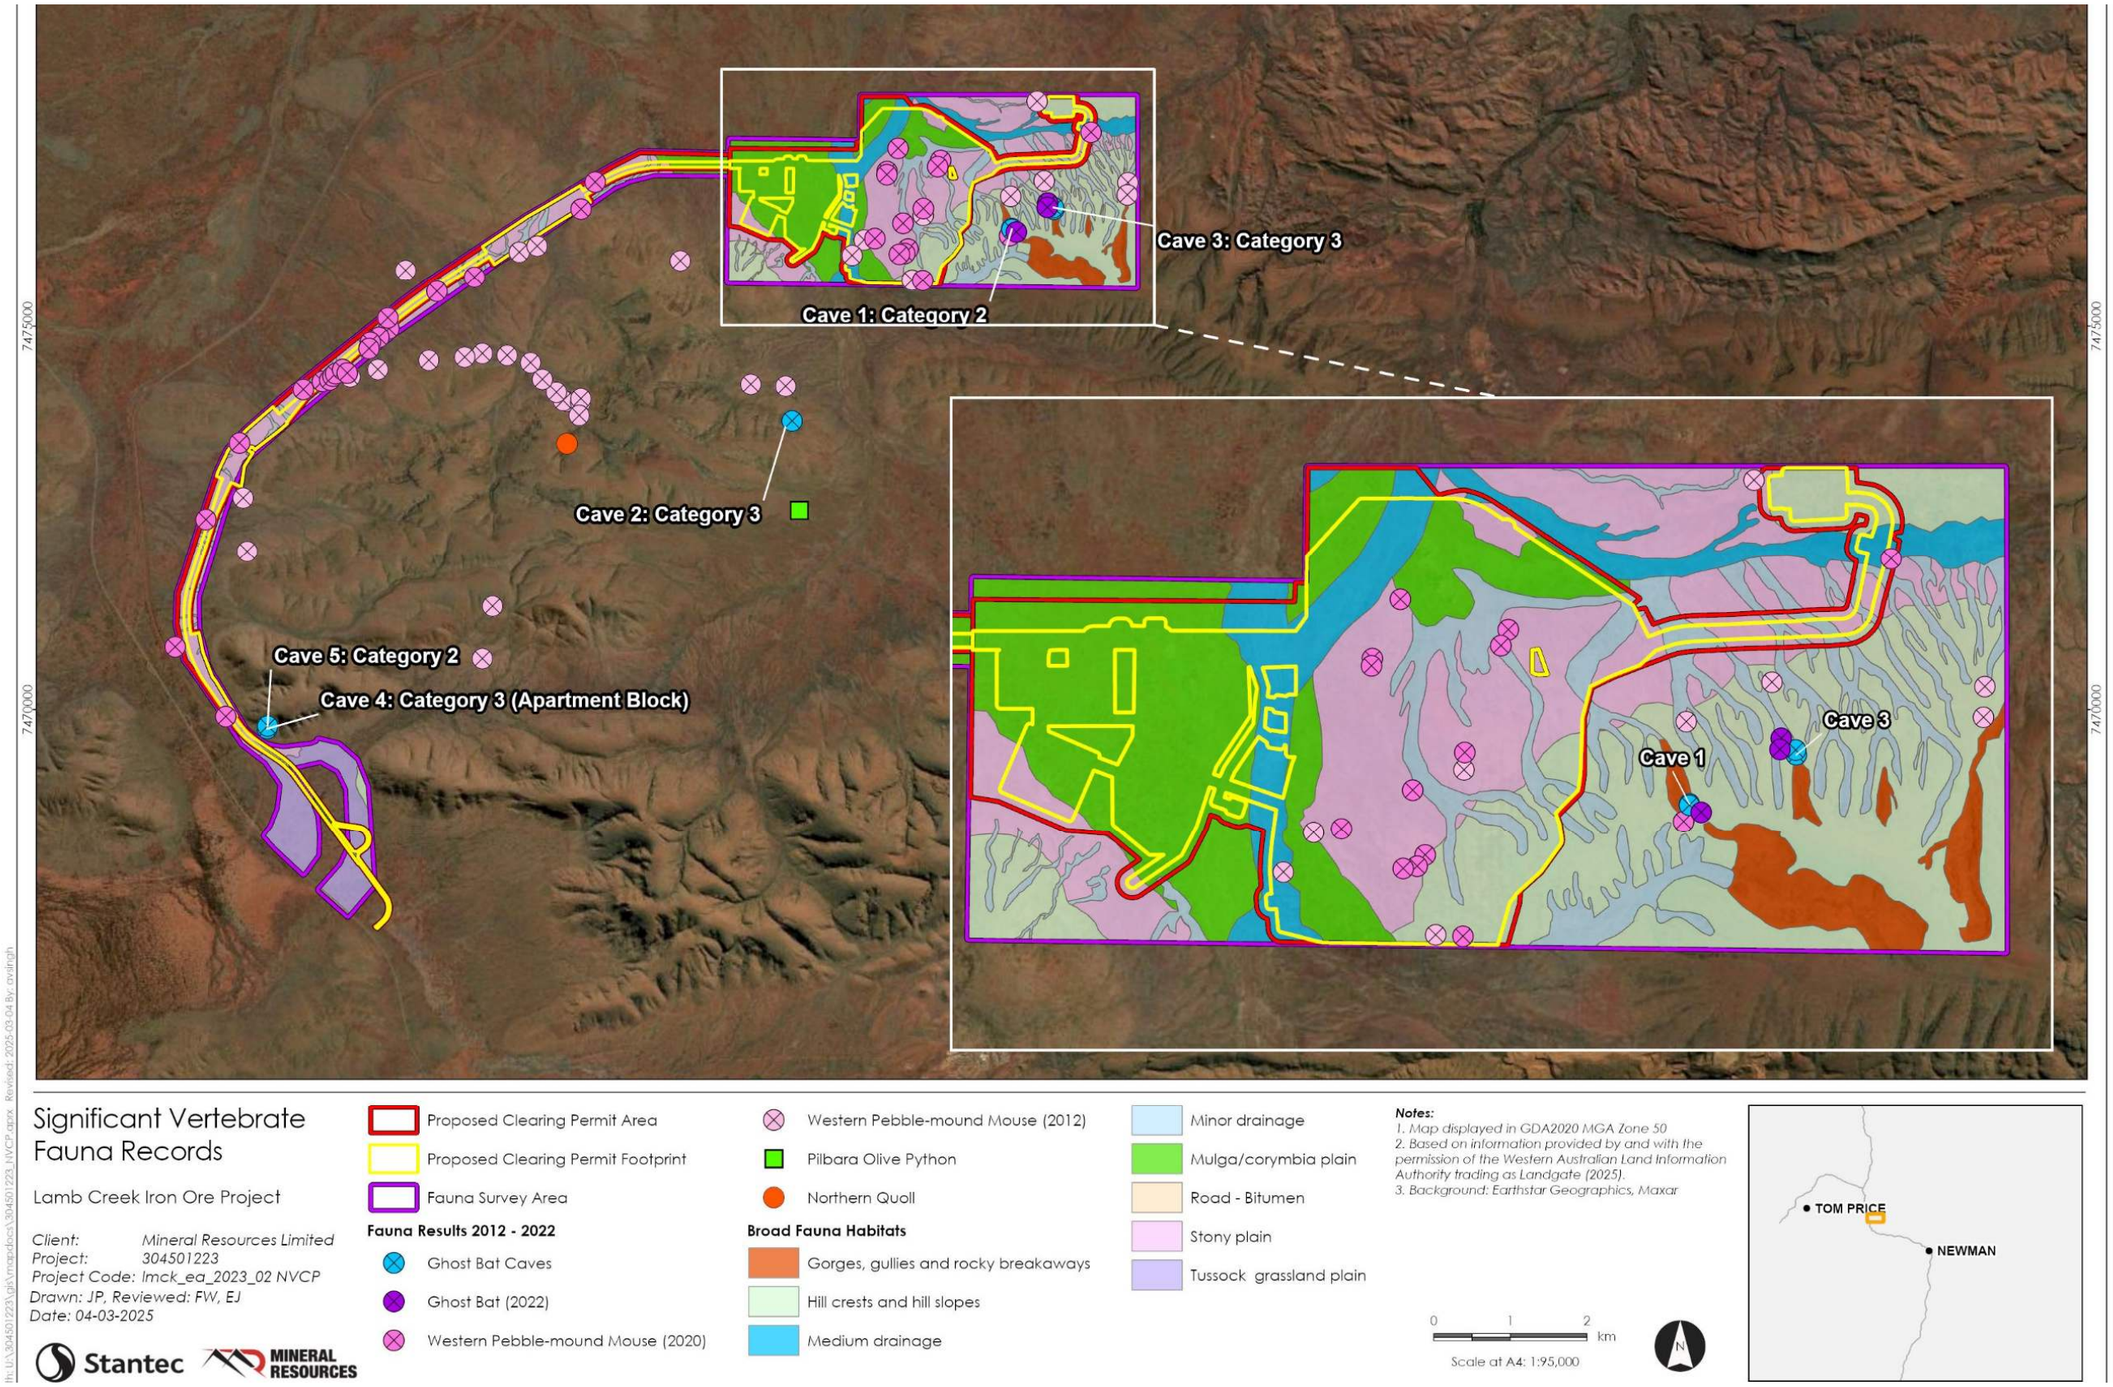

Figure 11: Significant Vertebrate Fauna Records within the Proposed Clearing Permit Area and Surrounds

5. ENVIRONMENTAL MANGEMENT MEASURES AND REHABILITATION

5.1 Approved Policies and Planning Instruments

The clearing of native vegetation in Western Australia is regulated under Part V of the EP Act and the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004* (Clearing Regulations).
In addition to the matters considered in accordance with section 51O of the EP Act, MinRes has also had regard for the below statutes, polices and guidelines:

Other Legislation of relevance for assessment of native vegetation clearing includes:

- *Biodiversity Conservation Act 2016* (WA) (BC Act);
- *Conservation and Land Management Act 1984* (WA) (CALM Act);
- *Environment Protection and Biodiversity Conservation Act 1999* (Cth) (EPBC Act);
- *Soil and Land Conservation Act 1945*;
- *Rights in Water and Irrigation Act 1914*; and
- *Aboriginal Heritage Act 1972.*

Other Relevant policies and guidance documents to this Project include:

- Environmental Offsets Policy (Government of Western Australia 2011);
- A guide to the assessment of applications to clear native vegetation (Department of Environment Regulation 2014);
- Procedure: Native vegetation clearing permits (Department of Water and Environmental Regulation 2021);
- Technical guidance – Flora and Vegetation Surveys for Environmental Impact Assessment (Environmental Protection Authority 2016b);
- Technical guidance – Terrestrial Vertebrate Fauna Surveys for Environmental Impact Assessment (Environmental Protection Authority 2020); and
- Approved Recovery Plans for threatened species.

5.2 Mitigation

MinRes has applied the EPA's mitigation hierarchy (avoid, minimise, rehabilitate, offset) during the design, planned construction and operation of the Project to reduce the potential impact to key environmental factors including Flora and Vegetation, Terrestrial Fauna, Inland Waters and Social surrounds. These management measures are detailed in subsequent sections.

5.2.1 Land Clearing and Flora Management

MinRes will ensure all clearing and ground disturbance is carried out in accordance with the LAP and Clearing Procedures. Vegetation clearing will be implemented in accordance with the Construction Environmental Management Plan (CEMP) during the construction phase of the Proposal. Clearing and ongoing operations for the Lamb Creek Project will also be undertaken in accordance with the Flora and Vegetation Management Plan (FVMP, **Appendix F**) developed for the site. The following actions will be implemented to minimise and manage impacts to native vegetation as a result of clearing (further detail provided in FVMP):

Avoid:

- Proposed clearing has been minimised as far as practicable to reduce the extent of disturbance required; the Proponent has reduced the Clearing Permit Area from 1,386 ha to 861 ha.
- A LAP and Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary.

- The area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager. Some heavy equipment used may have in-cab GPS mapping and alarm functions however in the absence of this functionality, other control measures such as the use of spotters and/or restricting clearing to the daylight hours will be undertaken.

Minimise:

- Spatially restricted footprint and short life of mine.
- Implement Flora and Vegetation Management Plan (FVMP)
- Follow management measures within the CEMP and Operations Environmental Management Plan (OEMP) with respect to clearing native vegetation.
- Clearing awareness training undertaken by all personnel involved in clearing activities.
- Vegetation clearing shall be kept to the minimum amount required, as far as practicable.
- Where significant flora taxa populations cannot be avoided, as may be the case with *Aristida lazaridis (*P2), infrastructure should be placed to avoid the highest densities, ensuring surface water flow is maintained.
- Significant flora populations and the area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager.

Rehabilitate:

- Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved Mine Closure Plan (MCP).
- Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.
- Salvage and stockpile soil and/or habitat features (e.g. vegetation, stumps, logs, boulders) for use in rehabilitation programs.

5.2.2 Weed Management

MinRes will aim to prevent the introduction of weeds and limit the spread of weeds in the proposed Clearing Permit Area as far as practicable. The following management actions will be implemented to minimise the risk of introduced flora resulting from the Project (further detail provided in FVMP):

Avoid:

- A LAP and Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary.

Minimise:

- Implement FVMP.
- A Weed Management Plan shall be prepared and implemented as part of the FVMP, prior to construction and operation, to control access and movement of vehicles and construction personnel to prevent the introduction and spread of weeds into the proposed Clearing Permit Area, weed free areas, and between work areas.
- Vehicles with ground engaging equipment to be cleaned, inspected and issued with a Weed Hygiene Certificate prior to entry to site or moving between areas on-site.
- Vehicles and equipment shall be restricted to designated roads and tracks.
- Weed awareness and weed hygiene training shall be delivered to all personnel as part of the induction process.
- Regular inspection and maintenance of vehicles and equipment shall be undertaken.
- Restrict movement of topsoil at known weed locations.
- Ensure timely response for the management of any declared weed occurrences or other weed infestations occurs.

Rehabilitation:

- Seasonal weed control programs shall be implemented, including herbicide spraying or physical removal, as required.
- Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.

5.2.3 Management for Terrestrial Fauna

MinRes will aim to ensure fauna species are not adversely affected, via either direct impacts or impacts to habitat as far as practicable. Clearing and ongoing operations for the Lamb Creek Project will also be undertaken in accordance with the Significant Fauna Management Plan (SFMP, **Appendix G**) developed for the site. The following management actions will be implemented to minimise the potential impacts on fauna:

Avoid:

- The proposed Clearing Permit Area has been minimised as far as practicable to reduce the extent of disturbance required; the Proponent has revised the Clearing Permit Area from 1,386 ha to 861 ha.
- Implement a 100 m radius exclusion zone around recorded Category 2 and Category 3 Ghost Bat roosts.
- Temporary closure of Cave 1 during construction and operation – a geotechnical assessment (peak particle velocity-PPV) of Cave 1 indicating that the conservative limit of 25 mm/sec PPV (Bat Call WA 2023) to maintain structural integrity of the cave will be met. This is considered to be an acceptable method (i.e. exclusion from using cave) to avoid impacts to nesting Ghost Bats (Bat Call WA 2023). This indicates that once the cave is reopened, the Ghost Bats are likely to return.
- Avoid placement of infrastructure in any habitat of high significance, where practicable.
- A LAP and Land Clearing Procedures will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary.
- The area to be cleared shall be clearly demarcated and machinery operators made aware of the operational boundary, following confirmation with the relevant manager. Some heavy equipment used may have in-cab GPS mapping and alarm functions however in the absence of this functionality, pegging of clearing boundaries, supplemented with other control measures such as the use of spotters and/or restricting clearing to the daylight hours will be used to prevent unauthorised clearing.
- Habitat and fauna surveys have been undertaken to identify key areas and species to avoid.

Minimise:

- Implement Significant Fauna Management Plan (SFMP).
- Closure of Cave 1 is likely to be closed by using a lightweight steel frame fitted to the entrance and bird avery steel netting or any heavier style with apertures not exceeding 100 mm. This would exclude Ghost bats but smaller species up to 10 g such as Pilbara leaf-nosed bats (*Rhinonicteris aurantia*) or Finlayson's cave bat (*Vespadelus finlaysoni*) would be able to pass through unharmed. Other small fauna of a similar size including reptiles, frogs and snakes would also be able to access the cave. With regard to larger fauna such as Quolls, Dingoes and/or Macropod species that will be excluded by the closures, Lamb Creek Cave 1 is situated in an area with numerous alternative deep overhangs and shallow caves that are suitable for their foraging and/or resting activities. Each of these species is known to travel significant distances on a daily basis (Bat Call WA 2023).
- Clearing awareness training is to be undertaken by all personnel involved in clearing activities, including specific information on significant flora within the Clearing Permit Area, the requirements for clearing, and the LAP and Land Clearing Procedure processes.
- Vegetation clearing shall be kept to the minimum amount required, as far as practicable.
- Clearing extents and approved ground disturbance areas shall be pegged by qualified surveyors in the field prior to ground disturbance commencing.

- In unpegged areas, the use of GPS guided machinery or other control measures such as the use of spotters and/or restricting clearing to the daylight hours will be used, provided the appropriate LAP and Land Clearing Procedure processes have been followed.
- Vehicles and equipment shall be restricted to designated roads and tracks.
- Machinery and vehicle movements should be restricted during construction to minimise the potential for vehicle strikes, where practicable.
- Machinery and vehicle movements that must be undertaken between dusk and dawn should be limited to low speeds on access tracks.
- Excavations and trenches will be kept open only as long as needed to undertake the work and egress points will be provided dependant on depth / morphology of the excavation.

Rehabilitate:

- Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved MCP.
- Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.
- All bores shall be capped.

5.2.4 Dust Deposition on Vegetation Management

MinRes will minimise degradation of vegetation through dust deposition as far as practicable through the implementation of the following measures:

Avoid:

- Intersection of the haul road with the Great Northern Highway, and the remainder of the access road up to the operational area within M47/1592 will be sealed to reduce the generation of dust.
- Road haulage iron ore loads will be covered.
- Ground clearing (including topsoil stripping) shall not be undertaken during periods of high wind.
- A LAP and Land Clearing Procedure will be implemented to ensure all clearing works are compliant with regulatory requirements and are within approved boundary.

Minimise:

- Spatially restricted footprint and short life of mine.
- Implement the FVMP.
- Vehicles and equipment shall be restricted to designated roads and tracks.
- Dust suppression shall be implemented to manage dust emission on cleared areas, unsealed roads and iron ore handling areas.
- Speed limits shall apply on unsealed roads.

Rehabilitate:

- Implement an appropriate rehabilitation plan (surface treatments; seed selection, collection, storage and management) in accordance with the approved MCP.
- Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.

5.2.5 Soil and Topsoil Management

The following soil management will be implemented as recommended by (MBS Environmental 2021):

- Soil from all disturbance areas can be stripped and used as a plant growth medium for rehabilitation purposes. Subsoils from the pit and WRD areas are physically, chemically, and structurally very similar to the topsoils and thus can also be harvested for rehabilitation purposes.
- If shallow loams present in the northern part of the proposed Clearing Permit Area are to be harvested, these could be co-mingled with stony soils from elsewhere as both soil types are physically and chemically similar in nature. However, it would be advisable to separately stockpile these should a need for less stony soil be identified.
- Within the pit area, excavation was typically possible up to a depth of around 900 mm. Excavation depths indicate that soils should be harvestable to a depth of at least 1,000 mm within the footprint of the WRL 1. Excavation of up to 2,000 mm is considered possible within the WRL 2 footprint.
- Volumes harvested from the pit shell may be sufficient for rehabilitation and closure commitments. In this circumstance, excavation of 200 mm within the WRD footprints is considered sufficient to meet regulatory expectation of good practise in soil resource management.

5.2.6 Water Management

The proposed Clearing Permit Area is not located within any major drainage lines or watercourses; therefore, clearing is not expected to impact surface water flows. Additionally, the proposed clearing is not located in proximity to any Public Drinking water Source Areas.

As impacts to Inland Waters associated with the Project are expected to be negligible, with a spatially restricted clearing area and a short life of mine, the key mitigation measures are mostly associated with management strategies. Operational impacts will be managed through a licence issued under Part V of the EP Act.

5.2.6.1 Groundwater:

The following management measures will be implemented to minimise potential impacts associated with groundwater drawdown.

Avoid:

- Groundwater drawdown is unavoidable.
- No groundwater dependent vegetation was identified from the proposed Clearing Footprint, avoiding impacts to this GDE type.

Minimise:

- Short life of mine.
- Implement groundwater management strategies in accordance with the Groundwater Operating Strategy (GWOS).
- Groundwater abstraction for pit dewatering will be managed in accordance with a *Rights in Water and Irrigation Act 1914* (RIWI Act) groundwater licence and associated GWOS.
- Hydrogeological assessments will continue to be undertaken to inform progressive dewatering requirements.

Rehabilitate:

- Groundwater is expected to recover to a substantial extent within 3 years of cessation of dewatering, and to recover back to original Standing Water Level (SWL) within five to 30 years.
- The open pit will be backfilled to a minimum of 5 m above the baseline groundwater level, to manage residual drawdown following groundwater recovery.
- Implement an appropriate rehabilitation plan in accordance with the approved MCP. Rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.

5.2.6.2 Surface Water

The design and implementation of the Project will incorporate management actions to minimise or mitigate any adverse changes in existing flow regime, flood characteristics, scour, siltation and erosion of the drainage channels, inundation of areas upstream and water starvation of areas downstream of the Project, as well as minimise impacts to groundwater as follows:

Avoid:

- Access road crossing of Mine Creek designed so as not to impede normal surface water flow.

Minimise:

- Culverts and floodways along access roads will maintain existing flood characteristics and maintain natural flow volumes.
- There is not anticipated to be any excess groundwater requiring discharge to the environment, minimising impacts to natural hydrological regimes, as well as impacts to any temporary aquatic biota (e.g. sediment loading), where present.
- Any runoff or rainfall required to be discharged to the environment (e.g. during a 10% AEP flood event) will be captured by bunding and diverted to settling ponds and sediment traps, located downstream of the mine disturbance area (outside of the 1% AEP floodplain of major drainage lines), prior to being released to the environment to reduce impacts to any temporary aquatic biota (e.g. sediment loading), where present.
- Any runoff or rainfall that accumulates in the pit will be used for dust suppression and/or as process water in the first instance. However, during rare rainfall events, there may be a requirement for short-term discharge to a local drainage line after passing through settling ponds and sediment traps, so as to limit impacts to natural hydrological regimes, as well as impacts to any temporary aquatic biota (e.g. sediment loading), where present.
- Sediment traps will be designed to remove particles greater than, or equal to, 75 µm from surface water prior to release to the environment.

Rehabilitate:

- Rehabilitate surfaces to align with original topography, as far as practicable.
- Implement an appropriate rehabilitation plan in accordance with the approved MCP.
- Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable.
- A MCP will be implemented to ensure that closure design aligns with regulatory expectations, including partial backfilling of the pit to avoid the development of a pit lake.

5.2.7 Hydrocarbon Management

There are no anticipated impacts from the Proposal on surface or groundwater quality as a result of contamination. Hydrocarbons will be managed to avoid leaks and spills through the use of bunds, location of bunded areas either outside floodplains or appropriately elevated to avoid the risk of inundation. Fuel / chemical storage and transfer will occur within designated bunded areas. Off road driving will be avoided. In addition, waste rock is not anticipated to contain potentially acid forming PAF or acid sulphate soil (ASS) material and seepage is not expected to occur due to the presence of drainage bunds to direct water away from the mining area as soon as practicable.

5.2.8 Rehabilitation

Progressive rehabilitation of disturbed areas will be undertaken throughout the life of mine, as far as practicable. Rehabilitation will be undertaken in accordance with the approved MCP through the implementation of an appropriate rehabilitation plan including (surface treatments; seed selection, collection, storage and management). Rehabilitation activities will aim to meet post closure land use objectives. MinRes will:

- continue to consult with key stakeholders throughout the life of the Project and at closure;
- ensure the rehabilitated land surfaces are safe and stable; and

- undertaken rehabilitation tasks detailed in the MCP.

6. TEN CLEARING PRINCIPLES

The detailed assessment of the Ten Clearing Principles is presented in **Table 12**. The proposed clearing **may be at variance** with Principle (b) related to significant fauna habitat.

The proposed clearing was **unlikely to be at variance** with Principle (a) relating to biodiversity values and Principle (c) clearing of rare flora.

The proposed clearing was **not at variance** with remaining clearing principles related to TECs, remnant vegetation, watercourses or wetlands, land degradation, nearby conservation areas, surface and groundwater quality, and flooding incidence or intensity.

Table 12: Assessment against the Ten Clearing Principles

Clearing Principle	Assessment of variance to Clearing Principle	Outcome - Assessment of variance with clearing principle
Principle (a) *Native vegetation should not be cleared if it comprises a high level of biological diversity*	The Pilbara region is known to have very high biodiversity value, possessing high species richness and many endemic flora and fauna species. The native vegetation in the proposed Clearing Permit Area is considered to possess a moderate level of biological diversity due to the presence of conservation significant fauna and flora species and their habitats (Umwelt 2022). Therefore, the proposed clearing will be impacting the biological diversity in the area. The Project will result in clearing of up to 638.4 ha of native vegetation in a 'Good to Excellent' condition within the Pilbara bioregion with 9 of the 10 mapped vegetation types being impacted (Umwelt 2022a). Proposed clearing of native vegetation also impacts on two of the Beard (1975) vegetation associations. At a regional and subregional scale, the impact to the pre-European extent of these vegetation associations as a result of the Project is equivalent to, or less than, 0.06% and 0.01% of the Hamersley 18.11 and Hamersley 82.3 associations within the Pilbara bioregion, respectively (**Table 6**). Therefore, implementation of the Project will not result in a significant impact on the vegetation associations of the Pilbara bioregion. Of the nine significant flora taxa recorded, one Federally listed as Critically endangered, six being listed as DBCA priority flora and two being potentially undescribed recorded in the Flora and Vegetation Umwelt 2022 Survey Area, only two were located within the Clearing Footprint: • Four individuals of *Aristida lazaridis* (P2), and • 221 individuals of *Seringia exastia* (T) Rapallo (2022c) previously recorded 3 individuals of *Rhagodia sp. Hamersley* (M. Trudgen 17794) (P3*)* in the Indicative Clearing Footprint, however none were recorded more recently by Umwelt (2022a) (**Table 8**). The vegetation associations, fauna habitats and landform types present within the proposed Clearing Area, are well represented in surrounding area and are not considered restricted to the proposed Clearing Permit Area. Umwelt (2022b) assessed direct impacts and edge effects to all nine significant flora taxa and their preferred habitats as unlikely to be significant at both the local and regional scale, due to the low percentage of plants and habitat impacted, the range of populations and the common and widespread nature of their preferred habitats. Likewise, direct impacts to vegetation are assessed as unlikely to be significant at both the local and regional scale, due to the relatively low percentage of each vegetation type potentially impacted and the common and widespread nature of the vegetation system associations. The proposed Clearing Footprint is unlikely to represent an area of higher biodiversity than surrounding areas, in either a local or regional context.	The proposed clearing is **unlikely to be at variance** with this principle.
Principle (b) Native vegetation should not be cleared if it comprises the whole, or part of, or is necessary for the maintenance of, a significant habitat for fauna indigenous to WA.	Two fauna species of significance were confirmed as occurring within the Clearing Permit Area based on the fauna detailed in-field surveys (Rapallo 2012a;2021b) within the Terrestrial Fauna Survey Area. These species comprise: • Western Pebble-mound Mouse (*Pseudomys chapmani*); and • Fork-tailed Swift (*Apus pacificus*). The Western Pebble-mound Mouse is listed as P4 under the BC Act. It is widespread in the broader region and has also been recorded numerous times at Mining Area C (Biologic 2017), situated approximately 15 km from the Clearing Permit Area (**Figure 1**). The Fork-tailed Swift is listed as Migratory under the BC Act and the EPBC Act. The species has been recorded within the broader Terrestrial Fauna Survey Area and it is likely to forage above the Clearing Permit Area during summer (Johnstone and Storr 1998). As the species is entirely aerial, the Project is not expected to impact the species. In addition to the two species of significance recorded from the detailed in-field surveys, another eight fauna species of significance are considered likely to occur within the Clearing Permit Area comprising the: • Ghost Bat (*Macroderma gigas*) – Vulnerable (BC Act and EPBC Act); • Northern Quoll (*Dasyurus hallucatus*) – Endangered (BC Act and EPBC Act); • Pilbara Leaf-nosed Bat (*Rhinonicteris aurantia*) – Vulnerable (BC Act and EPBC Act); • Pilbara Olive Python (*Liasis olivaceus barroni*) – Vulnerable (BC Act and EPBC Act); • Gane's Blind Snake (*Anilios ganei*) – Priority 1 (BC Act); • Pilbara Barking Gecko (*Underwoodisaurus seorsus*) – Priority 2 (BC Act); • Grey Falcon (*Falco hypoleucos*) – Vulnerable (BC Act and EPBC Act); and • Peregrine Falcon (*Falco peregrinus*) – Other Specially Protected (BC Act). Fauna habitats are not restricted to the Clearing Permit Area and all habitats recorded in the broader Terrestrial Fauna Survey Area extend beyond the Survey Area boundary. Suitable habitat for the Gane's Blind Snake, Pilbara Barking Gecko, Grey Falcon and Peregrine Falcon occur in the Clearing Permit Area however the habitat within the Proposed Clearing Area is not likely to be significant habitat or necessary for the maintenance of a significant habitat for these species. However, the Proposed Clearing Footprint is likely to significantly impact the habitat of four conservation significant species: • Northern Quoll (*Dasyurus hallucatus*): The Proposed Action will remove 44.2 ha of critical habitat and 125.6 ha of supporting habitat for Northern Quoll and will therefore have a significant impact on the species (as defined by DCCEEW). The removal of critical and supporting habitat for Northern Quoll is proposed to be offset via the EPBC approval. • Ghost Bat (*Macroderma gigas*): The Pilbara population of the Ghost Bat is considered an important population as it is genetically distinct and divergent (TSSC 2016). The Proposed Action will remove 624.4 ha of supporting habitat for Ghost Bat, which is considered to be a significant impact (as defined by DCCEEW) and is proposed to be offset via the EPBC approval.	The proposed clearing **is at variance** with this principle.

<table>
<tr><th>Clearing Principle</th><th>Assessment of variance to Clearing Principle</th><th>Outcome - Assessment of variance with clearing principle</th></tr>
<tr><td></td><td>

Pilbara Leaf-nosed Bat (Rhinonicteris aurantia): The Pilbara Leaf-nosed Bat population of the Pilbara and Gascoyne regions is considered an important population as it comprises multiple colonies that form one interbreeding population (TSSC 2016). The proposed Clearing Permit Area does not support critical habitat and they have not been observed in the area. It is considered unlikely the proposed Action will have a significant impact (as defined by DCCEEW).
Pilbara Olive Python (Liasis olivaceus barroni): No potential denning habitat is to be cleared by the proposed Clearing Permit Area. However, clearing of up to 118.7 ha of supporting habitat for Pilbara Olive Python is considered to be a significant impact (as defined by DCCEEW) and is proposed to be offset via the EPBC approval.

It is unlikely that important habitat for SRE's occurs within the Clearing Permit Area. No short-range endemic species were recorded within the proposed Clearing Permit Area. Despite 16 possible SRE taxa being recorded in the Clearing Permit Footprint (Appendix E), habitat connectivity across the landscape suggests that the potential SRE taxa found in these habitats are likely to have their distributions extending outside the Clearing Permit Footprint (Rapallo 2022a).
</td><td></td></tr>
<tr><td>Principle (c)
Native vegetation should not be cleared if it includes, or is necessary for the continued existence of, rare flora</td><td>Seringia exastia, was recorded in the Clearing Footprint and broader Flora and Vegetation Survey Area. This species has been delisted under State legislation but is still listed under the EPBC Act as Critically Endangered; however, this is due to a taxonomic revision where a Threatened and a common species were merged, and the name of the former was adopted as the new name, with the conservation status still attached. The current distribution map incorporates this revision, showing Seringia exastia as widespread across northern Western Australia (Western Australian Herbarium 2022).</td><td>The proposed clearing is unlikely to be at variance with this principle.</td></tr>
<tr><td>Principle (d)
Native vegetation should not be cleared if it comprises the whole or part of, or is necessary for the maintenance of, a Threatened Ecological Community</td><td>No PECs or TECs were identified within the Clearing Permit Footprint or the broader Flora and Vegetation Survey Area.
The nearest PEC to the Flora and Vegetation Survey Area is a subtype of the "Coolibah-lignum flats: Eucalyptus victrix over lignum community in the Pilbara". The edge of the PEC's buffer zone is located approximately 5 km south of the Flora and Vegetation Survey Area.
None of the vegetation types identified and described within the broader study area correspond with Commonwealth or State-listed TECs (Umwelt 2022b).</td><td>The proposed clearing is not at variance with this principle.</td></tr>
<tr><td>Principle (e)
Native vegetation should not be cleared if it is significant as a remnant of native vegetation in an area that has been extensively cleared</td><td>At a regional and subregional scale, the impact to the pre-European extent of these vegetation associations as a result of the Project is equivalent to, or less than, 0.01% Therefore, implementation of the Project will not result in a significant impact on the vegetation associations of the Pilbara bioregion. Similarly, the regional impact of the Clearing Permit Area to soil-landscape units is unlikely to be significant (Umwelt 2022b).
<table>
<tr><th>Vegetation Association</th><th>Scale</th><th>Pre-European Extent (Ha)</th><th>Current Extent Remaining (Ha)</th><th>Pre-European Extent Remaining</th><th>Cons. Status</th><th>Extent In Clearing Permit Area (Ha)</th></tr>
<tr><td>Hamersley 18.11</td><td>State Wide</td><td>19,892,306</td><td>19,843,148</td><td>99.75%</td><td>Least Concern</td><td>588</td></tr>
<tr><td></td><td>Pilbara Bio-region</td><td>676,556</td><td>671,843</td><td>99.30%</td><td>Least Concern</td><td></td></tr>
<tr><td>Hamersley 82.3</td><td>State Wide</td><td>2,565,901</td><td>2,157,841</td><td>99.51%</td><td>Least Concern</td><td>272</td></tr>
<tr><td></td><td>Pilbara Bio-region</td><td>2,563,583</td><td>2,550,888</td><td>99.50%</td><td>Least Concern</td><td></td></tr>
</table>
Umwelt (2022b) identified that potential fragmentation impacts to significant flora through separation (or increasing existing separation) are likely to be negligible and not significant. The local impact of the Clearing Permit Area on all Vegetation Types is relatively low in terms of the percentage of impact, and not likely to be significant at the local scale. Considering that none of the Vegetation Types within the proposed Clearing Permit Area are significant, the potential regional impact is unlikely to be significant.</td><td>The proposed clearing is not at variance with this principle.</td></tr>
<tr><td>Principle (f)
Native vegetation should not be cleared if it is growing in, or in association with, an environment associated with a watercourse or wetland</td><td>There are no permanent watercourses or wetlands within the area proposed to clear therefore there is no vegetation growing in association with a watercourse or wetland.
The main surface water feature in the broader region is Weeli Wolli Creek – Marillana Creek flows into Weeli Wolli Creek located more than 30 km to the east of the Clearing Permit Area. The Weeli Wolli spring is located upstream of the confluence of Weeli Wolli Creek with Marillana Creek. Weeli Wolli Creek is unlikely to be impacted by the proposed clearing.
The risk of clearing causing surface hydrology issues is considered low. The main surface water features in proximity to the Clearing Permit Area include:

Mine Creek – bisects the central western side of the proposed Clearing Permit Area from south to north. Mine Creek is an ephemeral creek and/or floodplain that likely only flows for a short duration following intense rainfall, is unlikely to support permanent or semi-permanent surface water pools and does not appear to support a substantial riparian vegetation community.
Marillana Creek – the confluence with Mine Creek is located approximately 7 km downstream of the proposed Clearing Permit Area and supports riparian vegetation and seasonal surface water pools in the Flat Rocks area (approximately 24 km downstream of the Clearing Permit Footprint). Marillana Creek is currently impacted by BHP and Rio Tinto mining operations. Marillana Creek is unlikely to be impacted by the proposed clearing.

Umwelt (2022b) stated there is a potential for indirect impacts via interruption of surface water flows (including sheet flow) or changes in water quality to the following areas, where they occur downstream:

The population of Corchorus sp. (potentially undescribed, and an assessed conservation significance rating of high;
Riparian vegetation;
Mulga grove vegetation (VT7);
Populations of significant flora in the GNH intersection area, downstream of interrupted sheet flows.

</td><td>The proposed clearing is not at variance with this principle.</td></tr>
</table>

Clearing Principle	Assessment of variance to Clearing Principle	Outcome - Assessment of variance with clearing principle
	• Any further significant taxa which have been assessed as 'possibly' occurring in the Study Area - Appendix A in Umwelt (2022b), which are dependent or partially dependent on surface water flows. Culverts and other drainage structures at creek crossings sufficient to minimise operational impacts will be installed with the design of drainage structures considering potential impacts to downstream flora and vegetation through interruption of surface water flow and the aim to re-establish both the volume and spread of water flows to avoid these potential impacts. Surface water flow diversion structures will be relatively small in size, any impacts on flooding potential from these diversion structures would be limited to within a few hundred metres of the Clearing Permit Footprint, and are not expected to impact surface water flow downstream. The discharge of excess water into the environment will only occur during significant rainfall events, with this water being managed to remove sediment and contaminants, prior to discharge. Negligible indirect impacts area anticipated from the proposed clearing, with mitigation proposed to manage surface water flow on-site and to maintain hydrological regimes in the broader region through implementation of a Surface Water Management Plan (SWMP).	
Principle (g) Native vegetation should not be cleared if the clearing of the vegetation is likely to cause appreciable land degradation	Land degradation includes any alteration to land capabilities, soil erosion, salinity, nutrient export, acidification, waterlogging and flooding that affects the present or future use of land. Based on the characteristics of soil and subsoil within the proposed Clearing Permit Area it is unlikely that any of the proposed disturbances will increase the chances that the area would be subject to waterlogging, acidification, salinization, subsoil compaction and/or erosion (MBS Environmental 2021). Drainage through the proposed Clearing Permit Area is ephemeral, part of the area is characterised as a floodplain, there is an apparent lack of permanent or semi-permanented surface water, and a lack of broad incised channels. No groundwater-dependent vegetation was recorded within the Flora and Vegetation Survey Area (Rapallo 2022c). Clearing of native vegetation for the construction of the Project may alter the natural hydrological regime and influence native vegetation health, as well as downstream receptors. Construction largely associated with linear infrastructure, such as the haul road, is of particular note for this indirect impact. However, the Project has been designed to maintain surface water flow so that impacts due to alteration of surface flow are unlikely to occur. The risk to native vegetation as a result of the altered hydrological regime is considered to be **low**; therefore, there is not expected to be significant impacts to native vegetation as a result of Project implementation.	The proposed clearing is **not at variance** with this principle.
Principle (h) Native vegetation should not be cleared if the clearing of the vegetation is likely to have an impact on the environmental values of any adjacent or nearby conservation area	The proposed Clearing Permit Area does not contain any environmental features of significance. It is located within the Hamersley subregion which hosts the Karijini Gorges and a Wetland of National Significance, located within the Karijini National Park. Wetlands of subregional significance within the Hamersley subregion include Weeli Wolli Spring, Palm Spring, Duck Creek, Mount Bruce Coolibah claypan, and springs and surface water pools of the Robe River. The nearest of these features is Weeli Wolli Spring at approximately 31 km to the northeast, with most others being over 100 km away.	The proposed clearing is **not at variance** with this principle.
Principle (i) Native vegetation should not be cleared if the clearing is likely to cause deterioration in the quality of surface or underground water	Given the location of several surface water features within the Proposed Clearing Area, the clearing of vegetation has the potential to impact the quality of surface water, directly and indirectly. However, the proposed management measures are designed to control surface water runoff and sediment loads. Risks related to groundwater quality were considered negligible in the hydrogeological assessment (PSM 2021). Thus, the proposed clearing is unlikely to cause deterioration in the quality of surface water or groundwater.	The proposed clearing is **not at variance** with this principle.
Principle (j) Native vegetation should not be cleared if the clearing is likely to cause, or exacerbate, the incidence or intensity of flooding	The topography and major drainage features within the Proposed Clearing Footprint indicate a significant flood risk is possible. There are no permanent watercourses or wetlands within the area proposed to clear. However, suitable drainage features incorporated into site design would appropriately direct surface run-off and avoid any flooding in adjacent natural areas. The proposed clearing is therefore unlikely to cause or increase the frequency or intensity of flooding.	The proposed clearing is **not at variance** with this principle.

7. STAKEHOLDER CONSULTATION

MinRes recognises the value of building positive relationships with key stakeholders and the communities in which we are active. We seek to engage early, openly, honestly and regularly with the communities impacted by our operations and consider their views in our decision-making with respect to key planning, operational and closure aspects.

A wide variety of stakeholders have been identified within the proposed Clearing Permit Area and include:

- Pastoral Lease Holders
- Native Title Groups
- Other Mining Tenement Holders
- Other Stakeholders (surface rights)
- Statutory Authorities, Government, Business and Community Bodies

A summary of the subject and objectives for stakeholder engagement is included in **Table 13**. Obtaining advice from the following groups will be ongoing.

Table 13: Ongoing Stakeholder Engagement Summary

Stakeholder	Key Interests
Local Government Authorities	
Shire of East Pilbara	Community improvement, including local infrastructure, recreational facilities, health services, community care, building services, planning and development approval, cultural facilities etc.
State Government Agencies	
DMIRS	Mining activities, port operations and tenure (including approvals).
DWER	Environmental impacts including prescribed activities including approvals.
DBCA	Impact to surrounding ecological communities.
DPLH	Crown land, Reserves and Aboriginal heritage management.
DPIRD	Regional Development opportunities
EPA	Assessment of significant proposals under Environmental Protection Act 1986
MRWA	Intersections with haul road / bridges ensuring appropriate design.
Federal Government Agencies	
DCCEEW	Matters of National Environmental Significance (MNES), EPBC referrals
Indigenous Groups	
Banjima People Banjima Native Title Aboriginal Corporation (Prescribed Body	Consultation, management and protection of Aboriginal cultural heritage and involvement with activities on their country. Employment and contracting opportunities. Heritage agreement.

Stakeholder	Key Interests
Corporate for the Banjima People)	
Land Users	
Hamersley Iron Pty Ltd	Mineral activities - will want to ensure that our proposed activities do not interfere with theirs. May want the ability to seek relocation of the road if it impacts areas that are to be mined.
BHP Billiton Minerals Pty Ltd	Mineral activities - will want to ensure that our proposed activities do not interfere with theirs. May want the ability to seek relocation of the road if it impacts areas that are to be mined.
Hamersley iron – Yandi Pty Ltd	Mineral activities - will want to ensure that our proposed activities do not interfere with theirs. May want the ability to seek relocation of the road if it impacts areas that are to be mined.
FMG Pilbara Pty Ltd	Mineral activities - will want to ensure that our proposed activities do not interfere with theirs. May want the ability to seek relocation of the road if it impacts areas that are to be mined.
Pastoralists	
Juna Downs Pastoral Lease	Ensure proposed activities do not impact their pastoral interests.
Non-Government Organisations	
Bird Life Western Australia	Environmental Impacts in relation to birds associated with the Project.
Conservation Council of WA	Environmental Impacts and sustainability of the Project.
Wilderness Society	
Wildflower Society of WA	Protection and preservation of wildflowers and native flora.

8. OTHER PLANNING MATTERS, NATIVE TITLE, ABORIGINAL HERITAGE

The Project lies wholly within the Banjima People's Native Title determination (WCD2014/001, WAD6096/1998). Initially recognised by the Federal Court in 2014 and varied by appeal in 2015, this determination area encompasses more than 8,000 km² of the Central Pilbara region. The Banjima People were recognised as having a range of exclusive and non-exclusive Native Title rights across the determination area.

The Banjima Native Title Aboriginal Corporation (BNTAC) is the Prescribed Body Corporate holding native title rights and interests on trust for the Banjima People.

Engagement with Traditional Owners in relation to the Project commenced in 2012 through the heritage survey processes and the negotiation of a native title agreement that was concluded in 2017 (since expired). Extensive further engagement and consultation has been undertaken with BNTAC, nominated heritage professionals and the MinRes Heritage Environment Reference Committee (MHERC) in relation to the Proposal.

The Proponent has been engaged with BNTAC and the relevant Banjima People throughout the history of the Project and continues to work together to strengthen this relationship through regular meetings. Collaborative consultation with BNTAC, their appointed consultants, and the MHERC has addressed:

- Proposal overview and progress updates, including amendment of Proposal elements following feedback.
- Key referral and approvals documents.
- The Proponent's commitment to its relationship with the Banjima People.

Heritage surveys, identifying Aboriginal sites to be avoided and managed on ground

- Business and employment opportunities that may arise during project development.

The MHERC ensures that the Banjima People have a direct role in decision-making processes. Through these ongoing engagements, the Proponent has been able to identify key Social Surrounds values that may exist within the disturbance envelope, such as general amenity and water availability. These values, important to the Banjima People and the cultural landscape, have been thoroughly examined to determine if and how they could be affected by the proposed Project. With guidance from the Banjima People, the Proponent has worked to develop strategies that aim to avoid, minimise, or offset any potential negative impacts on these values.

Together, the Proponent and the MHERC have carefully evaluated the potential consequences of the proposal on significant heritage values, ensuring that all relevant cultural, environmental, and social aspects are considered. This collaborative approach not only facilitates better-informed decision-making but also reflects a commitment to preserving the heritage and well-being of the Banjima People throughout the life of the Project.

As a result of the detailed engagement and consultation, in November 2024 BNTAC provided MinRes with a letter of support for the Lamb Creek Project. The letter acknowledges that MinRes has conducted thorough engagement with the Banjima People regarding the proposal and made adjustments to the Projects design and management plans based on feedback from the MHERC. As a result, both BNTAC and the MHERC are satisfied with the level of consultation so far and have expressed their support for the proposal, contingent upon certain conditions outlined in the letter. These conditions include, among others: no on-site landfills, pit backfilled to minimum of 5 m above the pre-mining water table, no permanent ex-pit storage of mineralised waste, various amendments which have been made to Proposal elements to minimise impacts to visual amenity and access road to be paved with asphalt to reduce impacts from dust.

The Proponent confirms that extensive heritage investigations have been conducted across the full extent of the area subject to this approval. The surveys have been done in close collaboration with the Banjima People and there nominated heritage professionals to ensure that all significant cultural and heritage values are identified and properly addressed and managed during construction and operations. Through this work, 28 heritage places were identified within, and adjacent to, the Proposal Area. A number of the sites recorded have been lodged (not registered) under the *Aboriginal Heritage Act 1972*. No registered sites recorded in the Aboriginal Cultural Heritage Inquiry System (AHIS) (DPLH 2018) under the *Aboriginal Heritage Act 1972* occur within the Indicative Footprint or Development Envelope.

The most significant site identified during heritage investigations is a large ethnographic site, known by the Banjima People as Gaguna. The 27 other places are archaeological in nature and consist of artefact scatters and scarred trees. **The Proposal's Indicative Footprint and Development Envelope avoid Gaguna and the 27 other identified heritage places to ensure that their cultural values are protected**. Due to the sensitive and confidential nature of the cultural significance of this place, no further details are provided in this NVCP submission.

MinRes confirms that no AHA (1972) approvals are required to support the activities undertaken, which are subject to the approval of the NVCP.

9. SUMMARY AND CONCLUSIONS

The proposed clearing **is at variance** with Principle (b) related to significant fauna habitat and the entire clearing footprint (638.4 ha) is proposed to be offset via the EPBC approval.

The proposed clearing was **unlikely to be at variance** with Principle (a) relating to biodiversity values and Principle (c) clearing of rare flora.

The proposed clearing was **not at variance** with remaining clearing principles related to TECs, remnant vegetation, watercourses or wetlands, land degradation, nearby conservation areas, surface and groundwater quality, and flooding incidence or intensity (Principles d, e, f, g, h, I, and j).

Impacts from the Project are expected to be negligible and will not result in any significant or long term impacts on key environmental factors within the proposed Clearing Permit Area or adjacent areas. Vegetation types and terrestrial fauna habitats are typically widespread, and significant flora and fauna species all occur outside of the proposed Clearing Permit Area.

The environmental impacts associated with the Project can be effectively managed by applying the EPA's mitigation hierarchy (avoid, minimise, rehabilitate, offset) for the Project.

Conservation Codes
T - Rare or likely to become extinct
X - Presumed extinct
IA - Protected under international agreement
S - Other specially protected fauna
1 - Priority 1
2 - Priority 2
3 - Priority 3
4 - Priority 4
5 - Priority 5

[1] For NatureMap's purposes, species flagged as endemic are those whose records are wholely contained within the search area. Note that only those records complying with the search criterion are included in the calculation. For example, if you limit records to those from a specific datasource, only records from that datasource are used to determine if a species is restricted to the query area.

Appendix 5. EPBC Protected Matters Search Tool results.

Fauna species listed for the area 20km in radius from 22.803ºS, 118.902ºE on the EPBC Act Protected Matters Search Tool.

Department of the Environment and Energy

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected.

Information on the coverage of this report and qualifications on data supporting this report are contained in the caveat at the end of the report.

Information is available about Environment Assessments and the EPBC Act including significance guidelines, forms and application process details.

Report created: 06/03/20 20:00:29

Summary

Matters of National Environmental Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance:	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	None
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	8
Listed Migratory Species:	9

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at http://www.environment.gov.au/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Land:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	14
Whales and Other Cetaceans:	None
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have nominated.

State and Territory Reserves:	None
Regional Forest Agreements:	None
Invasive Species:	9
Nationally Important Wetlands:	None
Key Ecological Features (Marine)	None

Details

Matters of National Environmental Significance

Listed Threatened Species		[Resource Information]
Name	Status	Type of Presence
Birds		
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat likely to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area
Mammals		
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat likely to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat likely to occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat likely to occur within area
Rhinonicteris aurantia (Pilbara form) Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat known to occur within area
Reptiles		
Liasis olivaceus barroni Olive Python (Pilbara subspecies) [66699]	Vulnerable	Species or species habitat likely to occur within area

Listed Migratory Species		[Resource Information]
* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.		
Name	Threatened	Type of Presence
Migratory Marine Birds		
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Migratory Terrestrial Species		
Hirundo rustica Barn Swallow [662]		Species or species habitat may occur within area

Name	Threatened	Type of Presence
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat may occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat may occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Species or species habitat may occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat may occur within area
Charadrius veredus		
Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species [Resource Information]

* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
Birds		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat may occur within area
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardea alba		
Great Egret, White Egret [59541]		Species or species habitat likely to occur within area
Ardea ibis		
Cattle Egret [59542]		Species or species habitat may occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Species or species habitat may occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat may occur within area
Charadrius veredus		
Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area

Name	Threatened	Type of Presence
Chrysococcyx osculans Black-eared Cuckoo [705]		Species or species habitat likely to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat may occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area
Rostratula benghalensis (sensu lato) Painted Snipe [889]	Endangered*	Species or species habitat may occur within area

Extra Information

Invasive Species [Resource Information]

Weeds reported here are the 20 species of national significance (WoNS), along with other introduced plants that are considered by the States and Territories to pose a particularly significant threat to biodiversity. The following feral animals are reported: Goat, Red Fox, Cat, Rabbit, Pig, Water Buffalo and Cane Toad. Maps from Landscape Health Project, National Land and Water Resouces Audit, 2001.

Name	Status	Type of Presence
Mammals		
Camelus dromedarius Dromedary, Camel [7]		Species or species habitat likely to occur within area
Canis lupus familiaris Domestic Dog [82654]		Species or species habitat likely to occur within area
Equus asinus Donkey, Ass [4]		Species or species habitat likely to occur within area
Equus caballus Horse [5]		Species or species habitat likely to occur within area
Felis catus Cat, House Cat, Domestic Cat [19]		Species or species habitat likely to occur within area
Mus musculus House Mouse [120]		Species or species habitat likely to occur within area
Oryctolagus cuniculus Rabbit, European Rabbit [128]		Species or species habitat likely to occur within area
Vulpes vulpes Red Fox, Fox [18]		Species or species habitat likely to occur within area
Plants		

APPENDIX B
SUMMARY OF FLORA AND VEGETATION SURVEYS

Table B.1: Summary of Flora and Vegetation Studies and Surveys

Studies And Surveys	Area	Scope And Timing	Survey / Study Effort	Consistency With Guidance and Limitations
Lamb Creek Detailed and Targeted Flora and Vegetation Survey (Umwelt 2023)	3785.7 ha	The 2022 field survey was conducted within the most appropriate time to survey in the Pilbara Region (approximately six to eight weeks post wet season – March to June). Above-average precipitation was received during the wet-post wet season 2021/2022, with significant above-average precipitation received in February and May 2022. This significant rainfall in May 2022 combined with reasonably warm temperatures allowed for further follow-up targeted survey in late June-July 2022. The 2022 survey was conducted mid-to end of season and the flowering season was considered to be good, with a relatively high proportion of annual and ephemeral vascular taxa recorded and many perennial taxa in flower. All perennial taxa were at least in good condition.	Detailed survey was undertaken encompassing the entire Study Area. At least three quadrats were established in each vegetation pattern identified through initial aerial photography interpretation and on-ground field survey in the Study Area. Re-score of an appropriate sample of existing quadrats (Rapallo 2021a) was undertaken during the survey. Mapping of VT boundaries was undertaken using a combination of aerial photography (scale 1:10,000) and information collected during traverses between quadrats and relevés. Field verification of VT boundaries post-analysis was not undertaken. Targeted survey was undertaken using transects spaced approximately 50m apart, with finer scale transects employed where significant flora taxa were identified. Opportunistic targeted survey for significant flora taxa was also undertaken while traversing the Study Area to establish quadrats and relevés during the 2022 survey. Detailed and Targeted Survey was conducted over a total of 90 person days in 2022. No constraints prevented appropriate sampling techniques (quadrat/relevé establishment, foot transects) being employed. Access within the Study Area enabled detailed VT and condition mapping to be undertaken throughout the Study Area via foot, vehicle and helicopter. Mapping and data reliability is therefore considered to be relatively high.	The survey and reporting works comply with the following documents: • Environmental Factor Guideline – Flora and Vegetation (Environmental Protection Authority 2016a) • *Technical Guidance: Flora and Vegetation Surveys for Environmental Impact Assessment* (Environmental Protection Authority 2016b)
Detailed flora and vegetation survey of the Great Northern Highway intersection – Lamb Creek Project (Rapallo 2021a)	254 ha	Detailed flora and vegetation survey of the Great Northern Highway intersection. The survey period of 12-17 May 2021 aligned with the recommended timing for vegetation surveys in the Eremaean Botanical Province and occurred within the primary survey period	A total of 19 flora quadrats (50 m by 50 m) and 1 relevé were sampled during the field survey. Additional flora taxa were recorded opportunistically while traversing between quadrats. Survey also included: • opportunistic records and field notes; • specimen collection and identification; and	The flora survey was conducted in accordance with Environmental Protection Authority (2016b) and conformed to requirements for a single-season detailed flora survey.

Studies And Surveys	Area	Scope And Timing	Survey / Study Effort	Consistency With Guidance and Limitations
		(Environmental Protection Authority 2016b).	• vegetation health classification.	
Targeted conservation significant flora survey of the Lamb Creek project area (Rapallo 2022c)	3,000 ha	A targeted significant flora survey was conducted over two phases: • Phase one: 15-29 April 2020, including the proposed mine site within R47/19 (271 ha), the haul road corridor (L47/736; 388 ha) and the Great Northern Highway intersection (57 ha). • Phase two: 12-17 May 2021, includes the targeted survey area at the Great Northern Highway intersection (156 ha).	Survey comprised: • a flora desktop assessment; • systematic parallel traverses spaced approximately 50 m apart; and • additional searches on foot and via helicopter, outside the survey area.	Survey undertaken in April 2020 and May 2021, which is within the appropriate time to survey for flora and vegetation in the Pilbara bioregion, in accordance with Environmental Protection Authority (2016b) and was undertaken by suitably experienced botanists. Key limitations included: • The interrogation area / methodology used for the desktop searches could have been more appropriate for the shape of the survey area. • A number of essential sources stipulated by guidance requirements were not reviewed prior to the survey as part of the desktop assessment. There is no clear summary of the review of previous local flora and vegetation surveys to indicate whether any significant flora taxa have been previously recorded in the vicinity of the survey area. • The full extent of significant flora populations outside the survey area were not surveyed; however, information from studies for other projects in the

Studies And Surveys	Area	Scope And Timing	Survey / Study Effort	Consistency With Guidance and Limitations
				region are available.
Lamb Creek and Wedge Deposits – Flora and Vegetation Desktop Assessment	3,110 ha	Desktop Assessment within a 40 km buffer of the defined Study Area to identify potential flora and vegetation factors that may occur within the Study Area and require surveys as part of the environmental approval process for the project.	Desktop Assessment to gather contextual information on the Study Area from existing surveys, literature, database searched and spatial information.	The Desktop Assessment addresses and/or complies with the following documents: • *Environmental Factor Guideline – Flora and Vegetation* (Environmental Protection Authority 2016a); • *Technical Guidance – Flora and Vegetation Surveys for Environmental Impact Assessment* (Environmental Protection Authority 2016b); and • *Matters of National Environmental Significance: Significant Impact Guidelines 1.1* (Department of the Environment 2013). Key limitations include: • A number of surveys used in the desktop assessment (including Rapallo 2012) have been undertaken over five years ago, they were not subject to as stringent guidelines as are currently required under the EPA Technical Guidance (Environmental Protection Authority 2016b).
Lamb Creek flora mapping update and data review	233 ha (215 ha of L47/736 outside of the	An extension to the 2012 vegetation mapping to account for a change in alignment	This desktop report comprised: extrapolation of vegetation mapping into the new haul road corridor;	As this was an amendment to the 2012 mapping data, this update was in line with Environmental

Studies And Surveys	Area	Scope And Timing	Survey / Study Effort	Consistency With Guidance and Limitations
(Rapallo 2017)	previous area mapped in 2012)	of one of the proposed haul road options.	• a review of the 2012 flora survey data; • No field work was conducted within the portion of the new haul road located outside the area surveyed in 2012 • 2012 observations and drawings were utilised.	Protection Authority (2016b).
Level 2 Flora and Vegetation Survey of Lamb Creek project area for Process Minerals International (Rapallo 2012b)	2,068 ha	The flora and vegetation survey took place from 27 March to 1 April 2012 (6 days). Conducted at a suitable time for the Eremaean Botanical Province (Environmental Protection Authority 2016b). The survey encompassed the proposed mine site, two alternate haul road routes (nominal 120 m buffer either side), three alternate accommodation camp locations.	Desktop search and a single-phase level 2 comprehensive field survey. A total of 46 flora quadrats of 50 x 50 m were established within the area within each of the five land systems within the Flora and Vegetation Survey Area as well as opportunistic collections of species. The team comprised of three botanists. A total of 230 species, from 110 genera and 42 families, were recorded. Of those, 209 species were recorded within survey quadrats, and 21 species were recorded opportunistically.	The flora and vegetation survey was designed according to *Guidance Statement No. 51: Guidance for the Assessment of Environmental Factors: Terrestrial Flora and Vegetation Surveys for Environmental Impact Assessment in Western Australia* (Environmental Protection Authority 2004) which has since been superseded by *Technical Guidance: Flora and Vegetation Surveys for Environmental Impact Assessment (Environmental Protection Authority 2016b)*; therefore, the field survey may not have met the existing requirements. There were very few access tracks, and all sites were accessed by helicopter.

Executive Summary

Mineral Resources Limited (MINRES) are exploring mining opportunities associated with the Lamb Creek Deposit (the Project), located approximately 120 kilometres (km) northwest of Newman. A number of flora and vegetation surveys have previously been undertaken for the Project, and a gap analysis and peer review of previous survey work recommended additional targeted survey and a detailed flora and vegetation survey. MINRES commissioned Umwelt (Australia) Pty Ltd to undertake a flora and vegetation survey of the Project to support the Environmental Impact Assessment (EIA) process for the Project.

The current survey comprised three field visits over March, April and June-July 2022. A total of 116 quadrats and five relevés were surveyed. Targeted searching for all significant flora previously recorded in the Study Area or considered to potentially occur within the Study Area, was undertaken over areas of the Development Envelope not previously surveyed in 2021. There were no survey limitations that are considered to have significantly influenced the results of the 2022 survey.

A total of 328 discrete vascular flora taxa representing 45 families and 137 genera were recorded in the Study Area, including seven introduced taxa. One Threatened taxon (*Seringia exastia*) was recorded within the Study Area however its status is currently under review and it will be delisted in the near future. A further seven significant flora taxa were recorded within the Study Area including five Department of Biodiversity, Conservation and Attractions (DBCA) listed Priority (P) taxa, and two potentially undescribed taxa, as listed below:

- *Aristida jerichoensis* var. *subspinulifera* (P3)
- *Aristida lazaridis* (P2)
- *Corchorus* sp. (Potentially undescribed)
- *Eremophila naaykensii* (P3)
- *Euphorbia ferdinandi* s. lat. (Potentially undescribed)
- *Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2)
- *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3)

An assessment of the likelihood of occurrence of further significant taxa within the Study Area and Targeted Survey Area identified a total of 42 taxa which could potentially occur within the Study Area, and no taxa which could potentially occur within the Targeted Survey Area.

Ten VTs were defined in the Study Area via floristic composition classification and subsequent examination of quadrat data. The VTs described and mapped within the Study Area are not considered to represent any listed Threatened or Priority Ecological Communities, nor are they considered to be significant for reasons other than formal listing. All VTs mapped in the Study Area are either known to, or considered likely to, extend outside the Study Area to some extent, and are not considered to be restricted in distribution. None of the vegetation within the Study Area is considered to represent Groundwater Dependant Vegetation. The majority of the vegetation within the Study Area (90.5 %) was rated as Excellent, with no obvious signs of damage caused by human activities. The remainder of the vegetation was rated as Very Good and Good, with some historical mechanical disturbance, introduced flora taxa dominating the lower stratum in some flowlines, and otherwise low levels of introduced flora taxa across the Study Area.

1.0 Introduction

1.1 Project Overview

Mineral Resources Limited (MINRES) are actively exploring mining opportunities associated with the Lamb Creek Deposit (the Project), located approximately 120 kilometres (km) northwest of Newman in Western Australia (WA). The exploration area consists of a proposed mining area and associated infrastructure corridor linking the proposed mining area to Great Northern Highway.

Several flora and vegetation surveys conforming to different levels of survey under various Environmental Protection Authority (EPA) Guidance Statements (EPA, 2004, 2016b) have been conducted for the Project. A gap analysis and peer review of previous survey work, as undertaken by Umwelt (Australia) Pty Ltd (Umwelt) (2022), recommended additional targeted survey and a detailed flora and vegetation survey (as per Sections 4.2 and 4.3 of EPA (2016b)).

MINRES commissioned Umwelt to undertake a flora and vegetation survey of the Project to support the Environmental Impact Assessment (EIA) process for the Project.

1.2 Project and Study Area Definitions

The Lamb Creek Project is located in the Shire of East Pilbara, near the junction with the Shire of Ashburton, within the Pilbara region, approximately 120 km northwest of Newman and 270 km south of Port Hedland (**Figure 1.1**).

1.2.1 Development Envelope and Disturbance Footprint

MINRES have defined a Proposed Development Envelope and Proposed Disturbance Footprint for the Project (version October 2022). The Proposed Development Envelope is nominally defined by a 70 metre (m) buffer of the infrastructure design, from which avoidance areas (heritage places, known locations of priority flora taxa) have been excised. The Proposed Development Envelope is approximately 894 hectares (ha) in size and encompasses the Proposed Disturbance Footprint, which is approximately 661 ha in size (**Figure 1.1**).

The development envelope is composed of three parts: the Great Northern Highway Intersection Development Envelope (GNHI DE); the Access Road Development Envelope (Access Rd DE); and the Mine Development Envelope (Mine DE), containing the waste rock dumps, pit area, crushing and screening plant and other infrastructure relevant to the mining operations. These three areas are displayed on **Figure 1.2.**

1.2.2 Desktop Study Area

A Desktop Study Area has been defined for the purposes of interrogation of databases and searches for relevant literature. The Desktop Study Area was defined as a 40 km buffer around the Proposed Development Envelope as supplied by MINRES on 2nd September 2021. Although the previous version of the Proposed Development Envelope was used to define the Desktop Study Area (superseded by the version provided in October 2022 as discussed above (Section 1.2.1)), the change to this area is minor, and therefore it is not considered necessary to update the Desktop Study Area. The location of the Desktop

Study Area in relation to the Proposed Development Envelope and Proposed Disturbance Footprint is presented on **Figure 1.1**.

1.2.3 Study Area

A Study Area of 3,785 ha has been defined in consultation with MINRES and represents a buffered area on the Proposed Development Envelope and MINRES tenements, sufficient to provide contextual information relevant to interpreting impacts. Detailed vegetation survey was undertaken within the Study Area, as presented on **Figure 1.2**.

1.2.4 Targeted Survey Area

A targeted survey area of 355 ha has been defined as the Proposed Development Envelope, excluding areas over which targeted searching has been completed by Rapallo (2021b). The Targeted Survey Area is presented on **Figure 1.2**.

1.3 Aims and Objectives

The primary aim of this assessment was to characterise the flora and vegetation values of the Study Area to provide MINRES relevant and defendable data and documentation to support the Environmental Impact Assessment (EIA) process for the Project.

The overall objectives of the assessment were to:

- Compile an inventory of vascular flora taxa that occur in the Study Area.
- Search for and census populations of the following taxa (hereafter referred to as significant flora taxa) identified as occurring or potentially occurring within the Targeted Survey Area, as well as opportunistically within the wider Study Area.
    - Listed Threatened Species (T) under the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) (Commonwealth).
    - Threatened Flora (T) under the Biodiversity Conservation Act 2016 (BC Act) (WA).
    - Priority Flora taxa (P) as classified by the WA Department of Biodiversity, Conservation and Attractions (DBCA).
    - Other significant flora taxa as defined by the Environmental Protection Authority (EPA) (2016a, 2016b).
- Identify locations and determine the extent of introduced vascular flora taxa, with particular focus on those that are Weeds of National Significance (WoNS), or Declared Pests under the Biosecurity and Agriculture Management Act 2007 (BAM Act).
- Identify, map and describe Vegetation Types (VTs) that occur within the Study Area.
- Identify, map and describe vegetation that occurs within the Study Area that is one of the following (hereafter referred to as significant vegetation), to provide context for impact assessment:
    - Listed Threatened Ecological Communities (TECs) under the EPBC Act.
    - TECs as classified by DBCA and endorsed by the WA Minister for the Environment.
    - Priority Ecological Communities (PECs) as classified by DBCA.
    - Other significant vegetation as defined by EPA (2016a, 2016b).
- Map the condition of the vegetation in accordance with EPA (2016b).

The survey and reporting works comply with the following documents:

- *Environmental Factor Guideline – Flora and Vegetation* (EPA 2016a).
- *Technical Guidance – Flora and Vegetation Surveys for Environmental Impact Assessment* (EPA 2016b).

1.4 Levels of Assessment

The flora and vegetation survey of the Study Area involved targeted survey and a detailed survey as defined in Sections 4.2 and 4.3 of the '*Technical Guidance for Flora and Vegetation Surveys for Environmental Impact Assessment*' (EPA 2016b). This level of survey is considered appropriate for the Project, based on the location of the Project (located within the Pilbara - known to support a moderate diversity of flora and vegetation relative to other areas of the state, including significant flora taxa and vegetation types (EPA 2016b)) and the level of previous survey effort undertaken within the area (as assessed within the gap analysis for the Project (Umwelt 2022)).

It should be noted that this survey builds on previous work conducted to inform the EIA process for the Project, as detailed in **Section 3.0**.

2.0 Background

2.1 Climate

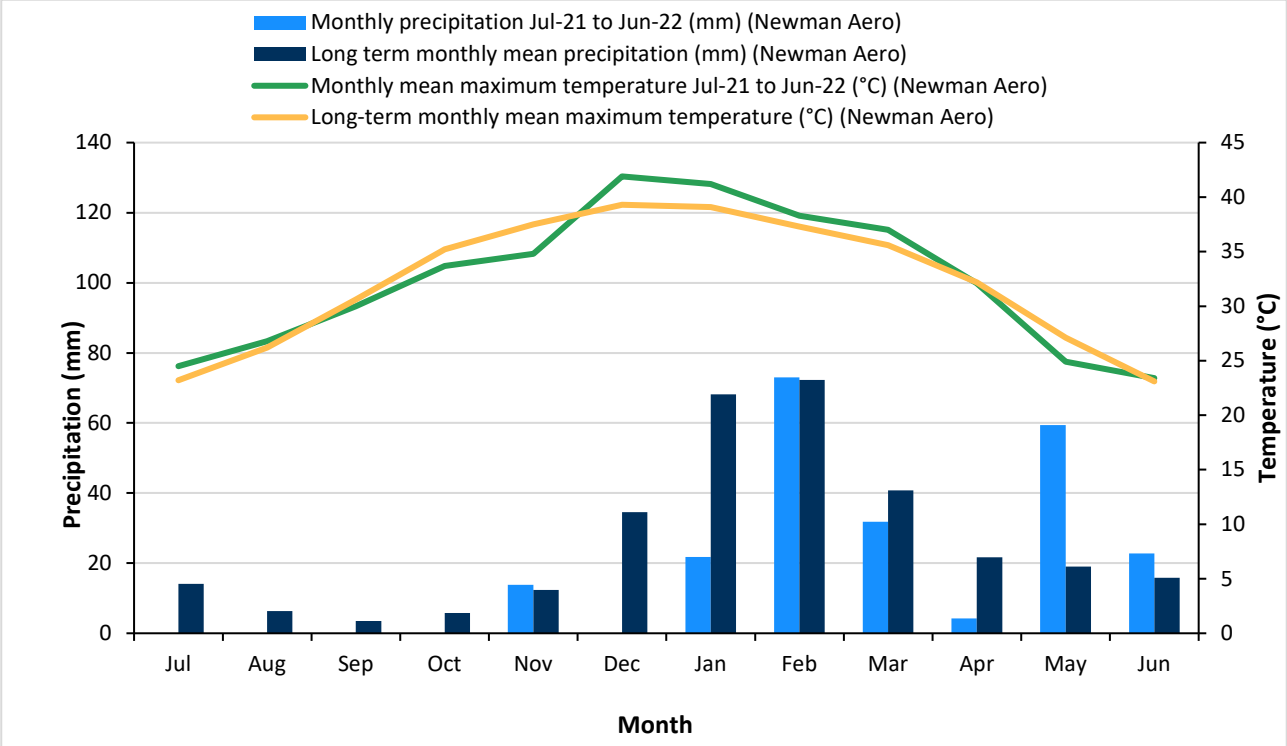
The Study Area is located in the Pilbara region (Fortescue Botanical District) as defined by Beard (1975, 2015). The climate of the Pilbara Bioregion is classified as arid tropical, with precipitation received primarily over the summer months. Average annual precipitation for the region is 250-300 millimetres (mm); this is generally slightly higher than most of the Eremaean Province of WA due to the influence of relatively frequent tropical cyclones that occur from November to April (Beard 2015; Bureau of Meteorology (BoM) 2018).

Graph 2.1 displays monthly precipitation and monthly maximum temperature statistics for the twelve months preceding the survey (July 2021 to June 2022), alongside long term averages for Newman Aero (Station number 007176). Graph 2.2 displays monthly data for the year preceding the survey for Karijini North (Station number 005098) alongside long term data for the now closed Wittenoom station (Station number 005026) which is 13 km from Karijini North station and at similar elevation (BoM, 2022a). These three stations provide the most relevant recent and long-term climate data. Karijini North and Wittenoom stations are located 68 and 79 km respectively northwest of the Study Area, while Newman Aero is located 113 km southeast of the Study Area, providing context for the Pilbara region.

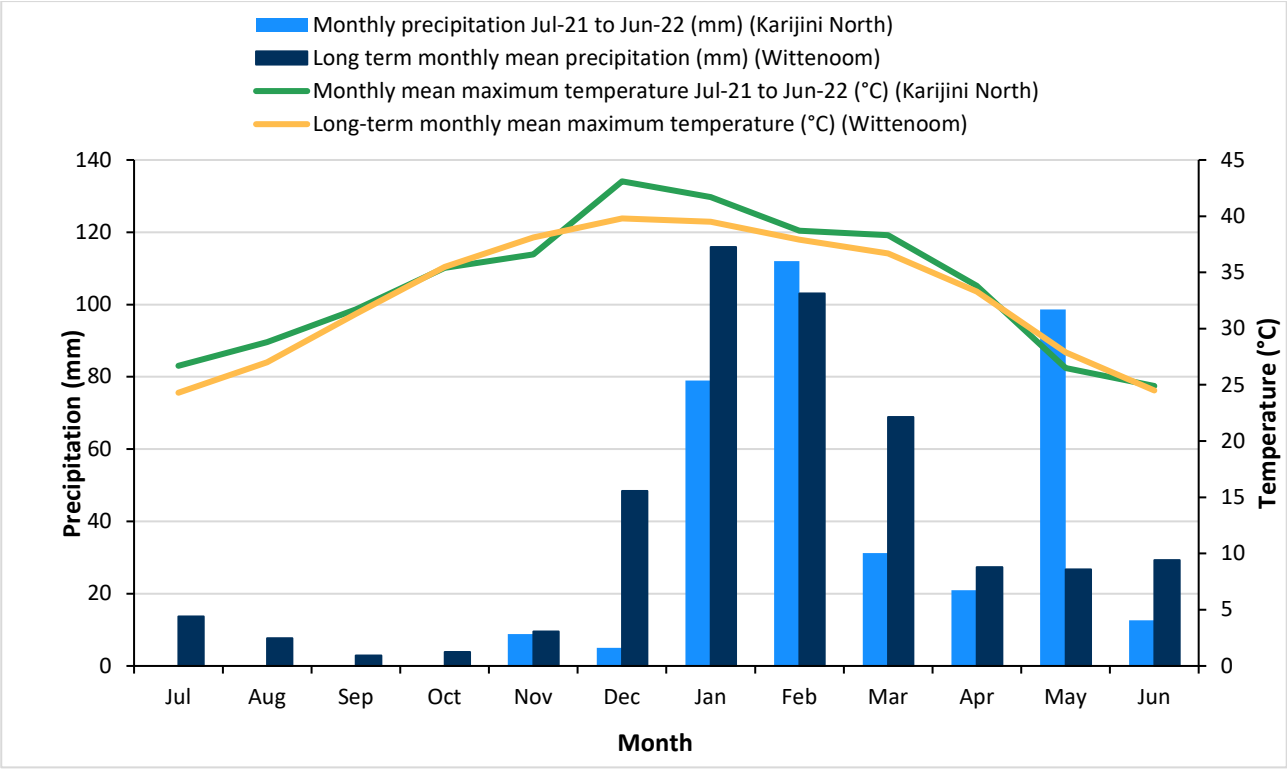
Long term averages indicate that the bulk of the annual rainfall occurs in January and February-68 and 72 mm respectively for Neman Aero, which receives 324 mm annually, and 116 and 103 mm respectively for Wittenoom, which receives 462 mm annually.

Although precipitation was below average in December 2021 and January 2022, precipitation was slightly above average for February 2022. Precipitation in March and April 2022 were again below-average, followed by above-average precipitation in May 2022 (three times the average for that month and similar to the volumes normally seen in February).

Mean maximum monthly temperatures were one to three degrees warmer than average in the five months leading up to and during Trips 1 and 2 (December 2021-April 2022), however were cooler than the average in May 2022.



Graph 2.1 Long term precipitation (1971 to 2022) and mean maximum temperature (1996 to 2022), and recent (Jul-21 to Jun-22) precipitation (mm) and mean maximum temperature (°C) for Newman Aero #007176 (BoM, 2022a).



Graph 2.2 Long term precipitation (1950 to 2019) and mean maximum temperature (1951 to 2019) for Wittenoom #005026, and recent (Jul-21 to Jun-22) precipitation (mm) and mean maximum temperature (°C) for Karijini North #005098 (BoM, 2022a).

2.2 Geology, Soils and Landscape

The Study Area is located in the Pilbara region as defined by Beard (1975; 2015). The Pilbara region is formed of a basement of Archaean granite and volcanics, overlain by massive deposits of Proterozoic sediments and volcanics (Beard 2015). This region is generally mountainous, rising to 1250 metres (m), with hard alkaline red soils on plains and pediments, and shallow and skeletal soils on ranges. The Study Area traverses one physiographic unit as defined by Beard (1975), being the Hamersley physiographic unit.

The Hamersley physiographic unit is a plateau bounded by a well-marked, abrupt escarpment on its northern, western and eastern flanks; on its southern edge the escarpment is more irregular (Beard 1975). It is composed of Lower Proterozoic rocks, which are predominantly jaspilite and dolomite with some shale, siltstone and volcanics. Above the escarpment, the plateau landscape is of rounded hills and ranges rising to around 900 m above sea level, and locally to 1250 m. There is often little soil on these hills, with cap rock abundant at the surface. Where the rock is mainly jaspilite and dolomite, there are ranges, steep hills and deeply dissected pediments with narrow, winding valley plains, however wider alluvial plains occur locally. The soils of the hills are predominantly stony and shallow, with non-coherent sands on the steeper slopes, and shallow brown loams. Neutral and hard alkaline red soils occur on the lower slopes, with deep coherent loams and clays in the valleys; in the wider alluvial valleys, deep, earthy loams with small areas of neutral red earths, and deep-cracking clays and earthy clays, both occur. Where the rock is basalt, there are valley plains and dissected stony pediments with steep, stony hills. Soils are predominantly hard alkaline red soils with significant areas of hard, neutral red soils and shallow brown loams (Beard 1975).

2.3 Groundwater and Surface Water Values

Broadscale mapping of potential Groundwater Dependent Ecosystems (GDEs) is available via the Groundwater Dependent Ecosystem Atlas which includes mapping of potential aquatic GDEs and terrestrial GDEs (BoM 2022b). A terrestrial GDE is a GDE which accesses subsurface groundwater to meet all or some of its water requirements, including terrestrial vegetation. An aquatic GDE refers to a GDE which interacts with rivers, springs, and wetland ecosystems and includes ecosystems that rely on groundwater that has been discharged to the surface, for example, as baseflow or spring flow.

The majority of the Study Area has been identified (BoM 2022b) as low potential terrestrial GDE, with minor areas of moderate potential terrestrial GDE also present. No aquatic GDEs have been mapped within the Study Area. There are no major rivers or creeks mapped within the Study Area. The nearest creeks include Marillana Creek to the north and Pebble Mouse Creek to the south-east which have been mapped as low to moderate aquatic GDEs (BoM 2022b).

The Mine DE is situated in the upper reaches of the Marillana Creek Catchment. PSM (2021) determined that the 'Mine creek' of the Study Area is characterised by sparse riparian vegetation, and that water table settings in the project area are comparatively deep (>10m), indicting unlikely groundwater dependency. Groundwater discharge zones, including shallow groundwater table environments, are expected to be present further downstream (northwards) at the confluence of 'Mine Creek' and Marillana Creek. Known GDE is present at Flat Rocks, approximately 24km downstream of the project. Known stands of *Melaleuca argentea*, *Eucalyptus camaldulensis*, *Eucalyptus victrix* are present further downstream in Marillana Creek, Yandicoogina and Weeli Wolli Creek systems, dependent to some extent on water stored in the alluvial aquifer (PSM 2021).

2.4 Land Tenure

The majority of the Study Area is within Juna Downs Pastoral Station (freehold tenure), with small areas of road (Great Northern Highway) also present (**Figure 2.1**)**.** There is one conservation reserve within the Desktop Study Area, being Karijini National Park (R 30082), which is located approximately 20 km west of the Study Area (DBCA, 2021a). Extensive areas of pastoral stations, including Juna Downs and Marillana Stations, as well as Unallocated Crown Land (UCL), also occur within the Desktop Study Area (Landgate, 2021).

2.5 Fire History

Fire is a regular and dynamic process in the Pilbara, either naturally caused by phenomena such as lightning strikes or otherwise by human intervention. Fire management of pastoral and rangeland areas is generally undertaken by land managers, to improve the palatability of grasslands or otherwise to avoid high intensity natural fires. As noted by van Vreeswyck (1994), hummock grasslands are particularly susceptible to fires (either by lightning strikes or prescribed burning); a range of herbaceous plants often emerges after rain in recently burnt areas but are usually succeeded by spinifex. Burbidge (1942) reported a succession of herbaceous annual and/or other short lived taxa in the first two seasons following fire, with regrowth being related to the amount of soil-water; after the third season, the competition in growth seemingly being between the perennial *Triodia pungens* individuals with the annual taxa forming a minor component of the lower stratum. Some species such as Mulga (*Acacia aneura*) are fire sensitive and too-frequent burns can affect the persistence of the species.

Figure 2.2 presents fire history of the Study Area and surrounding areas, as per publicly available data held by the DBCA (DBCA 2022e). Although the vegetation of the Study Area has for the most part been subject to fire in the past 10 years, areas in the north-west portion near the Mine Development Envelope, and smaller areas in the infrastructure corridor and Great Northern Highway intersection portions of the Study Area have not been burnt in the last 10 years. The eastern half of the Study Area surrounding the Mine Development Envelope was burnt in January 2014; portions of this area was then re-burnt in November 2017). The November 2017 burn also extended further west into this portion of the Study Area, also affecting portions of the infrastructure corridor. A separate burn in October 2015 (six and a half years since fire) affected portions of the Great Northern Highway intersection area and the infrastructure area (**Figure 2.2**).

None of the Study Area has been burnt more recently than four and a half years prior to survey (data as per DBCA 2022e), with no recent burns evident whilst undertaking survey.

3.0 Methods

3.1 Desktop Study

Prior to commencement of the 2022 field survey, a review of all publicly available flora and vegetation data relevant to the Study Area was undertaken. This included obtaining and reviewing copies of reports of previous biological surveys carried out within the vicinity of the Study Area (including studies assessed as part of the gap analysis for the Project (Umwelt 2022)) and interrogation of relevant databases and other sources as listed in **Table 3.1** within the Desktop Study Area (**Figure 1.1**). The results of the desktop assessment were updated prior to the 2022 field survey as per **Table 3.1**. Where TECs or PECs were identified by the desktop assessment, appropriate nomination / listing descriptions and recovery plans of the TEC or PEC were also reviewed prior to field survey.

Table 3.1 Searches undertaken for the Desktop Assessment of the Study Area

Source	Search Attributes	Search Purpose
Department of Agriculture, Water and the Environment (DAWE) Species Profile and Threats (SPRAT) Database (interrogated using the Protected Matters Search Tool) (DAWE 2021b)	Database interrogated using Desktop Study Area boundary. No additional buffer applied	Identify Matters of National Environmental Significance (MNES), including Threatened flora and TECs listed under the EPBC Act, that occur or have the potential to occur within the Desktop Study Area
DBCA Significant Flora Database (WA Herbarium Specimen Database and Threatened and Priority Flora (TPFL) Database) (DBCA 2022c)	Database interrogated using Desktop Study Area boundary. No additional buffer applied. Search conducted in 2020	Obtain records of DBCA-listed significant flora within the Desktop Study Area
DBCA NatureMap (WA Herbarium and TPFL records) (DBCA, 2007-2021)	Database interrogated using three points at the northern, centre and southern extents of the Desktop Study Area with a 40 km buffer (exact boundary cannot be used). Coordinates were: 22°48'10 S, 118°53'57 E 22°49'43 S, 118°47'39 E 22°53'39 S, 118°48'07 E	Obtain records of DBCA-listed significant flora within the Desktop Study Area
DBCA Threatened and Priority Ecological Communities Database (DBCA 2022d)	Database interrogated using Desktop Study Area boundary. No additional buffer applied.	Obtain records of DBCA-classified TECs and/or PECs within the Desktop Study Area
DBCA NatureMap (TEC and PEC records) (DBCA, 2007-2021)	Review of DBCA-classified TECs and PECs mapped in proximity to the Study Area	Identify whether there are any DBCA-classified TECs or PECs that could occur within the Desktop Study Area
DBCA TEC and PEC lists (DBCA 2018; 2022a)	Review of DBCA-classified TECs and PECs mapped in proximity to the Study Area	Identify whether there are any additional DBCA-classified TECs or PECs that could occur within the Desktop Study Area

3.2 Personnel and Licensing

Table 3.2 lists the personnel involved in both fieldwork and plant identifications for the flora and vegetation assessment. The Project Manager has previous experience in conducting flora and vegetation surveys in the Pilbara (> 3 years) and was supported in the role by the Project Director and Principal Botanist, both with in excess of 10 years experience in conducting field surveys, including in the Pilbara region. Remaining field team leaders have considerable previous experience in conducting flora and vegetation surveys in the Pilbara (> 10 years). Other personnel have previous experience in assisting with flora and vegetation surveys in the region. All plant material was collected under the relevant Flora Taking (Biological Assessment) Licence (under Regulation 62 of the Biodiversity Conservation Regulations 2018 (BC Regs)) and Authorisation to Take or Disturb Threatened Species (pursuant to Section 40 of the BC Act) as outlined in **Table 3.2**. Personnel managing plant identifications have had extensive previous experience (>10 years) in plant identifications of flora of the Pilbara.

3.3 Aerial Photography Interpretation and Survey Design

Initial interpretation of ortho-rectified aerial photography (at a scale of 1:10,000) was conducted to determine preliminary vegetation patterns present within the Study Area (including areas of restricted or unusual landforms and types), with quadrats allocated based on these patterns. A minimum of three quadrats were allocated to each major discernible vegetation pattern where possible; for smaller patterns, fewer quadrats were allocated based on the size of the pattern, while for widespread vegetation patterns, quadrats were allocated across their geographic range.

Quadrats were allocated across the Study Area, excluding the GNHI DE area that was the focus of Rapallo's (2021a) field survey, as this area was already well sampled. A selection of quadrats sampled by Rapallo (2021a) were revisited during the current survey in order to determine compatibility of Rapallo (2021a) data for inclusion in floristic analyses.

3.4 Field Survey Methods

The survey design for the 2022 survey of the Study Area complies with the requirements of EPA (2016b) and is consistent with the methods used by other similar flora and vegetation assessments conducted within the vicinity of the Study Area (**Section 5.1.3**) and the wider Pilbara Bioregion.

3.4.1 Survey Timing

Flora and vegetation field surveys were undertaken over three survey periods in 2022, as outlined below (the 2022 field surveys):

- 14-23 March 2022: flora and vegetation quadrat assessment.
- 4-14 April 2022: flora and vegetation quadrat assessment, targeted significant flora searching.
- 29 June-1 July 2022: targeted flora searching.

The timing of the field surveys was selected to coincide with the most appropriate time to survey in the Pilbara Bioregion; approximately six to eight weeks post wet season (generally March to June) (EPA 2016) as most of the taxa in this region flowers at this time. This includes the majority of significant taxa that potentially occur in the Study Area (see **Section 5.1.4**). Above-average rainfall in May 2022, coupled with moderate temperatures lengthened the flowering season, allowing for further targeted survey in June 2022.

The Study Area was accessed by helicopter and vehicle using existing access tracks, and via foot transects. Appropriate landholder/manager permissions were obtained prior to undertaking the 2022 surveys.

3.4.2 Sample Sites

A total of 116 non-permanent flora and vegetation quadrats and five relevés were surveyed in the Study Area (**Figure 3.1**).

Of the 116 quadrats, 108 were new quadrats established by this survey and eight were re-scores of quadrats established by Rapallo (2021a). A further 11 quadrats established by Rapallo (2021a) in the Study Area were not re-scored during this survey.

The quadrat size utilised for the flora and vegetation survey of the Study Area is the indicative size for flora and vegetation surveys in the Pilbara IBRA Bioregion, as outlined in Table 1 of the Technical Guidance (EPA 2016b). All quadrats encompassed a total area of 2500 metres squared (m^2); most measured 50 m × 50 m squares; however, occasionally rectangular quadrats with different dimensions (e.g. 100 m × 25 m) were established in narrower vegetation patterns such as those along creek lines. Quadrat locations were selected to ensure that at least three quadrats were surveyed within each vegetation pattern initially identified from aerial photography interpretation, where possible (as per **Section 3.3**). The final quadrat locations were adjusted from the initial proposed locations if variations in floristic patterning were observed in the field, or if access or safety issues were encountered. Vegetation boundaries or transition zones were avoided. Additional quadrats were established in areas that were not identified by the initial aerial photography interpretation but were observed in the field to differ from pre-identified areas, or areas of unusual habitat. Quadrat boundaries were demarcated using handheld Global Positioning System (GPS) units and surveying tape measures.

All vascular flora taxa (native and introduced) that were visually identifiable within each quadrat were recorded. At least one reference specimen of most taxa encountered (excluding common, distinctive taxa) was collected for verification and identification purposes (see Section 3.5).

The following information was recorded at each quadrat:

- Unique quadrat number (Site Name).
- Survey date.
- Global Positioning System (GPS) coordinates at start corner of quadrat (recorded using handheld GPS units) (Geocentric Datum of Australia (GDA94), Zone 50).
- Size and dimensions of quadrat.
- Site photograph, taken diagonally from start corner.
- Compass bearing for two sides of quadrat that commence at start corner of quadrat.
- Topography (including landform type and slope class).
- Soil colour and type (including the presence of any rock outcropping and surface stones).
- Vegetation condition (EPA 2016b; scale presented in **Appendix A**) and a description of disturbances (where relevant).
- Approximate time since fire.
- Foliage cover (%) (for each taxon, native and introduced, including cover within the quadrat of individuals rooted outside of the quadrat).
- Height (m) (average for each taxon, native and introduced, excluding climbers/aerial shrubs).
- Additional flora taxa present immediately outside of the quadrat.

Flora and vegetation survey quadrats are not considered to be the most appropriate sampling method in all instances. Where areas of vegetation in relatively degraded condition are encountered, or if areas of vegetation are too narrow to allow for the establishment of quadrats (e.g. narrow road verges), the establishment and survey of relevés rather than quadrats is considered more appropriate. A total of five non-permanent flora and vegetation survey relevés were established and surveyed within the Study Area during the 2022 field surveys. Each relevé surveyed an area approximately within a radius of 20 m around a central point. All data recorded for quadrats (as listed above) was also recorded for the relevé; however, only dominant taxa of each stratum level were recorded, as well as any taxa not previously observed elsewhere.

3.4.3 Vegetation Notes

Notes on vegetation pattern boundaries and distribution were also taken while traversing the Study Area. These notes included a GPS location at the point where the notes were taken (GDA94, Zone 50), and a brief description of the vegetation, including dominant and characteristic taxa. The notes were used to aid in mapping polygons of vegetation patterns that were not allocated quadrats or relevés. Not all vegetation pattern polygons received quadrats or relevés due to the size of the Study Area in combination with reasonable time constraints; however, polygons could be confidently allocated to a final vegetation type (VT) using a combination of field mapping notes and aerial photograph interpretation. Additional flora taxa were also recorded opportunistically in the Study Area during traverses, with GPS locations of such taxa recorded (GDA94, Zone 50).

3.4.4 Targeted Survey for Significant Flora and Vegetation

Targeted survey for significant flora taxa was undertaken during 2022 over the Targeted Survey Area (**Section 1.2**). Targeted survey was undertaken via transects spaced approximately 50 m apart. Where plants of significant flora taxa were encountered, survey was undertaken between transects. Where the current Development Envelope boundary exceeded the previously searched (Rapallo 2021) Targeted Study Area by less than 25 m, these small areas were not traversed during the 2022 survey.

The majority of taxa identified by the desktop assessment as potentially occurring within the Study Area were considered to be identifiable during the survey, and therefore the majority of such taxa were targeted (Section 5.1.5). Limitations to the survey are provided in **Section 4.2**. Information relating to identifying characteristics, flowering period and habitat of these taxa was provided to all field team members prior to undertaking targeted survey.

The following information was recorded along traverses (where significant flora were encountered):

- Location.
- GPS coordinates (recorded using handheld GPS units) (GDA94, Zone 50).
- Taxon encountered.
- Detailed count of individuals of taxon at location.
- Comments on landform, aspect, soil type, vegetation condition, time since fire, and disturbance, where relevant.

Targeted significant flora searching was also undertaken opportunistically while traversing to quadrat and relevé locations. If new populations of significant flora taxa were identified, a representative collection of material was made (**Section 3.5**). Information recorded at such locations was the same as that recorded during targeted searching.

A potentially undescribed entity (*Euphorbia* aff. *ferdinandi*) recorded by Rapallo (2021b), represented a gap in previous survey coverage. To address this, targeted survey outside the Targeted Survey Area was conducted to determine the presence of this entity within the Development Envelope. Efforts across the current Targeted Survey Area included searching for this entity.

Targeted survey in the GNHI DE, and in the vicinity of, was undertaken in June for *Aristida jerichoensis* var. *subspinulifera* in response to identification of this taxon in the 2022 plant identification process from a Rapallo (2021a) rescored quadrat.

A second potentially undescribed entity (*Corchorus* sp). was identified from a quadrat during the 2022 survey, representing a gap in survey coverage. To address this, further targeted survey outside of the Targeted Survey Area, was undertaken in late June-early July 2021 to determine presence of this entity within the Development Envelope.

No targeted searching for significant vegetation was undertaken in 2022 as the desktop assessment did not identify any listed significant vegetation likely to be present in the Study Area (**Section 5.1.5**).

All traverses made during the 2022 field surveys are mapped as track logs on **Figure 3.1**.

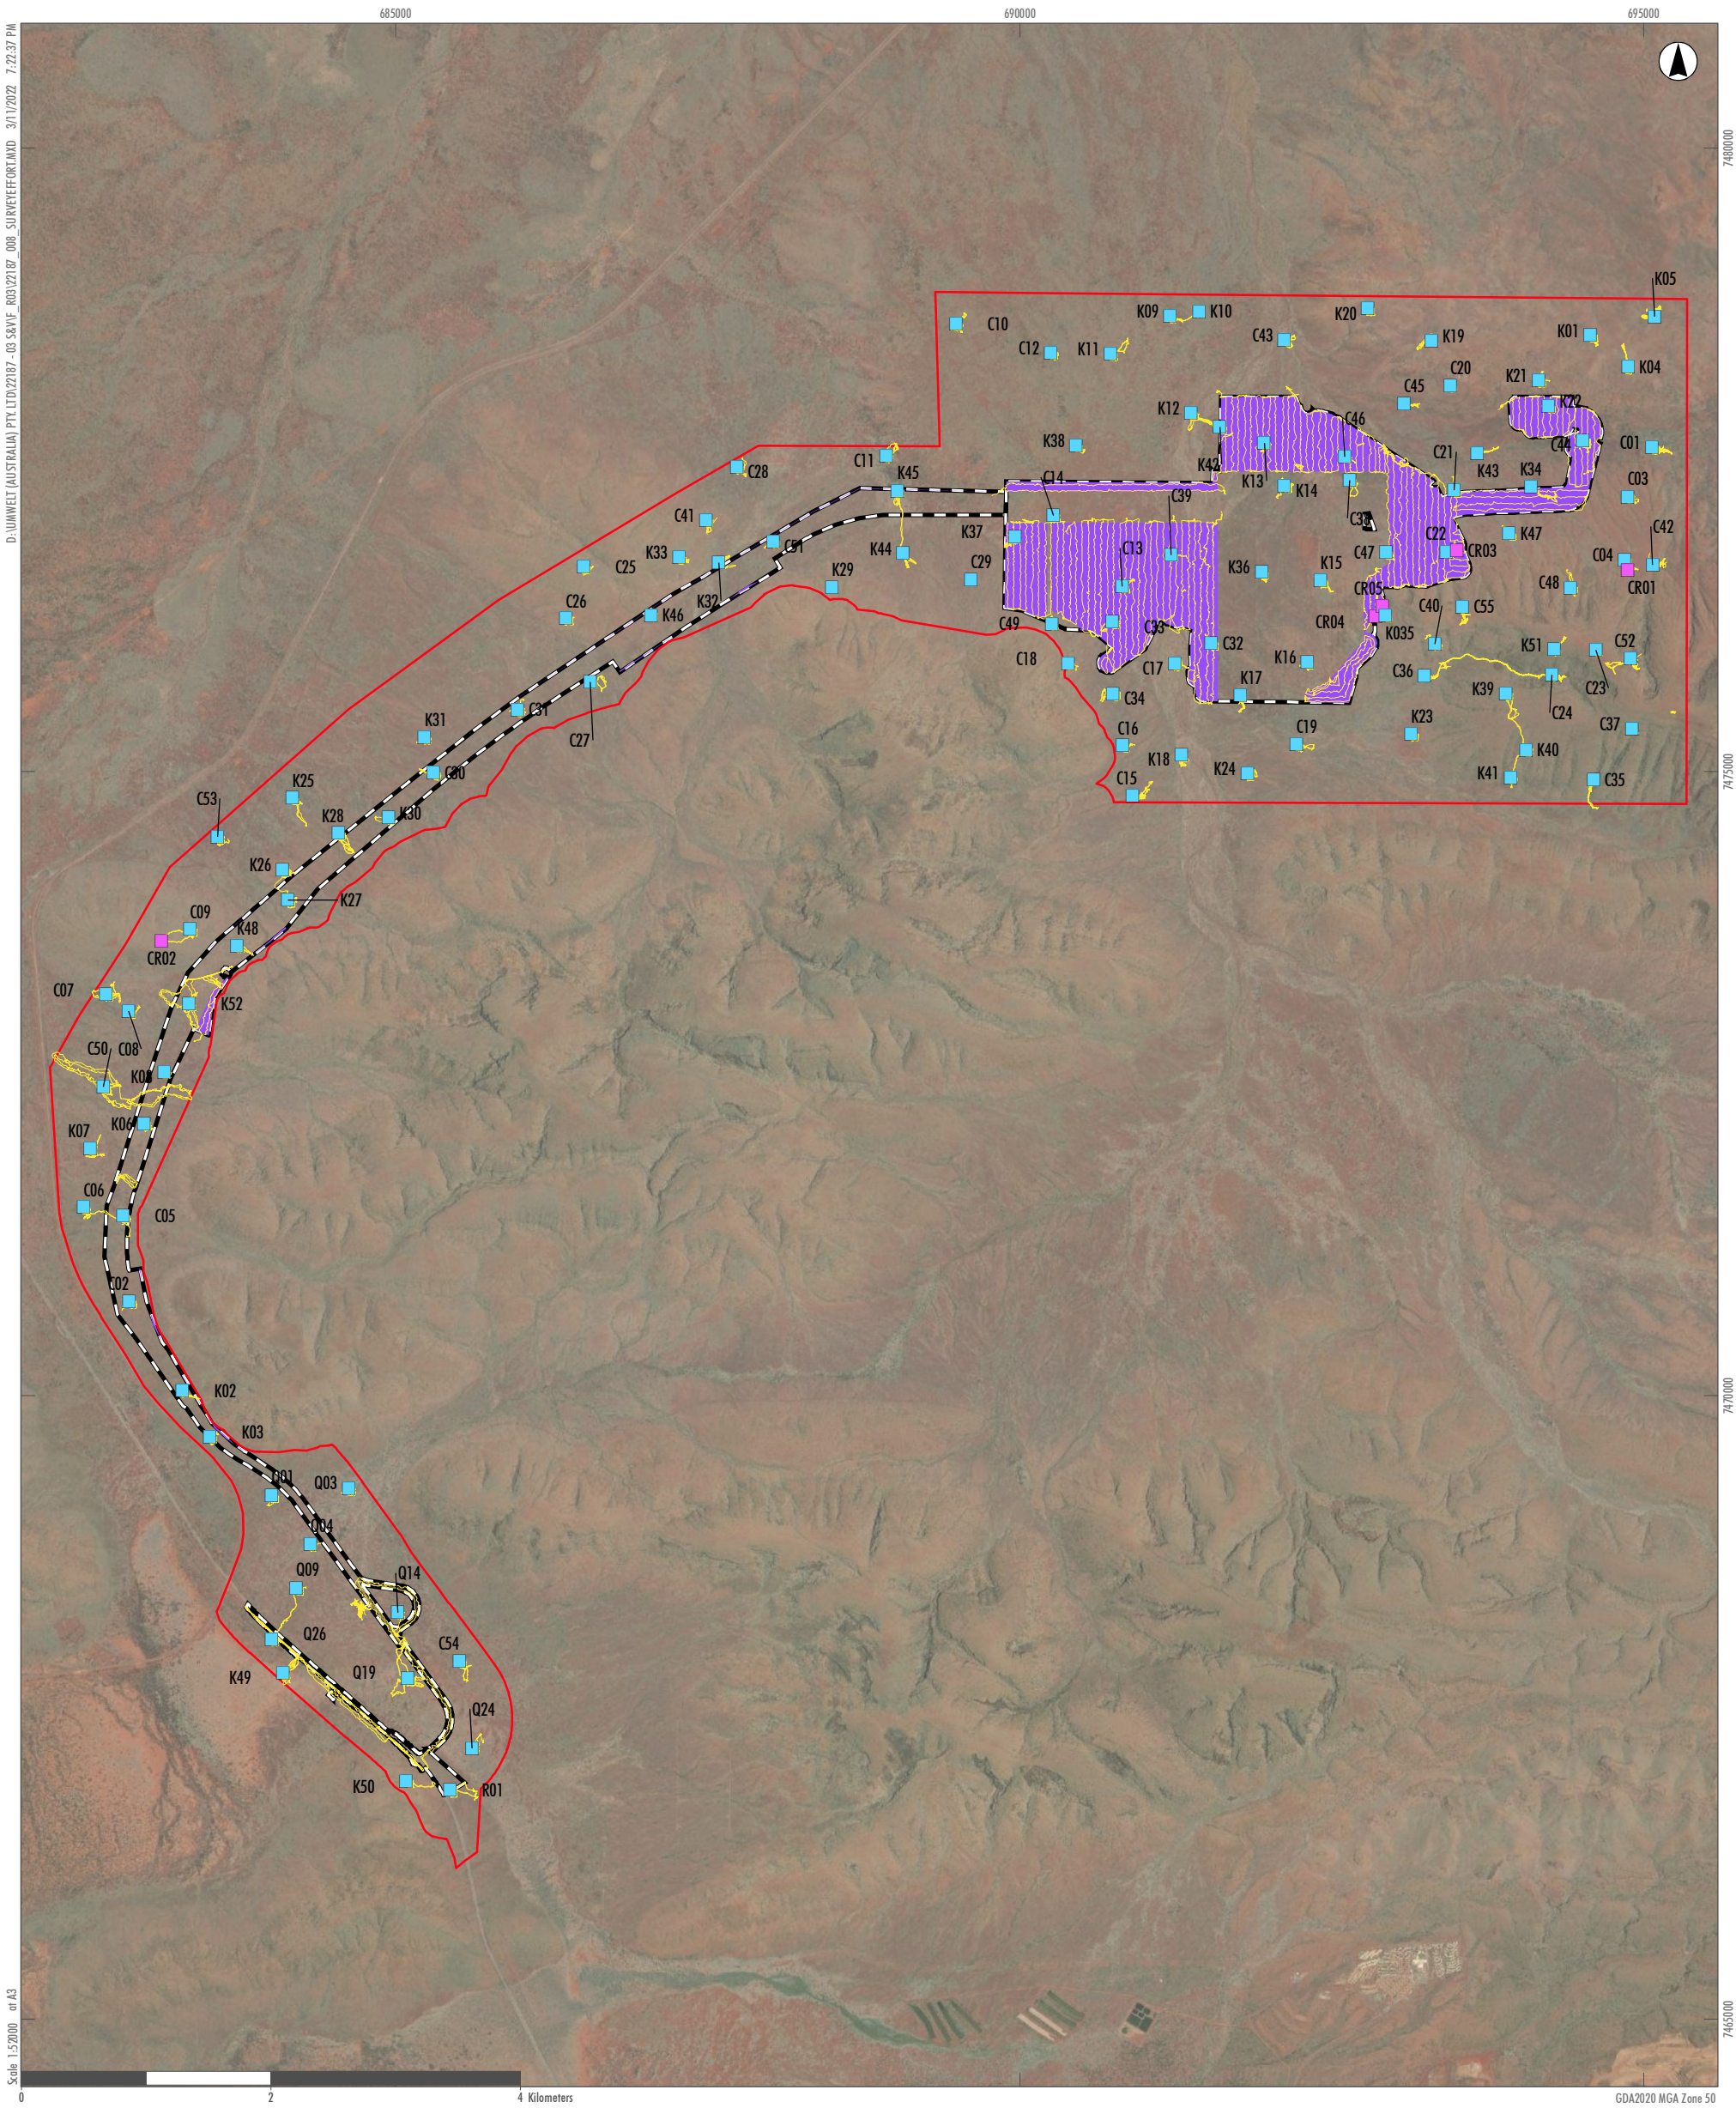

FIGURE 3.1

Survey effort: Track logs, Quadrats and Relevés from the 2022 Field Surveys

Image Source: ESRI Basemap (2022) Data source: Umwelt (2022)

3.4.5 Introduced Flora

Opportunistic locations of introduced flora taxa encountered while traversing between quadrats and relevés, and while conducting targeted searching for significant flora taxa, were recorded using the same method as for significant flora taxa, with particular emphasis given to WoNS and Declared Pests.

3.5 Plant Collection and Identification

Specimens of any unknown taxa encountered during the field survey were collected and pressed as per Western Australian Herbarium (WA Herbarium) guidelines. Plant identifications were undertaken at the WA Herbarium and were overseen by a Principal Botanist with extensive previous experience (> 10 years) in plant identifications for flora of the Pilbara (**Section 3.2**). The identification of all taxa (including significant taxa) used the most up to date information available (including taxonomic keys published in books, journals and online, comparison with herbarium specimens, and consultation with taxonomic experts). External experts of particular families or genera were consulted for any specimens considered to be difficult to identify or of taxonomic interest, including botanists at the WA Herbarium.

Taxon nomenclature generally follows *FloraBase* (WA Herbarium 1998-) with all names checked against the current DBCA Max database to ensure their validity. However, in cases where names of plant taxa have been published recently in scientific literature but have not yet been adopted on *FloraBase* due to time constraints, nomenclature in the published literature is followed. The conservation status of each taxon was checked against *FloraBase*, which provides the most up-to-date information regarding the conservation status of flora taxa in WA.

Specimens of interest, including significant flora taxa, taxa representing range extensions, potential new taxa, and key species in new occurrences of TECs and PECs will be sent to the WA Herbarium for consideration for vouchering as soon as practicable. However, this process is via donation, and the WA Herbarium may not voucher all specimens, in accordance with its own requirements. The specimen vouchering will be supported by completed Threatened and Priority Flora Report Forms submitted to DBCA (Species and Communities Branch) in the case of listed significant flora (i.e. Threatened and Priority flora taxa).

3.6 Floristic Classification Analysis

Floristic classification analysis of 127 quadrats established in 2021 and 2022 (Section 3.4.2) was performed to inform the final grouping of VTs in the Study Area. The floristic classification analysis was undertaken by a senior botanist with previous experience (> 3yrs) in undertaking and interpreting floristic analysis results, and was reviewed by a principal botanist with extensive previous experience (> 10 years) in Pilbara analyses. The taxa recorded in each of the 11 quadrats sampled by Rapallo (2021b) were reviewed and relevant changes to the data were made with regards to the field survey and plant identification process relevant to the quadrat re-score process undertaken during this survey (re-score of eight Rapallo (2021b) quadrats during 2022). These taxon changes are listed in **Appendix B.**

Taxa belonging to the below categories were removed prior to the classification analysis:

- Introduced taxa - introduced taxa were removed as their distributions are generally by the presence of disturbance (e.g. clearing, animal movement) rather than natural ecological drivers. Vegetation type must be determined independently of vegetation condition for the purposes of EIA; therefore,

including weeds in the classification analysis introduces the risk of VTs allocated by the analysis being based on condition (presence/absence of introduced species) rather than native taxon presence/absence.

- Hybrids – hybrids are usually the result of random reproductive events that produce small numbers (often only one) of sterile offspring and are often not associated with particular habitat types. As an exception, the hybrids *Senna glutinosa* subsp. x *luerssenii* and *Senna artemisioides* subsp. x *artemisioides* were retained due to their repetitive nature in the dataset.

- Taxa where identification was unclear – taxa were removed from the analysis where identification was unclear due to poor available material in the field. However, if such a taxon was known to be unique within the dataset (i.e. although not identifiable to species level, there was enough material to indicate it representing a unique taxon), and the taxon had multiple records in the dataset, it was included in the analysis.

- Singletons – taxa that occur only once in the dataset were removed, as published studies indicate that they provide little information in the dataset (e.g. Markey and Dillon 2008).

All taxa removed from the classification analysis (excluding taxa belonging to the abovementioned categories) are presented in **Appendix B**. Also presented in **Appendix B** are taxa that were amalgamated in the classification analysis; this was done, for example, where different infra-taxa could not be consistently positively identified at all quadrats due to inadequate material.

The final dataset contained 239 taxa following the removal and/or amalgamation of the above-noted taxa.

A single-layer data matrix using presence/absence species data was used in the classification analysis, with PATN (V4.0) (Belbin and Collins 2013) utilised to perform the classification and ordination analysis of the data matrix. The Bray-Curtis coefficient was used to generate an association matrix for the classification analysis. This association matrix consisted of pairwise coefficients of similarities between quadrats based on floristic data. Agglomerative hierarchical clustering, using flexible Unweighted Pair Group Method with Arithmetic Mean (UPGMA) (ß = - 0.1), was used to generate a quadrat classification dendrogram (Sneath and Sokal 1973).

3.7 Vegetation Type Definition, Mapping and Description

The classification analysis of the Study Area floristic data (**Section 3.6**) aggregated quadrats and taxa, with the number of groups equivalent to the square root of the number of quadrats/taxa (Belbin and Collins 2013). The resulting dendrogram and taxon group matrix were initially examined at this level to determine the plausibility of groups with regard to taxon groups, in combination with field observations. This process determined a final number of groups, which are considered to represent VTs.

Following this process, floristic and structural data recorded at relevés was examined to determine whether vegetation sampled by such relevés was analogous to any of the VTs defined by floristic composition classification.

VT descriptions have been adapted from the National Vegetation Information System (NVIS) Australian Vegetation Attribute Manual Version 6.0 (ESCAVI 2003), as stipulated by EPA (2016b). This model follows nationally-agreed guidelines to describe and represent VTs, so that comparable and consistent data are produced nation-wide. It should be noted that the NVIS system utilises vegetation descriptions derived

from structural characteristics of the individual community units, while VTs presented in this report are defined based on the results of a floristic classification analysis, excluding any structural data. Such VTs therefore may include multiple structural types. Considering the effect of disturbance factors such as fire on vegetation structure, this approach is designed to provide a map of VTs that reflect taxon composition and the influences of the physical and chemical environment rather than disturbance history.

The vegetation was described according to the stratum and dominant taxa present in each stratum upon review of the quadrat data for each VT. This report has described VTs at the NVIS Association level rather than the NVIS Sub-Association level, in accordance with the stratum present and consistently-dominant taxa recorded.

For each VT, indicator taxa were defined via Indicator Taxon Analysis (INDVAL). This was conducted using PC-Ord (V6.08) (McCune and Mefford 2011) via the method of Dufrêne and Legendre (1997). This generates INDVAL values (a measure of taxon fidelity to a given VT) that range from 0 to 100; an INDVAL value of 100 indicates that a taxon is present in all quadrats within a particular VT, and absent from all other quadrats included in the analysis. The INDVAL values were then tested for significance of the indicator taxa using a Monte Carlo permutation test. Indicator taxa were defined as taxa with a significance p value of either < 0.05, < 0.01 or < 0.001. The same taxa exclusions (i.e. introduced taxa, hybrids and singletons) and amalgamations (as per **Appendix B**) were employed for the indicator species analysis as per the floristic classification analysis (**Section 3.6**). Note that only VTs sampled with more than one quadrat were analysed for indicator species.

Locations of quadrats and/or relevés within each VT were used in conjunction with aerial photograph interpretation and field notes taken during the field survey to develop VT mapping polygon boundaries. VT mapping boundaries were developed using aerial photography on a scale of 1:10,000 and reflected changes in vegetation patterns visible at this scale. The VT mapping polygon boundaries were then digitised using Geographic Information System (GIS) software.

3.8 Vegetation Condition Mapping

Vegetation condition was described using the vegetation condition scale presented in EPA (2016b) for the Eremaean and Northern Botanical Provinces (**Appendix A)**. Notes on vegetation condition were taken via vehicle traverses along access tracks, and during foot traverses undertaken within the Study Area. Vegetation condition was also recorded at all quadrats and relevés. Vegetation condition category polygon boundaries were developed using this information and were digitised using GIS software as for VT polygon boundaries.

3.9 Significant Flora and Vegetation

3.9.1 Significant Flora

As per EPA (2016a, 2016b), flora taxa may be significant for a range of reasons, including, but not limited to the following:

- Being identified as a Threatened or Priority species (formally listed significant taxa – includes taxa listed under both State and Commonwealth legislation, and classified as Priority by DBCA).

- Being locally endemic or associated with a restricted habitat type (e.g. surface water or groundwater dependent ecosystems (GDEs)).
- Being a new species or having anomalous features that indicate a potential new species.
- Being representative of the range of a species (particularly at the extremes of range, recently discovered range extensions, or isolated outliers of the main range).
- Being an unusual species, including restricted subspecies, varieties or naturally occurring hybrids.
- Having a relictual status, being representative of taxonomic groups that no longer occur widely in the broader landscape.

Significant flora taxa recorded within the Study Area are discussed in **Sections 5.2.2**, with reference to the above categories. Numbers of point locations and individuals recorded of significant flora known from the Study Area are presented in **section 5.2.2.**

3.9.2 Significant Vegetation

As per EPA (2016a, 2016b), vegetation may be significant for a range of reasons, including, but not limited to the following:

- Being identified as a TEC or PEC (formally listed significant vegetation – includes vegetation listed under Commonwealth or State legislation, or classified as a PEC by DBCA).
- Having restricted distribution.
- Having a degree of historical impact from threatening processes.
- Playing a role as a refuge.
- Providing an important function required to maintain ecological integrity of a significant ecosystem.

To determine the presence of TECs and PECs defined from quadrat-derived data, EPA (2016b) requires comparison of the quadrat data with that of the survey in which the TEC or PEC was originally described. However, limited information is available for TECs and PECs of the Pilbara region. Generally, only broad descriptions are provided in the respective TEC and PEC lists to allow for diagnosis. The vegetation of the Study Area was therefore manually compared to such descriptions to determine whether any vegetation may represent a TEC or PEC; specifically, comparisons of dominant taxa, soils, topography and geographical distribution of VTs were made to those of any relevant TEC or PEC. A similar process was followed for TECs listed under the EPBC Act, with comparisons made to the appropriate listing and conservation advice for any TECs likely to occur in the Study Area.

The remaining significant vegetation criteria other than “being identified as a TEC and PEC” were applied to VTs mapped in the Study Area to determine whether a VT was significant in a local or regional context. In a regional context, limited information is available for comparison with VTs in the Study Area. This is discussed further in **Section 5.2.9**.

An assessment of the likelihood of groundwater dependent vegetation occurring in the Study Area was undertaken using a combination of known depth to groundwater (within 10m of the surface) taken from other studies prepared for the project (PSM 2021), combined with an assessment of the presence and extent of known phreatophytic taxa from the Pilbara region.

4.0 Adequacy and Limitations of Survey

4.1 Adequacy of Survey

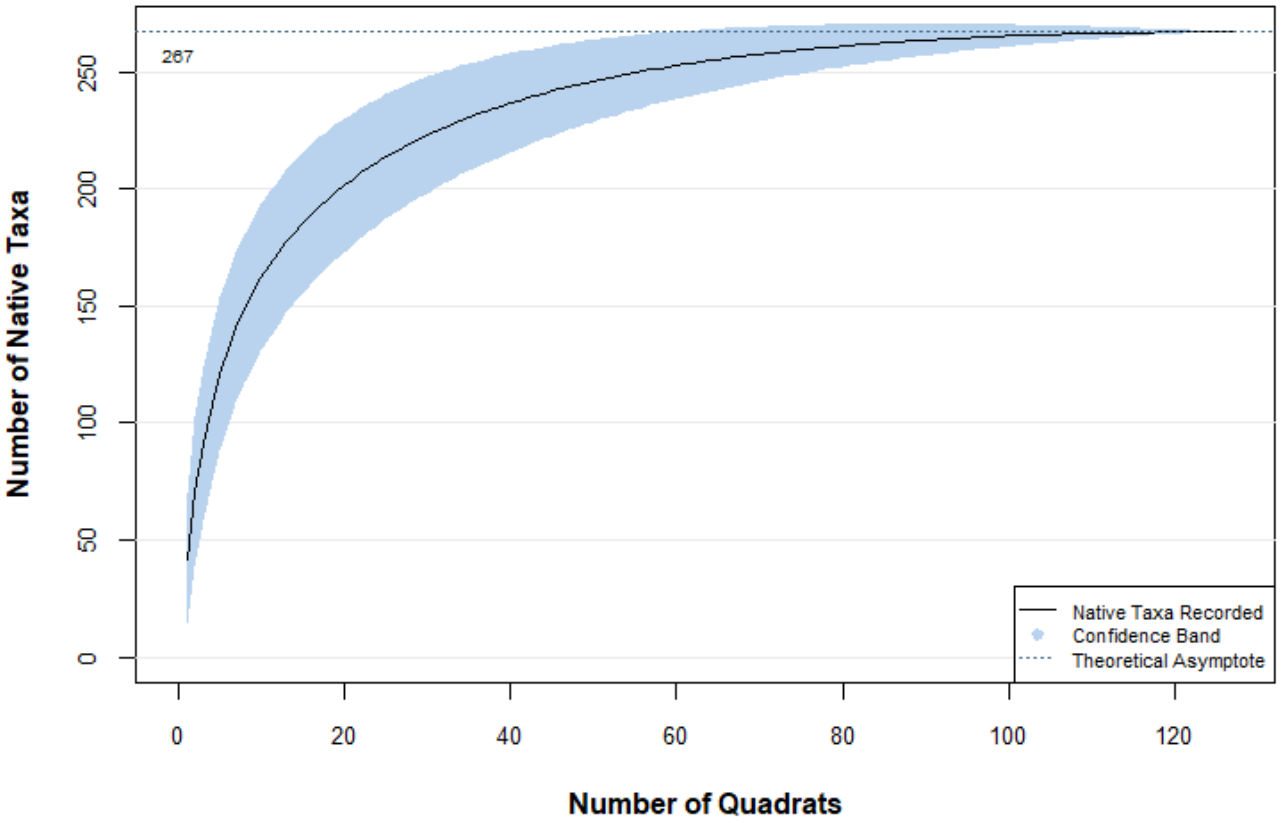
The Study Area covers 3,785.7 ha, with a total of 127 quadrats (including 108 newly established quadrats, eight re-scored Rapallo (2021a) quadrats and 11 Rapallo (2021a) quadrats which were not revisited) established within the Study Area. Quadrats were established in all preliminary vegetation patterns discernible by initial aerial photograph interpretation (**Section 3.3**), both to adequately sample variation in vegetation throughout the Study Area, and to ensure adequacy of sampling for vascular plant taxa.

The number of quadrats established within the Study Area is considered to be acceptable given the moderate diversity of topography and soil types noted in it, as well as the extent of native vegetation mapped in, the size of, and extent of native vegetation in the Study Area (approximately 1(99.9% of the Study Area). One quadrat was established per 30 ha of Study Area.

To provide an indication of the adequacy of this survey, a taxon accumulation curve was produced with the 'vegan' R package (Oksanen *et al.* 2020) using R Statistical Software (R Core Team 2022). Taxon accumulation curves represent a theoretical model of the relationship between sampling intensity and taxon accumulation; when sampling intensity is increased, taxon accumulation is reduced, and a taxon accumulation curve becomes asymptotic.

The taxon accumulation curve for quadrat data recorded in the Study Area was generated using all native taxa (both annual and perennial) recorded within each quadrat. Taxon accumulation calculations were then undertaken using the 'SpadeR' R package (Chao *et al.* 2016), utilising the Chao-2 estimator for species richness (bias corrected form) (Chao 1987) and compared to the actual number of taxa recorded in the Study Area. This provides an indication as to whether sufficient quadrats were surveyed to adequately sample the species richness in the Study Area. As the generation of taxon accumulation curves includes quadrat data only, and not opportunistically recorded taxa, the indication of adequacy of survey is considered to be conservative.

Graph 4.1 presents the taxon accumulation curve generated from quadrat data from the Study Area. Using the Chao-2 estimator, the recorded number of taxa within quadrats (267 taxa) has become asymptotic and is equivalent to 100 % of the estimated taxon richness in the Study Area, indicating that the Study Area was well-sampled. Interestingly, as per the flora census results (**Section 5.2.1**), a total of 320 discrete vascular native flora taxa, three known hybrids (as per WA Herbarium (1998)) and one putative hybrid were recorded in the Study Area by the 2022 survey. Therefore, in this case the Chao-2 estimator appears to have underestimated the native taxon richness of the Study Area.



Graph 4.1 Study Area Quadrata Data Taxon Accumulation Curve

Another adequacy of survey measure is that developed by Mueller-Dombois and Ellenberg (1974), who suggest that a cut-off point might be when a 10 % increase in quadrats surveyed results in a ≤ 5 % increase in taxa recorded. This measure was also calculated using all native taxa recorded within each quadrat. The number of quadrats established by the field survey satisfies this adequacy measure, with the final taxon increase value of 0 % recorded following a 10 % increase in quadrats.

Figure 3.1 presents the location of all quadrats and relevés sampled during the survey. Track logs of Targeted Flora survey intensity are also presented. Track logs between quadrats are presented only where quadrats were accessed via foot; due to poor access the majority of quadrats were accessed via helicopter and these logs are not presented.

4.2 Limitations of Assessment

Table 4.1 Limitations of the Flora and Vegetation Survey

Limitation	Limitation of Survey	Comment
Effort and extent	No	Detailed survey was undertaken encompassing the entire Study Area. At least three quadrats were established in each vegetation pattern identified through initial aerial photography interpretation and on-ground field survey in the Study Area. Re-score of an appropriate sample of existing quadrats (Rapallo 2021a) was undertaken during the survey. Mapping of VT boundaries was undertaken using a combination of aerial photography (scale 1:10,000) and information collected during traverses between quadrats and relevés. Field verification of VT boundaries post-analysis was not undertaken. Targeted survey for significant flora taxa identified by the desktop assessment and during quadrat sampling was conducted in 2022 across all areas identified as requiring such survey (Targeted survey area; see **section 1.2.4; and outside of this to address gaps; see section 3.4.4**) within the most appropriate time to survey in the Pilbara Bioregion (six to eight weeks post wet season). Targeted survey was undertaken using transects spaced approximately 50m apart, with finer scale transects employed where significant flora taxa were identified. Opportunistic targeted survey for significant flora taxa was also undertaken while traversing the Study Area to establish quadrats and relevés during the 2022 survey (see **Sections 3.4.4**). Detailed and Targeted Survey was conducted over a total of 90 person days in 2022. No constraints prevented appropriate sampling techniques (quadrat/relevé establishment, foot transects) being employed. Access within the Study Area enabled detailed VT and condition mapping to be undertaken throughout the Study Area via foot, vehicle and helicopter. Mapping and data reliability is therefore considered to be relatively high.

Limitation	Limitation of Survey	Comment
Competency/experience of the team carrying out the survey	No	The Project Manager and field lead has had over 3 years of experience in conducting flora and vegetation surveys in the Pilbara Region, as well as conducting systematic sampling and analysis, and worked with personnel with significant experience in field surveys of the region (> 10 years). The Project Manager also had previous experience in undertaking flora surveys in the local area. Other field team leaders have previous experience (> 14 years) in conducting flora and vegetation surveys in the Pilbara Region, and field team personnel have previous experience assisting in flora and vegetation surveys. Senior personnel provided guidance to less experienced botanists throughout the 2022 survey where necessary. Information relating to identifying characteristics, flowering period and habitat of significant flora taxa identified by the desktop assessment as potentially occurring in the Study Area were provided to all field team members prior to undertaking the 2022 field survey. Personnel overseeing plant identifications have had > 10 years' experience in plant identification in the Pilbara Region. Relevant taxonomic experts (including botanists at the WA Herbarium) were consulted for any specimens considered to be difficult to identify or of taxonomic interest.
Proportion of flora recorded and/or collected and identified	No	All vascular groups that were present in the Study Area were sampled. At least one reference specimen of all taxa encountered (excluding common, distinctive taxa) was collected for verification and identification purposes during the 2022 survey. A relatively high proportion of annual and ephemeral vascular taxa were recorded in 2022 based on the intensity and method of survey and the above-average precipitation received prior to the 2022 survey. Almost all ephemeral and perennial flora taxa could be positively identified. All unknown vascular taxa were collected, with specimens identified at the WA Herbarium. Adequacy of survey measures indicate that the Study Area was well sampled (**section 4.1**).
Sources of information e.g. previously available information (whether historic or recent) as distinct from new data	No	Reasonable contextual information for the Study Area was available prior to the 2022 survey. Sources of information used included government databases (DAWE, DBCA), previous unpublished reports and data from within and in the vicinity of the Study Area (**Section 5.1.3**), as well as numerous general sources pertaining to the climate, geomorphology, flora and vegetation of the Pilbara Region. All data sources used for the desktop assessment were considered to have high reliability.

Limitation	Limitation of Survey	Comment
Survey timing and weather/season/cycle	Partial	The 2022 field survey was conducted within the most appropriate time to survey in the Pilbara Region (approximately six to eight weeks post wet season – March to June). Above-average precipitation was received during the wet-post wet season 2021/2022, with significant above-average precipitation received in February and May 2022 (**Section 2.1**). This significant rainfall in May 2022 combined with reasonably warm temperatures allowed for further follow-up targeted survey in late June-July 2022. The 2022 survey was conducted mid-to end of season and the flowering season was considered to be good, with a relatively high proportion of annual and ephemeral vascular taxa recorded and many perennial taxa in flower. All perennial taxa were at least in good condition. All significant flora taxa known to occur or potentially occurring in the Study Area based on the desktop assessment results were considered to be identifiable during the 2022 survey with the exception of two taxa. *Arthropodium vanleeuwenii* (P2) is considered visible only when flowering in September, as it grows up through *Triodia.* This taxon could occur within the Study Area and Targeted Survey Area based on the habitats present (see **Section 5.2.5**). *Rhodanthe ascendens* (P1) was also potentially unidentifiable at the time of survey based the known flowering time. However, this taxon is unlikely to occur in the Study Area based on a combination of the habitat present, extent of targeted searching undertaken, and that the Study Area is outside of the known range (discussed in **Section 5.2.5**). One significant flora taxon (*Euphorbia clementii*) (P2) is a known fire responder; otherwise, fire response of significant flora from desktop review unknown or presumed not to be fire responders. The majority of the targeted flora survey area was either long-unburnt (>10 years), or otherwise subject to burn approximately 4.5 years ago. Unlikely that *Euphorbia clementii* (P2) is present in Study Area due to being outside of the known range of the taxon.

Limitation	Limitation of Survey	Comment
Disturbances (e.g. fire, flood, accidental human intervention etc.) that may have affected results of survey	No	Very minor historical clearing has occurred in the Study Area, mainly associated with tracks, historical mining exploration and associated clearing. The vegetation condition mapping reflects these impacts with regards to some of the larger areas of historical exploration clearing, however the overall vegetation type mapping was not affected. More recent minor clearing associated with exploration activities was underway (by a separate mining company) during the field survey in the Study Area in the vicinity of the Great Northern Highway. Various ages since fire have been mapped over the Study Area (**Figure 2.2**). These ages ranged from long unburnt (>10 years), January 2014 burn (8.5 years since fire) (affecting the eastern half of the Study Area associated with the Mine Development Envelope); October 2015 burn (6.5 years since fire) (affecting the western half of the Study Area associated with the Access Road and GNH intersection); and November 2017 burn (4.5 years since fire) (affecting extensive portions of the Study Area associated with the Access Road and Mine Development Envelope). Some areas have been affected by fire more than once in the last ten years. However, no vegetation was recently affected by fire, with at least four wet-season cycles allowing sufficient time for germination and regrowth of vegetation, with no effect of the burning regime on ability to identify vascular plant taxa at quadrats.
Remoteness and/or access restrictions	No	Some areas were somewhat difficult to reach due to large distances from available access tracks, or steep, rocky or unsafe terrain, however, significant access/remoteness issues were overcome with the use of a helicopter during field trips 1 and 2 during the 2022 survey, allowing high intensity of sampling across the Study Area. Access was not permitted to a number of relatively small areas that have been identified as Indigenous Australian Heritage Sites, both within the Footprint and in the wider Study Area. Therefore, such sites, in particular those within the Footprint, could not be surveyed for significant flora taxa. Such sites could also not be directly sampled in a vegetation context; however, most sites were relatively small and the vegetation could be observed from outside the site, and therefore it is considered that this did not affect the results of the VT mapping within the Study Area.

5.0 Results and Discussion

5.1 Desktop Assessment

5.1.1 Regional Flora

The interrogation of the DBCA TPFL Database and WA Herbarium (WA Herb) Specimen Database (DBCA 2022c) returned a total of 59 listed significant vascular flora taxa that have records in the Desktop Study Area. Of these, one taxon, *Thryptomene wittweri*, is listed as Threatened under the EPBC Act and BC Act, while the remaining 58 taxa are DBCA-classified Priority flora (**Table 5.1**). None of the taxa returned from the DBCA TPFL and WA Herbarium database interrogations have known records within the Study Area.

According to DAWE (2021b), *Thryptomene wittweri* (T) (or habitat for the taxon) is likely to occur within the Desktop Study Area (**Table 3.1**). As discussed above, according to DBCA databases this taxon has known records within the Desktop Study Area, with the closest record being approximately 23 km southwest of the Study Area. The full results of the DAWE database search are presented in **Appendix C**.

An interrogation of DBCA databases using NatureMap (DBCA 2007-2021) was also undertaken as part of the desktop assessment, to check for any recently added records and confirm the records returned from the DBCA TPFL and WA Herbarium Specimen Database searches. The NatureMap search did not return any additional listed significant flora taxa (**Table 5.1**). Conservation codes for Western Australia flora are presented on the DBCA Threatened species and communities website (DBCA 2020), with a full list of Threatened and Priority flora taxa available on the DBCA Threatened Plants website (current to 27 June 2022 (DBCA 2022a)).

* Sources are: DAWE: DAWE (2021b), WA Herb (1998-), TPFL: DBCA (2022c), NM (NatureMap) DBCA: (2007-2021).

The search of the DAWE SPRAT database with regard to MNES listed under the EPBC Act identified one significant invasive introduced flora taxon, or habitat for this taxon, as likely to occur within the Desktop Study Area, being **Cenchrus ciliaris* (Buffel Grass) (DAWE 2021b). **Cenchrus ciliaris* is known to be widespread and common in the Pilbara (WA Herbarium 1998-). This taxon is considered by the States and Territories to pose a particularly significant threat to biodiversity as it is known to be invasive under certain conditions (Hussey *et al.* 2007). This taxon is not listed as a Declared Pest under the BAM Act (DPIRD 2022). The full results of the DAWE database searches are presented in **Appendix C** (DAWE 2021b).

5.1.2 Regional Vegetation

The Study Area is located within the Pilbara Interim Biogeographic Regionalisation for Australia (IBRA) Bioregion, and specifically within the Hamersley IBRA Subregion (PIL3) (DAWE 2020). The Hamersley Subregion comprises mainly of mulga low woodland over bunch grasses on fine textured soils in valley floors, and *Eucalyptus leucophloia* over *Triodia brizoides* on skeletal soils of the ranges (Kendrick 2001).

Soil landscape mapping of WA (previously referred to as land system mapping) has been compiled from the results of various surveys across the state by the Department of Agriculture (now the Department of Primary Industries and Regional Development (DPIRD)) (DPIRD 2019). Data from van Vreeswyk *et al.* (2004) has been used to map soil landscape units in the region within which the Desktop Study Area is located. This data includes general ecological information, vegetation physiognomy and composition, patterns of variation, conservation status, gradational association and land system representation (van Vreeswyk *et al*., 2004).

The Study Area occurs across five soil landscape systems, as summarised in **Table 5.2** and presented on **Figure 5.1**. None of these soil landscape systems are listed as TECs under the EPBC Act (DAWE 2021a) or as TECs or PECs under the BC Act (DBCA 2018; 2022a), and all are detailed as being common in the Pilbara landscape mapping Study Area (van Vreeswyk *et al.* 2004).

Table 5.2 Soil Landscape Mapping of the Study Area (DPIRD 2019; van Vreeswyk *et al.*, 2004)

Soil Landscape System	Description	Area and % of van Vreeswyk Study Area	Area and % of Study Area
Boolgeeda (285Bg)	Stony lower slopes and plains below hill systems supporting hard and soft spinifex grasslands and mulga shrublands Predominantly colluvium on gently sloping plains; widespread and common Stony lower slopes, level stony plains and narrow sub-parallel drainage floors, relief up to 20 m. A common system in shallow valleys below hill systems such as Newman and Rocklea Noted to be subject to fairly frequent burning.	774,800 ha 4.3%	2510.3 ha 66.3%
McKay (285Mk)	Hills, ridges, plateaux remnants and breakaways of meta sedimentary and sedimentary rocks supporting hard spinifex grasslands Predominantly sedimentary rocks on hills; widespread and common Erosional surfaces; hill tracts, ridges, plateaux remnants and breakaways with steep upper slopes and more gently inclined lower footslopes, restricted stony plains and interfluves; moderately spaced tributary drainage patterns incised in narrow valleys in upper parts becoming broader and more widely spaced downstream. Relief up to 100 m.	420,200 ha 2.3%	213.1 ha 5.6
Newman (285Ne)	Rugged jaspilite plateaux, ridges and mountains supporting hard spinifex grasslands Predominantly jaspilite on ridges and plateaux; very common in the southern half of the Landscape mapping Study Area Rugged high mountains, ridges and plateaux with near vertical escarpments of jaspilite, chert and shale, the second largest system in the survey area and prominent in southern parts (e.g. Ophthalmia Range, Hamersley Range), relief up to 450 m.	1,458,000 ha 8.0%	654.3 ha 17.3 %
Platform (285Pl)	Dissected slopes and raised plains supporting hard spinifex grasslands Predominantly colluvium on incised slopes; common in the central and south-west of the Landscape mapping Study Area Narrow, raised plains and highly dissected slopes on partly consolidated colluvium below the footslopes of hill systems such as Newman, relief mostly up to about 30 m but occasionally considerably greater.	1,570,00 ha 0.9%	301.2 ha 8.0 %
Wannamunna (285Wn)	Hardpan plains and internal drainage tracts supporting mulga shrublands and woodlands (and occasionally Eucalypt woodlands) Predominately alluvium on hardpan plains, internal drainage flats; common in the central and south of the Landscape mapping Study Area Level alluvial plains with prominent grove patterns of vegetation and shallow loamy soils over hardpan and broad internal drainage plains with deeper more clayey soils, relief up to 5 m. The system is found in south central parts of the survey area as broad flats within the Hamersley Ranges (Newman land system).	57,700 ha 0.3%	106.8 ha 2.8 %

FIGURE 5.1

Soil Landscape Mapping of the Study Area

Image Source: ESRI Basemap (2021) Data source: Landgate (2022), DPIRD (2019)

The vegetation of WA as it was presumed to have existed prior to European settlement has been mapped at a scale of 1:250,000 as vegetation system associations (VSAs) (DBCA, 2019), with the pre-European Vegetation spatial database subsequently created (DPIRD, 2019). The Study Area occurs across two VSAs, as summarised in **Table 5.3** and presented on **Figure 5.2**. **Table 5.3** also presents the current extent of each VSA in relation to its pre-European extent within the Hamersley IBRA Subregion, and the percentage of the current extent of each VSA currently protected for conservation in all DBCA-managed land (as a proportion of the current extent) within the Hamersley IBRA Subregion (Government of Western Australia 2019), as well as area (ha) and extent (as percentage) in the Study Area.

There is over 99 % of the pre-European extent of both VSAs remaining, and both have some areas protected for conservation (**Table 5.3**).

Table 5.3 Bioregional Statistics of Vegetation System Associations of the Desktop Study Area (DPIRD 2019)

Vegetation System Association	Description	Current Extent (ha)	Pre-European Extent Remaining (%)	Current Extent Protected for Conservation (%)	Area and Extent in Study Area
Hamersley_18	Low woodland, open low woodland or sparse woodland	575,808	99.2	29.6	2432.9 ha 64.3%
Hamersley_82	Low tree-steppe	2,146,708	99.4	13.7	1352.8 ha 35.7%

Three main vegetation descriptions for the Hamersley Plateau were provided by Beard (1975), of which two are pertinent to the Study Area:

- The Ranges: vegetation on jaspilite and dolerite ranges is characteristically tree-steppe of *Eucalyptus brevifolia-Triodia wiseana*; few *E. gamophylla* may be present. There are generally few shrubs but a rich flora of small shrubs and forbs. On the summits the tree layer is replaced by *E. kingsmilli*, *E. gamophylla* and *E. brevifolia*. Representative of Hamersley_82.

- Valley Plains: mulga is dominant (*Acacia aneura* low woodland); can develop to open grassland in the wider and flatter areas. *Astroleba pectinata* is dominant on red cracking clays, with a variety of other grasses and forbs. Representative of Hamerlsey_18.

5.1.3 Local Flora and Vegetation Surveys

Flora and vegetation surveys undertaken for the Project or within the vicinity of the Study Area are summarised in **Table 5.4.** The locations of relevant surveys undertaken in the vicinity of the Desktop Study Area are presented on **Figure 5.3** (subject to the availability of survey boundary files) and those historical studies relevant to the Lamb Creek project area are displayed on **Figure 5.4**. Note that there have been numerous historical surveys undertaken in the general area and region, primarily due to the relatively extensive nature of mining interests; however, only more recent surveys (those undertaken in the last ten years; i.e. since 2011) have been summarised in **Table 5.4.**

Note that some previous surveys summarised in **Table 5.4** recorded locations of *Seringia exastia*, which despite being no longer recognised as Threatened under WA's BC ACT, remains listed as Threatened under the EPBC Act (Department of Premier and Cabinet (DPC) 2018). Binks *et al.* (2020) determined that material considered to represent *Seringia exastia*, which was thought to be restricted to a few locations near Broome and to the south of Broome in the Great Sandy Desert, should be considered conspecific with material considered to be *Seringia elliptica*, a taxon widespread across northern and central WA. Consequently, *Seringia elliptica* and *Seringia exastia* were synonymised under the oldest valid name, being *Seringia exastia*. This synonymisation has created an anomalous situation whereby *Seringia exastia* as now circumscribed is a common, widespread species that clearly does not meet the criteria for Threatened status under either of the aforementioned acts.

Detailed vegetation survey was undertaken in the GNH Intersection Area (Rapallo 2021a) and six vegetation types were mapped in this area:

A: Low open *Eucalyptus gamophylla* woodland over *Triodia melvillei* and *T. pungens* on stony plain.

B: Mulga and acacia low open woodland over open tussock grassland on gently sloping (drainage) plain with variable rock cover.

C: Mulga and acacia low open woodland over open spinifex and tussock grassland on flat plain with medium rock cove.

D: Mulga, *Hakea lorea*, and *Eucalyptus xerothermica* low open woodland over closed tussock grassland on gently sloping clay-loam plain (no rocks).

E: Low mulga woodland over sparse understorey on stony plain.

F: *Triodia wiseana* hummock grassland with emergent shrubs and low trees on gently sloping stony plain.

Likewise, six vegetation communities were mapped and described across the broader survey area of Rapallo (2012) as a result of a Level 2 survey:

1: *Eucalyptus gamophylla* woodland over hummock grassland.

2: *Eucalyptus leucophloia* subsp. *leucophloia* woodland over mixed shrubs over *Triodia wiseana* grassland.

3: Acacia shrubland over hummock grassland.

4: *Acacia tumida* var. *pilbarensis* scrub in creeklines.

5: Wannamunna Mulga grove.

6: *Acacia aptaneura* over hummock grassland.

Table 5.4 Summary of Results of Flora and Vegetation Surveys Previously Conducted Within and in the Vicinity of the Study Area

Project and Source	Size and Location of Survey Area	Survey Timing	Survey Scope and Parameters	No. Taxa Recorded	Vegetation	Significant Flora Taxa^
Flora and Vegetation Survey: Area C and Surrounds (Onshore 2011)	Approx. 29,411 ha. Located 1.4 km south of Study Area	• November to December 2009 • February 2010 • June 2010	Level 2 flora and vegetation assessment (now a Detailed Survey) and targeted survey. 204 quadrats assessed, incorporated data from 306 additional quadrats established from 1997 to 2010	479 taxa 166 genera 53 families over wider study area: Northern Study Area 206 species 45 families 97 genera Southern Study Area: 219 species 36 families 99 genera	37 vegetation associations described. One PEC recorded: • Weeli Wolli Spring Community (P1). Vegetation condition ranged from 'Excellent' to 'Completely Degraded' (majority mapped as 'Excellent' to 'Very Good')*	• *Acacia subtiliformis* (P3) • *Aristida jerichoensis* var. *subspinulifera* (P3) • *Aristida lazaridis* (P2) • *Eremophila magnifica* subsp. *magnifica* (P4) • *Euphorbia inappendiculata var. queenslandica* (P2) • *Fimbristylis sieberiana* (P3) • *Goodenia* sp. East Pilbara (A.A. Mitchell PRP 727) (P3) • *Nicotiana umbratica* (P3) (see note under **Section 5.1.4**) • *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) • *Rostellularia adscendens* var. *latifolia* (P3) • *Sida* sp. Barlee Range (S. van Leeuwen 1642) (P3) • *Vittadinia* sp. Coondewanna Flats (S. van Leeuwen 4684) (P1) • *Stylidium weeliwolli* (P3)

Project and Source	Size and Location of Survey Area	Survey Timing	Survey Scope and Parameters	No. Taxa Recorded	Vegetation	Significant Flora Taxa^
Botanical Survey for an Exploration Drilling Program at Juna Downs South E47/1943 and Supporting Document to a Native Vegetation Clearing Permit Application (Rio Tinto 2011)	Approx. 181.4 ha. Located 20 km west of Study Area	• May and July 2009 • October 2010	Flora and vegetation survey. Assessed via foot traverses using a grid search technique (methodology to record vegetation types and significant flora taxa is not clear)	225 taxa 97 genera 35 families	18 vegetation types described. No TECs or PECs identified. Vegetation condition ranged from 'Very Good' to 'Poor'	• *Sida* sp. Barlee Range (S. van Leeuwen 1642) (P3) • *Triodia* sp. Mt Ella (M.E. Trudgen 12739) (P3)
Level 1 Flora and Fauna Surveys along the Great Northern Highway for Jimblebar Mine Module Transport (Eco Logical 2012)	Multiple survey areas; most relevant (Site 3) approx. 17 km south of Study Area	• August 2011	Level 1 flora and vegetation assessment (now a Reconnaissance and Targeted Survey). Eight quadrats/relevés assessed	52 taxa 26 genera 14 families	Four vegetation communities described at Site 3. No TECs or PECs identified. Vegetation condition at Site 3 ranged from 'Excellent' to 'Good' (majority mapped as 'Excellent')*	No significant flora taxa recorded

Project and Source	Size and Location of Survey Area	Survey Timing	Survey Scope and Parameters	No. Taxa Recorded	Vegetation	Significant Flora Taxa^
Level 2 Flora and Vegetation Survey: South Flank (Onshore 2012)	Approx. 18,627 ha. Located 7 km south of Study Area	• March to May 2010 • September 2010 • June 2011	Level 2 flora and vegetation assessment (now a Detailed Survey). 220 quadrats assessed	386 taxa 160 genera 50 families (known to date from study area)	34 vegetation associations described. Two PECs recorded: • Coolibah-lignum flats: *Eucalyptus victrix* over lignum community in the Pilbara - sub type 1: Coolibah and mulga (*Acacia aneura*) woodland over lignum and tussock grasses on clay plains (Coondewanna Flats and Wanna Munna Flats) (P3) • Coolibah-lignum flats: *Eucalyptus victrix* over lignum community in the Pilbara - sub type 2: Coolibah woodlands over lignum (*Duma florulenta*) over swamp wanderrie (Lake Robinson) (P1). Vegetation condition ranged from 'Excellent' to 'Degraded' (majority mapped as 'Excellent')*	• *Acacia bromilowiana* (P4) • *Aristida jerichoensis* var. *subspinulifera* (P3) • *Aristida lazaridis* (P2) • *Eremophila magnifica* subsp. *magnifica* (P4) • *Dampiera metallorum* (P3) • *Lepidium catapycnon* (P4) • *Pilbara trudgenii* (P3) • *Ptilotus mollis* (P4) • *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) • *Rostellularia adscendens* var. *latifolia* (P3) • *Sida* sp. Barlee Range (S. van Leeuwen 1642) (P3) • *Themeda* sp. Hamersley Station (M.E. Trudgen 11431) (P3) • *Triodia* sp. Mt Ella (M.E. Trudgen 12739) (P3)

Project and Source	Size and Location of Survey Area	Survey Timing	Survey Scope and Parameters	No. Taxa Recorded	Vegetation	Significant Flora Taxa^
Level 2 Flora and Vegetation Survey of Lamb Creek Project Area (Rapallo 2012)	Approx. 2,068 ha. Overlaps majority of Development Envelope / part of Study Area	• March to April 2012	Level 2 flora and vegetation assessment (now a Detailed Survey). 46 quadrats assessed	230 taxa 110 genera 42 families	Six vegetation types described. No TECs or PECs identified. Vegetation condition ranged from 'Pristine' to 'Good'*	• *Aristida calycina* var. *calycina* (P2) (see note under **Section 5.1.4**) • *Aristida lazaridis* (P2)
Greater West Angelas Vegetation and Flora Assessment (ecologia 2013)	Approx. 17,596 ha. Located 26 km south of Study Area	• August 2011 • July 2012	Level 2 flora and vegetation assessment (now a Detailed Survey). 150 quadrats assessed	441 taxa 163 genera 48 families	22 vegetation communities described. One PEC recorded: • West Angelas Cracking-Clays (P1). Vegetation condition ranged from 'Excellent' to 'Poor' (majority mapped as 'Excellent')	• *Aristida jerichoensis* var. *subspinulifera* (P3) • *Aristida lazaridis* (P2) • *Eremophila pusilliflora* (P2) • *Lepidium catapycnon* (P4) • *Indigofera gilesii* (P3) • *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) • *Sida* sp. Barlee Range (S. van Leeuwen 1642) (P3) • *Themeda* sp. Hamersley Station (M.E. Trudgen 11431) (P3) • *Triodia* sp. Mt Ella (M.E. Trudgen 12739) (P3)

Project and Source	Size and Location of Survey Area	Survey Timing	Survey Scope and Parameters	No. Taxa Recorded	Vegetation	Significant Flora Taxa^
Baby Hope Downs Flora and Vegetation Survey (Biota 2014)	Approx. 1,652 ha. Located 25 km southeast of Study Area	• October to November 2014	Level 2 flora and vegetation assessment (now a Detailed Survey). 17 quadrats and 8 relevés assessed, incorporated data from additional 13 quadrats and 5 relevés established in 2012	354 taxa 150 genera 53 families	12 vegetation units described. No TECs or PECs identified. Vegetation condition ranged from 'Excellent' to 'Completely Degraded' (majority mapped as 'Excellent')	• *Eremophila magnifica* subsp. *magnifica* (P4) • *Eremophila magnifica* subsp. *velutina* (P3) • *Eremophila* sp. Hamersley Range (K. Walker KW 136) (P3) • *Goodenia lyrata* (P3) • *Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2)
Karijini National Park Tenements Flora and Vegetation Risk Assessment (Onshore 2015a)	Approx. 13,465 ha. Located 25 km southwest of Study Area	• November 2014	Reconnaissance and Targeted Survey. 50 relevés assessed	Not indicated	12 vegetation associations were described. No TECs or PECs identified; however there is an occurrence of the 'Brockman Iron cracking clay communities of the Hamersley Range' PEC (P1) in the southeast extent of the survey area. Three vegetation associations were determined to be of particular interest	• *Grevillea saxicola* (P3) • *Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2) • *Lepidium catapycnon* (P4) • *Olearia mucronata* (P3) • *Pilbara trudgenii* (P3) • *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) • *Sida* sp. Barlee Range (S. van Leeuwen 1642) (P3) • *Triodia* sp. Mt Ella (M.E. Trudgen 12739) (P3)

Project and Source	Size and Location of Survey Area	Survey Timing	Survey Scope and Parameters	No. Taxa Recorded	Vegetation	Significant Flora Taxa^
Riparian Flora and Vegetation Survey Marillana Creek (Onshore 2015b)	Approx. 1,028 ha. Located 8 km north of Study Area	• June 2015	Level 2 flora and vegetation assessment (now a Detailed Survey) along a 32 km section of Marillana Creek. 40 quadrats and 237 relevés assessed	399 taxa 186 genera 58 families	22 vegetation associations described. No TECs or PECs identified. Vegetation condition ranged from 'Excellent' to 'Degraded' (majority mapped as 'Very Good')*	• *Amaranthus centralis* (P3) • *Aristida lazaridis* (P2) • *Goodenia* sp. East Pilbara (A.A. Mitchell PRP 727) (P3) • *Ipomoea racemigera* (P2) • *Rostellularia adscendens* var. *latifolia* (P3)
Targeted Rare and Priority Flora Survey to Meet Conditions of CPS 4442 (Strategic Rail NVCP) (Rio Tinto 2015)	Multiple survey areas, totalling approx. 88 ha. Closest survey area on SW boundary of Study Area	• June 2015	Targeted Survey along railway	NA	NA	• *Aristida jerichoensis* var. *subspinulifera* (P3) • *Aristida lazaridis* (P2) • *Goodenia* sp. East Pilbara (A.A. Mitchell PRP 727) (P3) • *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) • *Rostellularia adscendens* var. *latifolia* (P3) • *Themeda* sp. Hamersley Station (M.E. Trudgen 11431) (P3)

Project and Source	Size and Location of Survey Area	Survey Timing	Survey Scope and Parameters	No. Taxa Recorded	Vegetation	Significant Flora Taxa^
Flora, Vegetation and Fauna Habitat Assessment at Juna Downs: Native Vegetation Clearing Permit – Supporting Report (Rio Tinto 2016a)	Approx. 546 ha. Located 25 km west of Study Area	• October to November 2014 • April 2015	Reconnaissance Survey. 23 relevés assessed, incorporated data from six additional relevés established in 2013	186 taxa 81 genera 38 families	Six vegetation associations described. No TECs or PECs identified. Vegetation condition mapped as 'Excellent'	• *Acacia bromilowiana* (P4) • *Eremophila magnifica* subsp. *magnifica* (P4) • *Eremophila* sp. Hamersley Range (K. Walker KW 136) (P3) (now known as *E. naaykensii*) (P3) • *Rostellularia adscendens* var. *latifolia* (P3) • *Sida* sp. Barlee Range (S. van Leeuwen 1642) (P3) • *Solanum kentrocaule* (P3) • *Tetratheca fordiana* (P2) • *Triodia* sp. Mt Ella (M.E. Trudgen 12739) (P3)
Flora, Vegetation and Fauna Habitat Assessment at Koodaideri: Native Vegetation Clearing Permit – Supporting Report (Rio Tinto 2016b)	Approx. 1,313 ha. Located 33 km northeast of Study Area	• May 2016	Reconnaissance and Targeted Survey. 63 relevés assessed	135 taxa 68 genera 31 families	12 vegetation units described. No TECs or PECs identified. Vegetation condition ranged from 'Excellent' to 'Poor' (majority mapped as 'Excellent')	• *Acacia bromilowiana* (P4) • *Synostemon hamersleyensis* (P1)
Ministers North to Yandi Corridor Single Phase Level 2 Fauna and Detailed Flora/Vegetation Survey (Biologic 2017)	Approx. 2,025 ha. Located 14 km east of Study Area	• October 2017	Detailed Survey. 32 quadrats assessed	260 taxa 127 genera 44 families	12 vegetation associations described. No TECs or PECs identified. Vegetation condition ranged from 'Excellent' to 'Very Good' (majority mapped as 'Excellent')	• *Rostellularia adscendens* var. *latifolia* (P3) • *Sida* sp. Barlee Range (S. van Leeuwen 1642) (P3)

Project and Source	Size and Location of Survey Area	Survey Timing	Survey Scope and Parameters	No. Taxa Recorded	Vegetation	Significant Flora Taxa^
Area C West to Yandi Flora and Vegetation Assessment (Astron 2019)	Approx. 3,729 ha. Part of survey area overlaps Study Area	• November 2018	Reconnaissance Survey of four riparian systems (five creeklines: Marillana, Pebble Mouse, Yandicoogina, Lamb and Area C Mine Creeks). 24 relevés assessed	102 taxa 54 genera 21 families	38 vegetation associations described. No TECs or PECs identified. Vegetation condition ranged from 'Excellent' to 'Poor'. Eight vegetation associations potentially represent GDEs	• *Eremophila* sp. Hamersley Range (K. Walker KW 136) (P3) (now known as *E. naaykensii*) (P3)
West Angelas Gas Pipeline Native Vegetation Clearing Permit (B-2018-007) (Biota 2019)	Approx. 1,150 ha. Located 28 km south-southwest of Study Area	• October 2016	Reconnaissance and Targeted Survey. 56 relevés assessed	343 taxa 130 genera 41 families	18 vegetation units described. One PEC recorded: • West Angelas Cracking-Clays (P1). Vegetation condition ranged from 'Excellent' to 'Completely Degraded' (majority mapped as 'Excellent' to 'Very Good')	• *Aristida lazaridis* (P2) • *Eremophila pusilliflora* (P2) • *Isotropis parviflora* (P2) • *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) • *Themeda* sp. Hamersley Station (M.E. Trudgen 11431) (P3)
Stock Proof Fence Phase III Juna Rail Surveys to meet CPS 4442 Conditions, RTIO-HSE-0335913 (Rio Tinto 2019)	Approx. 412 ha. Located 6 km west of Study Area	• July 2019	Targeted Survey along Stock Proof Fence	NA	NA	• *Aristida jerichoensis* var. *subspinulifera* (P3) • *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) • *Themeda* sp. Hamersley Station (M.E. Trudgen 11431) (P3)

Project and Source	Size and Location of Survey Area	Survey Timing	Survey Scope and Parameters	No. Taxa Recorded	Vegetation	Significant Flora Taxa^
Detailed Flora and Vegetation Survey of the Great Northern Highway Intersection – Lamb Creek Project (Rapallo 2021a)	Approx. 254 ha. Overlaps southern extent of Study Area	• May 2021	Detailed Survey. 19 quadrats and 1 relevé assessed Vegetation Types defined using floristic analysis	187 taxa 35 families	Six vegetation types described. No TECs or PECs identified. All vegetation types assessed as having 'Moderate' significance, primarily due to the presence of *Aristida lazaridis* (P2). Vegetation condition ranged from 'Very Good' to 'Degraded' (majority mapped as 'Good')	• *Aristida lazaridis* (P2) • *Euphorbia* aff. *ferdinandi* (potentially undescribed) • *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3)
Targeted Conservation Significant Flora Survey of the Lamb Creek Project Area (Rapallo 2021b)	Approx. 872 ha. Overlaps majority of Development Envelope / part of Study Area	• April 2020 • May 2021	Targeted Survey	NA	NA	• *Aristida jerichoensis var. subspinulifera* (P3) • *Aristida lazaridis* (P2) • *Eremophila* sp. Hamersley Range (K. Walker KW 136) (P3) (now known as *E. naaykensii*) (P3) • *Euphorbia* aff. *ferdinandi* (potentially undescribed) • *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) • *Rostellularia adscendens* var. *latifolia* (P3)

Project and Source	Size and Location of Survey Area	Survey Timing	Survey Scope and Parameters	No. Taxa Recorded	Vegetation	Significant Flora Taxa^
ICSS Phase 2 Rail Project: Desktop Assessment and Targeted Significant Flora Survey (Stantec 2021)	Multiple survey areas, totalling approx. 311 ha. Closest survey area 6 km west of Study Area	• June 2021	Targeted Survey along railway	NA	Vegetation not described. No TECs or PECs identified.	• *Acacia subtiliformis* (P3) • *Goodenia* sp. East Pilbara (A.A. Mitchell PRP 727) (P3) • *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) • *Rostellularia adscendens* var. *latifolia* (P3) • *Seringia exastia* (T)

^ Currently listed significant flora taxa only.

* Vegetation condition described using the scale for the South West and Interzone Botanical Provinces (**Appendix A**).

5.1.4 Summary of Significant Flora

Table 5.5 presents a summary of significant flora taxa known from or potentially occurring within the Desktop Study Area. This list has been compiled from the results of desktop searches of DBCA's Threatened Flora Databases (TPFL and WA Herbarium) (DBCA, 2022b), DAWE's SPRAT Database (DAWE 2021b), and the results of previous surveys as summarised in **Section 5.1.3**. **Table 5.5** also presents known information on the flowering period and habitat for each taxon (WA Herbarium, 1998-). **Figure 5.5** presents the known historical locations of significant flora taxa from within the Desktop Study Area (subject to the availability of spatial data).

A total of 61 significant flora taxa are known from the Desktop Study Area. This comprises two Threatened flora taxa listed under the EPBC Act and BC Act (*Thryptomene wittweri* and *Seringia exastia*, the latter of which will be delisted in the near future, as discussed in **Section 5.1.3**), 58 DBCA-classified Priority flora taxa, and one potentially undescribed taxon (discussed further below) (**Table 5.5**). Two taxa have records within the Study Area, being *Aristida lazaridis* (P2) and *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) (shaded in blue in **Table 5.5**) (**Figure 5.5**).

Rapallo (2021a, 2021b) recorded four locations of an entity *Euphorbia* aff. *ferdinandi* that was noted as being potentially undescribed. Rapallo (2021b) stated that material of this entity was reviewed by Steve Dillon from the WA Herbarium, who remarked that the specimen differs from typical *Euphorbia ferdinandi* in its broader seeds and a stigma 'opposite from what has been described for this species'. This latter statement is somewhat difficult to interpret, and no further detail was provided on whether further advice was sought or action taken to resolve this taxonomic uncertainty, including whether a representative specimen was submitted to the WA Herbarium for lodgement. At the time of writing of this report, no specimens of *Euphorbia ferdinandi* or *Euphorbia* aff. *ferdinandi* collected in 2021 from the Lamb Creek area have been submitted to the WA Herbarium (WA Herbarium, 1998-). However, as a precaution, this taxon has been included in **Table 5.5**.

Note that *Aristida calycina* var. *calycina* (P2) was recorded by the Rapallo 2012 Survey (**Table 5.5**); however, this taxon does not occur in WA according to the WA Herbarium (1998-), and accordingly, the specimen lodged to the WA Herbarium by Rapallo (2012) has since been redetermined as *Aristida lazaridis* (S. Dillon, *pers. comm.* May 2013). *Nicotiana umbratica* (P3) was recorded by Onshore (2011) approximately 21 km south of the Study Area; however, according to DBCA databases this taxon does not occur in the area (WA Herbarium, 1998-), and no records of the taxon were returned from the DBCA TPFL and WA Herbarium database searches (DBCA, 2022b). Therefore, *Aristida calycina* var. *calycina* (P2) and *Nicotiana umbratica* (P3) are not considered to occur in the Desktop Study Area and are not considered further in this assessment.

Table 5.5 Significant Flora Taxa Known from or Potentially Occurring Within the Desktop Study Area

Taxon	Status (WA)	Status (EPBC Act)	Flowering Period (WA Herbarium, 1998-)	Habitat (WA Herbarium, 1998-)	Source*
Acacia bromilowiana	P4		July to August	Rocky hills, breakaways, scree slopes, gorges, creek beds. Rocky red-brown loam with ironstone or laterite	DBCA, Onshore, Rio Tinto
Acacia daweana	P3		July to September	Low rocky rises, along drainage lines. Red stony clay loam	DBCA
Acacia effusa	P3		May to August	Scree slopes of low ranges. Red-brown silty clay or clay loam with ironstone and quartz stones and pebbles	DBCA
Acacia subtiliformis	P3		May to June	Rocky ridges, hills and slopes, often with calcrete. Light brown or brown loam or silty clay	DBCA, Onshore, Stantec
Amaranthus centralis	P3		May to July	Plains, flats and granite outcrops. Gritty red clay loam	DBCA, Onshore
Aristida jerichoensis var. *subspinulifera*	P3		likely after significant rainfall	Plains and flats. Red-brown loamy clay or cracking clay	DBCA, ecologia, Onshore, Rapallo, Rio Tinto
Aristida lazaridis	P2		likely after significant rainfall	Floodplains, drainage areas and plains. Red or red-brown clay loam, sometimes with ironstone	Biota, DBCA, ecologia, Onshore, Rapallo, Rio Tinto
Arthropodium vanleeuwenii	P2		September	Steep hill slopes and gorges. Red-brown or orange-brown loam, often with banded ironstone	DBCA
Cladium procerum	P2		likely year-round	Major creeks and gorges. Red gravelly sand	DBCA
Dampiera metallorum	P3		June to October	High in the landscape on steep slopes, summits of hills. Red-brown stony clay loam over banded ironstone	DBCA, Onshore
Dolichocarpa sp. Hamersley Station (A.A. Mitchell PRP 1479)	P3		May to September	Floodplains and crabhole plains. Red-brown or brown cracking clay	DBCA

Taxon	Status (WA)	Status (EPBC Act)	Flowering Period (WA Herbarium, 1998-)	Habitat (WA Herbarium, 1998-)	Source*
Eragrostis crateriformis	P3		likely after significant rainfall	Creek banks, depressions. Gritty or gravelly brown sandy loam, red-brown clay loam	DBCA
Eragrostis sp. Mt Robinson (S. van Leeuwen 4109)	P1		likely after significant rainfall	Steep slopes, summits. Brown or red-brown silty loam, often with banded ironstone	DBCA
Eremophila magnifica subsp. *magnifica*	P4		August to November	Hillslopes and gullies. Rocky red-brown or brown sandy loam, often with ironstone	Biota, DBCA, Onshore, Rio Tinto
Eremophila magnifica subsp. *velutina*	P3		August to September	Hillslopes and ridges. Red stony loam, often with ironstone or banded ironstone	Biota, DBCA
Eremophila pusilliflora	P2		March to July	Flats and plains. Red-brown sandy loam, often with ironstone	Biota, DBCA, ecologia
Eremophila spongiocarpa	P3		May to September	Weakly saline alluvial plains and dune slopes on margins of marshes and saline flats. Red-brown clay loam	DBCA
Eremophila naaykensii (previously *Eremophila* sp. Hamersley Range (K. Walker KW 136))	P3		June to August	Rocky hill slopes, crests and gorges. Rocky red-brown clay loam, sometimes over banded ironstone	Astron, Biota, DBCA, Rapallo, Rio Tinto
Eremophila sp. West Angelas (S. van Leeuwen 4068)	P1		August to September	Hill slopes and crests. Brown or red silty loam over banded ironstone	DBCA
Euphorbia australis var. *glabra*	P3		likely after significant rainfall	Drainage lines and flats. Red-brown clay loam, sometimes with calcrete or silcrete	DBCA
Euphorbia clementii	P3		likely after significant rainfall	Fire responder. Recently burnt hills, slopes and undulating plains. Red-brown clay loam	DBCA
Euphorbia aff. *ferdinandi*	Potentially Undescribed		likely after significant rainfall	-	Rapallo
Euphorbia inappendiculata var. *queenslandica*	P2		likely after significant rainfall	Flats and plains. Brown cracking clay, gilgai	DBCA, Onshore
Euphorbia stevenii	P3		likely after significant rainfall	Gentle slopes and plains. Brown or red-brown clay and cracking clay	DBCA

Taxon	Status (WA)	Status (EPBC Act)	Flowering Period (WA Herbarium, 1998-)	Habitat (WA Herbarium, 1998-)	Source*
Fimbristylis sieberiana	P3		May to June	Pool edges, sandstone cliffs and major creek lines. Brown or red-brown gritty sand	DBCA, Onshore
Glycine falcata	P3		May to September	Along drainage depressions in crabhole plains and clay plains. Brown or red cracking clay	DBCA
Goodenia lyrata	P3		likely after significant rainfall	Claypans and plains. Red or brown sandy loam or clay loam	Biota, DBCA
Goodenia sp. East Pilbara (A.A. Mitchell PRP 727)	P3		likely after significant rainfall	Low undulating plains, swampy plains. Red-brown clay soil, calcrete pebbles	DBCA, Onshore, Rio Tinto, Stantec
Grevillea saxicola	P3		February to June	Rocky hills, slopes and gullies. Red-brown sandy loam	DBCA, Onshore
Gymnanthera cunninghamii	P3		February to May, October to December	Drainage lines. Brown or red-brown sand or sandy loam	DBCA
Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708)	P2		April to August, October	Rocky gullies, drainage lines and gorges. Loamy skeletal soil	Biota, DBCA, Onshore
Indigofera gilesii	P3		May, August	Rocky slopes, hills, creeklines and outcrops. Red or orange loam, often with ironstone	DBCA, ecologia
Iotasperma sessilifolium	P3		August to September	Edges of waterholes, plains, Cracking clay, black loam	DBCA
Ipomoea racemigera	P2		April to June	Drainage lines and flats. Brown silty loam	DBCA, Onshore
Isotropis parviflora	P2		June to August	Rocky hills, slopes and undulating plains. Red or brown sandy loam, often with ironstone	Biota, DBCA
Kohautia australiensis	P2		likely after significant rainfall	Plains and hills. Brown or orange clay with calcrete	DBCA
Lepidium catapycnon	P4		September	Rocky hills and slopes. Red or brown loam or sandy loam, often with ironstone	DBCA, ecologia, Onshore
Olearia mucronata	P3		July to August	Rocky hills, gullies and creeklines. Red-brown or orange-brown silty clay or sandy clay loam with ironstone	DBCA, Onshore

Taxon	Status (WA)	Status (EPBC Act)	Flowering Period (WA Herbarium, 1998-)	Habitat (WA Herbarium, 1998-)	Source*
Oxalis sp. Pilbara (M.E. Trudgen 12725)	P2		May to July	Gorges, gullies, drainage lines and slopes. Red loam or sandy loam, often with ironstone	DBCA
Pilbara trudgenii	P3		September to October	Hill summits, steep slopes, screes, cliff faces. Skeletal red stony soil over ironstone	DBCA, Onshore
Ptilotus mollis	P4		July to September	Rocky hills and screes with red or brown clay loam, often with ironstone	DBCA, Onshore
***Rhagodia* sp. Hamersley (M. Trudgen 17794)**	P3		March to May, September	Plains and alluvial plains. Red or brown clay loam, often with ironstone gravel	Biota, DBCA, ecologia, Onshore, Rapallo, Rio Tinto, Stantec
Rhodanthe ascendens	P1		September	Flats. Cracking clay and sand over clay	DBCA
Rhynchosia bungarensis	P4		May to November	Rocky hill slopes, drainage lines, gorges. Orange brown loam, often with ironstone	DBCA
Rostellularia adscendens var. *latifolia*	P3		April to May	Rocky hills, gullies, floodplains and drainage lines. Red/brown sandy loam	Biologic, DBCA, Onshore, Rapallo, Rio Tinto, Stantec
Seringia exastia	T	Critically Endangered	July to September	Sandplains, pindan plain, rangelands. Orange or red sand	Rapallo, Stantec
Sida sp. Barlee Range (S. van Leeuwen 1642)	P3		likely after significant rainfall	Rocky hills, gullies and gorges. Red or brown sandy loam, often with ironstone	Biologic, DBCA, ecologia, Onshore, Rio Tinto
Sida sp. Hamersley Range (K. Newbey 10692)	P3		likely after significant rainfall	Ironstone gullies, slopes and breakaways. Skeletal red loam	DBCA
Solanum kentrocaule	P3		May to September	Steep rocky gullies, slopes, gorges. Skeletal red loam	DBCA, Rio Tinto
Stackhousia clementii	P3		April to September	Floodplains and flats. Clay loam, sometimes saline or with calcrete	DBCA
Stylidium weeliwolli	P3		March to September	Drainage lines, pool edges, seepage areas. Sandy loam or clay	DBCA, Onshore
Swainsona thompsoniana	P3		April to August	Floodplains and flats. Red or brown cracking clay, clay loam	DBCA

Taxon	Status (WA)	Status (EPBC Act)	Flowering Period (WA Herbarium, 1998-)	Habitat (WA Herbarium, 1998-)	Source*
Synostemon hamersleyensis	P1		August to November	Steep hills, slopes, screes. Rocky red or brown sandy loam with ironstone or banded ironstone	DBCA, Rio Tinto
Tetratheca fordiana	P2		April to July	Cliffs, ridges and breakaways. Skeletal soil with ironstone	DBCA, Rio Tinto
Teucrium pilbaranum	P2		April to September	Flats, clay pans and crabhole plains. Red or brown sandy loam, clay or cracking clay, sometimes with calcrete	DBCA
***Themeda* sp. Hamersley Station (M.E. Trudgen 11431)**	P3		May to July	Floodplains, drainage lines and flats. Red or brown clay loam, clay or cracking clay	Biota, DBCA, ecologia, Onshore, Rio Tinto
Thryptomene wittweri	T	Vulnerable	April to August	Breakaways and cliffs. Skeletal red-brown soil with sandstone or ironstone	DAWE, DBCA
***Triodia* sp. Karijini (S. van Leeuwen 4111)**	P1		likely after significant rainfall	Hill crests, moderate to steep hill slopes. Grey, brown or red sandy loam or silty loam, often with ironstone	DBCA
***Triodia* sp. Mt Ella (M.E. Trudgen 12739)**	P3		likely after significant rainfall	Rocky slopes, gullies, ridges gorges and associated drainage lines/floodplains. Red or brown sandy clay loam, often with ironstone	DBCA, ecologia, Onshore, Rio Tinto
***Vittadinia* sp. Coondewanna Flats (S. van Leeuwen 4684)**	P1		March to September	Floodplains and drainage areas. Red or brown clay loam or silty loam	DBCA, Onshore
Xerochrysum boreale	P3		July, September	Stony plains and flats. Red or brown clay or clay loam	DBCA

LEGEND - Existing Formally Listed Flora Records in the Desktop Study Area

5.1.5 Summary of Significant Vegetation

Table 5.6 presents a summary of listed significant vegetation communities known from or potentially occurring within the Desktop Study Area. This list has been compiled from the results of searches of DBCA's Threatened and Priority Ecological Communities Database (DBCA, 2022c) and the results of previous surveys as summarised in **Section 5.1.3**. **Figure 5.6** presents the known historical locations of significant vegetation from within the Desktop Study Area (subject to the availability of spatial data). Note that DBCA records of significant vegetation communities presented on **Figure 5.6** consist of DBCA-applied buffers (ranging from 500 m to 5 km) surrounding known locations, as per the metadata from the DBCA Threatened and Priority Ecological Communities Database interrogation (DBCA, 2022c).

A total of eight significant vegetation communities have records within the Desktop Study Area. All communities are DBCA-classified PECs, with no TECs listed under the EPBC Act or BC Act identified by the desktop assessment (**Table 5.6**).

There are no known records of significant vegetation communities within the Study Area, with the closest record being 'Coolibah-lignum flats: *Eucalyptus victrix* over lignum community in the Pilbara - sub type 2: Coolibah woodlands over lignum (*Duma florulenta*) over swamp wanderrie (Lake Robinson)' PEC (P1); the edge of this PEC's buffer polygon is approximately 3 km south of the Study Area (**Figure 5.6**).

According to the DBCA Threatened and Priority Ecological Communities Database interrogation results (DBCA 2022c), there are no records of the 'Coolibah-lignum flats: *Eucalyptus victrix* over lignum community in the Pilbara - sub type 1: Coolibah and mulga (*Acacia aneura*) woodland over lignum and tussock grasses on clay plains (Coondewanna Flats and Wanna Munna Flats)' PEC (P3) in the Desktop Study Area. However, as discussed in **Section 3.9.2**, a review of current DBCA PEC lists (DBCA 2022a) identified this PEC as having the potential to occur in the Desktop Study Area as the Coondewanna Flats are located within the Desktop Study Area. According to Rapallo (2021a), Onshore undertook a review of vegetation mapping within the Coodewanna Flats and Lake Robinson areas in 2013 and confirmed fine-scale mapping for sub types 1 and 2 of the Coolibah-lignum flats PECs. Onshore concluded that sub type 2 lies at the lowest point of the Coondewanna Flats associated with Lake Robinson, and sub type 1 occurs on alluvial flats (Coondewanna Flats) around Lake Robinson (Onshore (2013), cited in Rapallo (2021a)). Therefore, this PEC has been included in **Table 5.6**; however, the report and associated data from Onshore (2013) could not be acquired, and therefore this PEC is not presented on **Figure 5.6**.

The definitions, categories and criteria for TECs and PECs are presented on the DBCA Threatened species and communities website (DBCA 2013).

Table 5.6 Listed Significant Vegetation Known from or Potentially Occurring Within the Desktop Study Area

Community	Status (WA)	Status (EPBC Act)	Source*
Brockman Iron cracking clay communities of the Hamersley Range	PEC (P1)		DBCA, Onshore
Coolibah-lignum flats: *Eucalyptus victrix* over lignum community in the Pilbara - sub type 1: Coolibah and mulga (*Acacia aneura*) woodland over lignum and tussock grasses on clay plains (Coondewanna Flats and Wanna Munna Flats)	PEC (P3)		DBCA, Onshore

Community	Status (WA)	Status (EPBC Act)	Source*
Coolibah-lignum flats: *Eucalyptus victrix* over lignum community in the Pilbara - sub type 2: Coolibah woodlands over lignum (*Duma florulenta*) over swamp wanderrie (Lake Robinson)	PEC (P1)		DBCA, Onshore
Fortescue Marsh (Marsh Land System)	PEC (P1)		DBCA
Kumina Land System	PEC (P3)		DBCA
Riparian flora and plant communities of springs and river pools with high water permanence of the Pilbara Region	PEC (P2)		DBCA
Weeli Wolli Spring Community	PEC (P1)		DBCA, Onshore

5.2 Field Survey

5.2.1 Vascular Flora Census

A total of 328 discrete vascular flora taxa, three known hybrids (as per WA Herbarium (1998-)) and one putative hybrid were recorded in the Study Area by the 2022 survey. The taxa and hybrids represent 45 families and 137 genera. The most well-represented families were Fabaceae (64 discrete taxa, three known hybrids), Poaceae (56 taxa), Malvaceae (45 taxa) and Amaranthaceae (16 taxa). A total of seven taxa are introduced (see **Section 5.2.6**).

Within quadrats established by the 2022 survey, average taxon richness per quadrat was 42.3 (± 14.8), with the greatest number of taxa recorded in a single quadrat being 89 (C19), and the lowest number being 12 (K39) (excluding hybrid, introduced and opportunistic taxa).

A full list of taxa recorded by the 2022 survey is presented in **Appendix D**, with raw quadrat and relevé data and parameters presented in **Appendix E**.

Note that several collections could not be identified to species level due to poor material. Some are known to be distinct taxa relative to other taxa recorded by the survey, and therefore have been included in the totals presented above and **Appendix D** (e.g. ?*Enchylaena tomentosa*). Other collections may represent distinct taxa relative to other taxa recorded by the survey; however, it is more likely that they represent taxa already recorded elsewhere, with the quality of the material such that this distinction cannot be made (e.g. *Ptilotus* ?*exaltatus*). Such collections are not included in the totals above or presented in **Appendix F**. None of these collections are considered to represent significant flora taxa.

5.2.2 Summary of Significant Flora

Table 5.7 presents a summary of data relating to significant flora taxa recorded in the Study Area by the 2022 survey. A total of eight significant flora taxa were recorded by the 2022 survey; this includes one Threatened taxon, five DBCA-listed Priority flora taxa and two taxa considered significant under the 'new species or species with anomalous features that indicate a potential new species' reason from EPA (2016a, 2016b) (**Section 3.9.1**); these taxa are subsequently referred to as 'potentially undescribed'. Locations of significant flora taxa recorded in the Study Area by the 2022 survey are presented on **Figure 5.7**. A detailed description and summary of information for each taxon recorded by the 2022 survey is provided in **Sections 5.2.3** and **5.2.4**, with specific location details presented in **Figure 5.7** and **Appendix F**.

Three significant taxa were recorded in the Development Envelope: *Aristida jerichoensis* var. *subspinulifera* (single record with single individual); *Aristida lazaridis* (P2) (three records with a total of four individuals); and *Seringia exastia* (T) (14 records with a total of 222 individuals). *Rhagodia* sp. Hamersley (M. Trudgen 17794) was not further recorded in the Development Envelope (recorded previously by Rapallo (2021b)).

Table 5.7 includes a summary of the VTs within which each significant flora taxon was recorded. Preferred habitat for each taxon has been determined based on proportional location representation and landforms/soils and is indicated with '~'. However, it must be qualified that some taxa recorded by the 2022 survey were recorded from few locations; and this in combination with the limited area of the Targeted survey area (and the targeted survey area of Rapallo (2021b)) within the Study Area concludes that there may not be sufficient data to confidently assign preferred habitat in terms of VTs for these taxa.

Note that assessment of VT habitat includes record information from Rapallo (2021b). Further qualification is provided for each taxon in **sections 5.2.3** and **5.2.4**

Note that the 2022 survey recorded locations of *Seringia exastia*, a taxon currently listed as Threatened under the EPBC Act. As described in **Section 5.1.3**, the conservation status of this taxon will not be revised until both the Threatened Species Scientific Committee meet to formalise the delisting and the name is formally removed from the published listing (W.A. Government Gazette). Further information is provided in **section 5.2.3.7**.

Table 5.7 Summary of Significant Flora Taxa Recorded by the 2022 Survey Within the Study Area

Taxon	Status (WA)	Study Area		Vegetation Types*
		Number of Locations	Number of Individuals	
Aristida jerichoensis* var. *subspinulifera	P3	8	97	8~
Aristida lazaridis	P2	5	264	7~; 8~; 3, 9
***Corchorus* sp.**	Potentially undescribed	21	33	9~
***Euphorbia ferdinandi* s. lat.**	Potentially undescribed	12	53	8~, 7
Eremophila naaykensii	P3	2	38	4~
***Hibiscus* sp. Gurrinbiddy Range (M.E. Trudgen MET 15708)**	P2	2	17	4~
***Rhagodia* sp. Hamersley (M. Trudgen 17794)**	P3	3	7	7~; 8; 9
Seringia exastia	T	37	783	1~, 2, 3, 6, 9, 10

* Refer to **Section 5.2.8** for VT descriptions.

~ Designates preferred habitat, based on proportional location representation and landforms/soils. Counts not undertaken for taxon.

FIGURE 5.7

Significant Flora Recorded by the 2021 and 2022 Field Surveys

5.2.3 Listed Significant Flora Taxa

5.2.3.1 *Aristida jerichoensis* var. *subspinulifera* (P3)

Aristida jerichoensis var. *subspinulifera* (P3) is a perennial tussock grass growing to 0.8 m high (**Photo 5-1**), occurring on flats with red-brown clay over ironstone (WA Herbarium 1998-). In WA it has a range of over 1,000 km from near Gill Pinnacle (close to the WA / Northern Territory (NT) border) in the east, to north-west of Tom Price in the west; the Study Area is in the known range of this taxon. This taxon is known from 42 WA Herbarium records across approximately 38 broad regional locations, three of which occur within DBCA-managed tenure within Karijini National Park (WA Herbarium 1998-). The nearest WA Herbarium specimen record of this taxon is in close proximity to the GNHI area (within one kilometre of the Study Area, located on the western side of the GNH – specimen PERTH08694265 (WA Herbarium 1998-), recorded as occurring in Mulga woodland over closed sedges and open tussock grassland on orange light clay.

WA Herbarium records include three locations from outside of WA, including one location in the Northern Territory (NT) (north of Alice Springs) and two locations within Queensland (Qld) (north of Capella and west of St George). There are considerably more locations of this taxon across the NT, South Australia (SA), Qld, New South Wales (NSW) and Victoria (Vic) (over 1,800 records across Australia) according to records presented by the Atlas of Living Australia (ALA) (2022).

Photo 5-1: *Aristida jerichoensis* var. *subspinulifera* (P3) (Photos: Umwelt)

Rapallo (2021b) previously recorded this taxon within the Study Area; however, this record was not lodged at the WA Herbarium and inspection of this location during the survey in 2022 has determined this to be erroneous (considered to be a misidentification, with *Aristida burbidgeae* recorded at the given location during the 2022 survey). This record occurred on a south-facing rocky slope of a gorge/gully a high

elevation, which was noted as being odd by Rapallo (2021b) due to this habitat not being typical of the taxon.

A total of 97 individuals of *Aristida jerichoensis* var. *subspinulifera* (P3) were recorded at eight locations within the Study Area in 2022 within VT 8 (**Figure 5.7**; Sheet 10 and 11 of **Appendix F**); one of these locations was recorded in the DE. This taxon was not otherwise recorded within the Targeted Survey Area during the 2022 survey; no other locations were recorded within the Development Envelope by Rapallo (2021b). All records were returned from areas mapped as VT 8, which is considered to be the preferred habitat of this taxon in the Study Area.

Note that this taxon was recorded at Area C and South Flank by Onshore Environmental (2011; 2012); Greater West Angeles (ecological 2013), and surveys conducted on behalf of Rio Tinto including the stock proof fence and Rail NVCP (2019 and 2015 respectively) (**Table 5.4**).

5.2.3.2 *Aristida lazaridis* (P2)

Aristida lazaridis (P2) is a perennial tussock grass growing to 1.5 m high (**Photo 5-2**), occurring on flats with red-brown clay loam, sometimes in floodplains and minor drainage areas (WA Herbarium 1998-). This taxon occurs over a range of approximately 130 km within WA, from north-east of Newman in the south-east, to south-east of Wittenoom in the north-west, and the Study Area is within the known range of this taxon. *Aristida lazaridis* (P2) is known from 22 WA Herbarium records across approximately 17 broad regional locations, one of which occurs within DBCA-managed tenure within Karijini National Park (WA Herbarium 1998-). This taxon is also known from two records in the NT and 78 records in Qld (ALA 2022).

Photo 5-2: *Aristida lazaridis* (P2) (Photo: Umwelt)

Rapallo (2021a; b) undertook extensive survey to map the extent of the *Aristida lazaridis* (P2) population in the vicinity of the GNHI, recording an estimated population of 12,773 plants from 6,757 point locations over the 2020 and 2021 survey periods combined (71 locations, representing 85 individuals, of which occur

within the Development Envelope). A further 264 individuals of *Aristida lazaridis* (P2) were recorded at five locations within the Study Area in 2022; three of these locations (total four plants) were in the Development Envelope (**Figure 5.7**; **Appendix F**).

This taxon was recorded mainly in VTs 7 and 8, with less representation in VTs 3 and 9 (as mapped on Sheets 10 and 11 of **Appendix K).** The representative habitat of this taxon in the Study Area can be considered VTs 7 and 8 in the GNHI DE area only; this taxon was not otherwise recorded in other areas mapped as VT 7, despite targeted survey effort by both Rapallo (2021b) and Umwelt (2022 survey) in these areas.

5.2.3.3 *Eremophila naaykensii* (P3)

Eremophila naaykensii (P3) (previously *Eremophila* sp. Hamersley Range (K. Walker KW 136)) is a perennial shrub or tree growing to 3 m high (**Photo 5-3**), characterised by large, silver-green leaves and pale grey-brown bark. This taxon occurs in gorges, breakaways, and clifftops of ironstone, often growing out of seemingly solid rock walls (WA Herbarium 1998-). This taxon is endemic to WA (ALA 2022), known from a range of approximately 200 km from near Newman in the east to east of Paraburdoo in the west, with the Study Area in the known range of this taxon.

This taxon is known from 21 WA Herbarium records across approximately 19 broad regional locations, one of which occurs within DBCA-managed tenure within Karijini National Park (WA Herbarium 1998-). The nearest WA Herbarium record of this taxon is located south of these records, on a range of hills between the Lamb Creek Study Area and Area C (PERTH09105972; two plants recorded on rocky hill slopes, hills crests and upper hill slopes, 2018 record).

Photo 5-3: *Eremophila naaykensii* (P3) (Photos: Umwelt)

Rapallo (2021b) recorded 35 locations (representing 35 individuals) of *Eremophila naaykensii* (P3) within the VT 4 and VT6. A total of 38 individuals of *Eremophila naaykensii* (P3) were recorded at two locations within the Study Area in 2022 within VT 4 (**Figure 5.7**; **Appendix F**). VTs 4 and 6 are considered to be the preferred habitat of this taxon within the Study Area. This taxon was not recorded within the Targeted Survey Area in 2022, nor otherwise in the Development Envelope.

5.2.3.4 Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2)

Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2) is a slender shrub growing to 2 m high (**Photo 5-5**), occurring on rocky gullies, drainage lines and gorges with loamy skeletal soil (WA Herbarium 1998-). It is endemic to WA (ALA 2022), known from a range of approximately 180 km from north of Newman in the east to north-east of Paraburdoo in the west. The Study area is located on the northern extent of its known range. This taxon is known from 24 WA Herbarium records across 10 broad regional locations, two of which occur within DBCA-managed tenure within Karijini National Park (WA Herbarium 1998-); no records are within 10km of the Study Area.

Rapallo (2021a; b) did not record *Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2) during the targeted or detailed survey. A total of 17 individuals of *Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2) were recorded at two locations within the Study Area in 2022 within VT 4 (**Figure 5.7**; **Appendix F**). VT 4 is considered to be the preferred habitat of this taxon in the Study Area. This taxon was not recorded within the Targeted Survey Area in 2022 and was not otherwise recorded in the Development Envelope. This record of *Hibiscus* sp. Gurinbiddy Range (M.E. Trudge MET 15708) (p2) is a slight range extension of the known range of this taxon to the north.

Photo 5-4: *Hibiscus* sp. Gurrinbiddy Range (M.E. Trudgen MET 15708) (P2) (Photos: Umwelt)

5.2.3.5 *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3)

Rhagodia sp. Hamersley (M. Trudgen 17794) (P3) is an erect shrub growing to 2 m high (**Photo 5-6**), occurring on plains and alluvial plains with red or brown clay loam, often with ironstone gravel (WA Herbarium 1998-). It is endemic to WA (ALA 2022), known from a range of approximately 330 km from west of Jigalong in the east to north-east of Tom Price in the west. The Study Area in in the northern extent of the known range of this taxon.

This taxon is known from 72 WA Herbarium records across more than 50 broad regional locations, two of which occur within DBCA-managed tenure including Jigalong Aboriginal Reserve and Karijini National Park (WA Herbarium 1998-). A total of five records are known from within 10km of the Study Area, with nearby records confirming preferred habitat for this taxon.

Rapallo (2021a; b) recorded 50 individuals of *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) during the targeted and detailed surveys. A total of seven individuals of this taxon were recorded at three locations within the Study Area during the current survey in 2022 within VT 7 (**Figure 5.7**; **Appendix F**). This taxon was not recorded within the Targeted Survey Area or otherwise further in the Development Envelope in 2022.

All records are located in the GNHI section of the Study Area (Sheets 10 and 11 of **Appendix K**). The mapped areas of VT 7 in the GNHI section of the Study Area is considered preferred habitat for this taxon, due to the majority of known records occurring in this area combined with soil and landform descriptions.

Photo 5-5: *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) (Photos: Umwelt)

5.2.3.6 Seringia exastia

The Threatened taxon *Seringia exastia* has been recorded within the Development Envelope and wider Study Area, which despite being no longer recognised as Threatened under WA's BC ACT, remains listed as Threatened under the EPBC Act (Department of Premier and Cabinet (DPC) 2018). Correspondence with DBCA Species and Communities Assessment Team (dated 4th August 2022) has provided clarity with regards to the treatment of this taxon. It is understood that the synonymisation of *S. elliptica* under *S. exastia* means that *S. exastia* is now considered common and widespread. However, until changes are officially made to the threatened species list, *S. exastia* should still be treated as Threatened flora, however the new understanding of the taxon's distribution would be considered in the EIA process.

A total of 37 locations with 783 individuals were recorded within the Study Area, of which 22 locations and 222 individuals are located in the Development Envelope. This taxon was recorded across a range of VTs **Figure 5.7**; **Appendix F**, however was predominantly recorded in VT1 which can be considered preferred habitat. This taxon now has a very wide range across Western Australia, extending from Giralia Station in the west through to the border with the NT, and from Broome in the north to Mt Manning Range NR in the south. The Study Area is within the known range of this taxon.

5.2.4 Other Flora Taxa of Interest

5.2.4.1 Euphorbia ferdinandi s. lat. (potentially undescribed)

Euphorbia ferdinandi s. lat. (**Photo 5-7**) is considered conspecific with the entity *Euphorbia* aff *ferdinandi* recorded by Rapallo (2021a; b). It was recorded at 12 locations consisting of 53 individuals within the Study Area in 2022 within VTs 7 and 8 (**Figure 5.7**; **Appendix F**). This taxon was not recorded within the Targeted Survey Area in 2022, otherwise further in the Development Envelope.

Rapallo (2021a; b) recorded this entity at four locations in 2021 and treated it as a potentially undescribed taxon based on discussions with personnel from the WA Herbarium (see **Section 5.1.4**). The specimens collected during the current survey are considered to represent the same taxon previously collected in the area by Rapallo (2021a; b). The taxonomic status of this entity is currently under review by the WA Herbarium; it has been segregated by the WA Herbarium in the main collection, though still housed under the name *E. ferdinandi* var. *ferdinandi*. It appears to have been distinguished by the broader seeds (0.8-0.9mm), longer capsules (to 2.4mm) and bifid styles, although styles are apparently only just bifid on the segregated material, as per the collection taken in 2022. The specimen collected in April 2022 required mature fruit to confirm the status; that specimen and those collected in June 2022 have been submitted to the WA Herbarium to confirm the taxonomic status of this entity. In the interim, a precautionary approach would see this entity treated as potentially significant.

Photo 5-6: *Euphorbia ferdinandi* s. lat. (Potentially undescribed) (Photos: Umwelt)

5.2.4.2 *Corchorus* sp. (potentially undescribed)

Corchorus sp. (**Photo 5-8**) does not match reference specimens of any published species and has potential taxonomic significance. This entity is distinct in having elongated fruit. Fruiting specimens were collected in April and June 2022, indicating approximately a March-May flowering period. Flowering specimens were also collected in late June, though this could be considered a response to the unseasonably late rains of May 2022 rather than an indicator of usual flowering time.

Targeted survey in June 2022 recorded a single population of 35 plants, restricted to one drainage line in VT 9, between the hills and the railway line (**Figure 5.7**; Sheets 5 and 9 of **Appendix F**). The habitat of the recorded population was restricted to drainage lines of sandy loam soils, with no or very few stones, and an open lower stratum of tussock grasses and low shrubs. Nearby drainage lines were searched and further individuals were not located; these drainage lines did not represent the same micro-habitat, with differing percentage cover of surface stones, density of the understory stratum, and differing species composition. No plants were recorded within the Development Envelope.

A review of the quadrat data for VT 9 in the mine area DE shows it is unlikely that this taxon would occur in other areas of VT9, based on absence of habitat features.

There are no other known populations of this entity, which may indicate that it is geographically restricted. A precautionary approach would see it regarded as a taxon of potential conservation significance, though this is not yet able to be formally assessed.

Photo 5-7: ***Corchorus*** **sp. (Potentially undescribed) (Photos: Umwelt)**

No other flora taxa were recorded that are potentially significant in terms of being representative of significant extensions of their known ranges, however it is of general interest that there is a relative lack of representative flora specimens housed in the WA Herbarium from the general project area.

5.2.5 Likelihood of Occurrence of Further Significant Flora Taxa

Table 5.8 presents an assessment of the likelihood of occurrence of significant taxa within the Study Area and Targeted Survey Area. This list includes significant taxa identified as occurring (or potentially occurring) within the Desktop Study Area prior to survey (listed in **Table 5.5**) as well as any additional significant taxa recorded by the survey (listed in **Table 5.7**). The assessment considered whether a taxon was identifiable at the time of survey, the known range of the taxon, if habitat is present in the Study Area and/or Targeted Survey Area, proximity of known records to the Study Area and the extent of targeted survey undertaken within the Study Area and Targeted Survey Area, when determining the potential for a taxon to occur in the Study Area and Targeted Survey Area.

A total of 62 taxa have been assessed within **Table 5.8** including two Threatened taxa, 58 Priority listed taxa and two potentially undescribed taxa**.** Of these, eight taxa were recorded within the Study Area by the 2022 survey, and two taxa are considered potentially not identifiable during the survey. *Arthropodium vanleeuwenii* (P2) is considered visible only when flowering in September as it grows up through *Triodia*. *Rhodanthe ascendens* (P1) is an annual taxon known from a limited number of records all of which were collected in August or September. It is possible that this taxon is present (and therefore identifiable) after significant rainfall; however, this cannot be confirmed based on the current existing information. It is considered that the 60 remaining taxa were identifiable during the 2022 survey, either because the survey period coincides with the taxon's flowering period, or the taxon can be identified reliably when in fruit or sterile.

The likelihood of occurrence assessment identified a total of 42 taxa which could Possibly occur within the Study Area due to suitable habitat occurring within the Study Area and the Study Area being within the known range of the taxon or within close proximity to its known range. All of these taxa were identifiable at the time of survey with the exception of *Arthropodium vanleeuwenii* (P2). Suitable habitat for this taxon is described as elevations above 900 m on south-facing hillslopes of Brockman Iron Formation (Dillon and Macfarlane 2020). This habitat occurs within the Study Area, at the highest elevation areas of VTs 4 and 6. The areas of VT 4 and 6 within the Targeted Survey Area are not considered to represent suitable habitat; these areas occur at or below 750 m elevation and are north and north-west facing.

It is worthy of note that 'suitable habitat' as used to inform the assessment has been determined using details recorded at known locations. However, for many of the taxa known from the general vicinity of the Study Area, suitable habitat is difficult to define, as available habitat information is often vague or very broad and difficult to interpret; for example an area described as a stony plains and flats with red or brown clay or clay loam could feasibly occur almost anywhere in the Pilbara. Therefore, a precautionary approach has been adopted when assessing whether suitable habitat for a species is present in the Study Area.

All 62 taxa assessed are considered unlikely to occur within the Targeted Survey Area due to their known range, the extent of targeted survey undertaken and/or the absence of suitable habitat within the Targeted Survey Area.

Table 5.8 Likelihood of Occurrence of Further Significant Flora Taxa in the Study Area and Targeted Survey Area

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Acacia bromilowiana	P4	July to August	Rocky hills, breakaways, scree slopes, gorges, creek beds. Rocky red-brown loam with ironstone or laterite	Yes	3.9 km W of Study Area	**Possible** – known record in close proximity to Study Area, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Acacia daweana	P3	July to September	Low rocky rises, along drainage lines. Red stony clay loam	Yes	37 km W of Study Area	**Possible** – Study Area occurs outside of known range of taxon; however, suitable habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Acacia effusa	P3	May to August	Scree slopes of low ranges. Red-brown silty clay or clay loam with ironstone and quartz stones and pebbles	Yes	1.6 km NW of Study Area	**Possible** – known record in close proximity to Study Area, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Acacia subtiliformis	P3	May to June	Rocky ridges, hills and slopes, often with calcrete. Light brown or brown loam or silty clay	Yes	7.1 km NE of Study Area	Unlikely –potential habitat unlikely to be present in Study Area	Unlikely – potential habitat unlikely to be present in Targeted Survey Area, all potential habitat searched
Amaranthus centralis	P3	May to July	Plains, flats and granite outcrops. Gritty red clay loam	Yes	23.5 km E of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Aristida jerichoensis var. *subspinulifera*	P3	likely after significant rainfall	Plains and flats. Red-brown loamy clay or cracking clay	Yes	0.6 km W of Study Area	**Recorded in the Study Area**	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Aristida lazaridis	P2	likely after significant rainfall	Floodplains, drainage areas and plains. Red or red-brown clay loam, sometimes with ironstone	Yes	Within Study Area	**Recorded in the Study Area**	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Arthropodium vanleeuwenii	P2	September	Steep hill slopes and gorges. Red-brown or orange-brown loam, often with banded ironstone	No	20.4 km W of Study Area	**Possible** – Study Area occurs outside of the known range of taxon; however, suitable habitat present in Study Area and taxon not identifiable during the survey	**Unlikely** –taxon not identifiable during the survey however suitable habitat not present in Targeted Survey Area.
Cladium procerum	P2	likely year-round	Major creeks and gorges. Red gravelly sand	Yes	33.2 km NNE of Study Area	Unlikely –Study Area occurs within known range of taxon; however, potential habitat unlikely to be present in Study Area	Unlikely - potential habitat unlikely to be present in Targeted Survey Area
Corchorus sp.	-	No data on *FloraBase* but flowering during the survey	No data on *FloraBase* (not formally described)*;* in the Study Area this entity was recorded within a drainage line in VT10 on sandy loam soils	Yes	NA	**Recorded in the Study Area**	Unlikely - all potential habitat has been searched within the Targeted Survey area.
Dampiera metallorum	P3	June to October	High in the landscape on steep slopes, summits of hills. Red-brown stony clay loam over banded ironstone	Yes	10.3 km E of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Dolichocarpa sp. Hamersley Station (A.A. Mitchell PRP 1479)	P3	May to September	Floodplains and crabhole plains. Red-brown or brown cracking clay	Yes	11 km N of Study Area	Unlikely –Study Area occurs within known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 9; however the area of cracking clay has been searched	Unlikely - potential habitat unlikely to be present in Targeted Survey Area

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Eragrostis crateriformis	P3	likely after significant rainfall	Creek banks, depressions. Gritty or gravelly brown sandy loam, red-brown clay loam	Yes	20.7 km N of Study Area	**Possible** – Study Area occurs outside of the known range of taxon; however, suitable habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Eragrostis sp. Mt Robinson (S. van Leeuwen 4109)	P1	likely after significant rainfall	Steep slopes, summits. Brown or red-brown silty loam, often with banded ironstone	Yes	16.7 km S of Study Area	**Possible** – Study Area occurs outside of the known range of taxon; however, suitable habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Eremophila magnifica subsp. *magnifica*	P4	August to November	Hillslopes and gullies. Rocky red-brown or brown sandy loam, often with ironstone	Yes	11 km S of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Eremophila magnifica subsp. *velutina*	P3	August to September	Hillslopes and ridges. Red stony loam, often with ironstone or banded ironstone	Yes	15.1 km SW of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Eremophila naaykensii	P3	June to August	Rocky hill slopes, crests and gorges. Rocky red-brown clay loam, sometimes over banded ironstone	Yes	5.6 km E of Study Area	**Recorded in the Study Area**	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Eremophila pusilliflora	P2	March to July	Flats and plains. Red-brown sandy loam, often with ironstone	Yes	13.9 km W of Study Area	**Possible** –Study Area occurs on eastern edge of range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Eremophila spongiocarpa	P3	May to September	Weakly saline alluvial plains and dune slopes on margins of marshes and saline flats. Red-brown clay loam	Yes	38.2 km NE of Study Area	Unlikely –Study Area occurs outside of known range of taxon (known from plains adjacent to Fortescue Marsh), potential habitat unlikely to be present in Study Area	Unlikely - potential habitat unlikely to be present in Targeted Survey Area
Eremophila sp. West Angelas (S. van Leeuwen 4068)	P1	August to September	Hill slopes and crests. Brown or red silty loam over banded ironstone	Yes	17.9 km S of Study Area	**Possible** – Study Area occurs outside of the known range of taxon; however, suitable habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Euphorbia australis var. *glabra*	P3	likely after significant rainfall	Drainage lines and flats. Red-brown clay loam, sometimes with calcrete or silcrete	Yes	10.7 km N of Study Area	**Possible** – Study Area occurs outside of the known range of taxon; however, suitable habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Euphorbia clementii	P3	likely after significant rainfall	Fire responder. Recently burnt hills, slopes and undulating plains. Red-brown clay loam	Yes	29.1 km S of Study Area	Unlikely –Study Area is outside of known range of taxon according to FloraBase (WA Herbarium (1998-)); the record of this taxon near the Study Area is potentially erroneous given it is not verified by a vouchered specimen and is a significantly disjunct record	Unlikely – record near Study Area potentially erroneous, all potential habitat searched, however area not recently burnt.
Euphorbia ferdinandi s. lat	-	No data on *FloraBase* but flowering during the survey	No data on *FloraBase* (not formally described); recorded on VTs 7 and 8 on red-brown clay to clay loam with ironstone pebbles on plains in the Study Area	Yes	Unknown	**Recorded in the Study Area**	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Euphorbia inappendiculata var. *queenslandica*	P2	likely after significant rainfall	Flats and plains. Brown cracking clay, gilgai	Yes	26 km W of Study Area	Unlikely –Study Area occurs within known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 9; however the area of cracking clay has been searched	Unlikely - potential habitat unlikely to be present in Targeted Survey Area
Euphorbia stevenii	P3	likely after significant rainfall	Gentle slopes and plains. Brown or red-brown clay and cracking clay	Yes	31 km SSW of Study Area	**Possible** –Study Area occurs on eastern edge of range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Fimbristylis sieberiana	P3	May to June	Pool edges, sandstone cliffs and major creek lines. Brown or red-brown gritty sand	Yes	33.7 km E of Study Area	Unlikely –Study Area occurs within known range of taxon; however, potential habitat unlikely to be present in Study Area	Unlikely - potential habitat unlikely to be present in Targeted Survey Area
Glycine falcata	P3	May to September	Along drainage depressions in crabhole plains and clay plains. Brown or red cracking clay	Yes	11 km N of Study Area	Unlikely –Study Area occurs outside of known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 9; however the area of cracking clay has been searched	Unlikely - potential habitat unlikely to be present in Targeted Survey Area
Goodenia lyrata	P3	likely after significant rainfall	Claypans and plains. Red or brown sandy loam or clay loam	Yes	1.5 km S of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Goodenia sp. East Pilbara (A.A. Mitchell PRP 727)	P3	likely after significant rainfall	Low undulating plains, swampy plains. Red-brown clay soil, calcrete pebbles	Yes	6.6 km NE of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Grevillea saxicola	P3	February to June	Rocky hills, slopes and gullies. Red-brown sandy loam	Yes	20 km S of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Gymnanthera cunninghamii	P3	February to May, October to December	Drainage lines. Brown or red-brown sand or sandy loam	Yes	24.1 km NE of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708)	P2	April to August, October	Rocky gullies, drainage lines and gorges. Loamy skeletal soil	Yes	26.6 km SW of Study Area	**Recorded in the Study Area**	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Indigofera gilesii	P3	May, August	Rocky slopes, hills, creeklines and outcrops. Red or orange loam, often with ironstone	Yes	13.3 km W of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Iotasperma sessilifolium	P3	May to September	Edges of waterholes, plains, Cracking clay, black loam	Yes	23.3 km N of Study Area	Unlikely –Study Area occurs outside of known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 9; however the area of cracking clay has been searched	Unlikely - potential habitat unlikely to be present in Targeted Survey Area

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Ipomoea racemigera	P2	April to June	Drainage lines and flats. Brown silty loam	Yes	11.9 km NE of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Isotropis parviflora	P2	June to August	Rocky hills, slopes and undulating plains. Red or brown sandy loam, often with ironstone	Yes	8.2 km SE of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Kohautia australiensis	P2	likely after significant rainfall	Plains and hills. Brown or orange clay with calcrete	Yes	11.8 km N of Study Area	Unlikely – Study Area occurs outside the known range of taxon, potential habitat unlikely to be present in the Study Area	Unlikely – potential habitat unlikely to be present in Targeted Survey Area
Lepidium catapycnon	P4	September	Rocky hills and slopes. Red or brown loam or sandy loam, often with ironstone	Yes	15.6 km S of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Olearia mucronata	P3	July to August	Rocky hills, gullies and creeklines. Red-brown or orange-brown silty clay or sandy clay loam with ironstone	Yes	26.1 km SW of Study Area	**Possible** –Study Area occurs on eastern edge of range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Oxalis sp. Pilbara (M.E. Trudgen 12725)	P2	May to July	Gorges, gullies, drainage lines and slopes. Red loam or sandy loam, often with ironstone	Yes	15.6 km S of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Pilbara trudgenii	P3	September to October	Hill summits, steep slopes, screes, cliff faces. Skeletal red stony soil over ironstone	Yes	15.8 km S of Study Area	**Possible** –Study Area occurs north of known range of taxon; however, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Ptilotus mollis	P4	July to September	Rocky hills and screes with red or brown clay loam, often with ironstone	Yes	16.9 km S of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Rhagodia sp. Hamersley (M. Trudgen 17794)	P3	March to May, September	Plains and alluvial plains. Red or brown clay loam, often with ironstone gravel	Yes	Within Study Area	**Recorded in the Study Area**	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Rhodanthe ascendens	P1	August to September	Flats. Cracking clay and sand over clay	Unknown – limited information	32.1 km SW of Study Area	Unlikely –Study Area occurs within known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 8; however the area of cracking clay has been searched	Unlikely - potential habitat unlikely to be present in Targeted Survey Area. Study Area is outside known range.
Rhynchosia bungarensis	P4	May to November	Rocky hill slopes, drainage lines, gorges. Orange brown loam, often with ironstone	Yes	21 km NE of Study Area	**Possible** –Study Area occurs on southern edge of known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Rostellularia adscendens var. latifolia	P3	April to May	Rocky hills, gullies, floodplains and drainage lines. Red/brown sandy loam	Yes	8.6 km NNE of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Seringia exastia	T		Sandy soils on plains, creeks, rocky areas	Yes	5 km south of the Study Area	**Recorded in the Study Area**	**Recorded in the Targeted Survey Area**
Sida sp. Barlee Range (S. van Leeuwen 1642)	P3	likely after significant rainfall	Rocky hills, gullies and gorges. Red or brown sandy loam, often with ironstone	Yes	13.9 km S of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Sida sp. Hamersley Range (K. Newbey 10692)	P3	likely after significant rainfall	Ironstone gullies, slopes and breakaways. Skeletal red loam	Yes	37.4 km SSW of Study Area	**Possible** –Study Area occurs outside of known range of taxon; however, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Solanum kentrocaule	P3	May to September	Steep rocky gullies, slopes, gorges. Skeletal red loam	Yes	16.1 km S of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Stackhousia clementii	P3	April to September	Floodplains and flats. Clay loam, sometimes saline or with calcrete	Yes	20.6 km W of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Stylidium weeliwolli	P3	March to September	Drainage lines, pool edges, seepage areas. Sandy loam or clay	Yes	32.2 km E of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Swainsona thompsoniana	P3	April to August	Floodplains and flats. Red or brown cracking clay, clay loam	Yes	18.1 km W of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Synostemon hamersleyensis	P1	April to November	Steep hills, slopes, screes. Rocky red or brown sandy loam with ironstone or banded ironstone	Yes	23.7 km NE of Study Area	**Possible** –Study Area occurs outside (south) of known range of taxon; however, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Tetratheca fordiana	P2	April to July	Cliffs, ridges and breakaways. Skeletal soil with ironstone	Yes	26.8 km W of Study Area	**Possible** –Study Area occurs outside (east) of known range of taxon; however, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Teucrium pilbaranum	P2	April to September	Flats, clay pans and crabhole plains. Red or brown sandy loam, clay or cracking clay, sometimes with calcrete	Yes	15.4 km SSW of Study Area	Unlikely –Study Area occurs within known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 9; however the area of cracking clay has been searched	Unlikely - potential habitat unlikely to be present in Targeted Survey Area
Themeda sp. Hamersley Station (M.E. Trudgen 11431)	P3	May to July	Floodplains, drainage lines and flats. Red or brown clay loam, clay or cracking clay	Yes	4.6 km S of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Thryptomene wittweri	T	April to August	Breakaways and cliffs. Skeletal red-brown soil with sandstone or ironstone	Yes	22.9 km SW of Study Area	**Possible** –Study Area occurs outside (east) of known range of taxon; however, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Triodia sp. Karijini (S. van Leeuwen 4111)	P1	likely after significant rainfall	Hill crests, moderate to steep hill slopes. Grey, brown or red sandy loam or silty loam, often with ironstone	Yes	3.7 km W of Study Area	**Possible** –Study Area occurs on eastern edge of known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Triodia sp. Mt Ella (M.E. Trudgen 12739)	P3	likely after significant rainfall	Rocky slopes, gullies, ridges gorges and associated drainage lines/floodplains. Red or brown sandy clay loam, often with ironstone	Yes	12.3 km SW of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched
Vittadinia sp. Coondewanna Flats (S. van Leeuwen 4684)	P1	March to September	Floodplains and drainage areas. Red or brown clay loam or silty loam	Yes	1.7 km S of Study Area	**Possible** –Study Area occurs within known range of taxon, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Targeted Survey Area
Xerochrysum boreale	P3	July, September	Stony plains and flats. Red or brown clay or clay loam	Yes	21.6 km SW of Study Area	**Possible** –Study Area occurs outside (north) of known range of taxon; however, potential habitat present in Study Area	Unlikely – potential habitat present in Targeted Survey Area; however, all potential habitat searched

5.2.6 Introduced Flora Taxa

Seven introduced flora taxa were recorded within the Study Area by the current survey. **Table 5.9** lists location information and comments regarding the significance of these taxa, including ecological impact and invasiveness ratings for each introduced taxon under Ecological Impact and Invasiveness Ratings from the Department of Parks and Wildlife for the Pilbara Region (DBCA 2014). None of the recorded introduced flora taxa are Declared Pests under the BAM Act (DPIRD 2022) or WoNS (Weeds Australia 2022).

Four introduced flora taxa recorded in the Study Area by the survey are rated as having 'High' ecological impact (**Table 5.9**). Taxa with this ecological impact rating are considered significant weeds capable of causing acute disruption of ecological processes, as well as dominating and/or significantly altering the vegetation structure, composition and function of ecosystems (DBCA 2014).

Five introduced flora taxa recorded in the Study Area by the current survey are rated as having 'Rapid' invasiveness in native vegetation (**Table 5.9**) (DBCA 2014). These taxa are typically disturbance opportunists and are relatively common around disturbance areas, and as well as along drainage lines and other areas of periodic inundation.

It is worthy of note that despite the High/Rapid ecological impact and invasiveness ratings of the introduced flora taxa recorded in the Study Area, no introduced taxa were widespread in the Study Area, and the vegetation of the Study Area was considered to be in mostly Excellent condition (**Section 5.2.11**). *Bidens bipinnata*, *Cenchrus ciliaris* and *C. setigera* were the most common introduced taxa in terms of numbers of locations and individuals recorded; these taxa were likewise identified in the top 20 most common weed taxa in terms of presence records assessed in a Pilbara weed risk assessment (Webber *et al.* 2017). Introduced flora were most commonly recorded in drainage areas, and presented further in section **5.2.11**.

Locations of introduced flora taxa are presented on **Figure 5.8**.

Table 5.9 Introduced Flora Taxa Recorded in the Study Area

Taxon	Common Name	Number of Locations	Number of Individuals	VTs	Ecological Impact*	Invasiveness*
Bidens bipinnata	Bipinnate Begger's Tick	31	824	1, 2, 4, 6, 7, 9, 10	Unknown	Rapid
Cenchrus ciliaris	Buffel Grass	13	149	1, 4, 7, 10	High	Rapid
Cenchrus setiger	Birdwood Grass	17	2,654	1, 7, 10	High	Rapid
Malvastrum americanum	Spiked Malvastrum	11	70	1, 7, 10	High	Rapid
Portulaca pilosa	Pink Purslane	1	1	2	Not rated	Not rated
Setaria verticillata	Whorled Pigeon Grass	6	20	1, 7, 10	High	Rapid
Tribulus terrestris	Caltrop	3	5	7, 10	Unknown	Moderate

FIGURE 5.8

Introduced Flora Recorded by the 2022 Field Surveys

5.2.7 Flora Classification Results

The PATN software package (Belbin and Collins 2013) initially suggested that classification of quadrats into 11 groups may be appropriate for the data analysed. The resulting dendrogram (**Appendix G**) and taxon group matrix (**Appendix H**) were therefore initially examined at this level, to determine the plausibility of groups with regard to taxon groups and field observations. This process identified one group of quadrats (containing two quadrats) that did not represent a plausible VT based on field observations and site knowledge. Both quadrats were manually reassigned to related groups, as indicated in **Appendix I**, based on detailed investigation of their species composition, as well as other characteristics including topography, soils, and geographic location.

The examination of the dendrogram also identified an additional two quadrats that were considered to have been misclassified, for similar reasons. These quadrats were also reassigned, as presented in **Appendix I**.

It was ultimately determined that there were 10 plausible groups that are considered to represent VTs in the Study Area; these groups were resolved at differing levels of similarity. The groups are labelled in the dendrogram in **Appendix G** and taxon group matrix in **Appendix H**. The initial 11 groups identified by the analysis are also indicated on the dendrogram in **Appendix G** and taxon group matrix in **Appendix H**.

5.2.8 Vegetation Types

As noted above, 10 VTs were defined in the Study Area via floristic composition classification and subsequent examination of quadrat data. The VTs are considered to belong to three broad vegetation groups based on soils and topography, and are also separated on the analysis dendrogram (**Appendix G**):

- Group 1: VTs 1, 2 and 3

  Woodlands over sparse shrublands and hummock grasslands on gentle lower to upper slopes on red-brown clay loams. This supergroup was mapped on the gentle foot slopes associated with the hill relevant to the Gaguna heritage area (Study Area associated with the GNHI DE; Access Rd DE and Mine DE), and areas of lower relief between the steeper ranges present in the south of the Study Area associated with the Mine DE and vegetation associated with the McKay land system. Representative taxa are from species groups L and O, with common species from species groups D, B and C, and lacking in representation of species groups E-J (representative of group 3) and Q (representative of group 2) (**Appendix H**).

- Group 2: VTs 4, 5 and 6

  Open Woodlands over sparse shrublands and tussock and hummock grasslands on steep slopes, crests, gullies and gorges with exposed ironstone and skeletal soils. This supergroup was mapped on areas of higher relief, steep, rocky areas with exposed ironstone on the range within the eastern portion of the Study Area associated with the Mine DE, associated with the Newman and McKay land systems in this area. Representative taxa are from species groups K and Q, with common representation of species groups B and D and lacking species from species groups E-J (**Appendix H**).

- Group 3: VTs 7, 8, 9 and 10

  Mulga Woodlands over tussock grasslands and open woodlands over sparse shrublands over hummock grasslands on red-brown clay-loam on plains; and open woodlands over shrublands over hummock grasslands on major and minor drainage lines. This group was mapped on plains within the Study Area

associated with the GNHI DE, the Access Rd DE and in the vicinity of the western part of the Mine DE, as well as Mine Creek and associated tributaries in the vicinity of the Mine DE. Representative taxa are from species groups E-J, with common taxa from species groups B-D (and minor from A) and lacking in representation from species groups K-Q (**Appendix H**).

The review of the relevé data did not identify any additional VTs in the Study Area. Relevé sites were therefore assigned to one of the 10 VTs defined by the floristic classification analysis, following detailed investigation of their species composition, topography, soils, and geographic location.

The locations of quadrats and/or relevés within each VT were used in conjunction with examination of aerial photography and field notes taken during the 2022 survey to develop VT mapping polygon boundaries across the Study Area.

Table 5.10 presents a description of each of the VTs mapped in the Study Area, including location, area mapped, sampling regime, significant flora taxa ('^' denotes preferred habitat for a significant taxon, significant flora taxa recorded in 2022 and by previous surveys), average taxon richness and a description of variation found within the VT. **Figure 5.9** presents an overview of the distribution of VTs. Raw quadrat and relevé data and parameters are presented in **Appendix E**. Detailed VT mapping with locations of quadrats and relevés established by the 2020 and 2021 surveys are presented in **Appendix J**. **Appendix K** presents a taxon-VT matrix and **Appendix L** presents the results of the indicator taxon analysis.

VTs 1, 7 and 9 had the greatest extents within the Study Area (combined VTs covering 67.5% of the Study Area); of these, they were also dominant in the Development Envelope (76.9 % of the DE).

Table 5.10 Summary of VTs Mapped in the Study Area

VT	Summary	Representative Photograph
1	**Description:** Low Open Woodland of *Eucalyptus leucophloia* subsp. *leucophloia* and/or *E. gamophylla* with isolated *Corymbia deserticola* subsp. *deserticola* over low to mid sparse to open shrubland dominated by species including *Acacia atkinsiana* and *A. ancistrocarpa* over low open hummock grassland of *Triodia pungens*, *T. vanleeuwenii* and *T. wiseana* and low open tussock grassland of *Themeda* sp. Mt Barricade (M.E. Trudgen 2471) and *Paraneurachne muelleri* on red-brown sandy clay loam to clay loam on gently inclined mid to lower slopes and associated drainage lines **Area mapped:** Study Area – 1429.2 ha (37.8 % of Study Area); Development Envelope – 445.0 ha (50% of the DE) **Sampling:** 33 quadrats (C01, C02, C03, C08, C09, C15, C16, C18, C21, C27, C29, C30, C31, C34, C44, C46, C49, C51, K02, K03, K06, K10, K14, K20, K21, K22, K24, K27, K28, K30, K31, K36, K44) **Indicator taxa:** *Ptilotus rotundifolius*, *Senna glutinosa* subsp. x *luerssenii* **Significant taxa:** *Rostellularia adscendens* var. *latifolia* (P3)^;*Seringia exastia* (T) **Average taxon richness per quadrat:** 37 ± 10 **Notes:** VT 1 was mapped on undulating plains (**Photo 5-9**), gently inclined slopes **(Photo 5-10**) and occasionally minor associated drainage lines, with no outcropping, mainly associated with the Boolgeeda and Platform land systems (DPIRD 2019), and the Hamersley_18 VSA. VT 1 had the greatest mapped extent in the Study Area and correspondingly had the highest number of representative quadrats, which is reflective of the relatively widespread nature of these land systems. Despite a relatively high species richness of annual and perennial shrubs and forbs they provided relatively little foliage cover and were not dominant in any stratum. Quadrats of VT 1 had a variety of burn ages, ranging from >10 years, 5-10 years (Photo 5-9) and <5 years, with the greatest portion of quadrats subject to burn in November 2017 (**Figure 2.2**; DBCA 2022). VT 1 is represented by two branches on the analysis dendrogram (**Appendix G**); which roughly represent VT 1 quadrats located in the far north-east of the Study Area (Sheet 4 of **Appendix J**) (top dendrogram branch) and the quadrats downslope of the hills representing the Gaguna heritage area and within the Study Area associated with the Mine DE (Sheets 2, 3, 5, 6, 9 of **Appendix J)**. The two indictor taxa are	 **Photo 5-8: VT 1 (Quadrat C08)** **Photo 5-9: VT 1 (Quadrat C21)**

VT	Summary	Representative Photograph
	commonly recorded on stony or rocky hills, however are also associated with more sandy soils (WA Herbarium 1998-). VT 1 is represented strongly by taxa from species group D, which were also common to VTs 2 and 3 (**Appendix H**). Although VT 1 is most closely related to VTs 2 and 3, differences include greater representation of taxa such as *Eucalyptus gamophylla*, *Duperreya commixta* and *Themeda* sp. Mt Barricade (M.E. Trudgen 2471) (species group C), and reduced representation of taxa such as *Acacia hilliana*, *Fimbristylis simulans*, *Acacia adoxa* subsp. *adoxa*, *Goodenia stobbsiana* and *G. triodiophylla*.	
2	**Description:** Low open woodland of *Eucalyptus leucophloia* subsp. *leucophloia* with occasional *Corymbia deserticola* subsp. *deserticola* and *C. hamersleyana* over low sparse shrubland of *Acacia hilliana* and *Hakea chordophylla* over open hummock grassland of *Triodia vanleeuwenii* and *T. wi*seana on red-brown clay loam with ironstone pebbles on gently inclined lower to upper slopes **Area mapped:** Study Area – 382.3 ha (10.1 % of Study Area), Development Envelope – 85.6 ha (9.6 % of the DE) **Sampling:** 16 quadrats (C04, C20, C22, C25, C26, C41, C47, K15, K16, K23, K26, K29, K33, K46, K47, K48) **Indicator taxa:** *Acacia adoxa* var. *adoxa*, *Acacia hilliana*, *Fimbristylis simulans*, *Goodenia stobbsiana*, *Goodenia triodiophila*, *Ptilotus calostachyus*, *Triodia vanleeuwenii* **Significant taxa:** *Seringia exastia* (T) **Average taxon richness per quadrat:** 36 ± 8 **Notes:** VT 2 was mapped in areas mainly adjoining VT 1 on the Boolgeeda land system and extended onto slopes associated with the Newman land system; it is also associated with the Hamersley_82 VSA. VT 2 was represented by a relatively large number of quadrats, reflecting the widespread nature of this vegetation and landform type (Sheets 1-5 and 7-8 of **Appendix J**). Similar to VT 1, few of the taxa recorded dominated the existing strata, with the majority of taxa contributing limited foliage cover. The indicator taxa are commonly recorded on a variety of soils, including sandplains, rocky rises and stony hills. Floristics of VT 2 were represented by taxa mainly from species group D, which was common to group 1 (and indeed, more widely throughout the Study Area); however had a greater representation of taxa such as *Acacia adoxa* var. *adoxa*, *Goodenia stobbsiana*, *Goodenia triodiophylla*, *Triodia vanleeuwenii* and	 **Photo** 5-10: VT 2 (Quadrat C41)

VT	Summary	Representative Photograph
	Ptilotus calostachyus in comparison to VT 1. VT 2 also had representation from taxa of species group L including *Acacia hilliana*, *Fimbristylis simulans* and *Gompholobium oreophilusm* (**Appendix H)**. The majority of quadrats in this VT had experienced a burn in the preceding 10 years, most of them within 5 years (November 2017) (**Photo 5-11**; quadrat on foothills), and others approximately 8.5 years ago (January 2014) (**Photo 5-12**; quadrat on lower slope); two quadrats had no data and therefore had not been burnt in excess	 **Photo 5-11: VT 2 (Quadrat C47)**
3	**Description:** Isolated trees of *Corymbia hamersleyana*, *Eucalyptus leucophloia* subsp. *leucophloia* and *E. gamophylla* over low sparse shrubland of mixed Acacia species over low hummock grassland of *Triodia pungens* and *T. wiseana* on red-brown sandy clay loam on mid to lower slopes with ironstone pebbles **Area mapped:** Study Area – 48.2 ha (1.3 % of Study Area); Development Envelope – 7.3 ha (0.8% of the DE) **Sampling:** 2 quadrats (K50; R01) **Indicator taxa:** *Acacia adsurgens*, *Acacia atkinsiana*, *Acacia minyura*, *Acacia tenuissima*, *Acacia pachyacra*, *Amphipogon sericeus*, *Gompholobium oreophilum*, *Schizachyrium fragile*, *Senna glutinosa* subsp. *pruinosa*, *Senna pleurocarpa* var. *angustifolia*, *Senna pleurocarpa* var. *pleurocarpa*, *Seringia exastia* (T), *Triodia pungens* **Significant taxa:** *Aristida lazaridis* (P2); *Seringia exastia* (T) **Average taxon richness per quadrat:** 33 ± 3 VT 3 is mapped on one area on the far southern end of the Study Area in the Great Northern Highway Intersection area (Sheet 11 of **Appendix J). This area corresponds to that mapped by Rapallo (2021a) as**	 **Photo 5-12: VT 3 (Quadrat R01)**

VT	Summary	Representative Photograph
	VT 'A'. It is associated with the Boolgeeda land system and the Hamersley_83 VSA. In the analysis dendrogram two further quadrats (C23 and K01) were grouped into this VT, however it was determined that re-allocation of these quadrats was warranted (see Appendix I). A relatively high number of indicator species were determined for VT 3, however many of these taxa had been recorded in other VTs from group 1. The species richness of this VT is less than that of the other VTs in this group; partially due to the lower number of quadrats, but also the quadrats themselves recorded generally fewer taxa. Taxa recorded were predominantly those from species group D (**Appendix H**). One of the quadrats was long unburnt (>10 years) (**Photo 5-13**, quadrat on a lower slope); the other was burnt in October 2015 (6.5 years since fire) (**Photo 5-14**, quadrat on a midslope).	 **Photo 5-13: VT 3 (Quadrat K50)**
4	**Description:** Low open woodland of *Corymbia ferriticola* or *Corymbia hamersleyana* and *Eucalyptus leucophloia* subsp. *leucophloia* with *Ficus brachypoda* occurring on gorge and gully areas, over low sparse shrubland of mixed species dominated by *Corchorus laniflorus*, *Dodonaea viscosa* subsp. *mucronata* and *Gossypium robinsonii* over sparse hummock grassland dominated by *Triodia pungens* with *T. wiseana* and tussock grasses including *Cymbopogon ambiguus* and *Aristida burbidgeae* on red brown clay loam on steep upper slopes, gullies, breakaways and gorges with significant ironstone outcropping **Area mapped:** Study Area – 95.3 ha (2.5 % of Study Area), Development Envelope – 1.0 ha (0.1% of the DE) **Sampling:** Six quadrats (C24; C35; C36; C42; C52; C55) and two relevés (CR04; CR05) **Indicator taxa:** *Abutilon* sp. Dioicum (A.A. Mitchell PRP 1618), *Amaranthus undulatus*, *Aristida burbidgeae*, *Astrotricha hamptonii*, *Brachychiton acuminatus*, *Capparis mitchellii*, *Capparis spinosa* subsp. *nummularia*, *Corymbia ferriticola*, *Corchorus laniflorus*, *Cucumis variabilis*, *Cymbopogon ambiguus*, *Cynanchum pedunculatum*, *Cyperus cunninghamii* subsp. *cunninghamii*, *Dodonaea pachyneura*, *Dodonaea viscosa* subsp. *mucronata*, *Eremophila naaykensii* (P3), *Eremophila petrophila* subsp. *petrophila*, *Euphorbia trigonosperma*, *Ficus brachypoda*, *Gomphrena cunninghamii*, *Hibiscus* sp. Gurinbiddy Range	 **Photo 5-14: VT 4 (Quadrat C24)**

VT	Summary	Representative Photograph
	(M.E. Trudgen MET 15708) (P2), *Paspalidium clementii*, *Ptilotus astrolasius*, *Senna venusta*, *Sida* sp. Shovelanna Hill (S. van Leeuwen 3842), *Solanum cleistogamum*, *Solanum gabrielae*, *Stylobasium spathulatum*, *Tinospora smilacina*, *Triodia biflora*, *Triumfetta leptacantha*, *Triumfetta maconochieana* **Significant taxa:** *Eremophila naaykensii* (P3)^, *Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2)^ **Average taxon richness per quadrat:** 53 ± 12 VT 4 was mapped on steep, rocky areas associated with the range present in the south-eastern corner of the Study Area associated with the Mine DE, corresponding to the Newman land system (**Figure 5.1;** Sheets 4 and 8 of **Appendix J).** VT 4 was species richness in comparison to the other VTs in this group and had the highest species richness per quadrat, however relatively few taxa contributed significantly to the foliage cover to the stratum present. Although significant representation of taxa from species groups B, D and K were present (similar to the other VTs of group 2), VT 4 represents the almost exclusive presence of taxa from species group Q, which include the taxa as listed above as indicator taxa. These taxa are known to occur on rocky sites, including gorges, gullies, rocky hills and screen slopes. Other common taxa to VT 4 which were not commonly recorded in other VTs include *Cucumis variabilis*, *Pterocaulon sphacelatum*, *Arivela viscosa* (species group O) and *Solanum cleistogamum*. This clear species differentiation is due to the landform upon which it occurs, including rocky gorge areas. The vegetation associated with VT 4 was mostly burnt 8.5 years prior to survey (October 2014 burn) (**Photo 5-15**; quadrat in a gorge); however one representative quadrat was burnt 4.5 years prior to survey (November 2017) (**Photo 5-16**; quadrat on a breakaway).	 **Photo 5-15: VT 4 (Quadrat C52)**

VT	Summary	Representative Photograph
5	**Description:** Occasional *Eucalyptus leucophloia* subsp. *leucophloia* and *Corymbia hamersleyana* over mixed isolated shrubs including *Acacia inaequilatera* and *Senna artemisioides* subsp. *glutinosa* over low hummock grassland of *Triodia wiseana* on steep upper slopes and associated drainage lines on red-brown clay loam with exposed ironstone and dolerite **Area mapped:** Study Area – 523.4 ha (13.8 % of Study Area), Development Envelope – not mapped in the DE **Sampling:** Three quadrats (K04; K05; K01) **Indicator taxa:** *Acacia inaequilatera*; *Fimbristylis dichotoma*; *Tephrosia* sp. Newman (A.A. Mitchell PRP 29) **Significant taxa:** NA **Average taxon richness per quadrat:** 27 ± 10 VT 5 is comprised of three quadrats, two of which grouped in the analysis dendrogram, and one of which was manually grouped (K01). VT 5 is mapped in the far north-eastern corner of the Study Area associated with the Mine DE, on an area of higher relief (Sheet 4 of **Appendix J)**. This area is associated with the McKay land system, which although is not extensive in the Study Area extends further northwards (**Figure 5.1**). Although the indicator taxa are widespread in the Pilbara, they commonly occur on stony areas. VT 5 is most closely associated to VT 4, however fewer taxa were recorded in VT 5 and it is lacking the presence of taxa associated with species group Q (representative of VT 4) and K (representative of VTs 4 and 6). Although moderately diverse, most flora taxa provided little cover and the structure of the vegetation was dominated by the few taxa listed in the description. This VT was sampled both on upper slopes (**Photo 5-17**) and associated small drainage lines **(Photo 5-18**). VT 5 was burnt over two occasions in the last ten years; in October 2014 (8.5 years prior to survey) and November 2017 (4.5 years prior to survey). It is unlikely that this fire history has influenced the separation of this VT from the VTs 4 and 6 (group 2), due to the differing land system which this VT occurs and associated differences in geology, soil and microhabitats.	 **Photo 5-16: VT 5 (Quadrat K04)** **Photo 5-17: VT 5 (Quadrat K05)**

VT	Summary	Representative Photograph
6	**Description:** Low woodland to open woodland of *Corymbia hamersleyana* and *Eucalyptus leucophloia* subsp. *leucophloia* and occasional *E. kingsmillii* over mid isolated shrubs of *Acacia hamersleyensis* and *Grevillea wickhamii* ?subsp. *hispidula* over low hummock grassland of *Triodia wiseana* on red brown sandy clay loam on steep mid to upper slopes with exposed ironstone **Area mapped:** Study Area – 316.6 ha (8.4 % of Study Area), Development Envelope – 3.7 ha (0.4% of the DE) **Sampling:** Nine quadrats (C23; C37; C40; C48; K35; K39; K40; K41; K51); one relevé (CR01) **Indicator taxa:** *Cassytha capillaris*, *Cheilanthes brownii*, *Eucalyptus kingsmillii*, *Scaevola browniana* subsp. *browniana* **Significant taxa:** *Seringia exastia* (T) **Average taxon richness per quadrat:** 25 ± 9 VT 6 was mapped in the same landscape as VT 4, on the range present in the south-eastern corner of the Study Area surrounding the Mine DE, in association with the Newman land system (Sheets 4 and 8 of **Appendix J**). However, VT 6 was recorded and mapped on the steep upper slopes of this range, with VT 4 mapped on the associated gorges and gullies. Quadrat C23 was manually grouped into VT 6, and one relevé was also allocated to VT 6. The species richness was generally less than that recorded in VT 4, however as with previous VTs relatively few of the taxa present contributed significant cover the stratum of the VT. Taxa commonly occurring in VT 6 are from species groups K, B and D, which were all common in VTs in group 2. VT 6 was floristically most similar to VT 4, which is expected as they occur on similar habitats on the same range of hills; however, there was no or little representation of taxa from species group Q, nor some others common to VT 4, for example *Cymbopogon ambiguus* or *Jasminium didymium* subsp lineare (species group C). The indicator taxa of VT 6 are commonly found on hillslopes and ironstone areas, however *Tephrosia* sp. Newman (A.A. Mitchell PSP 29) is also commonly recorded on basalt plains and drainage lines (WA Herbarium 1998-). Of note is *Eucalyptus kingsmillii*, which was not recorded in any other VT, and is mentioned by Beard (1975) as occurring on summits.	 **Photo 5-18: VT** 6 **(Quadrat** C37) **Photo 5-19: VT 6 (Quadrat K51)**

VT	Summary	Representative Photograph
	The vegetation of this VT was mainly burnt in January 2014 (8.5 years prior to survey) (**Photo 5-19; Photo 5-20**; both quadrats on upper slopes); however, several quadrats were also more recently burnt in November 2017 (4.5 years prior to survey).	
7	**Description:** Isolated trees of *Corymbia hamersleyana*, *Eucalyptus leucophloia* subsp. *leucophloia* and *Eucalyptus xerothermica* over low open to sparse shrubland dominated by *Acacia aptaneura*, *A. aneura* and *A. pruinocarpa* over low tussock grassland to sparse tussock grassland dominated by *Themeda* sp. Mt Barricade (M.E. Trudgen 2471), *Enneapogon polyphyllus*, *Chrysopogon fallax* and *Aristida* spp. with occasional *Triodia pungens* on red brown clay loam with some ironstone pebbles on plains **Area mapped:** Study Area – 523.4 ha (13.8 % of Study Area), Development Envelope – 171.9 ha (19.3 % of the DE) **Sampling:** 16 quadrats (C05; C11; C13; C32; C33; C53; K07; K17; K37; K42; K45; Q03; Q04; Q09; Q14; Q26); 11 quadrats recorded by Rapallo (2021a)) (Q02-Rap; Q05-Rap; Q06-Rap; Q09-Rap; Q10-Rap; Q11- Rap; Q12 -Rap; Q13-Rap; Q14-Rap; Q17-Rap) **Indicator taxa:** *Acacia aptaneura*, *Acacia aneura*, *Acacia ayersiana*, *Acacia acradenia*, *Acacia* ?*ayersiana*, *Acacia pruinocarpa*, *Dactyloctenium radulans*, *Duperreya commixta*, *Enneapogon polyphyllus*, *Enneapogon robustissimus*, *Maireana villosa*, *Perotis rara*, *Ptilotus helipteroides*, *Salsola australis*, *Sclerolaena cornishiana* **Significant taxa:** *Aristida lazaridis* (P2), *Euphorbia ferdinandi* s. lat. (potentially undescribed), *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3)^ **Average taxon richness per quadrat:** 52 ± 10 VT7 broadly represents the mulga woodlands and shrublands within the Study Area. Although isolated *Corymbia* and *Eucalyptus* trees were recorded, the dominant upper stratum is the tall shrubland which was typically dominated by mulga species (*A. aptaneura* and *A. aneura* in the Study Area), although other taxa such as *A. pruinocarpa*, *A. atkinsoniana* and *A. ayersiana* were generally present. The lower stratum also differed from the grasslands of the majority of the other VTs, being dominated by taxa other than the ubiquitous *Triodia*. However, common to other VTs presented each stratum were dominated by relatively few taxa.	 **Photo 5-20: VT 7 (Quadrat C11)**

VT	Summary	Representative Photograph
	Several indicator taxa, including *Maireana villosa*, *Salsola australis* and *Sclerolaena cornishiana* highlight the higher salinity of the soils on which this VT was mapped. VT 7 contained taxa from species groups F-J which were not well represented in other VTs; however, common taxa were those from species group C (**Appendix H**). The average species richness of this VT was higher than all others recorded in group 3. VT 7 was mapped on the Boolgeeda land system and in association with the Hamersley_18 VSA. VT 7 was mapped relatively widespread in the Study Area adjacent to the GNHI DE (Sheets 10 and 11 of **Appendix J**), in the Access Rd DE (Sheets 2, 5 and 9 of **Appendix J**) and in the section of the Mine DE west of the ranges in the Study Area, on plains downslope of areas of mapped VT 1 and in the vicinity of Mine Creek which occurs in this area (VT 10) (Sheets 2 and 3 of **Appendix J**). The mapped area in the vicinity of the GNHI DE is at the upper reaches of a drainage system which flows north-eastwards around the hills associated with the Gaguna heritage area towards the Mine DE within the Study Area. The majority of quadrats of VT 7 have not been burnt in the past 10 years (**Photo 5-21)**; several were burnt in October 2015 (6.5 years prior to survey) (**Photo 5-22**; quadrat showing recovery after the last burn, approximately 6.5 years prior to survey); and one quadrat was burnt in November 2017 (4.5 years prior to survey). A split in the analysis dendrogram for VT 7 separates the quadrats near the GNHI DE and Access Rd DE apart from those in the Study Area associated with the Mine DE (Appendix G), however, floristic differences are minor and do not warrant further splitting of this VT.	 **Photo 5-21: VT 7 (Quadrat K07)**

VT	Summary	Representative Photograph
8	**Description:** Isolated trees of *Eucalyptus xerothermica* over tall open to sparse shrubland of *Hakea lorea* subsp. *lorea* and *Acacia aptaneura* over low open tussock grassland of *Aristida contorta*, *A. inaequiglumis* and *Themeda triandra* on red-brown sandy clay to clay on plains **Area mapped:** Study Area – 68.9 ha (1.8 % of Study Area), Development Envelope – 3.6 ha (0.4% of the DE) **Sampling:** Three quadrats (K49; Q19; Q24); two Rapallo quadrats (Q23-Rap; Q27-Rap) **Indicator taxa:** *Abutilon otocarpum*, *Alternanthera nana*, *Aristida inaequiglumis*, *Chrysopogon fallax*, *Digitaria ammophila*, *Eremophila lanceolata*, *Goodenia nuda*, *Panicum effusum*, *Panicum decompositum*, *Ptilotus obovatus*, *Sida platycalyx*, *Sida* sp. L (A.M. Ashby 4202) **Significant taxa:** *Aristida jerichoensis* var. *subspinulifera* (P3)^, *Aristida lazaridis* (P2)^, *Euphorbia Euphorbia ferdinandi* s.lat (potentially undescribed)^, *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) **Average taxon richness per quadrat:** 31 ± 4 VT 8 is most closely floristically related to VT 7 and is mapped in proximity to that VT in the southern end of the Study Area, adjacent to the GNHI DE (Sheets 10 and 11 of **Appendix J**). Both the species richness per quadrat and diversity were lower in comparison to VT 7, generally lacking in taxa in species groups D – I, and a portion of C, which were common to VT 7. A variety of mid stratum taxa were present, however as with other described VTs foliage covers were generally very low. Indicator taxa generally occur on a variety of stony loams, plains, mulga hardplain and stony flats. VT 8 is most closely associated with the Wannamunna land system, which although poorly represented in the Study Area extends outside of the Study Area in both a westerly and easterly direction (**Figure 5.1**). One quadrat in this VT (K49) was established in a small area of cracking clay, on the south-western side of the Great Northern Highway; the cracking clay is limited to this side of the GNH in the Study Area, however extends further to the west outside of the Study Area (by review of aerial photography). The vegetation in this area is generally long unburnt (>10 years) (**Photo 5-23)**, although one quadrat in this VT was burnt in October 2015 (6.5 years prior to survey) (**Photo 5-24).**	 **Photo 5-22: VT 8 (Quadrat Q19)** **Photo 5-23: VT 8 (Quadrat Q24)**

VT	Summary	Representative Photograph
9	**Description:** Low open woodland of *Corymbia hamersleyana*, *C. deserticola* subsp. *deserticola*, *Eucalyptus gamophylla* and *Eucalyptus leucophloia* subsp. *leucophloia* over tall sparse shrubland of *Acacia atkinsoniana* and occasional *A. ancistrocarpa* and *A. aptaneura* over low hummock grassland dominated by *Triodia pungens* and occasional *T. wiseana* with *Paraneurachne muelleri* also dominant on red-brown clay loam with ironstone pebbles on plains **Area mapped:** Study Area – 600.8 ha (15.9 % of Study Area), Development Envelope – 102.1ha (11.5 % of the DE) **Sampling:** 17 quadrats (C06; C07; C10; C12; C14; C28; C38; C39; C50; C54; K08; K09; K11; K25; K38; K52: Q01) **Indicator taxa:** *Goodenia microptera*, *Hibiscus burtonii*, *Hibiscus sturtii* var. *platychlamys*, *Paraneurachne muelleri*, *Vincetoxicum lineare* **Significant taxa:** *Aristida lazaridis* (P2), *Corchorus* sp. (potentially undescribed)^, *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) **Average taxon richness per quadrat:** 49 ± 11 VT9 is mapped on the Boolgeeda land system, and the Hamersley_18 VSA, on plains in the Study Area to the north-west of the Mine DE (Sheets 2 and 3 of **Appendix J**), along the Access Rd DE (Sheets 1, 2, 5,9 and 10 of **Appendix J**) and in the GNHI DE portions of the Study Area (Sheets 10 and 11 of **Appendix J**). It is associated with areas mapped as VT 7, and mulga was recorded as commonly occurring within this VT (*A. aptaneura* and *A. aneura*), however the lower stratum is dominated by *Triodia* species. Floristically it is most similar to VT 10, however having less representation of taxa from species groups A and B and greater representation from species group C; with taxa in group D also commonly present (**Appendix H**). A variety of forbs and shrubs were recorded in this VT, however the vast majority had little foliage cover and did not dominate any stratum. Indicator taxa for VT 9 are commonly recorded on a variety of habitats including plains, drainage lines, sandplains and footslopes. A split in the analysis dendrogram roughly separates quadrats located on the Access Rd DE (lower branch) from those quadrats occurring in and northwards of the Mine DE (upper branch) portions of the Study Area, however floristic differences between the two branches are minor and do not warrant further separation and may be related to differences in burn age. Approximately half of this VT is long unburnt	 **Photo 5-24: VT 9 (Quadrat K52)** **Photo 5-25: VT 9 (Quadrat K38)**

VT	Summary	Representative Photograph
	(more than 10 years) (Study Area in the vicinity of the Mine DE) (**Photo 5-25)**; the rest had a scattering of burn ages, between January 2014 (8.5 years prior to survey) and November 2017 (4.5 years prior to survey) (**Photo 5-26).**.	
10	**Description:** Low open woodland of *Corymbia hamersleyana* with occasional *Eucalyptus gamophylla*, *E. leucophloia* subsp. *leucophloia* and *E. xerothermica* over tall open shrubland dominated by taxa including *Acacia cowleana*, *A. tumida* var. *pilbarensis*, *Gossypium robinsonii* and *A. pyrifolia* over low open hummock grassland of *Triodia pungens* and tussock grassland dominated by *Themeda* sp. Mt Barricade (M.E. Trudgen 2471) and *Aristida* spp. on red-brown clay loams on major and minor drainage lines **Area mapped:** Study Area – 215.5 ha (5.7 % of Study Area), Development Envelope – 67.5 ha (7.6 % of the DE) **Sampling:** 17 quadrats (C06; C07; C10; C12; C14; C28; C38; C39; C50; C54; K08; K09; K11; K25; K38; K52: Q01) **Indicator taxa:** *Afrohybanthus aurantiacus*, *Androcalva luteiflora*, ?*Androcalva loxophylla*, *Bonamia erecta*, *Corchorus crozophorifolius*, *Corymbia hamersleyana*, *Crotalaria medicaginea* var. *neglecta*, *Dodonaea lanceolata* var. *lanceolata*, *Euphorbia australis* var. *subtomentosa*, *Evolvulus alsinoides* var. *decumbens*, *Evolvulus alsinoides* var. *villosicalyx*, *Gomphrena canescens* subsp. *canescens*, *Gossypium australe*, *Indigofera monophylla*, *Melhania oblongifolia*, *Nellica maderaspatensis*, *Polymeria ambigua*, *Senna artemisioides* subsp. *oligophylla*, *Setaria surgens*, *Sida* sp. spiciform panicles (E. Leyland s.n. 14/8/90), *Themeda* sp. Mt Barricade (M.E. Trudgen 2471), *Themeda triandra*, *Waltheria indica* **Significant taxa:** NA **Average taxon richness per quadrat:** 63 ± 13 VT10 is mapped on the Boolgeeda land system, and the Hamersley_18 VSA, on drainage lines in the centre of the Study Area associated with the Mine DE (Sheets 3, 4, 7 and 8 of **Appendix J**). Floristically it similar to VT 9, however it has greater representation of taxa from species groups A and B (**Appendix H)**. The indicator species were representative of taxa which commonly occur on drainage lines, flats and broad plains, with some taxa recorded on drainage lines associated with rocky areas.	 **Photo 5-26: VT 10 (Quadrat C45)**

VT	Summary	Representative Photograph
	A split in the analysis dendrogram roughly separates quadrats located on and near Mine Creek in the centre of the Mine DE (**Photo 5-28)** from those on smaller tributaries feeding into Mine Creek (**Photo 5-27)**; however, differences are minor and do not warrant splitting the VT. All quadrats had been burnt in November 2017 (4.5 years since fire). Although the majority of the VTs of the Study Area had relatively small areas of less than Excellent condition, VT 10 had the greatest extent of vegetation mapped as either Very Good or Good. This is due to the nature of drainage areas which both tend to collect seed from upstream areas, and also attract animals which may have been feeding in or otherwise inhabiting or crossing through areas of greater weed loading associated with water gaining areas.	 **Photo 5-27: VT 10 (Quadrat K18)**

Vegetation Types

1 Low Open Woodland of *Eucalyptus leucophloia* subsp. *leucophloia* and/or *E. gamophylla* with isolated *Corymbia deserticola* subsp. *deserticola* over low to mid sparse to open shrubland dominated by species including *Acacia atkinsiana* and *A. ancistrocarpa* over low open hummock grassland of *Triodia pungens, T. vanleeuwenii* and *T. wiseana* and low open tussock grassland of *Themeda* sp. Mt Barricade (M.E. Trudgen 2471) and *Paraneurachne muelleri* on red-brown sandy clay loam to clay loam on gently inclined mid to lower slopes and associated drainage lines

2 Low open woodland of *Eucalyptus leucophloia* subsp. *leucophloia* with occasional *Corymbia deserticola* subsp. *deserticola* and *C. hamersleyana* over low sparse shrubland of *Acacia hilliana* and *Hakea chordophylla* over open hummock grassland of *Triodia vanleeuwenii* and *T. wi*seana on red-brown clay loam with ironstone pebbles on gently inclined lower to upper slopes

3 Isolated trees of *Corymbia hamersleyana, Eucalyptus leucophloia* subsp. *leucophloia* and *E. gamophylla* over low sparse shrubland of mixed Acacia species over low hummock grassland of *Triodia pungens* and *T. wiseana* on red-brown sandy clay loam on mid to lowerslopes with ironstone pebbles

4 Low open woodland of *Corymbia ferriticola* or *Corymbia hamersleyana* and *Eucalyptus leucophloia* subsp. *leucophloia* with *Ficus brachypoda* occurring on gorge and gully areas, over low sparse shrubland of mixed species dominated by *Corchorus laniflorus, Dodonaea viscosa* subsp. *mucronata* and *Gossypium robinsonii* over sparse hummock grassland dominated by *Triodia pungens* with *T. wiseana* and tussock grasses including *Cymbopogon ambiguus* and *Aristida burbidgeae* on red brown clay loam on steep upperslopes, gullies, breakaways and gorges with significant ironstone outcropping

5 Occasional *Eucalyptus leucophloia* subsp. *leucophloia* and *Corymbia hamersleyana* over mixed isolated shrubs including *Acacia inaequilatera* and *Senna artemisioides* subsp. *glutinosa* over low hummock grassland of *Triodia wiseana* on steep upperslopes and associated drainage lines on red-brown clay loam with exposed ironstone and dolerite

6 Low woodland to open woodland of *Corymbia hamersleyana* and *Eucalyptus leucophloia* subsp. *leucophloia* and occasional *E. kingsmillii* over mid isolated shrubs of *Acacia hamersleyensis* and *Grevillea wickhamii* ?subsp. *hispidula* over low hummock grassland of *Triodia wiseana* on red brown sandy clay loam on steep mid to upperslopes with exposed ironstone

7 Isolated trees of *Corymbia hamersleyana, Eucalyptus leucophloia* subsp. *leucophloia* and *Eucalyptus xerothermica* over low open to sparse shrubland dominated by *Acacia aptaneura, A. aneura* and *A. pruinocarpa* over low tussock grassland to sparse tussock grassland dominated by *Themeda* sp. Mt Barricade (M.E. Trudgen 2471), *Enneapogon polyphyllus, Chrysopogon fallax* and *Aristida* spp. with occasional *Triodia pungens* on red brown clay loam with some ironstone pebbles on plains

8 Isolated trees of *Eucalyptus xerothermica* over tall open to sparse shrubland of *Hakea lorea* subsp. *lorea* and *Acacia aptaneura* over low open tussock grassland of *Aristida contorta, A. inaequiglumis* and *Themeda triandra* on red-brown sandy clay to clay on plains

9 Low open woodland of *Corymbia hamersleyana, C. deserticola* subsp. *deserticola, Eucalyptus gamophylla* and *Eucalyptus leucophloia* subsp. *leucophloia* over tall sparse shrubland of *Acacia atkinsoniana* and occasional *A. ancistrocarpa* and *A. aptaneura* over low hummock grassland dominated by *Triodia pungens* and occasional *T. wiseana* with *Paraneurachne muelleri* also dominant on red-brown clay loam with ironstone pebbles on plains

10 Low open woodland of *Corymbia hamersleyana* with occasional *Eucalyptus gamophylla, E. leucophloia* subsp. *leucophloia* and *E. xerothermica* over tall open shrubland dominated by taxa including *Acacia cowleana, A. tumida* var. *pilbarensis, Gossypium robinsonii* and *A. pyrifolia* over low open hummock grassland of *Triodia pungens* and tussock grassland dominated by *Themeda* sp. Mt Barricade (M.E. Trudgen 2471) and *Aristida* spp. on red-brown clay loams on major and minor drainage lines

C Cleared Land (road and verge)

FIGURE 5.9

LEGEND - Overview of Vegetation Types of the Study Area

5.2.9 Significant Vegetation

The desktop assessment did not identify any EPBC or DBCA-listed significant vegetation communities with records within the Desktop Study Area (**Section 5.1.5**). The closest significant vegetation record to the Study Area is an occurrence of the 'Coolibah-lignum flats: *Eucalyptus victrix* over lignum community in the Pilbara - sub type 2: Coolibah woodlands over lignum (*Duma florulenta*) over swamp wanderrie (Lake Robinson)' PEC (P1); the edge of this PEC's buffer polygon is approximately 3 km south of the Study Area (**Figure 5.6**). In addition, sub type 1: Coolibah and mulga (*Acacia aneura*) woodland over lignum and tussock grasses on clay plains (Coondewanna Flats and Wanna Munna Flats)' PEC (P3) may occur in the Desktop Study Area (see **Section 5.1.5**). Lake Robinson is the only known occurrence of sub type 2 (DBCA 2022a) and mapping by Onshore indicates both sub types are restricted to flats associated with Lake Robinson (see **Section 5.1.5**). In addition, there were no occurrences of *Eucalyptus victrix* or *Duma florulenta* within the Study Area, this PEC is not considered to occur in the Study Area. Likewise, the VTs mapped within the Study Area are not considered to represent any other listed PECs (DBCA 2022a) or TECs (DAWE 2021a; DBCA 2018).

One small area of cracking clay was recorded in the Study Area; this area was mapped within a polygon of VT 8 on the southern side of the Great Northern Highway. This area was too small to be sampled by a quadrat. It is possible that if the Study Area were to extend further to the west to capture larger areas of cracking clay, and these areas were sampled with quadrats, floristic analysis may determine that the vegetation occurring on this cracking clay would represent a VT discrete from VT 8. The PEC 'Brockman Iron cracking clay communities of the Hamersley Range' is known to occur in the wider region surrounding the Study Area; however, the dominant taxon associated with this PEC (*Astrebla lappacea* (P3)) was not identified in this area; this area is also not located on the Brockman land system. The small area of cracking clay identified in the Study Area is therefore not considered to represent this PEC.

None of the VTs described in the Study Area by the 2022 survey are considered to be significant for reasons other than formal listing (**Section 3.9.2**). No vegetation is considered to have a significant degree of historical impact due to threatening processes; historical clearing for exploration has been limited in the Study Area, and weeds are not widespread. Likewise, no VTs are considered to be providing important functions required to maintain ecological integrity of a significant ecosystem. VT 4 could be considered to provide a role as a refuge, due to the presence of gorges, gullies and steep cliffs which could provide both micro habitats for refuge species to occur, and also protect from significant, repeated burning. No flora taxa recorded in the survey in VT 4 are considered restricted across the region, and both Priority flora known to occur in VT 4 have widespread regional extents (*Eremohila naaykensii* (P3) and *Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2)), although they are restricted to similar habitats such as those characteristic to VT 4. As such, although VT 4 does contain refugia-type habitat it is not considered significant in a regional context.

Based on field observations and aerial photography interpretation, all VTs mapped in the Study Area are either known to, or considered likely to, extend outside the Study Area to some extent, and are not considered to be restricted in distribution. All are associated with both soil landscape systems and VSAs which are not restricted in the region.

VTs 3, 4, 5 and 8 can be considered locally restricted within the Study Area, each being mapped over less than 3 % of the total area of the Study Area; this is considered an artefact of the location and extent of the Study Area:

- VT 4 is associated with the steep cliffs and gorges in the hills in Study area to the south-east of the Mine DE. It is considered likely that similar vegetation occurs on ranges to the east of the Study Area.
- VT 5 is associated with the hills in the north-east of the Study Area associated with the McKay soil landscape system which is poorly represented in the Study Area. It is considered that this VT extends further outside of the Study Area to the north and east, and that the limited representation is an artefact of the Study Area extent and location.
- VT 3 was mapped in the far southern extent of the GNHI section of the Study Area and was associated with the area mapped as 'A' (Low open *Eucalyptus gamophylla* woodland over *Triodia melvillei* and *T. pungens* on stony plain) by Rapallo (2021a). It is considered likely that this VT extends further to the south-west based on review of aerial photography, and its association with Boolgeeda land system.
- VT 8 is associated with mulga on the Wannamunna land system, corresponding with the area mapped as VT 'D' (Mulga, *Hakea lorea* and *Eucalyptus xerothermica* low open woodland over closed tussock grassland on gently-sloping clay-loam plain) by Rapallo (2021a). The Wannamunna land system is restricted within the Study Area, extending to the south and west. It is considered that this VT extends in these directions outside of the Study Area.

As no Pilbara-wide vegetation dataset defined at the same scale at which the Study Area VTs were defined is available, it is not possible to conclusively assess the significance of VTs in a regional context. However, based on the overall taxon composition of the VTs mapped, it is likely that these would be relatively widespread in the general region surrounding the Study Area; additionally, the landforms and geology with which the VTs are associated are known to occur widely in the region (**Section 5.1.2**). Although several VTs are considered preferred habitat for significant flora taxa, none of the listed taxa have particularly restricted distributions; the most restricted is *Aristida lazaridis* (P2) with a known range of 130km (**Section 5.2.3.2**). This taxon is associated with VTs 7 and 8 in and near the Study Area in the vicinity of the GNHI; Rapallo (2021b) recorded this taxon as occurring further northwards outside of the Study Area, and therefore it is likely that this habitat extends outside the Study Area.

5.2.10 Surface and Groundwater Dependent Vegetation

The main surface water feature of the Study Area is located in association with the Mine DE (Mine Creek, a tributary flowing northwards to Marillana Creek). This drainage feature allows for drainage around the hills associated with the Gaguna heritage area, as well as the range present in the south-east and north-east of the Study Area associated with the Mine DE. Other minor ephemeral drainage features direct water from rain events (including cyclones) from the hills crossing into both the GNHI DE and Access Rd DE portions of the Study Area. None of the drainage features in the Study Area hold permanent water, and are ephemeral creeklines during and post-wet season, particularly after larger rainfall events. The vegetation downstream of these ephemeral creeklines, in particular the Mine Creek, may be reliant on periodic inundation after such events.

Groundwater dependent terrestrial vegetation (GDV) is a component of Groundwater Dependent Ecosystems (GDEs), and is at least partly composed of phreatophytic species - those that use groundwater to meet some or all of their water requirements (Clifton *et al*., 2007a). As a minimum groundwater is usually relied upon during seasonal or episodically dry periods such as droughts. Phreatophytes are usually deep-rooted perennial species that rely on groundwater sources for water uptake (Busch *et al*., 1992). These species are often found within the riparian zones of permanent and ephemeral rivers, creeks and

wetlands where water tables are often very close to the ground surface. Phreatophytes are divided into 2 main groups:

- Obligate phreatophytic vegetation is completely reliant on access to groundwater to survive, including riverine species such as *Melaleuca argentea* and *Eucalyptus camaldulensis* (Loomes & Braimbridge, 2010). This reliance can be continual, seasonal or episodic and is often highly sensitive to alterations in groundwater regimes.

- Facultative phreatophytes rely on groundwater only during extended periods of drought. These are generally deep-rooted species occurring on floodplains and higher in the landscape away from very shallow groundwater aquifers. These species tend to be less sensitive to changes in groundwater regimes, however may suffer stress during prolonged periods of drought.

Vegetation can be considered as a candidate for GDV when the groundwater is 0-10 mbgl, based on the known habitat preferences and apparent drawdown susceptibility of phreatophytic taxa (Loomes and Braimbridge, 2010; Braimbridge & Loomes, 2013). As the depth to groundwater in the Study Area is presumed to be >10m (as referred to by PSM 2021), the vegetation is unlikely to be groundwater dependent. The presence of phreatophytic taxa from the Pilbara region is used to assist in determination of likelihood of associated vegetation being GDV; a number of phreatophytic flora species are known from the Pilbara region including:

- *Melaleuca argentea* (obligate phreatophyte): occurs along rivers and creeklines in the Pilbara, and can also be associated with permanent pools (Department of Water, 2009). *Melaleuca argentea* is an obligate phreatophyte at all locations where it occurs; however, it will utilise surface water sources such as floodwaters and river flows when available (O'Grady *et al*., 2002). *M. argentea* appears to be the most sensitive to changes in groundwater regimes according to literature, due to its shallow planiform root system adapted to areas of very shallow groundwater (2-3m below ground level) (Graham (2001); it has difficulty adjusting to short periods of dry conditions (Loomes & Braimbridge, 2010).

- *Eucalyptus camaldulensis* (obligate phreatophyte when in close proximity to groundwater, facultative in areas with deeper groundwater resources): a riparian tree species of the Pilbara and is commonly found on rivers and creeklines mostly occurring where the groundwater is less than 10 mbgl (Loomes, 2010). As such, *Eucalyptus camaldulensis* is treated as an obligate phreatophyte in situations where the groundwater source is within 10m of the surface, though its reliance on groundwater is likely to be less in areas where surface water (such as floodwaters and river flows) is the primary source of water.

- *Sesbania formosa* is also considered likely to be an obligate phreatophyte, as it is restricted to alluvial soils in rivers or major creeks, potentially indicating high groundwater use (Department of Water 2010). No published data was available that describes this taxon's reliance on groundwater or sensitivity to drawdown.

- *Eucalyptus victrix* (facultative phreatophyte): known to occur on drier locations in comparison to *E. camaldulensis* or *M. argentea*; it is treated as a facultative phreatophyte in most situations but is a vadophyte due to its ability to access water in the unsaturated vadose soil zone above the water table. It is worth noting that the vadose zone is itself dependent on the presence of a groundwater layer.

- *Melaleuca glomerata*, *Atalaya hemiglauca*, *Acacia ampliceps* and *Melaleuca linophylla* appear to generally be considered at least partially facultative phreatophytes, primarily based on their presence

in major river channels where groundwater is known to be close to the surface (Loomes 2010a, 2010b; Loomes and Braimbridge 2010). However, this appears to not have been substantiated by any specific investigation; only Loomes (2010a) has investigated depth to water ranges for some of these species, however this investigation considered a limited number of sample sites, all of which were in significant drainage channels.

No obligate phreatophytes were recorded in the Study Area, and likewise *Eucalyptus victrix* was not recorded. The only potential facultative-phreatophyte listed above recorded in the Study Area is *Atalaya hemiglauca*, which typically occurs on floodplains and creeklines higher in the topography where groundwater levels exceed 3-5 mbgl; it can also be found on sandstone ridges (Loomes, 2010; WA Herbarium, 1998). Although this species requires moist soil conditions it is more tolerant of prolonged periods of drought and are likely to access other sources of moisture such as clays within the soil profile (Loomes & Braimbridge, 2010). This taxon may only rely upon groundwater during extended drought periods and may suffer stress if a significant dry period coincides with a period of groundwater drawdown, if indeed those individuals are relying on a groundwater source. Observations by Woodman Environmental Consulting (unpublished) of vegetation being supported by shallow groundwater in the Pilbara subjected to drawdown saw impacts to obligate phreatophytes *Melaleuca argentea* and *Eucalyptus camaldulensis*; however, co-occurring individuals of *Atalaya hemiglauca* were not affected.

Atalaya hemiglauca was recorded in one quadrat in VT 5 (associated with a minor drainage line), and three quadrats in VT 10, associated with Mine Creek, the main drainage line in the centre of the Study Area associated with the Mine DE. It is unlikely that this system represents GDV, as no other phreatophytic taxa were recorded, and *A. hemiglauca* was present only in low densities (percentage foliage cover ranged between 0.1-1%). The presence of *Atalaya hemiglauca* alone is not considered justification for categorising this area as GDV.

5.2.11 Vegetation Condition

Table 5.11 presents the area (ha) of each VT and corresponding condition rating (as per EPA 2016b; **Appendix A**) mapped in the Study Area by the 2022 survey. An overview of vegetation condition mapping is presented in **Figure 5.10**, with detailed vegetation condition mapping, including locations of introduced flora taxa recorded in the Study Area, presented in **Appendix M**.

The condition of the vegetation in the Study Area was rated Good to Excellent. The majority of the vegetation (90.5 %) rated as Excellent, with no obvious signs of damage caused by human activities. The remainder of the vegetation was rated as Very Good and Good (8.2 % and 1.2 % respectively), with some historical mechanical disturbance, introduced flora taxa dominating the lower stratum in some flowlines, and otherwise low levels of introduced flora taxa across the Study Area. Areas where natural vegetation has been completely and apparently permanently removed, with no native taxa remaining were mapped as 'Cleared' (C) and not subjected to rating under the condition scale. Areas mapped as cleared included Great Northern Highway only, with small, potentially temporary cleared areas such as minor tracks and clearing associated with exploration, not mapped as cleared. Less than 1 % of the Study Area (4.6 ha) was mapped as cleared.

Occasional weeds only were present in VTs 2, 4, 6 and 9. There were higher levels of aggressive weed taxa including *Cenchrus ciliaris* and *Cenchrus setiger*, generally present in high numbers within flowlines in VT 10, and disturbed areas within VT 7 to a lesser extent. VT 10 was most impacted by disturbance with the majority of this VT (over 70 %) rated as Very Good.

Table 5.11 Vegetation Condition Ratings for VTs Described in the Study Area

VT	Excellent (ha)	Very Good (ha)	Good (ha)	Poor (ha)	Degraded (ha)	Completely Degraded (ha)	Cleared
1	1387.6	37.6	3.9	-	-	-	
2	355.1	27.3	-	-	-	-	
3	35.5	6.8	5.8	-	-	-	
4	94.6	0.7	-	-	-	-	
5	100.9	-	-	-	-	-	
6	315.8	0.8	-	-	-	-	
7	441.6	66.3	15.5	-	-	-	
8	61.9	4.1	2.9	-	-	-	
9	585.3	10.1	5.4	-	-	-	
10	48.9	155.3	11.3	-	-	-	
Cleared	-	-	-	-	-	-	4.6
Total	**3427.3**	**309.0**	**44.8**	**0**	**0**	**-**	**4.6**
Percentage of Study Area	**90.5**	**8.2**	**1.2**				**0.1**

- Good
- Cleared

FIGURE 5.10

Overview of Vegetation Condition of the Study Area

6.0 Conclusions

The species diversity (328 taxa across the Study Area) is moderately diverse in comparison to other Pilbara flora studies conducted across the region and is commensurate with those recorded in nearby ranges; for example, Onshore Environmental (2011; 2012) reported totals of 479 and 386 flora taxa known to date at Area C and South Flank respectively, both study areas of which are located in relatively close proximity to the south of the Study Area. A total of 206 flora taxa, and 219 flora taxa were recorded by Onshore Environmental (2011) in their northern and southern study areas within Area C respectively during that particular survey. The species diversity of the Study Area is comprised of a number of annual, short-lived perennial and perennial forbs and small shrubs and grasses which may be associated with the large-scale burns which affected the Study Area within the last five years. The highest mean species richness per quadrat were recorded in VTs 10 (major and associated minor drainage lines), VT 4 (gorges and steep rocky gullies) and VT 7 (predominantly mulga woodlands).

A diversity of Vegetation Types (VTs) were recorded across the 3,785 ha study area, due to the variety of landforms and soil types present. No VTs are considered to represent any listed PEC or TEC, nor are they considered regionally significant vegetation for any other reason, and are likely to be represented elsewhere. The gorges, gullies and steep cliffs of VT4 could be considered locally significant in providing refuge and protection from significant repeated burning, however permanent water in the form of pools or creeks was not observed at time of survey. The significant taxa known from VT 4 are restricted to such gorge habitat, however these taxa and habitats have widespread regional extents. Three VTs (3, 5, and 8) have limited extents within the Study Area, however this is considered an artifact of the location and extent of the Study Area.

The potentially undescribed *Corchorus* sp. is considered taxonomically significant as it is not able to be matched to any other specimen within the WA Herbarium collection. The WA Herbarium has advised that a precautionary approach would also see it regarded as a plant of conservation significance, whilst noting that its poorly collected nature and potential geographical restriction make this difficult to formally assess (M. Hislop, *pers. comm*. June 2022). Six specimens of *Corchorus* sp. from the 2022 survey have been submitted for lodgement with the WA Herbarium to facilitate this assessment going forward.

The potentially undescribed entity *Euphorbia ferdinandi* s. lat is currently under review by the WA Herbarium, with a comparison to an Eastern Australia species of similar morphology underway. In response to consultation the WA Herbarium have advised in the interim to treat the entity as a plant of taxonomic significance (M. Hislop, *pers. comm.* August 2022).

APPENDIX A

Vegetation Condition Scale for the Eremaean and Northern Botanical Provinces (EPA 2016b)

Condition Ranking	Description
Excellent (E)	Pristine or nearly so, no obvious signs of damage caused by human activities since European settlement
Very Good (VG)	Some relatively slight signs of damage caused by human activities since European settlement. For example, some signs of damage to tree trunks caused by repeated fire, the presence of some relatively non-aggressive weeds, or occasional vehicle tracks
Good (G)	More obvious signs of damage caused by human activity since European settlement, including some obvious impact on the vegetation structure such as that caused by low levels of grazing or slightly aggressive weeds
Poor (P)	Still retains basic vegetation structure or ability to regenerate it after very obvious impacts of human activities since European settlement, such as grazing, partial clearing, frequent fires or aggressive weeds
Degraded (D)	Severely impacted by grazing, very frequent fires, clearing or a combination of these activities. Scope for some regeneration but not to a state approaching good condition without intensive management. Usually with a number of weed species present including very aggressive species
Completely Degraded (CD)	Areas that are completely or almost completely without native species in the structure of their vegetation; i.e. areas that are cleared or 'parkland cleared' with their flora comprising weed or crop species with isolated native trees or shrubs

APPENDIX B

Vascular Plant Taxa Omitted from and Amalgamated in the Classification Analysis

Action	Taxon	Data Source	Reasoning
Amalgamated	*Abutilon fraseri*	Rapallo	Taxon identified to differing levels between different surveys
	Abutilon fraseri subsp. *fraseri*	Umwelt	
Amalgamated	*Acacia aneura*	Rapallo/Umwelt	Potential for taxa not to be consistently identified due to inadequate material
	Acacia ?aneura	Umwelt	
	Acacia aptaneura	Rapallo/Umwelt	
Amalgamated	*Acacia acradenia*	Rapallo	Taxa not be consistently positively identified due to inadequate material; Inconsistencies in identifications between different surveys (potential misidentification of *A. acradenia*)
	Acacia ayersiana	Umwelt	
	Acacia ?ayersiana	Umwelt	
Amalgamated	*Acacia cowleana*	Rapallo/Umwelt	Taxa not consistently identified due to inadequate material; difficult to separate these entities in the field leading to potential misidentification (require juvenile growth)
	Acacia elachantha	Rapallo/Umwelt	
	Acacia ?elachantha	Umwelt	
Amalgamated	*Acacia pachyacra*	Rapallo/Umwelt	Potential for taxa not consistently identified due to inadequate material within and between datasets
	Acacia tenuissima	Rapallo/Umwelt	
Amalgamated	*Acacia hamersleyensis*	Umwelt	Taxa not consistently identified due to inadequate material
	Acacia ?hamersleyensis	Umwelt	
Amalgamated	*Androcalva luteiflora*	Umwelt	Taxa not consistently identified due to inadequate material; potential misidentification between surveys
	?Androcalva loxophylla	Umwelt	
Amalgamated	*Convolvulus clementii*	Rapallo	Inconsistencies in identifications between different surveys; potential misidentification of *Convolvulus clementii* as young individuals look very similar in a field environment
	Ipomoea polymorpha	Umwelt	
Amalgamated	*Corchorus lasiocarpus* subsp. *parvus*	Umwelt	Taxa not consistently identified due to inadequate material
	Corchorus ?lasiocarpus subsp. *parvus*	Umwelt	
Amalgamated	*Dysphania rhadinostachya* subsp. *inflata*	Rapallo	Subspecies not consistently identified due to inadequate material; potential misidentification of subspecies between different surveys
	Dysphania rhadinostachya	Umwelt	
	Dysphania ?rhadinostachya	Umwelt	
Amalgamated	*Eriachne pulchella* subsp. *dominii*	Umwelt	Inconsistencies in identification to subspecies between different surveys
	Eriachne pulchella subsp. *pulchella*	Rapallo	
Amalgamated	*Euphorbia coghlanii*	Rapallo	Taxa not consistently identified due to inadequate material; potential misidentification between surveys
	Euphorbia biconvexa	Umwelt	
	Euphorbia ?biconvexa	Umwelt	
Amalgamated	*Euphorbia* aff. *ferdinandi*	Rapallo	Considered to represent the same potentially undescribed taxon
	Euphorbia ?aff. ferdinandi subsp. *ferdinandi*	Umwelt	
Amalgamated	*Evolvulus alsinoides*	Umwelt	Variants could not be consistently identified due to inadequate material (requires flowering material to identify to variant level)
	Evolvulus alsinoides var. *decumbens*	Umwelt	
	Evolvulus alsinoides var *villosicalyx*	Rapallo/Umwelt	

Action	Taxon	Data Source	Reasoning
Amalgamated	*Glycine* sp.	Rapallo	Inconsistencies in identifications between different surveys
	Glycine canescens	Umwelt	
Amalgamated	*Grevillea wickhamii* subsp. *hispidula*	Umwelt	Subspecies not consistently identified due to inadequate material
	Grevillea wickhamii subsp. ?*hispidula*	Umwelt	
Amalgamated	*Iseilema macratherum*	Rapallo	Inconsistencies in identifications between different surveys
	Iseilema membranaceum	Umwelt	
Amalgamated	*Panicum decompositum*	Rapallo	Inconsistencies in identifications between different surveys; *P. effusum* consistently recorded during 2022 survey in same habitats
	Panicum effusum	Umwelt	
Amalgamated	*Polycarpaea corymbosa*	Rapallo	Taxon identified to differing levels between different surveys
	Polycarpaea corymbosa var. *corymbosa*	Umwelt	
Amalgamated	*Portulaca oleracea*	Rapallo	Taxon not consistently identified due to inadequate material
	Portulaca ?*oleracea*	Umwelt	
Amalgamated	*Ptilotus* ?*exaltatus*	Umwelt	Taxa not consistently identified due to juvenile material
	Ptilotus ?*carinatus*	Umwelt	
	Ptilotus exaltatus	Rapallo	
Amalgamated	*Ptilotus obovatus*	Rapallo	Taxon identified to differing levels between different surveys
	Ptilotus obovatus var. *obovatus*	Umwelt	
Amalgamated	*Scaevola parvifolia* subsp. *parvifolia*	Rapallo	Inconsistencies in identifications between different surveys. The two subspecies are difficult to tell apart in the field and there is an overlap in their ranges.
	Scaevola parvifolia subsp. *pilbarae*	Umwelt	
Amalgamated	*Senna ferraria*	Umwelt	Taxon not consistently identified due to inadequate material
	Senna ?*ferraria*	Umwelt	
Amalgamated	*Senna pleurocarpa* var. *angustifolia*	Umwelt	Variants potentially not consistently identified due to inadequate material
	Senna pleurocarpa var. *pleurocarpa*	Umwelt	
Amalgamated	*Sida* sp. L (A.M. Ashby 4202)	Umwelt	Taxon not consistently identified due to inadequate material
	Sida ?L (A.M. Ashby 4202)	Rapallo	
Amalgamated	*Themeda* sp. Mt Barricade (M.E. Trudgen	Umwelt	Taxa potentially not consistently identified within/between surveys
	Themeda triandra	Rapallo/Umwelt	
Amalgamated	*Tribulus macrocarpus*	Umwelt	Taxon not consistently identified due to inadequate material
	Tribulus ?*macrocarpus*	Umwelt	
Amalgamated	*Trichodesma zeylanicum* var. *zeylanicum*	Umwelt	Taxon identified to differing levels between different surveys
	Trichodesma zeylanicum	Rapallo	
Omitted	?*Enchylaena tomentosa*	Umwelt	Identification unclear due to poor material
Omitted	*Euphorbia* ?*trigonosperma*	Umwelt	Identification unclear due to poor material

Action	Taxon	Data Source	Reasoning
Omitted	Poaceae sp.	Umwelt	Identification unclear due to poor material
Taxon Change	*Acacia pachyacra* changed to *A. tenuissima* at Quadrat 09	Rapallo	Field collection confirmed different species to be present at this location
Taxon Change	*Acacia* sp. changed to *A. aneura* at Quadrat 03	Rapallo	Field collection confirmed different species to be present at this location
Taxon Change	*Acacia* ?*sibirica* changed to *A. aneura* at Quadrat 26	Rapallo	Field collection confirmed different species to be present at this location
Taxon Change	*Enneapogon lindleyanus* changed to *E. robustissimus* at Quadrat 26	Rapallo	Field collection confirmed different species to be present at this location

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 14-Nov-2021

Summary
Details
- Matters of NES
- Other Matters Protected by the EPBC Act

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	None
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	10
Listed Migratory Species:	9

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at http://www.environment.gov.au/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	13
Whales and Other Cetaceans:	None
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	2
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	24
Key Ecological Features (Marine):	None
Biologically Important Areas:	None
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Listed Threatened Species		[Resource Information]
Status of Conservation Dependent and Extinct are not MNES under the EPBC Act. Number is the current name ID.		
Scientific Name	Threatened Category	Presence Text
BIRD		
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat likely to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area
MAMMAL		
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Breeding known to occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat likely to occur within area
Rhinonicteris aurantia (Pilbara form) Pilbara Leaf-nosed Bat [82790]	Vulnerable	Roosting known to occur within area
PLANT		

Scientific Name	Threatened Category	Presence Text
Thryptomene wittweri		
Mountain Thryptomene [16645]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Liasis olivaceus barroni		
Olive Python (Pilbara subspecies) [66699]	Vulnerable	Species or species habitat likely to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Migratory Terrestrial Species		
Hirundo rustica		
Barn Swallow [662]		Species or species habitat may occur within area
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat may occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat may occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Species or species habitat may occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Chalcites osculans as Chrysococcyx osculans		
Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius veredus		
Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area overfly marine area
Hirundo rustica		
Barn Swallow [662]		Species or species habitat may occur within area overfly marine area
Merops ornatus		
Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato)		
Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area overfly marine area

Extra Information

State and Territory Reserves		[Resource Information]
Protected Area Name	Reserve Type	State
Karijini	National Park	WA
Unnamed WA41696	5(1)(g) Reserve	WA

EPBC Act Referrals			[Resource Information]
Title of referral	Reference	Referral Outcome	Assessment Status
Controlled action			

Title of referral	Reference	Referral Outcome	Assessment Status
Controlled action			
Baralaba Train Load Out and Rail Loop	2012/6548	Controlled Action	Post-Approval
Brockman Railway	2011/5833	Controlled Action	Post-Approval
Cloud Break Open Pit Iron Ore Mine	2005/2205	Controlled Action	Post-Approval
construction of iron ore mine & associated infrastructure	2013/6945	Controlled Action	Completed
FerrAus Pilbara Project - mine & Rail Pilbara Region WA	2011/6036	Controlled Action	Post-Approval
Iron ore mine expansion, West Angelas Revised Project	2021/8923	Controlled Action	Assessment Approach
Jinidi Iron Ore Mine	2012/6299	Controlled Action	Post-Approval
Koodaideri Iron Ore Mine & Infrastructure Project, WA	2012/6422	Controlled Action	Post-Approval
Marillana Iron Ore Project	2011/5892	Controlled Action	Post-Approval
Phil's Creek Iron Ore Project	2009/5107	Controlled Action	Post-Approval
West Angelas Iron Ore Mine Deposits C, D and G, Pilbara, WA	2018/8299	Controlled Action	Post-Approval
Yandicoogina Junction South West and Oxbow Iron Ore Project	2011/5815	Controlled Action	Post-Approval
Not controlled action			
Baiting Efficacy Trial of Feral Cat Bait and PAPP Toxicant	2012/6381	Not Controlled Action	Completed
Development of iron ore resources in eastern Pilbara region, including port at P	2004/1562	Not Controlled Action	Completed
Development of the Hope Downs 4 Iron Ore Mine and Associated Infrastructure	2008/4636	Not Controlled Action	Completed
Improving rabbit biocontrol: releasing another strain of RHDV, sthrn two thirds of Australia	2015/7522	Not Controlled Action	Completed
Iron Valley Iron Ore Project	2012/6458	Not Controlled Action	Completed
Lamb Creek Iron Ore Project, East Pilbara, WA	2012/6666	Not Controlled Action	Completed

Title of referral	Reference	Referral Outcome	Assessment Status
Not controlled action			
Pilbara Bulk Ore Transport System Project, WA	2016/7637	Not Controlled Action	Completed
Railway Iron Ore Project, to develop and operate mine, plant and supporting infrastructure, Central Pilbara, WA	2009/5005	Not Controlled Action	Completed
Roy Hill Iron Ore Project	2008/4624	Not Controlled Action	Completed
Yandicoogina Pocket and Billiard South, Iron ore mine, WA	2014/7343	Not Controlled Action	Completed
Referral decision			
Baiting Efficiency of Feral cat bait and PAPP Toxicant	2012/6363	Referral Decision	Completed
Iron ore mine, Hope Downs 2 Proposal	2021/9035	Referral Decision	Referral Publication

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales
-Department of Environment and Primary Industries, Victoria
-Department of Primary Industries, Parks, Water and Environment, Tasmania
-Department of Environment, Water and Natural Resources, South Australia
-Department of Land and Resource Management, Northern Territory
-Department of Environmental and Heritage Protection, Queensland

APPENDIX D

Vascular Plant Taxa Recorded in the Study Area

Family	Taxon
Aizoaceae	*Trianthema glossostigmum*
Amaranthaceae	*Alternanthera nana*
	Amaranthus cuspidifolius
	Amaranthus undulatus
	Gomphrena canescens subsp. *canescens*
	Gomphrena cunninghamii
	Gomphrena kanisii
	Ptilotus astrolasius
	Ptilotus calostachyus
	Ptilotus ?carinatus
	Ptilotus clementii
	Ptilotus exaltatus
	Ptilotus fusiformis
	Ptilotus helipteroides
	Ptilotus obovatus var. *obovatus*
	Ptilotus rotundifolius
	Ptilotus schwartzii var. *schwartzii*
Apocynaceae	*Cynanchum pedunculatum*
	Cynanchum viminale subsp. *australe*
	Vincetoxicum flexuosum
	Vincetoxicum lineare
Araliaceae	*Astrotricha hamptonii*
	Trachymene oleracea subsp. *oleracea*
Asteraceae	**Bidens bipinnata*
	Leiocarpa semicalva subsp. *semicalva*
	Olearia xerophila
	Peripleura obovata
	Pluchea dentex
	Pluchea tetranthera
	Pterocaulon serrulatum var. *velutinum*
	Pterocaulon sphacelatum
	Streptoglossa bubakii
	Streptoglossa decurrens
Boraginaceae	*Euploca cunninghamii*
	Euploca pachyphylla
	Euploca tanythrix
	Trichodesma zeylanicum
Brassicaceae	*Lepidium pedicellosum*
Capparaceae	*Capparis lasiantha*
	Capparis mitchellii

Family	Taxon
Capparaceae cont.	*Capparis spinosa* subsp. *nummularia*
Caryophyllaceae	*Polycarpaea corymbosa* var. *corymbosa*
	Polycarpaea holtzei
	Polycarpaea longiflora
Celastraceae	*Maytenus* sp. Mt Windell (S. van Leeuwen 846)
	Stackhousia sp. swollen gynophore (W.R. Barker 2041)
Chenopodiaceae	*Dysphania rhadinostachya*
	?*Enchylaena tomentosa*
	Maireana planifolia
	Maireana villosa
	Rhagodia eremaea
	Rhagodia sp. Hamersley (M. Trudgen 17794) (P3)
	Salsola australis
	Sclerolaena cornishiana
	Sclerolaena tetragona
Cleomaceae	*Areocleome oxalidea*
	Arivela viscosa
Commelinaceae	*Commelina ensifolia*
Convolvulaceae	*Bonamia erecta*
	Bonamia pilbarensis
	Duperreya commixta
	Evolvulus alsinoides var. *decumbens*
	Evolvulus alsinoides var. *villosicalyx*
	Ipomoea polymorpha
	Polymeria ambigua
Cucurbitaceae	*Cucumis variabilis*
Cyperaceae	*Bulbostylis barbata*
	Cyperus cunninghamii subsp. *cunninghamii*
	Fimbristylis dichotoma
	Fimbristylis simulans
Euphorbiaceae	*Euphorbia ferdinandi* s. lat. (potentially underscribed)
	Euphorbia australis var. hispidula
	Euphorbia australis var. subtomentosa
	Euphorbia biconvexa
	Euphorbia drummondii
	Euphorbia tannensis subsp. *eremophila*
	Euphorbia trigonosperma
Fabaceae	*Acacia adoxa* var. *adoxa*
	Acacia adsurgens
	Acacia ancistrocarpa

Family	Taxon
Fabaceae cont.	*Acacia aneura*
	Acacia aptaneura
	Acacia atkinsiana
	Acacia ayersiana
	Acacia bivenosa
	Acacia cowleana
	Acacia dictyophleba
	Acacia elachantha
	Acacia hamersleyensis
	Acacia hilliana
	Acacia inaequilatera
	Acacia maitlandii
	Acacia marramamba
	Acacia minyura
	Acacia monticola
	Acacia pachyacra
	Acacia pruinocarpa
	Acacia pyrifolia var. *pyrifolia*
	Acacia rhodophloia x *sibirica*
	Acacia sericophylla
	Acacia sibirica
	Acacia steedmanii subsp. *borealis*
	Acacia synchronicia
	Acacia tenuissima
	Acacia tetragonophylla
	Acacia tumida var. *pilbarensis*
	Crotalaria medicaginea var. neglecta
	Crotalaria novae-hollandiae DC. subsp. *novae-hollandiae*
	Cullen leucochaites
	Glycine canescens
	Gompholobium oreophilum
	Indigofera fractiflexa subsp. *fractiflexa*
	Indigofera georgei
	Indigofera linnaei
	Indigofera monophylla
	Indigofera rugosa
	Isotropis iophyta
	Mirbelia viminalis
	Petalostylis labicheoides
	Rhynchosia minima

Family	Taxon
Fabaceae cont.	*Senna artemisioides* subsp. *helmsii*
	Senna artemisioides subsp. *oligophylla*
	Senna artemisioides subsp. x *artemisioides*
	Senna ferraria
	Senna glaucifolia
	Senna glutinosa subsp. *glutinosa*
	Senna glutinosa subsp. *pruinosa*
	Senna glutinosa subsp. x *luerssenii*
	Senna notabilis
	Senna pleurocarpa var. *angustifolia*
	Senna pleurocarpa var. *pleurocarpa*
	Senna sericea
	Senna stricta
	Senna symonii
	Senna venusta
	?*Swainsona decurrens*
	Tephrosia densa
	Tephrosia oxalidea
	Tephrosia rosea var. Fortescue creeks (M.I.H. Brooker 2186)
	Tephrosia sp. Bungaroo Creek (M.E. Trudgen 11601)
	Tephrosia sp. Newman (A.A. Mitchell PRP 29)
	Tephrosia sp. NW Eremaean (S. van Leeuwen et al. PBS 0356)
	Tephrosia virens
	Vigna sp. Hamersley Clay (A.A. Mitchell PRP 113)
Goodeniaceae	*Dampiera candicans*
	Goodenia cusackiana
	Goodenia microptera
	Goodenia muelleriana
	Goodenia nuda
	Goodenia prostrata
	Goodenia stellata
	Goodenia stobbsiana
	Goodenia triodiophila
	Scaevola amblyanthera var. *centralis*
	Scaevola browniana subsp. *browniana*
	Scaevola parvifolia subsp. *pilbarae*
	Scaevola spinescens
Gyrostemonaceae	*Codonocarpus cotinifolius*
Lamiaceae	*Clerodendrum floribundum* var. *angustifolium*
	Newcastelia clavipetala

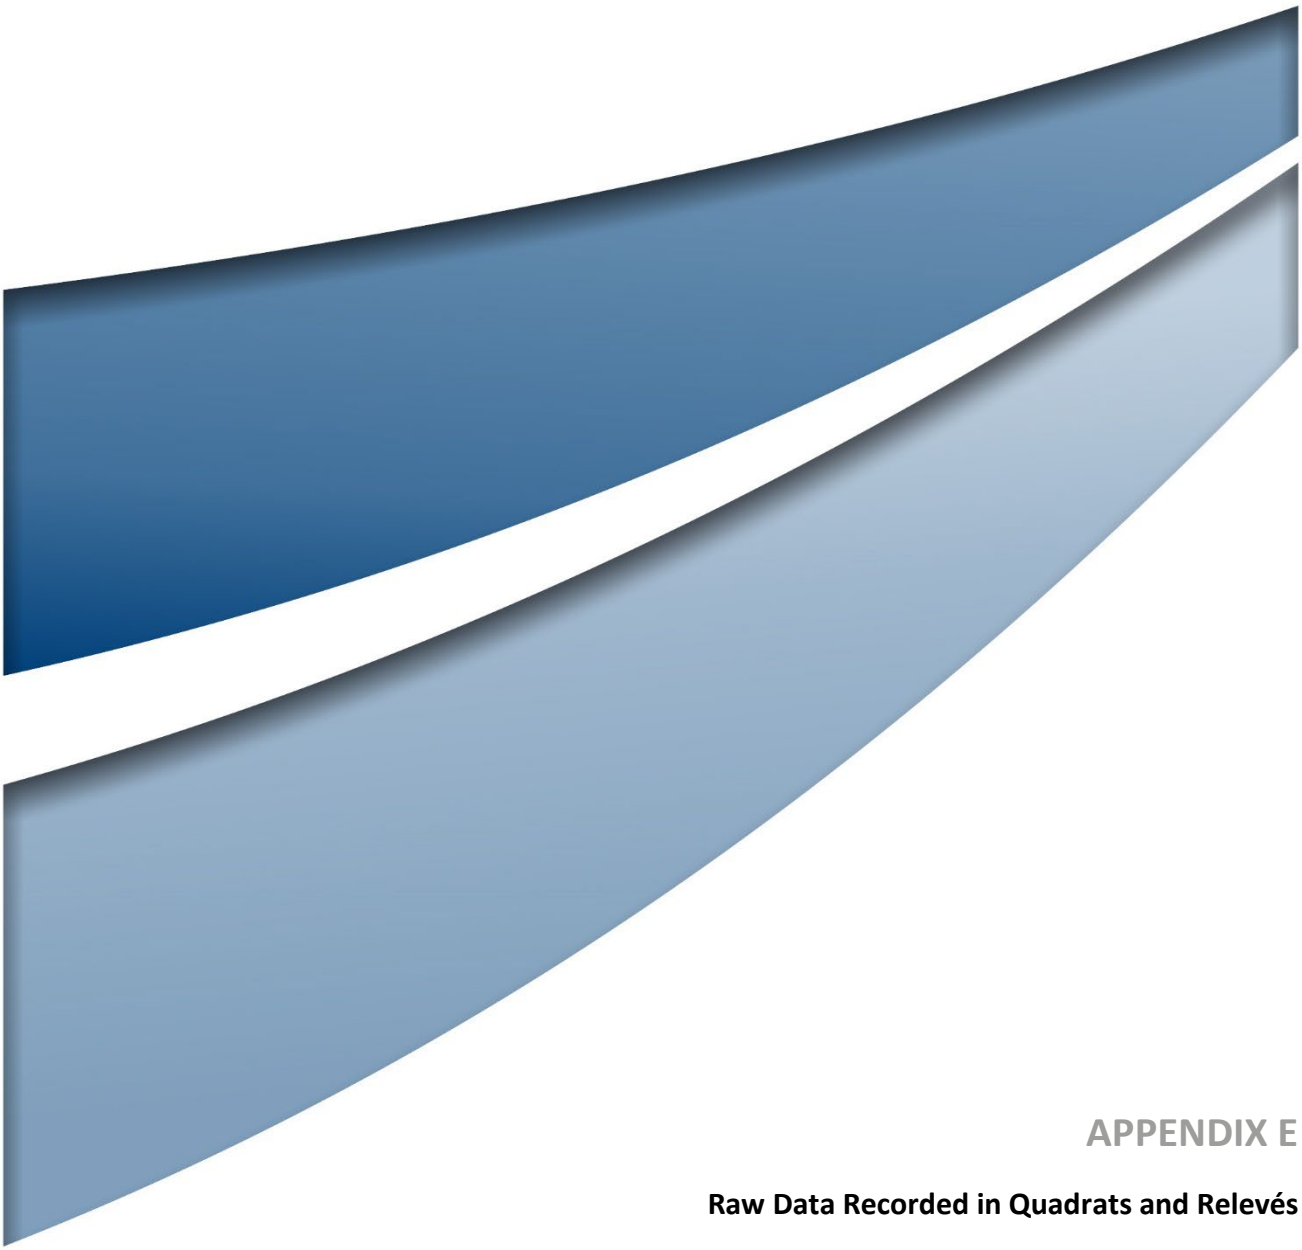
Family	Taxon
Lamiaceae cont.	*Prostanthera albiflora*
	Teucrium teucriiflorum
Lauraceae	*Cassytha capillaris*
Loranthaceae	*Amyema bifurcata*
	Diplatia grandibractea
	Lysiana murrayi
Malvaceae	*Abutilon amplum*
	Abutilon cunninghamii
	Abutilon fraseri subsp. *fraseri*
	Abutilon lepidum
	Abutilon macrum
	Abutilon otocarpum
	Abutilon sp. Dioicum (A.A. Mitchell PRP 1618)
	?*Androcalva loxophylla*
	Androcalva luteiflora
	Brachychiton acuminatus
	Corchorus crozophorifolius
	Corchorus incanus subsp. *lithophilus*
	Corchorus laniflorus
	Corchorus lasiocarpus subsp. *parvus*
	Corchorus sp. (potentially undescribed)
	Corchorus sp. (sterile)
	Corchorus tridens
	Gossypium australe
	Gossypium robinsonii
	Hibiscus burtonii
	Hibiscus coatesii
	Hibiscus leptocladus
	Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708) (P2)
	Hibiscus sturtii var. *campylochlamys*
	Hibiscus sturtii var. *platychlamys*
	**Malvastrum americanum*
	Melhania oblongifolia
	Seringia exastia (T)
	Sida arenicola
	Sida cardiophylla
	Sida echinocarpa
	Sida ectogama
	Sida fibulifera
	Sida platycalyx

Family	Taxon
Malvaceae cont.	*Sida* sp. Articulation below (A.A. Mitchell PRP 1605)
	Sida sp. dark green fruits (S. van Leeuwen 2260)
	Sida sp. Excedentifolia (J.L. Egan 1925)
	Sida sp. L (A.M. Ashby 4202)
	Sida sp. Pilbara (A.A. Mitchell PRP 1543)
	Sida sp. Shovelanna Hill (S. van Leeuwen 3842)
	Sida sp. spiciform panicles (E. Leyland s.n. 14/8/90)
	Sida sp. Supplejack Station (T.S. Henshall 2345)
	Triumfetta leptacantha
	Triumfetta maconochieana
	Waltheria indica
Menispermaceae	*Tinospora smilacina*
Moraceae	*Ficus brachypoda*
Myrtaceae	*Calytrix carinata*
	Corymbia deserticola subsp. *deserticola*
	Corymbia ferriticola
	Corymbia hamersleyana
	Eucalyptus gamophylla
	Eucalyptus kingsmillii
	Eucalyptus leucophloia subsp. *leucophloia*
	Eucalyptus xerothermica
Nyctaginaceae	*Boerhavia burbidgeana*
	Boerhavia coccinea
	Boerhavia repleta
Oleaceae	*Jasminum didymum* subsp. *lineare*
Phyllanthaceae	*Dendrophyllanthus erwinii*
	Nellica maderaspatensis
	Notoleptopus decaisnei
Plantaginaceae	*Stemodia grossa*
Poaceae	*Amphipogon sericeus*
	Aristida burbidgeae
	Aristida contorta
	Aristida holathera var. *holathera*
	Aristida inaequiglumis
	Aristida jerichoensis var. *subspinulifera* (P3)
	Aristida lazaridis (P2)
	Aristida obscura
	Aristida pruinosa
	Bothriochloa ewartiana
	**Cenchrus ciliaris*

Family	Taxon
Poaceae cont.	**Cenchrus setiger*
	Chrysopogon fallax
	Cymbopogon ambiguus
	Cymbopogon obtectus
	Dactyloctenium radulans
	Digitaria ammophila
	Digitaria brownii
	Digitaria ctenantha
	Enneapogon caerulescens
	Enneapogon lindleyanus
	Enneapogon polyphyllus
	Enneapogon robustissimus
	Eragrostis cumingii
	Eragrostis eriopoda
	Eragrostis setifolia
	Eragrostis tenellula
	Eriachne aristidea
	Eriachne lanata
	Eriachne mucronata
	Eriachne pulchella subsp. *dominii*
	Eriachne sp. Dugald River (B.K. Simon+ 3007)
	Eriachne tenuiculmis
	Eulalia aurea
	Iseilema membranaceum
	Mnesithea formosa
	Panicum effusum
	Paraneurachne muelleri
	Paspalidium clementii
	Paspalidium rarum
	Paspalidium tabulatum
	Perotis rara
	Schizachyrium fragile
	Setaria surgens
	**Setaria verticillata*
	Sporobolus australasicus
	Themeda sp. Mt Barricade (M.E. Trudgen 2471)
	Themeda triandra
	Tragus australianus
	Triodia biflora
	Triodia melvillei

Family	Taxon
Poaceae cont.	*Triodia pungens*
	Triodia vanleeuwenii
	Triodia wiseana
	Tripogonella loliiformis
	Urochloa occidentalis var. *ciliata*
Polygalaceae	*Polygala glaucifolia*
Portulacaceae	*Portulaca* ?*oleracea*
	**Portulaca pilosa*
Proteaceae	*Grevillea berryana*
	Grevillea pyramidalis subsp. *leucadendron*
	Grevillea wickhamii subsp. *hispidula*
	Hakea chordophylla
	Hakea loreus subsp. *loreus*
Pteridaceae	*Cheilanthes brownii*
	Cheilanthes contigua
	Cheilanthes sieberi subsp. *sieberi*
Rubiaceae	*Dolichocarpa crouchiana*
	Psydrax latifolia
	Psydrax rigidula
	Psydrax suaveolens
	Spermacoce brachystema
	Synaptantha tillaeacea var. *tillaeacea*
Santalaceae	*Anthobolus leptomerioides*
	Santalum lanceolatum
Sapindaceae	*Atalaya hemiglauca*
	Dodonaea coriacea
	Dodonaea lanceolata var. *lanceolata*
	Dodonaea pachyneura
	Dodonaea petiolaris
	Dodonaea viscosa subsp. *mucronata*
Scrophulariaceae	*Eremophila forrestii* subsp. *forrestii*
	Eremophila fraseri subsp. *fraseri*
	Eremophila jucunda subsp. *pulcherrima*
	Eremophila lanceolata
	Eremophila latrobei subsp. *filiformis*
	Eremophila latrobei × *forrestii*
	Eremophila longifolia
	Eremophila naaykensii (P3)
	Eremophila petrophila subsp. *petrophila*
Solanaceae	*Nicotiana benthamiana*

Family	Taxon
Solanaceae cont.	*Solanum cleistogamum*
	Solanum ferocissimum
	Solanum gabrielae
	Solanum lasiophyllum
	Solanum phlomoides
Surianaceae	*Stylobasium spathulatum*
Thymelaeaceae	*Pimelea forrestiana*
Violaceae	*Afrohybanthus aurantiacus*
Zygophyllaceae	*Tribulus astrocarpus*
	Tribulus macrocarpus
	Tribulus suberosus
	**Tribulus terrestris*



APPENDIX E

Raw Data Recorded in Quadrats and Relevés

Site Name:	C01
Site Type:	QUADRAT
Dimensions:	50m x 50m
Survey Date:	14/03/2022
GPS Location:	GDA94 Zone 50 695066.75E 7477598.34N
Orientation:	90/180
Vegetation Type:	1
Landform Type:	Other, Undulating plain (other)
Slope Class:	Very Gently Inclined (1 degree)
Aspect:	E
Soil Type:	Clay Loam
Soil Colour:	Brown, Orange (other)
Rock Outcrop:	Ironstone, <2% bedrock exposed
CF Abundance:	>90%
CF Sizes:	2-6mm, 6-20mm, 20-60mm, 60-200mm
CF Types:	Ironstone, Quartz
Vegetation Condition:	Northern Vegetation Condition - E - Excellent
Disturbance:	None
Fire:	5-10 Years
Habitat:	Low open woodland over open shrubland over open hummock grassland

Site Name:	C09
Site Type:	QUADRAT
Dimensions:	50m x 50m
Survey Date:	18/03/2022
GPS Location:	GDA94 Zone 50 683353.41E 7473736.1N
Orientation:	90/180
Vegetation Type:	1
Landform Type:	Mid Slope
Slope Class:	Moderately Inclined (10 degrees)
Aspect:	NE
Soil Type:	Clay Loam
Soil Colour:	Red-Brown
Rock Outcrop:	Ironstone, 2-10% bedrock exposed
CF Abundance:	>90%
CF Sizes:	2-6mm, 6-20mm, 20-60mm, 60-200mm, 200-600mm
CF Types:	Ironstone
Vegetation Condition:	Northern Vegetation Condition - E - Excellent
Disturbance:	None, (other) - wallaby poo
Fire:	>10 Years
Habitat:	Sparse low woodland over sparse shrubland over closed grassland

Slope Class:	Level (0 degrees)
Soil Type:	Clay Loam
Soil Colour:	Red-Brown
Rock Outcrop:	No bedrock exposed
CF Abundance:	>90%
CF Sizes:	2-6mm, 6-20mm, 20-60mm
CF Types:	Ironstone, Quartz
Vegetation Condition:	Northern Vegetation Condition - E - Excellent
Disturbance:	Mining - Drill lines adj./in
Fire:	<5 Years
Habitat:	Low isolated trees over mid-tall open shrubland over low sparse shrubland over hummock grassland.

Soil Type:	Clay Loam
Soil Colour:	Red-Brown
Rock Outcrop:	No bedrock exposed
CF Abundance:	2-10%
CF Sizes:	2-6mm, 6-20mm, 20-60mm
Vegetation Condition:	Northern Vegetation Condition - VG - Very Good
Disturbance:	Exotic Weeds
Fire:	>10 Years
Habitat:	Mulga and acacia low open woodland over open spinifex and tussock grassland on flat plain with medium rock cover

APPENDIX I

Summary of Misclassified and Manually Reassigned Quadrats Assessed in the Study Area

Quadrat	Original Group	Reassigned VT	Reasoning
C23	VT 3	VT 6	This quadrat grouped with K01 split at a higher level to remainder of quadrats originally grouped into VT 3, indicating a lower level of similarity. Quadrat C23 is within transitional vegetation and has been relatively recently burnt (~4-5 years ago). Allocated to VT 6 based on dominant taxa present and its occurrence on an ironstone crest.
K01	VT 3	VT 5	This quadrat grouped with quadrat C23 split at a higher level to remainder of quadrats originally grouped into VT 3, indicating a lower level of similarity. Quadrat K23 is within transitional vegetation and has been relatively recently burnt (~4-5 years ago). Allocated to VT 5 based on dominant taxa present, it's location and occurrence on an upperslope with ironstone within the McKay soil landscape system.
K10	Separate grouping (located between VT 9 / 10 in dendrogram)	VT 1	This quadrat grouped with K11 within the dendrogram, however the two quadrats were not sufficiently floristically similar to form a unique VT. Allocated to VT 1 based on floristics, soil, landform and location.
K11	Separate grouping (located between VT 9 / 10 in dendrogram)	VT 9	This quadrat grouped with K10 in the dendrogram, however the two quadrats were not sufficiently floristically similar to form a unique VT. Allocated to VT 9 based on floristics, soil, landform and location.

Matrix of Vascular Plant Taxa Recorded within Each VT Described in the Study Area

Taxon	VT									
	1	2	3	4	5	6	7	8	9	10
Abutilon amplum										x
Abutilon cunninghamii										x
Abutilon fraseri							x			
Abutilon fraseri subsp. *fraseri*	x						x		x	x
Abutilon lepidum	x			x			x		x	x
Abutilon macrum	x						x		x	x
Abutilon otocarpum	x	x					x	x	x	
Abutilon sp. Dioicum (A.A. Mitchell PRP 1618)	x			x			x			x
Acacia adoxa var. *adoxa*	x	x				x			x	x
Acacia adsurgens	x	x	x	x		x	x	x	x	x
Acacia ancistrocarpa	x	x					x		x	x
Acacia aneura	x						x		x	
Acacia aptaneura	x	x		x		x	x	x	x	x
Acacia atkinsiana	x	x	x	x			x		x	x
Acacia ayersiana							x			
Acacia bivenosa	x	x	x				x		x	x
Acacia cowleana	x	x	x			x	x	x	x	x
Acacia dictyophleba	x	x	x				x	x	x	x
Acacia elachantha	x	x					x		x	
Acacia hamersleyensis		x		x		x				
Acacia hilliana	x	x								
Acacia inaequilatera	x	x		x	x		x		x	x
Acacia maitlandii		x	x	x					x	x
Acacia marramamba			x							
Acacia minyura			x						x	

Taxon	VT									
	1	2	3	4	5	6	7	8	9	10
Acacia monticola	x	x	x	x					x	x
Acacia pachyacra							x	x	x	
Acacia pruinocarpa	x	x	x	x		x	x		x	x
Acacia pyrifolia var. *pyrifolia*	x	x	x	x		x	x			x
Acacia rhodophloia x sibirica			x							
Acacia sericophylla										x
Acacia sibirica		x					x		x	
Acacia steedmanii subsp. *borealis*	x								x	
Acacia synchronicia	x									
Acacia tenuissima	x	x	x		x	x	x	x	x	x
Acacia tetragonophylla	x				x					
Acacia tumida var. *pilbarensis*	x			x		x	x		x	x
Afrohybanthus aurantiacus	x			x		x	x	x	x	x
Alternanthera nana				x			x	x	x	x
Amaranthus cuspidifolius				x			x		x	
Amaranthus undulatus				x						
Amphipogon sericeus	x	x	x							
?Androcalva loxophylla	x								x	
Androcalva luteiflora	x	x		x					x	x
Anthobolus leptomerioides							x	x	x	x
Areocleome oxalidea								x		
Aristida burbidgeae				x						
Aristida contorta	x	x		x	x		x	x	x	x
Aristida holathera var. *holathera*	x	x	x		x	x	x		x	x
Aristida inaequiglumis	x	x	x				x	x	x	x

Taxon	VT									
	1	2	3	4	5	6	7	8	9	10
Aristida jerichoensis var. *subspinulifera* (P3)								x		
Aristida lazaridis (P2)							x	x		
Aristida obscura	x			x			x			x
Aristida pruinosa	x	x								
Arivela viscosa	x	x		x	x	x	x	x	x	x
Astrotricha hamptonii				x						
Atalaya hemiglauca					x					x
**Bidens bipinnata*	x			x		x	x	x	x	x
Boerhavia coccinea	x			x	x	x	x	x	x	x
Boerhavia repleta				x			x	x	x	x
Boerhavia schomburgkiana							x			
Bonamia erecta	x						x		x	x
Bonamia pilbarensis										x
Bothriochloa ewartiana	x				x		x		x	x
Brachychiton acuminatus				x						
Bulbostylis barbata				x				x		x
Capparis lasiantha	x	x		x			x	x	x	x
Capparis mitchellii				x						
Capparis spinosa subsp. *nummularia*				x						
Cassytha capillaris	x	x				x				x
**Cenchrus ciliaris*	x			x			x			x
**Cenchrus setiger*							x			x
Cheilanthes brownii				x		x				
Cheilanthes contigua		x			x	x				x
Cheilanthes sieberi subsp. *sieberi*				x		x	x	x	x	

Taxon	VT									
	1	2	3	4	5	6	7	8	9	10
Chrysocephalum apiculatum subsp. *pilbarense*							x			
Chrysocephalum gilesii								x		
Chrysopogon fallax	x		x				x	x	x	x
Clerodendrum floribundum var. *angustifolium*	x	x		x		x	x			x
Codonocarpus cotinifolius	x	x				x			x	
Commelina ensifolia							x			
Corchorus crozophorifolius	x									x
Corchorus incanus subsp. *lithophilus*	x	x			x	x			x	x
Corchorus laniflorus				x		x				
Corchorus lasiocarpus subsp. *parvus*	x	x		x		x	x		x	x
Corchorus tridens							x			
Corchorus sp. (potentially undescribed)									x	
Corymbia deserticola subsp. *deserticola*	x	x	x				x		x	
Corymbia ferriticola				x						
Corymbia hamersleyana	x	x	x	x	x	x	x		x	x
Crotalaria medicaginea var. *neglecta*	x			x					x	x
Cucumis variabilis	x	x		x			x	x	x	x
Cullen leucochaites				x	x					
Cymbopogon ambiguus	x	x	x	x	x	x	x		x	x
Cymbopogon obtectus	x	x	x			x	x	x	x	x
Cynanchum pedunculatum				x		x			x	
Cynanchum viminale subsp. *australe*				x			x			
Cyperus cunninghamii subsp. *cunninghamii*				x						
Dactyloctenium radulans							x			
Dampiera candicans	x	x								

Taxon	VT									
	1	2	3	4	5	6	7	8	9	10
Dendrophyllanthus erwinii	x						x			x
Dichanthium sericeum subsp. *humilius*								x		
Digitaria ammophila				x			x	x	x	x
Digitaria brownii	x	x	x				x	x	x	x
Digitaria ctenantha							x			x
Diplatia grandibractea				x						
Dodonaea coriacea	x	x				x			x	
Dodonaea lanceolata var. *lanceolata*	x					x				x
Dodonaea pachyneura				x						
Dodonaea petiolaris	x						x		x	
Dodonaea viscosa subsp. *mucronata*				x		x				
Dolichocarpa crouchiana	x	x				x				
Duperreya commixta	x	x		x		x	x	x	x	x
Dysphania glomulifera subsp. *eremaea*								x		
Dysphania kalpari							x	x		
Dysphania rhadinostachya		x		x		x	x			
Dysphania rhadinostachya subsp. *inflata*							x			
?Enchylaena tomentosa							x			
Enneapogon caerulescens	x	x			x		x			x
Enneapogon lindleyanus	x			x	x		x	x	x	x
Enneapogon polyphyllus	x	x		x	x	x	x	x	x	x
Enneapogon robustissimus				x			x		x	x
Eragrostis cumingii										x
Eragrostis eriopoda	x	x					x		x	x
Eragrostis pergracilis								x		

Taxon	VT									
	1	2	3	4	5	6	7	8	9	10
Eragrostis setifolia							x	x		
Eragrostis tenellula				x						
Eremophila forrestii subsp. *forrestii*	x	x					x		x	
Eremophila fraseri subsp. *fraseri*	x						x		x	
Eremophila jucunda subsp. *pulcherrima*		x		x		x				
Eremophila lanceolata								x		
Eremophila latrobei subsp. *filiformis*	x	x			x		x	x	x	
Eremophila latrobei × *forrestii*	x									
Eremophila longifolia	x				x		x	x	x	x
Eremophila naaykensii (P3)				x						
Eremophila petrophila subsp. *petrophila*				x						
Eriachne aristidea										x
Eriachne lanata	x									
Eriachne mucronata	x	x	x	x	x	x	x		x	x
Eriachne pulchella subsp. *dominii*	x	x	x		x	x	x		x	x
Eriachne pulchella subsp. *pulchella*							x			
Eriachne tenuiculmis	x			x						x
Eriachne sp. Dugald River (B.K. Simon+ 3007)		x								x
Eucalyptus gamophylla	x	x	x				x		x	x
Eucalyptus kingsmillii						x				
Eucalyptus leucophloia subsp. *leucophloia*	x	x	x	x	x	x	x		x	x
Eucalyptus xerothermica							x	x		x
Eulalia aurea	x	x	x			x	x	x	x	x
Euphorbia australis var. *subtomentosa*		x					x			x
Euphorbia australis var. *hispidula*	x	x					x		x	

Taxon	VT									
	1	2	3	4	5	6	7	8	9	10
Euphorbia biconvexa				x	x		x	x	x	x
Euphorbia coghlanii							x			
Euphorbia drummondii							x			
Euphorbia ferdinandi s. lat.								x		
Euphorbia aff. *ferdinandi*							x	x		
Euphorbia tannensis subsp. *eremophila*	x			x			x		x	x
Euphorbia trigonosperma		x		x		x	x		x	
Euploca cunninghamii	x	x					x		x	x
Euploca pachyphylla	x									x
Euploca tanythrix	x	x					x		x	x
Evolvulus alsinoides	x	x	x	x			x	x	x	x
Evolvulus alsinoides var. *villosicalyx*							x	x	x	
Evolvulus alsinoides var. *decumbens*							x		x	x
Ficus brachypoda				x						
Fimbristylis dichotoma	x	x			x	x		x	x	x

APPENDIX L

Results of Indicator Species Analysis for VTs Described in the Study Area

Note: Shading denotes highest INDVAL values per taxon and VT. INDVAL values are only shown for taxa that were significant at $p < 0.05$. p values are indicated by:

* = $p < 0.05$

** = $p < 0.01$

*** = $p < 0.001$.

Taxon	INDVAL Value (%)

Executive Summary

Mineral Resources Limited (MinRes) are exploring mining opportunities associated with the Lamb Creek Deposit (the Project), located approximately 120 kilometres (km) northwest of Newman. Baseline flora and vegetation surveys were completed over 2020 to 2022 by Rapallo (2021b) and Umwelt (in prep) including detailed and targeted level assessments, to inform the Environmental Impact Assessment (EIA) process for the Project (the Baseline Surveys). This Impact Assessment considers the potential significance of significant flora populations and vegetation in a regional context and the significance of potential direct and indirect impacts to them.

The extent of proposed direct impacts are presented in quantifiable terms (numbers of individuals and locations, and area of preferred habitat, of significant flora taxa within the Disturbance Footprint). Indirect impacts are presented quantitatively (regarding edge effects) where possible, with comments provided otherwise. All local data for flora and vegetation was based on data collected by the Baseline Surveys, (Rapallo, 2021a, b; Umwelt, 2022) with regional data sourced from relevant government databases.

Nine significant flora taxa were considered in the impact assessment. Of these, three have records within the proposed indicative footprint (the Disturbance Footprint) being *Aristida lazaridis* (P2), *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) and *Seringia exastia* (T), and an additional one (*Aristida jerichoensis* var. *subspinulifera* (P3)) occurring in the Indirect Impact Assessment Zone (IIAZ). The occurrence of further significant flora taxa within the Disturbance Footprint is considered unlikely (Appendix A). It should be noted that recent changes to the understanding of the Threatened taxon *S. exastia* mean that it is now considered common and widespread (Binks, *et al*., 2020) and whilst it is no longer recognised as Threatened under WA's BC ACT, it remains listed as Threatened under the EPBC Act (Department of Premier and Cabinet (DPC) 2018). Until such time as it can be delisted the new understanding of the taxon's distribution would be considered in the EIA process.

At a regional scale, the potential direct impacts are unlikely to be significant for any of the significant flora taxa occurring within the Disturbance Footprint due to the relatively low percentage of impact to plant numbers and the extent of known records and preferred habitat outside the Disturbance Footprint in the local area.

There is potential for indirect impacts via interruption of surface water flows (including sheet flow) or changes in water quality to areas downstream or downslope of the Disturbance Footprint, where those areas contain vegetation that are reliant on surface water inputs. These include Mulga grove and riparian vegetation, and the significant flora that those habitats potentially support. It is recommended that the volume, spread, and quality of surface water flows be maintained over the course of construction and mine life.

Any potential fragmentation impacts to significant flora through separation (or increasing existing separation) are likely to be negligible and not significant.

A total of 10 vegetation types (VTs) were defined and mapped across the Study Area by Umwelt's (in prep) Baseline Survey, and all but one VT occurs in the Disturbance Footprint. None of the VTs were considered to represent any formally listed Threatened Ecological Communities (TECs) or Priority Ecological Communities (PECs). In addition, none of the VTs described in the Study Area are considered to be significant for reasons other than formal listing. While a small number of VTs are not well-represented

within the Study Area, there are very low potential direct impacts to these VTs. In addition all VTs mapped in the Study Area and Disturbance Footprint are either known to, or considered likely to, extend outside the Study Area to some extent, based on field observations and aerial photography interpretation.

The local impact of the Disturbance Footprint on all VTs is relatively low in terms of the percentage of impact, and not likely to be significant at the local scale. Consequently, and considering that none of the VTs in the Disturbance Footprint are significant, the potential regional impact to VTs is unlikely to be significant. Similarly, the regional impact of the Disturbance Footprint to pre-European vegetation system associations (VSAs) and soil-landscape units is unlikely to be significant.

Predicted potential combined impacts to VTs of the Study Area was calculated, which considered direct impacts as a result of clearing of the Disturbance Footprint and complete removal/deterioration of vegetation in the Indirect Impact Assessment Zone (IIAZ). However, total permanent loss of vegetation in the IIAZ is considered unlikely. Although the combined impact assessment is considered to represent a worst-case scenario, the impacts to VTs at a combined scale are unlikely to be significant for any assessed VT.

Abbreviations

Term	Definition
Baseline Surveys	Rapallo (2021a, 2021b) and Umwelt (in prep)
Combined impacts	Potential impacts on significant flora and vegetation values as a combination of direct and indirect impacts by Project activities
DBCA	Department of Biodiversity, Conservation and Attractions
Development Envelope	The area within which clearing of vegetation will be contained. Approximately 894 ha in size. Contains the Footprint.
Direct impacts	Impacts on environment values occurring as a result of direct removal of significant flora and/or vegetation components by Project activities
Disturbance Footprint	Proposed indicative footprint, approximately 661 ha in size
EIA	Environmental Impact Assessment
EPA	Environmental Protection Authority
EPBC Act	Environment Protection Biodiversity Conservation Act 1999
EP Act	Environmental Protection Act 1986
GIS	Geographic Information System
GDE	Groundwater Dependent Ecosystem
GDV	Groundwater Dependent Vegetation
ha	Hectares
IBRA	Interim Biogeographic Regionalisation for Australia
IIAZ	Indirect Impact Assessment Zone, a 20 m buffer around the Disturbance Footprint utilised for the assessment of indirect impacts to flora and vegetation. Approximately 119 ha in size.
Indicative regional populations	Populations of significant flora taxa within WA, determined by review of distribution of known flora taxa locations according to DBCA databases (using the DBCA (2017) definition of a population, as a discrete group of individuals of a taxon separated by more than 500 m from the nearest discrete group of individuals), or from the results of intensive surveys of significant flora taxa over their known range
Indirect impacts	Impacts on environmental values occurring via indirect pathways as a result of Project activities
km	Kilometres
Listed	Pertaining to listed taxa or vegetation - those that are formally listed as conservation significant under the *Environment Protection and Biodiversity Conservation Act 1999*, or the *Biodiversity Conservation Act 2016*. Refer to
Local	Known distribution of significant flora and vegetation within the Study Area and relevant contiguous habitat
Local population	Local significant flora populations, defined using the DBCA (2017) definition of a population as a discrete group of individuals of a taxon separated by more than 500 m from the nearest discrete group of individuals
m	Metres
MinRes	Mineral Resources Limited
P	Priority
PEC	Priority Ecological Community

Term	Definition
the Project	Lamb Creek Project
Regional	Known distribution of significant flora and vegetation within WA
Significant flora	As defined in **Section 1.3**
Significant vegetation	As defined in **Section 1.3**

1.0 Introduction

1.1 Project Overview

Mineral Resources Limited (MinRes) are actively exploring mining opportunities associated with the Lamb Creek Deposit (the Project), located approximately 120 kilometres (km) northwest of Newman in Western Australia (WA). The exploration area consists of a proposed mining area and associated infrastructure corridor linking the proposed mining area to Great Northern Highway.

Previous flora and vegetation surveys conforming to different levels of survey under various Environmental Protection Authority (EPA) Guidance Statements (EPA, 2004, 2016b) have been conducted for the Project. A gap analysis and peer review of previous survey work, as undertaken by Umwelt (Australia) Pty Ltd (Umwelt) (2022), recommended additional targeted survey and a detailed flora and vegetation survey (as per Sections 4.2 and 4.3 of EPA (2016b)).

MinRes commissioned Umwelt to undertake a flora and vegetation survey of the Project to support the Environmental Impact Assessment (EIA) process for the Project, and to use the data collected with that of Rapallo (2021a, b) to develop a flora and vegetation impact assessment report utilising a supplied Development Envelope and Indicative Footprint.

1.2 Purpose and Scope

This report presents a summary of the significant features of the Project area with respect to flora and vegetation, and an assessment of potential aspects of the Project that will impact flora and vegetation, including discussion of the potential significance of any such impacts, using the information collected by the Baseline Surveys (Rapallo, 2021a, b; Umwelt, 2022).

Direct and indirect impacts are presented as quantitative data where possible. Where indirect impacts cannot be assessed quantitatively, a qualitative discussion is presented.

1.3 Terminology and Definitions

The following definitions apply with reference to the Project area and are presented on **Figure 1.1** (with the exception of the Indirect Impact Assessment Zone, which is too narrow to present meaningfully on this figure):

- **Study Area:** an area of 3,785 ha, defined in consultation with MinRes and representing a buffered area on the Proposed Development Envelope and MinRes tenements, sufficient to provide contextual information relevant to interpreting impacts. Detailed vegetation survey was undertaken within the Study Area by Umwelt (in prep).
- **Development Envelope:** the area (approximately 894 ha) within which clearing of vegetation will be contained. The development envelope is composed of three parts: the Great Northern Highway Intersection Development Envelope (GNHI DE); the Access Road Development Envelope (Access Rd DE); and the Mine Development Envelope (Mine DE), containing the waste rock dumps, pit area and other infrastructure relevant to the mining operations. These three areas are displayed on **Figure 1.1**.

- **Disturbance Footprint:** the proposed indicative area (approximately 661 ha) within the Development Envelope that is planned to be cleared for the Project. The Disturbance Footprint encompasses the infrastructure design, from which avoidance areas have been excised (heritage) or impact minimised (flora), and has been utilised in this assessment to calculate potential impacts to flora and vegetation as a result of the project.

- **Indirect Impact Assessment Zone (IIAZ):** a potential indirect impact zone surrounding the Disturbance Footprint to an extent of 20 m. The IIAZ is approximately 119 ha in size. The IIAZ is designed to capture potential quantitative impact of some indirect impact pathways as listed below, including edge effects through dust, clearing, water and sediment run-off and the introduction of weeds. The buffer distance of 20 m is considered sufficient to assess edge effects, based on field observations of flora and vegetation adjacent to impact areas at Lamb Creek. It is considered unlikely that there would be any edge effects beyond this distance.

Direct, indirect and combined impacts in the context of this assessment are defined as below:

- **Direct impacts:** impacts on environment values occurring as a result of direct removal of flora taxa and vegetation by clearing and other ground disturbance activities for the Project. This results in both removal of known locations, death of individuals at these locations, and removal of habitat.

- **Indirect impacts:** impacts on environmental values occurring via indirect pathways as a result of Project activities. Such impacts may occur as a result of processes including, but not limited to:

    - Smothering of plants from dust emissions, causing potential decline in health or death of individual plants, and reduction in the overall condition of vegetation.

    - Degradation of vegetation through edge effects associated with clearing activities.

    - Water and/or sediment run off (e.g. erosion after significant rainfall from waste rock landforms, and spillage of saline water/tailings/hydrocarbons), causing potential smothering of individual plants and vegetation, resulting in decline in health or death.

    - Altered hydrology and drainage shadow, causing potential reduction or removal of seasonal surface water flow, resulting in either death or loss of condition to individual plants or vegetation.

    - Introduction of weeds, leading to increased competition for available resources with individual plants, and reduction in the overall condition of vegetation.

    - Changes to groundwater levels in groundwater dependent ecosystems (GDEs), causing potential death of phreatophytic taxa and change in composition of groundwater dependent vegetation (GDV).

    - Fragmentation of local populations of significant flora taxa and vegetation, leading to a decline in health and quality of populations/patches of vegetation, or loss of genetic diversity through isolation of segments of a population, resulting in reduced genetic fitness of remaining populations.

- **Combined impacts:** the total impact on environmental values from direct and indirect impacts as a result of the Project, as far as they can be assessed.

The following definitions apply with reference to significant flora and vegetation:

- **Significant flora:** flora taxa that belong to one of the following categories as defined by EPA (2016a, 2016b):
    - taxa identified as a Threatened (T) or Priority (P) species (formally listed significant taxa – includes taxa listed under both State and Commonwealth legislation, and classified as Priority by DBCA)
    - locally endemic taxa or taxa associated with a restricted habitat type (e.g. surface water or GDEs)
    - new species or taxa having anomalous features that indicate a potential new species
    - representative of the range of a species (particularly at the extremes of range, recently discovered range extensions, or isolated outliers of the main range)
    - unusual species, including restricted subspecies, varieties or naturally occurring hybrids
    - having a relictual status, being representative of taxonomic groups that no longer occur widely in the broader landscape.
- **Significant vegetation:** vegetation communities that belong to one of the following categories as defined by EPA (2016a, 2016b):
    - being identified as a Threatened Ecological Community (TEC) or Priority Ecological Community (PEC) (formally listed significant vegetation – includes vegetation listed under State or Commonwealth legislation, or classified as a PEC by DBCA)
    - having a restricted distribution
    - having a degree of historical impact from threatening processes
    - playing a role as a refuge
    - providing an important function required to maintain ecological integrity of a significant ecosystem.
- **Local:** the known distribution of significant flora taxa and vegetation within the Study Area (**Figure 1.1**) and verified, contiguous habitat outside the Study Area. Therefore, local impacts are defined as impacts to significant flora taxa or Vegetation Types (VTs) located within the Study Area and surrounding contiguous habitat, as per the results of the Baseline Survey (Umwelt, 2022). Note that narrow, natural breaks such as creeks and rivers are not considered barriers to contiguous habitat in a local context. Given that the extent of contiguous habitat will be different for each significant flora taxon, and limited survey for significant flora has been undertaken outside the Study Area, an 'overall' local area cannot be specifically mapped.
- **Regional:** the known distribution of significant flora taxa and vegetation within WA. Therefore, regional impacts are defined as impacts to significant flora taxa or VTs across their total known distributions in WA.
- **Local populations:** flora populations within the Study Area, defined using the DBCA (2017) definition of a population (a discrete group of individuals of a taxon separated by more than 500 metres (m) from the nearest discrete group of individuals). Note that this definition can only be tentatively applied if the intervening 500 m has not been surveyed and should consider whether appropriate habitat extends within this area.

- **Indicative regional populations:** populations of significant flora taxa within WA, determined by review of distribution of known locations according to DBCA databases (via NatureMap (DBCA, 2007) and Florabase (WA Herbarium, 1998)), and using the DBCA (2017) definition of populations as provided above. However, if the characteristics of regional populations of a significant flora taxon has been surveyed intensively over its known range, the values presented in these reports or literature publications will be used instead, provided this data is considered current and reliable.

FIGURE 1.1

Project Location

Image Source: ESRI Basemap (2021) Data source: Landgate (2022), MRL (2022)

2.0 Background

Baseline Survey data relevant to this assessment were recorded over 2020 to 2022, encompassing:

- Detailed flora and vegetation assessment across the Study Area, conducted by:
    - Rapallo (2021a) in May 2021
    - Umwelt (in prep) over March and April 2022; and
- Targeted Survey over the Development Envelope conducted by
    - Rapallo (2021b) in April 2020 and May 2021; and
    - Umwelt (in prep) in April, June and July 2022.

These baseline surveys encompassed the establishment of vegetation survey quadrats and relevés in the Study Area, targeted searching for significant flora taxa in the Development Envelope, and description of VTs following statistical analysis of quadrat data. The assessment was conducted to the requirements of EPA's *Technical Guidance – Flora and Vegetation Surveys for Environmental Impact Assessment* (EPA, 2016b). The results of the Baseline Survey relating to significant flora and vegetation are summarised in the following sections.

2.1 Significant Flora

Over 2020 to 2022, targeted surveys by Rapallo (2021b) and Umwelt (in prep.) were undertaken across the Development Envelope, with the exception of some small areas identified as Australia Heritage Sites that could not be accessed. Targeted searching for significant flora taxa was also undertaken outside the Development Envelope to provide context for the assessment.

The Threatened taxon *Seringia exastia* has been recorded within the Development Envelope and wider Study Area, which despite being no longer recognised as Threatened under WA's BC ACT, remains listed as Threatened under the EPBC Act (Department of Premier and Cabinet (DPC) 2018). Correspondence with the Department of Biodiversity, Conservation and Attractions (DBCA) Species and Communities Assessment Team (dated 4th August 2022) has provided clarity with regards to the treatment of this taxon. It is not expected that the taxon would be removed from the official published Threatened flora listing before September – October 2022, however no exact date can be provided. It is understood that the synonymisation of *S. elliptica* under *S. exastia* means that *S. exastia* is now considered common and widespread (Binks, *et al*., 2020). However, until changes are officially made to the threatened species list, *S. exastia* is still legally listed as threatened flora and should be treated as such. Authorisation to take under section 40 of the *Biodiversity Conservation Act 2016* is still required, however the new understanding of the taxon's distribution would be considered in the EIA process by the DBCA.

A further eight significant flora taxa were recorded within the Study Area including six DBCA listed Priority (P) taxa, and two taxa considered significant as a 'new species or species with anomalous features that indicate a potential new species' as defined in EPA (2016a, 2016b) (**Figure 2.1)**. Rapallo's (2021a, b) study recorded three locations of *Goodenia nuda* within the Study Area, however this taxon has since been delisted (formerly P4).

The potentially undescribed *Corchorus* sp. is considered taxonomically significant as it is not able to be matched to any other specimen within the WA Herbarium collection. The WA Herbarium has advised that a precautionary approach would also see it regarded as a plant of conservation significance, whilst noting that its poorly collected nature and potential geographical restriction make this difficult to formally assess (M. Hislop, *pers. comm*. June 2022). Six specimens of *Corchorus* sp. from the 2022 survey have been submitted for lodgement with the WA Herbarium to facilitate this assessment going forward.

The potentially undescribed entity *Euphorbia ferdinandi* s. lat is currently under review by the WA Herbarium. In response to consultation the WA Herbarium have advised in the interim to treat the entity as a plant of taxonomic significance (M. Hislop, *pers. comm.* August 2022).

A summary of data relating to significant flora taxa recorded in the Study Area by the Baseline Survey is presented in **Table 2.1**. Of the nine significant flora taxa known to occur in the Study Area, three have been recorded in the Disturbance Footprint (**Figure 2.1, Table 2.1**)**.** All other significant flora taxa recorded within the Study Area or identified by the Desktop Study (Umwelt, 2022) have been assessed as unlikely to occur within the Disturbance Footprint (**Appendix A**).

A likelihood of occurrence assessment (**Appendix A**) of the remaining significant flora taxa identified by the Desktop Study, resolved that 41 significant taxa could possibly occur within the Study Area (excluding the Development Envelope), in addition to those already recorded, based on the presence of suitable habitat and the known range of the taxon.

The likelihood that any further significant flora taxa may occur within the Development Envelope has been assessed as unlikely (**Appendix A**).

Table 2.1 Summary of Significant Flora Taxa Recorded by the Baseline Surveys Within the Study Area (Rapallo 2021b, Umwelt, 2022)

2.2 Vegetation

2.2.1 Regional Vegetation

The Study Area is located within the Pilbara Interim Biogeographic Regionalisation for Australia (IBRA) Bioregion, and specifically within the Hamersley IBRA Subregion (PIL3) (DAWE 2020). The Hamersley Subregion comprises mainly of mulga low woodland over bunch grasses on fine textured soils in valley floors, and *Eucalyptus leucophloia* over *Triodia brizoides* on skeletal soils of the ranges (Kendrick, 2001).

The vegetation of WA as it was presumed to have existed prior to European settlement has been mapped at a scale of 1:250,000 as vegetation system associations (VSAs) (DBCA, 2019), with the pre-European Vegetation spatial database subsequently created (DPIRD, 2019). The Study Area occurs across two VSAs, as summarised in **Table 2.3**. **Table 2.3** also presents the current extent of each VSA in relation to its pre-European extent within the Hamersley IBRA Subregion, and the percentage of the current extent of each VSA currently protected for conservation in all DBCA-managed land (as a proportion of the current extent) within the Hamersley IBRA Subregion (Government of Western Australia 2019), as well as area (ha) and extent (as percentage) in the Study Area.

There is over 99 % of the pre-European extent of both VSAs remaining, and both have some areas protected for conservation.

Table 2.2 Vegetation System Associations of the Study Area

Vegetation System Association	Description *	Mapped Extent (ha)				Pre-European Extent Remaining (%)*	Current Extent Protected for Conservation (%)*
		Disturbance Footprint	Development Envelope	Study Area	Current Extent*		
Hamersley_18	Low woodland, open low woodland or sparse woodland	412.74	594.40	2,432.9	575,808	99.2	29.6
Hamersley_82	Low tree-steppe	247.89	299.73	1,352.8	2,146,708	99.4	13.7

* Data from DBCA (2019).

Soil landscape mapping of WA (previously referred to as land system mapping) has been compiled from the results of various surveys across the state by the Department of Agriculture (now the Department of Primary Industries and Regional Development (DPIRD)) (DPIRD 2019). Data from van Vreeswyk *et al.* (2004) has been used to map soil landscape units in the region within which the Desktop Study Area is located. This data includes general ecological information, vegetation physiognomy and composition, patterns of variation, conservation status, gradational association and land system representation (van Vreeswyk *et al*., 2004).

The Study Area occurs across five soil landscape systems, as summarised in **Table 2.3.** None of these soil landscape systems are listed as TECs under the EPBC Act (DAWE 2021a) or as TECs or PECs under the BC Act (DBCA 2018; 2022a), and all are detailed as being common in the Pilbara landscape mapping Study Area (van Vreeswyk *et al.* 2004).

Table 2.3 Soil Landscape Units of the Study Area

	Description*	Mapped Extent (ha)			
		Indicative Footprint	Development Envelope	Study Area	Total*
Boolgeeda (285Bg)	Stony lower slopes and plains below hill systems supporting hard and soft spinifex grasslands and mulga shrublands. Predominantly colluvium on gently sloping plains; widespread and common Stony lower slopes, level stony plains and narrow sub-parallel drainage floors, relief up to 20 m. A common system in shallow valleys below hill systems such as Newman and Rocklea. Noted to be subject to fairly frequent burning.	588.41	790.68	2,510.3	774,800
McKay (285Mk)	Hills, ridges, plateaux remnants and breakaways of meta sedimentary and sedimentary rocks supporting hard spinifex grasslands. Predominantly sedimentary rocks on hills; widespread and common. Erosional surfaces; hill tracts, ridges, plateaux remnants and breakaways with steep upper slopes and more gently inclined lower footslopes, restricted stony plains and interfluves; moderately spaced tributary drainage patterns incised in narrow valleys in upper parts becoming broader and more widely spaced downstream. Relief up to 100 m.	12.70	20.07	213.1	420,200
Newman (285Ne)	Rugged jaspilite plateaux, ridges and mountains supporting hard spinifex grasslands Predominantly jaspilite on ridges and plateaux; very common in the southern half of the Landscape mapping Study Area Rugged high mountains, ridges and plateaux with near vertical escarpments of jaspilite, chert and shale, the second largest system in the survey area and prominent in southern parts (e.g. Ophthalmia Range, Hamersley Range), relief up to 450 m.	44.53	54.01	654.3	1,458,000
Platform (285Pl)	Dissected slopes and raised plains supporting hard spinifex grasslands Predominantly colluvium on incised slopes; common in the central and south-west of the Landscape mapping Study Area Narrow, raised plains and highly dissected slopes on partly consolidated colluvium below the footslopes of hill systems such as Newman, relief mostly up to about 30 m but occasionally considerably greater.	10.25	22.90	301.2	1,570,000

	Description*	Mapped Extent (ha)			
		Indicative Footprint	Development Envelope	Study Area	Total*
Wannamunna (285Wn)	Hardpan plains and internal drainage tracts supporting mulga shrublands and woodlands (and occasionally Eucalypt woodlands) Predominately alluvium on hardpan plains, internal drainage flats; common in the central and south of the Landscape mapping Study Area Level alluvial plains with prominent grove patterns of vegetation and shallow loamy soils over hardpan and broad internal drainage plains with deeper more clayey soils, relief up to 5 m. The system is found in south central parts of the survey area as broad flats within the Hamersley Ranges (Newman land system).	4.75	6.47	106.8	57,700

* Data from DPIRD (2018)

2.2.2 Local Vegetation

Three flora and vegetation surveys have been previously undertaken at Lamb Creek (see Umwelt (in prep) for a summary of previous surveys conducted within and in the vicinity of the Study Area); however two of these have been considered out of date and/or unlikely to be sufficient to support assessment under current EPA Guidance and Policy (Umwelt, 2022). Furthermore, previous flora and vegetation assessments have been conducted utilising a variety of survey methods and naming conventions, and/or were not undertaken using the methods detailed in EPA's *Technical Guidance—Flora and Vegetation Surveys for Environmental Impact Assessment* (EPA, 2016b). Therefore, assessment of impacts from the Project to vegetation is undertaken using the VT dataset presented by Umwelt (in prep), which was conducted in line with EPA (2016b) requirements, and is considered to supersede all previous flora and vegetation surveys undertaken in the Study Area.

The 10 Vegetation Types determined by Umwelt (in prep) were derived through analysis of a total of 127 quadrats recorded by Rapallo (2021a) and Umwelt (in prep) which were established over 2021 and 2022. The quadrat locations were established across the Study Area, targeting all landform types identified via aerial photography interpretation and field observations. Floristic composition classification and subsequent examination of quadrat data resulted in the definition of 10 VTs across the Study Area, as presented on **Figure 2.2** (Umwelt, 2022).

Table 2.4 presents a summary of the extent of VTs mapped within the Study Area and Disturbance Footprint. All but one VT mapped in the Study Area occurs in the Disturbance Footprint.

None of the VTs defined by the Baseline Survey were considered to represent any formally listed TECs (DAWE, 2021a; DBCA, 2018) or PECs (DBCA, 2021). In addition, none of the VTs described in the Study Area are considered to be significant for reasons other than formal listing (**Section 1.3**). While a small number of VTs are not well-represented within the Study Area (i.e. mapped over < 3 % of the Study Area), based on field observations and aerial photography interpretation, all VTs mapped in the Study Area and Disturbance Footprint are either known to, or considered likely to, extend outside the Study Area to some extent (Umwelt, 2022).

Table 2.4 Vegetation Types of the Study Area and Disturbance Footprint Mapped by the Baseline Survey (Umwelt, 2022)

Vegetation Type	Mapped Extent in Study Area (ha)	Percent of Study Area (%)	Mapped Extent in Disturbance Footprint (ha)	Percent of Disturbance Footprint (%)
1	1,429.16	37.75	343.39	51.98
2	382.30	10.10	76.30	11.55
3	48.16	1.27	6.32	0.96

Vegetation Types

1 Low Open Woodland of *Eucalyptus leucophloia* subsp. *leucophloia* and/or *E. gamophylla* with isolated *Corymbia deserticola* subsp. *deserticola* over low to mid sparse to open shrubland dominated by species including *Acacia atkinsiana* and *A. ancistrocarpa* over low open hummock grassland of *Triodia pungens, T. vanleeuwenii* and *T. wiseana* and low open tussock grassland of *Themeda* sp. Mt Barricade (M.E. Trudgen 2471) and *Paraneurachne muelleri* on red-brown sandy clay loam to clay loam on gently inclined mid to lower slopes and associated drainage lines

2 Low open woodland of *Eucalyptus leucophloia* subsp. *leucophloia* with occasional *Corymbia deserticola* subsp. *deserticola* and *C. hamersleyana* over low sparse shrubland of *Acacia hilliana* and *Hakea chordophylla* over open hummock grassland of *Triodia vanleeuwenii* and *T. wi*seana on red-brown clay loam with ironstone pebbles on gently inclined lower to upper slopes

3 Isolated trees of *Corymbia hamersleyana, Eucalyptus leucophloia* subsp. *leucophloia* and *E. gamophylla* over low sparse shrubland of mixed Acacia species over low hummock grassland of *Triodia pungens* and *T. wiseana* on red-brown sandy clay loam on mid to lowerslopes with ironstone pebbles

4 Low open woodland of *Corymbia ferriticola* or *Corymbia hamersleyana* and *Eucalyptus leucophloia* subsp. *leucophloia* with *Ficus brachypoda* occurring on gorge and gully areas, over low sparse shrubland of mixed species dominated by *Corchorus laniflorus, Dodonaea viscosa* subsp. *mucronata* and *Gossypium robinsonii* over sparse hummock grassland dominated by *Triodia pungens* with *T. wiseana* and tussock grasses including *Cymbopogon ambiguus* and *Aristida burbidgeae* on red brown clay loam on steep upperslopes, gullies, breakaways and gorges with significant ironstone outcropping

5 Occasional *Eucalyptus leucophloia* subsp. *leucophloia* and *Corymbia hamersleyana* over mixed isolated shrubs including *Acacia inaequilatera* and *Senna artemisioides* subsp. *glutinosa* over low hummock grassland of *Triodia wiseana* on steep upperslopes and associated drainage lines on red-brown clay loam with exposed ironstone and dolerite

6 Low woodland to open woodland of *Corymbia hamersleyana* and *Eucalyptus leucophloia* subsp. *leucophloia* and occasional *E. kingsmillii* over mid isolated shrubs of *Acacia hamersleyensis* and *Grevillea wickhamii* ?subsp. *hispidula* over low hummock grassland of *Triodia wiseana* on red brown sandy clay loam on steep mid to upperslopes with exposed ironstone

7 Isolated trees of *Corymbia hamersleyana, Eucalyptus leucophloia* subsp. *leucophloia* and *Eucalyptus xerothermica* over low open to sparse shrubland dominated by *Acacia aptaneura, A. aneura* and *A. pruinocarpa* over low tussock grassland to sparse tussock grassland dominated by *Themeda* sp. Mt Barricade (M.E. Trudgen 2471), *Enneapogon polyphyllus, Chrysopogon fallax* and *Aristida* spp. with occasional *Triodia pungens* on red brown clay loam with some ironstone pebbles on plains

8 Isolated trees of *Eucalyptus xerothermica* over tall open to sparse shrubland of *Hakea lorea* subsp. *lorea* and *Acacia aptaneura* over low open tussock grassland of *Aristida contorta, A. inaequiglumis* and *Themeda triandra* on red-brown sandy clay to clay on plains

9 Low open woodland of *Corymbia hamersleyana, C. deserticola* subsp. *deserticola, Eucalyptus gamophylla* and *Eucalyptus leucophloia* subsp. *leucophloia* over tall sparse shrubland of *Acacia atkinsoniana* and occasional *A. ancistrocarpa* and *A. aptaneura* over low hummock grassland dominated by *Triodia pungens* and occasional *T. wiseana* with *Paraneurachne muelleri* also dominant on red-brown clay loam with ironstone pebbles on plains

10 Low open woodland of *Corymbia hamersleyana* with occasional *Eucalyptus gamophylla, E. leucophloia* subsp. *leucophloia* and *E. xerothermica* over tall open shrubland dominated by taxa including *Acacia cowleana, A. tumida* var. *pilbarensis, Gossypium robinsonii* and *A. pyrifolia* over low open hummock grassland of *Triodia pungens* and tussock grassland dominated by *Themeda* sp. Mt Barricade (M.E. Trudgen 2471) and *Aristida* spp. on red-brown clay loams on major and minor drainage lines

FIGURE 2.2

LEGEND - Vegetation Types described by the Baseline Survey (Umwelt, in prep)

3.0 Methods

3.1 Conservation Significance Ratings and Direct Impacts

The assessment of direct impacts to significant flora and vegetation is provided by quantification of the Project layout (i.e. Disturbance Footprint) in a Geographic Information System (GIS) environment on the known extent and range of significant environmental factors in the Study Area and local area. Therefore, the Project is expected to directly impact no more than 661 ha within an 894 ha Development Envelope.

3.1.1 Significant Flora

As previously mentioned, the significant flora dataset collected by the Baseline Surveys (Rapallo, 2021b, Umwelt, 2022) has been utilised for the flora component of this impact assessment.

A qualitative assessment of the significance of local populations of significant flora taxa to the regional conservation status of each taxon was undertaken. This assessment considered the number and distribution of indicative regional populations, the size of these populations, the reservation status of the tenure of the lands upon which they occur, and the position of the Study Area within the known range of each taxon. Information relating to significant flora taxa indicative regional populations was sourced from DBCA databases (NatureMap; Threatened and Priority Flora (TPFL) and Western Australian Herbarium Specimen databases (DBCA, 2007)), in combination with data collected for the Baseline Survey (Umwelt, 2022).

Table 3.1 Regional Conservation Significance Ratings of Local Populations of Significant Flora Taxa

Regional Conservation Significance Rating	Description
Low	Local populations are not of particular significance in terms of maintaining the survival of the taxon, as: • taxon is known from a wide distribution • taxon is known from ≥ 10 indicative regional populations, some of which are protected in conservation estate • local populations are likely to have low significance in maintaining the extent of the taxon; e.g. the local populations are located within the known range and do not represent disjunct populations, the local populations are located in relatively close proximity to other populations.
Moderate	Local populations are moderately significant in terms of maintaining the taxon through its range, as: • taxon is known from < 10 indicative regional populations, which may include those on conservation estate • taxon may have a wide distribution; however, the local populations are located on the edge of the known range or forms a significant disjunct population in comparison to other known populations • there are few, if any, nearby known populations.

Regional Conservation Significance Rating	Description
High	Local populations are relatively significant in terms of maintaining the taxon through its range, as: • taxon has a restricted distribution (< 40 km) • taxon is known from < 5 indicative regional populations, with no populations being located on conservation estate • local populations potentially contribute significantly to the maintenance of the taxon through being representative of the edge of the known range, forming a significant disjunct population or representing a significantly large population in comparison to other populations.

The number of individuals of each significant flora taxon potentially impacted, along with the impact to potential habitat for such taxa, was used to assess potential local impacts to significant flora taxa. The Disturbance Footprint was overlain on locations of significant flora taxa in a GIS environment to determine the potential extent of impact to these locations. The extent of proposed impact to preferred habitat VTs for each taxon was also calculated, to determine the proportional extent to which habitat for each taxon will be impacted. Qualitative assessment of the potential significance of impact to flora taxa and preferred habitat is provided with regard to the extent of impact and significance of local populations.

3.1.2 Vegetation

The VT mapping prepared by Umwelt (in prep) has been utilised for the vegetation component of this impact assessment.

Table 3.2 Local Conservation Significance Rating of Vegetation Types

Local Conservation Significance Rating	Description
1	• VT mapped over > 10 % of the Study Area, and • Landform/soil type on which the VT occurs is locally common and widespread.
2	• VT mapped over 1-10 % (inclusive) of the Study Area, and • Landform/soil type on which the VT occurs is locally common and widespread.
3	• VT mapped over 1-10 % (inclusive) of the Study Area, and • Landform/soil type on which the VT occurs is not locally common and/or is restricted.
4	• VT mapped over < 1 % of the Study Area, and • Landform/soil type on which the VT occurs is potentially locally uncommon and/or restricted.
5	• VT mapped over < 1 % of the Study Area, and • Landform/soil type on which the VT occurs is locally uncommon and/or restricted.

VTs ranked '1' and '2' are of low significance, with VTs ranked '3' or above considered to be of higher significance and examined on that basis accordingly.

The Development Footprint was overlain on VT polygons mapped in the Study Area in a GIS environment to determine the proposed impact area of each VT. Qualitative assessment of the potential significance of impact to vegetation is provided with regard to the extent of impact and local significance of vegetation.

Limited information regarding the regional distribution of vegetation is available for the Pilbara Bioregion. Although a regional flora and vegetation survey of the Pilbara Region has been undertaken by DBCA (McKenzie et al., 2009), no reports describing VTs on a regional scale are currently available. Studies by Beard (1975) and van Vreeswyk et al. (2004) have characterised the vegetation of the Pilbara Bioregion, but not at a scale appropriate for EIA. The significance of potential impacts to vegetation on a regional scale has been assessed through the determination of impact to pre-European vegetation (i.e. VSAs) mapped within the IBRA Subregion (DBCA, 2019), and to soil landscape units (DPIRD, 2018) (**Section 4.2.2.2**). The Disturbance Footprint was overlain on VSA polygons in a GIS environment to determine the proposed impact area for each VSA, and subsequent analysis of the pre-European and current extent of each VSA proposed to be impacted, with a similar process utilised for soil landscape units, to provide regional context.

In addition to the above, a brief qualitative assessment of potential significance of local and regional impact to Study Area VTs is provided.

3.2 Indirect Impacts

A potential indirect impact zone surrounding the Disturbance Footprint to an extent of 20 m (the IIAZ) was used to quantify potential indirect impacts (i.e. edge effects) of the Project on nearby significant flora and vegetation, in a GIS environment.

A qualitative discussion of other potential indirect impacts to flora and vegetation surrounding the Disturbance Footprint is also provided where a quantitative assessment cannot be undertaken.

4.0 Results

4.1 Conservation Significance Ratings

4.1.1 Significant Flora

As discussed in **Section 2.1**, nine significant flora taxa have been recorded within the Study Area; of these, three have records within the Disturbance Footprint (Rapallo 2021b; Umwelt, 2022). It is considered unlikely that any further significant flora taxa occur within the Disturbance Footprint (Appendix A).

An assessment of the regional conservation significance of the local populations of these significant flora taxa is provided in **Table 4.1**. This assessment uses the scale defined in **Table 3.1** and considers factors including the number of known indicative regional populations in WA, the presence of known records on lands managed for conservation, the known range of the taxon in WA, and the position of the Study Area within this range.

The ranges, number of indicative regional populations and number of populations in conservation estate of the two potentially undescribed taxa (*Corchorus* sp. and *Euphorbia ferdinandi* s. lat.) are unknown, and therefore the significance of their local populations in a regional context have been rated as High **(Table 4.1).**

Table 4.1 Significant Flora Taxa Considered in the Impact Assessment and the Significance of their Local Populations in a Regional Context

Taxon	Status (WA)	Occurrence in the Disturbance Footprint (Umwelt, 2022; Rapallo 2021b))	Significance of Local Populations in a Regional Context (Table 3.1)
Aristida jerichoensis* var. *subspinulifera	P3	• Not known to occur in the Disturbance Footprint, but one plant has been recorded 5 m away, within the Development Envelope. • Preferred habitat present in the Disturbance Footprint (VT8). • 69 ha of preferred habitat (VT8) has been mapped in the Study Area, of which 3 ha has been mapped in the Disturbance Footprint. • All suitable habitat in the Disturbance Footprint has been surveyed. • Total of 8 locations (97 individuals) recorded in the Study Area.	Local population assessed to be of Low regional significance • Taxon has a relatively wide distribution of approximately 1,000 km from near Gill Pinnacle (close to the WA / Northern Territory (NT) border) in the east, to north-west of Tom Price in the west; the Study Area is in the known range of this taxon. • Known from 42 WA Herbarium records across approximately 38 broad regional locations, three of which occur within DBCA-managed tenure within Karijini National Park (WA Herbarium 1998-). • There are 14 populations recorded (WA Herbarium, 1998-; DBCA, 2022c) within 40km of the Study Area, the nearest within one kilometre on the western side of the GNH and considered continuous with the population recorded by the baseline study (Umwelt, 2022).
Aristida lazaridis	P2	• Known to occur in the Disturbance Footprint. • Preferred habitat is present in the Disturbance Footprint (VTs 7 and 8), though it only occurs in the GNHI areas of VTs 7 and 8. • Within the GNHI area, there is 286 ha of preferred habitat. Of this, 16.8 ha (5.9%) is in the Disturbance Footprint. • All suitable habitat in the Disturbance Footprint has been surveyed. • Over 12,000 individuals recorded in the local area, of which 77 were recorded in the Disturbance Footprint.	Local populations assessed to be of Low regional significance: • Taxon has a distribution of approximately 130 km within WA, from north west of Newman in the south-east, to south-east of Wittenoom in the north-west (DBCA, 2007); the Study Area is in the centre of the known range of this taxon. • Known from 22 WA Herbarium records across approximately 17 broad regional locations, one of which occurs within DBCA-managed tenure within Karijini National Park (WA Herbarium 1998-). This taxon is also known from two records in the NT and 78 records in Qld (ALA 2022). • There are an additional 10 recorded populations within 40 km of the Study Area, the nearest to the Project's population is 10 km to the south.

Taxon	Status (WA)	Occurrence in the Disturbance Footprint (Umwelt, 2022; Rapallo 2021b))	Significance of Local Populations in a Regional Context (Table 3.1)
***Corchorus* sp.**	Potentially undescribed	• Not known to occur in the Disturbance Footprint, but one record located approximately 150 m from the Disturbance Footprint. • Preferred habitat (VT9) present in the Disturbance Footprint, however it is likely that this taxon will only occur in specific, localised sites within this VT (the known population occurs on sandy drainage lines). • 601 ha of preferred habitat (VT9) has been mapped in the Study Area, of which 68 ha has been mapped in the Disturbance Footprint. • All suitable habitat in the Disturbance Footprint been surveyed. • Total of 23 locations (35 individuals) recorded in the Study Area.	Local populations assessed to be of High regional significance: • Potentially represents an unrecognised taxon. • Range and extent of the potential new taxon is unknown; there are currently no other confirmed locations of this entity outside those collected in the local area for the Project.
Eremophila naaykensii	P3	• Not known to occur in the Disturbance Footprint. • Preferred habitat (VTs 4 and 6) present in the Disturbance Footprint. • 412 ha of preferred habitat (VTs 4 and 6) has been mapped in the Study Area, of which 1.5 ha has been mapped in the Disturbance Footprint. • All suitable habitat in the Disturbance Footprint has been surveyed. • A total of 37 locations (73 individuals) recorded in the Study Area.	Local populations assessed to be of Low regional significance: • Taxon has a distribution of approximately 200 km from near Newman in the east to east of Paraburdoo in the west, with the Study Area in the known range of this taxon. • Known from 21 WA Herbarium records across approximately 19 broad regional locations, one of which occurs within DBCA-managed tenure within Karijini National Park (WA Herbarium 1998-). • The nearest WA Herbarium record of this taxon is located 8 km south, on a range of hills between the Lamb Creek Study Area and Area C.

Taxon	Status (WA)	Occurrence in the Disturbance Footprint (Umwelt, 2022; Rapallo 2021b))	Significance of Local Populations in a Regional Context (Table 3.1)
***Euphorbia ferdinandi* s. lat.**	Potentially undescribed	• Not known to occur in the Disturbance Footprint. • Preferred habitat (VT8) present in the Disturbance Footprint. • 69 ha of preferred habitat has been mapped in the Study Area, of which 3 ha has been mapped in the Disturbance Footprint. • Total of 19 locations (60 individuals) recorded in the Study Area. • All suitable habitat in the Disturbance Footprint has been surveyed.	Local populations assessed to be of potentially High regional significance: • Potentially represents an unrecognised taxon. • Range and extent of the potential new taxon is unknown; although there are several segregated specimens at the WA Herbarium which may represent this taxon, a determination on this would be required. The submitted specimens of this entity are awaiting final determination by the WA Herbarium.
***Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708)**	P2	• Not known to occur in the Disturbance Footprint • Preferred habitat (VT4) present in the Disturbance Footprint. • 95 ha of preferred habitat (VT4) has been mapped in the Study Area, of which less than 1 ha has been mapped in the Disturbance Footprint. • All suitable habitat in the Disturbance Footprint has been surveyed. • 2 locations (17 individuals) were recorded in the Study Area.	Local populations assessed to be of Moderate regional significance: • Taxon has a distribution of approximately 180 km from north of Newman in the east to north-east of Paraburdoo in the west. The Study area is located on the northern extent of its known range. • known from 24 WA Herbarium records across 10 broad regional locations, two of which occur within DBCA-managed tenure within Karijini National Park (WA Herbarium 1998-). • No records are within 10km of the Study Area.
***Rhagodia* sp Hamersley (M. Trudgen 17794)**	P3	• Known to occur in the Disturbance Footprint • Preferred habitat present in the Disturbance Footprint (VT7); however this species only occurs in the GNHI area of VT7. • Within the GNHI area, there is 217 ha of preferred habitat. Of this, 13.8 ha (6.4%) is in the Disturbance Footprint. • All suitable habitat in the Disturbance Footprint has been surveyed. • Total of 43 locations (53 individuals) have been recorded in the Study Area, 3 locations (3 individuals) of which occur in the Disturbance Footprint.	Local populations assessed to be of Low regional significance: • Taxon has a distribution of approximately 330 km from west of Jigalong in the east to north-east of Tom Price in the west. The Study Area is in the northern extent of the known range of this taxon. • Known from 72 WA Herbarium records across more than 50 broad regional locations, two of which occur within DBCA-managed tenure including Jigalong Aboriginal Reserve and Karijini National Park (WA Herbarium 1998-). • A total of five records are known from within 10km of the Study Area, with nearby records confirming preferred habitat for this taxon.

Taxon	Status (WA)	Occurrence in the Disturbance Footprint (Umwelt, 2022; Rapallo 2021b))	Significance of Local Populations in a Regional Context (Table 3.1)
Rostellularia adscendens* var. *latifolia	P3	• Not known to occur in the Disturbance footprint, but one record (one individual) located approximately 80 m from the Disturbance Footprint. • Preferred habitat (VT1) present in the Disturbance Footprint; however taxon is likely to occur only in rocky drainage lines of VT1. • 1,429 ha of preferred habitat (VT1) has been mapped in the Study Area, of which 342 ha has been mapped in the Disturbance Footprint. • All suitable habitat in the Disturbance Footprint has been searched. • One location (one individual) has been recorded in the Study Area.	Local population assessed to be of Low regional significance: Taxon has • A distribution of approximately 450 km from west of Tom Price to north east of Meenthena Station. The study area is in the centre of the known range of this taxon. • Known from 42 WA Herbarium records across more than 280km from near Mt Farquhar (89km north-west of Tom Price) to the Oakover River. At least six locations occur in the Karijini National Park. • This taxon has been recorded approximately 20km south-east of the Lamb Creek retention license on the MAC development Envelope (Onshore 2017 quoted in Rapallo 2021a).
Seringia exastia	T	• Known to occur in the Disturbance Footprint. • Preferred habitat (VT1) present in the Disturbance Footprint. • 1,429 ha of preferred habitat (VT1) has been mapped in the Study Area, of which 342 ha has been mapped in the Disturbance Footprint. • Taxon was not specifically searched for in Disturbance Footprint given its common and widespread nature since synonimisation with *S. elliptica* (Binks, *et al.*, 2020), and its consistent and abundant occurrence throughout VT1. • 37 locations (783 individuals) recorded in the Study Area, of which 11 locations (211 individuals) were recorded in the Disturbance Footprint.	Local populations assessed to be of Low regional significance: • At the time of publication, *S. exastia* is no longer recognised under WA's BC Act, but remains listed as Threatened under the EPBC Act. • This taxon now has a very wide range across Western Australia (>1200km), extending from Giralia Station in the west through to the border with the NT, and from Broome in the north to Mt Manning Range NR in the south. The Study Area is within the known range of this taxon. • There are 293 records of this taxon across its range (WA Herbarium 1998-).

4.1.2 Vegetation

As discussed in **Section 2.2.2**, a total of nine VTs have been mapped in the Disturbance Footprint (Umwelt, 2022), and therefore are at risk of impact by the Project. The single VT that is not mapped in the Disturbance Footprint, VT5, predominately occurs north-east of the Disturbance Footprint in the north-eastern portion of the Study Area, with the closest occurrence being approximately 150 m from the Disturbance Footprint. VT 5 is likewise not mapped within the Development Envelope. Consequently, it is not expected that this VT will be directly impacted by Project activities.

None of the VTs mapped in the Study Area are considered to represent any formally listed TECs or PECs, nor considered significant for reasons other than formal listing (Umwelt, 2022) (**Section 2.2.2**). Although the VTs have not been mapped at a regional scale, none of the VTs are likely to be regionally significant, as no listed TECs or PECs occur in the Study Area, all landform and soil types associated with the VTs are likely to be relatively common in the region and all VTs are likely to extend outside of the Study Area due to continuing similarity of landforms and soils.

An assessment of the local conservation significance rating of each VT mapped in the Disturbance Footprint is presented in **Table 4.2.** This assessment uses the scale defined in **Table 3.2,** and considers the extent of the VT mapped over the Study Area and whether it occurs on restricted landforms and/or soils. Significant flora taxa that have preferred habitat in each VT is also provided in **Table 4.2** for context.

The local conservation significance of the majority (six) of VTs mapped was rated as '2', due to the VTs being mapped over 1-10 % of the Study Area and having a common local or widespread occurrence. Four VTs were mapped widely (>10%) over the Study Area, also on common or widespread landforms and soil types, and were therefore rated '1', the lowest significance rating. No VTs were mapped over less than 1% of the Study Area, nor were considered to occur on restricted landforms or soils **(Table 4.2)**. Therefore, all VTs are considered to have low significance at the local scale.

Table 4.2 Local Conservation Significant Rating Assessment of Vegetation Types of the Disturbance Footprint

Vegetation Type	Percent of Study Area (%)	Local Area Characteristics (Umwelt, 2022)	Local Conservation Significance Rating (Table 3.2)
1	37.8	• Occurs on stony red-brown sandy clay loam to clay loam on gently inclined mid to lower slopes and associated drainage lines. • Mapped widely over the entirety of the Study Area. • Considered likely to extend outside the Study Area to the north, west and south. • Occurs on landforms and soils that are likely to be locally common and widespread.	1
2	10.1	• Occurs on red-brown clay loam with ironstone pebbles on gently inclined lower to upper slopes. • Mapped across four general occurrences in the Study Area, typically at the upper slopes and summits of low hills, or the midslopes of high elevation ranges. • Considered likely to extend outside the Study Area to the northwest, north, east and south. • Occurs on landforms and soils that are likely to be locally common and widespread.	1
3	1.3	• Occurs on red-brown clay loam with ironstone pebbles on gently inclined lower to upper slopes. • Mapped over low ranges in the south west of the Study Area. • Considered likely to extend outside the Study Area to the south west. • Occurs on landforms and soils that are likely to be locally common and widespread.	2
4	2.5	• Occurs on red brown clay loam on steep upperslopes, gullies, breakaways and gorges with significant ironstone outcropping. • Mapped on ranges in the east of the Study Area, south east of the Mine DE. • Considered likely to extend outside the Study Area to the east and south. • Occurs on landforms and soils that are likely to be locally common and widespread.	2
5	2.7	• Occurs on steep upperslopes and associated drainage lines on red-brown clay loam with exposed ironstone and dolerite. • Mapped on ranges in the north east of the Study Area. • Considered likely to extend outside the Study Area to the north and east. • Occurs on landforms and soils that are likely to be locally common and widespread.	2

Vegetation Type	Percent of Study Area (%)	Local Area Characteristics (Umwelt, 2022)	Local Conservation Significance Rating (Table 3.2)
6	8.4	• Occurs on red brown sandy clay loam on steep mid to upper slopes with exposed ironstone. • Mapped on ranges in the east of the Study Area, south east of the Mine DE. • Considered likely to extend outside the Study Area to the east and south. • Occurs on landforms and soils that are likely to be relatively locally common and widespread.	2
7	13.8	• Occurs on red brown clay loam with some ironstone pebbles on plains. • Mapped widely over plains west of Mine Creek. • Considered likely to extend outside the Study Area to the north and west. • Occurs on landforms and soils that are likely to be locally common and widespread.	1
8	1.8	• Occurs on red-brown sandy clay to clay on plains. • Mapped over plains in the south west of the Study Area. • Considered likely to extend outside the Study Area to the west and south. • Occurs on landforms and soils that are likely to be locally common and widespread.	2
9	15.9	• Occurs on red-brown clay loam with ironstone pebbles on plains. • Mapped widely over plains west of Mine Creek. • Considered likely to extend outside the Study Area to the north and west and south. • Occurs on landforms and soils that are likely to be locally common and widespread.	1
10	5.7	• Occurs on red-brown clay loams on major and minor drainage lines. • Mapped over Mine Creek and its tributaries, significant drainage lines flowing down from hills in the south west, east and north east of the Mine DE. • Considered likely to extend outside the Study Area to the north and south. • Occurs on landforms and soils that are likely to be locally common and widespread.	2

4.2 Direct Impacts

4.2.1 Significant Flora

4.2.1.1 Local Impact

Table 4.3 presents a summary of potential direct impacts to the three significant flora taxa that are known to occur in the Disturbance Footprint (as per **Table 2.1**), based on calculation of percentages of individuals known from the Disturbance Footprint that are at risk of direct impact by the Project.

Less than 7% of the local population of *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3) and less than 1% of the local population of *Aristida lazaridis* (P2) is potentially at risk of direct impact by the project. Approximately 27% of the known numbers of individuals of *Seringia exastia* are potentially directly impacted by the project (**Table 4.3**).

Table 4.3 Potential Direct Impact to Locations and Individuals of Significant Flora Taxa

Taxon	Status*	Local Area		Disturbance Footprint			
		Number of Locations	Number of Individuals	Number of Locations	Percent of Locations (%)	Number of Individuals	Percent of Individuals (%)
Aristida lazaridis	P2	6,766[a]	12,942[a]	63	0.9	77	0.6
***Rhagodia* sp. Hamersley (M. Trudgen 17794)**	P3	49[b]	53[b]	3	6.1	3	5.7
Seringia exastia	T	37[b]	783[b]	11	29.7	211	26.9

[a] Counts include locations and individuals outside the Study Area, representing a continuance of the population within the study area (Rapallo, 2021b)

[b] Count is of locations and individuals inside the Study Area only

*Conservation status in WA under the BC Act, with the exception of *Seringia exastia* (T) which remains recognised only under the EPBC Act.

Table 4.4 presents a summary of the potential local direct impact to significant flora taxa whose preferred habitat occurs within the Disturbance Footprint, based on calculation of the percentage of its preferred habitat in the Disturbance Footprint that is at risk of impact by the Project. For the purpose of calculating impacts, the preferred habitat of two taxa (*Aristida lazaridis* and *Rhagodia* sp. Hamersley (M. Trudgen 17794)) is considered restricted to the GNH area of their respective VTs. **Table 4.4** considers all significant flora taxa in **Table 4.1**, irrespective of whether known locations are present in the Disturbance Footprint.

Table 4.4 Potential Direct Impact to Preferred Habitat of Significant Flora Taxa

Taxon	Status*	Preferred Habitat (VTs)	Mapped Extent of Preferred Habitat (ha)		Percent Impact (%)
			Study Area	Disturbance Footprint	
Aristida jerichoensis* var. *subspinulifera	P3	8	68.93	2.93	4.3
Aristida lazaridis	P2	7 and 8 (GNHI Area only)	286.17	16.81	5.9

Taxon	Status*	Preferred Habitat (VTs)	Mapped Extent of Preferred Habitat (ha)		Percent Impact (%)
Corchorus sp.	Potentially undescribed	9	600.81	68.28	11.4
Eremophila naaykensii	P3	4 and 6	411.93	1.46	0.4
Euphorbia ferdinandi s. lat.	Potentially undescribed	8	68.93	2.93	4.3
Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708)	P2	4	95.32	0.62	0.7
Rhagodia sp Hamersley (M. Trudgen 17794)	P3	7 (GNHI Area only)	217.24	13.88	6.4
Rostellularia adscendens var. *latifolia*	P3	1	1,429.16	343.39	24.0
Seringia exastia	T	1	1,429.16	343.39	24.0
*Conservation status in WA under the BC Act, with the exception of *Seringia exastia* (T) which remains recognised only under the EPBC Act.					

Table 4.5 presents a qualitative assessment of the significance of the potential direct impact by the Project to significant flora taxa at a local scale. The potential direct impact to all assessed taxa is considered unlikely to be significant at the local scale.

Table 4.5 Significance of Potential Local Direct Impact to Significant Flora Taxa

Taxon	Status*	Regional Significance of Local Populations (Table 4.1)	Potential Local Direct Impact (%)		Comment Regarding Potential Significance of Local Direct Impact
			Number of Individuals (Table 4.3)	Preferred Habitat VT (Table 4.4)	
Aristida jerichoensis var. *subspinulifera*	P3	Low	0	4.3	Unlikely to be significant direct impact. No individuals and less than 5% of preferred habitat of the Study Area is at risk of direct impact.
Aristida lazaridis	P2	Low	0.6	5.9	Unlikely to be significant direct impact. Less than 2% of individuals at risk of direct impact and preferred habitat is well represented outside of the Disturbance Footprint and in the local area.
Corchorus sp.	Potentially undescribed	High	0	11.4	Unlikely to be significant direct impact. No individuals at risk of direct impact and preferred habitat is primarily represented outside the Disturbance Footprint in the local area.
Eremophila naaykensii	P3	Low	0	0.4	Unlikely to be significant direct impact. No individuals and less than 1% of preferred habitat of the Study Area is at risk of direct impact.

Taxon	Status*	Regional Significance	Potential Local Direct Impact (%)		Comment Regarding Potential Significance of Local Direct Impact
***Euphorbia ferdinandi* s. lat.**	Potentially undescribed	High	0	4.3	Unlikely to be significant direct impact. No individuals and less than 5% of preferred habitat of the Study Area is at risk of direct impact.
***Hibiscus* sp. Gurinbiddy Range (M.E. Trudgen MET 15708)**	P2	Moderate	0	0.7	Unlikely to be significant direct impact. No individuals and less than 1% of preferred habitat of the Study Area is at risk of direct impact.
***Rhagodia* sp Hamersley (M. Trudgen 17794)**	P3	Low	5.7	6.4	Unlikely to be significant direct impact. Less than 6% of individuals at risk of direct impact and preferred habitat is well represented outside of the Disturbance Footprint and in the local area.
Rostellularia adscendens* var. *latifolia	P3	Low	0	24.0	Unlikely to be significant direct impact. No individuals and less than 25% of preferred habitat of the Study Area is at risk of direct impact.
Seringia exastia	T	Low	26.9	24.0	Unlikely to be significant direct impact. Taxon is common in the local area, and preferred habitat is well represented outside the Disturbance Footprint in the local area.
*Conservation status in WA under the BC Act, with the exception of *Seringia exastia* (T) which remains recognised only under the EPBC Act.					

4.2.1.2 Regional Impact

Table 4.6 presents a summary of significance of potential impacts at the regional scale to populations of significant flora taxa that are known to occur in the Disturbance Footprint (as per **Table 4.3**). Note that while the number of indicative regional populations of significant flora taxa presented in **Table 4.6** has been determined using the DBCA (2017) definition of a population (described in **Section 1.3**), the number of new populations recorded by the Baseline Survey and the number of regional populations that will be impacted has been limited to a maximum of one, as it is considered that there is insufficient spatial separation between significant flora records in the local area and Disturbance Footprint to indicate the presence of multiple indicative local populations.

There is unlikely to be significant regional impact to any of the assessed taxa, including those with local populations that have high regional conservation significance. This is primarily due to the relatively low levels of direct impact on local populations of these taxa, with all taxa that have known records in the Disturbance Footprint also having known records and preferred habitat outside the Disturbance Footprint in the wider local area (**Table 4.1**).

Table 4.6 Potential Regional Impact of Populations of Significant Flora Taxa

Taxon	Status*	Regional Significance of Local Populations (Table 4.1)	Known Indicative Regional Populations (Table 4.1)	New Regional Populations Recorded by Baseline Survey	Total Known Indicative Regional Populations	Indicative Regional Populations to be Impacted	Comment Regarding Potential Significance of Regional Impact
Aristida lazaridis	P2	Low	17	0	17	1	Unlikely to be significant impact Whilst the taxon is known from only 17 regional populations (low regional significance of these local populations), the Project has a very low (less than 1%) potential direct impact at the local scale.
***Rhagodia* sp. Hamersley (M. Trudgen 17794)**	P3	Low	72	0	72	1	Unlikely to be significant impact Taxon is known from a relatively large number of regional populations (low regional significance of these local populations) and has a low impact at the local scale.
Seringia exastia	T	Low	293	0	293	1	Unlikely to be significant impact Taxon is known from an extensive and large number of regional populations (low regional significance of these local populations) and has a low impact at the local scale.

*Conservation status in WA under the BC Act, with the exception of *Seringia exastia* (T) which remains recognised only under the EPBC Act.

4.2.2 Vegetation

4.2.2.1 Local Impact

Table 4.7 presents a summary of potential local impact to VTs mapped in the Disturbance Footprint, based on the mapped extent of VTs in the Disturbance Footprint in relation to their total mapped extent in the Study Area.

The extent of impact on VTs mapped in the Disturbance Footprint is relatively low with the mapped extents in the Disturbance Footprint ranging between 23.9 % (VT1) and 0.3 % (VT6) of the mapped extent in the Study Area (**Table 4.7**).

The highest local conservation significance rating for VTs of the Disturbance Footprint was '2' (VT mapped over 1-10 % (inclusive) of the Study Area, and landform/soil type is locally common and widespread) (VTs 3,4,5,6,8 and 10) (**Table 4.2**). Therefore, these VTs are considered to be of low local significance. In addition, there is unlikely to be significant impact at the local scale for any of the assessed VTs due to the relatively low percentage of impact, with less than 25% of the mapped extent of any VT at risk of direct impact (**Table 4.7**).

Table 4.7 Potential Local Impact to Vegetation Types

Vegetation Type	Local Conservation Significance Rating (Table 4.2)	Mapped Extent (ha)		Percent Impact (%)
		Study Area	Disturbance Footprint	
1	1	1,429.16	343.39	24.0
2	1	382.30	76.30	20.0
3	2	48.16	6.32	13.1
4	2	95.32	0.62	0.7
5	2	100.95	-	0.0
6	2	316.61	0.84	0.3
7	1	523.39	118.88	22.7
8	2	68.93	2.93	4.3
9	1	600.81	68.28	11.4
10	2	215.50	41.11	19.1

4.2.2.2 Regional Impact

As discussed in **Section 2.2.1,** two VSAs occur in the Study Area and Disturbance Footprint. A summary of the impact of the Project to these VSAs is presented in **Table 4.8**. This assessment considers the spatial extent of each VSA that will remain in the Hamersley IBRA subregion following clearing of vegetation for the Project, and the extent remaining as a percent of each VSA's Pre-European extent in the Hamersely IBRA subregion.

The implementation of the Project will not result in any of the VSAs in the Disturbance Footprint falling below the 30 % pre-European extent threshold (EPA, 2008) (**Table 4.8**). Therefore, the scale of regional impact to these VSAs because of the Project is unlikely to be significant.

Table 4.8 Impact to Vegetation System Associations of the Disturbance Footprint

Vegetation System Association	Mapped Extent (ha)			Extent Remaining^ (ha)	Extent Remaining$ (%)
	Pre-European*	Current*	Disturbance Footprint		
Hamersley_18	580,512	575,808	413	575,395	99.1
Hamersley_82	2,158,862	2,146,708	248	2,146,460	99.4

* Data from DBCA (2019).

^ Current extent of VSA remaining following clearing of the Disturbance Footprint.

$ Current extent of VSA remaining as a percent of the Pre-European extent following clearing of the Disturbance Footprint.

Five soil landscape units occur in the Study Area and Disturbance Footprint (**Table 2.3**). A summary of the impact of the Project to these soil landscape units is presented in **Table 4.9**. This assessment considers the spatial extent of each soil landscape unit that maybe impacted by the Project, which in all cases is negligible (less than 0.01%).

Table 4.9 Impact to Soil Landscape Units of the Disturbance Footprint

Unit	Mapped Extent (ha)		Extent Remaining (ha)	Percent Impact (%)
	Total*	Disturbance Footprint		
Boolgeeda (285Bg)	774,800	588.41	774,212	0.076
McKay (285Mk)	420,200	12.70	420,187	0.003
Newman (285Ne)	1,458,000	44.53	1,457,955	0.003
Platform (285Pl)	1,570,000	10.25	1,569,990	0.001
Wannamunna (285Wn)	57,700	4.75	57,695	0.008

* Data from DPIRD (2018) and van Vreeswyk et al. (2004).

Given that none of the VTs are considered regionally significant, nor correspond to any formally-listed TECs or PECs, nor are considered significant for reasons other than formal listing (Umwelt, 2022), and all VTs are considered to be represented outside of the Study Area, the potential regional significance of impact to VTs is unlikely to be significant.

4.3 Indirect Impacts

4.3.1 Background

4.3.1.1 Dust

There is potential for dust generated during Project construction and operation to be deposited on flora and vegetation in close proximity to Project areas. Dust can impede photosynthesis and other physiological processes of plants, including by blocking stomata, which can impact the overall health of vegetation.

Some research has been undertaken to investigate the impact of dust on native vegetation in the Pilbara and southwest of WA (Butler, 2009; Matsuki *et al.*, 2016), as well as at mine sites in nearby regions. There is some evidence to suggest that dust from mining operations can impact flora taxa and/or vegetation, but the long-term impact is not clear. Turner (2013) reported that heavy dust loading resulted in reduced stomatal conductance in two *Acacia* taxa; likewise, it was evident in field observations that heavy dust loads resulted in some plant stress, including leaf shed, or plant senescence. It was found that the leaf surface and dust interaction was more important to plant stress levels than the actual amount of dust; however, metal-rich dust with low pH may have been the causal factor.

In other studies, while some temporary impacts have been recorded in terms of reduced photosynthesis, no long-term effects such as increased plant mortality have been established. Monitoring by Woodman Environmental (2017) at the Atlas Iron Pty Ltd Pardoo iron ore mine focussed on potential impacts of dust generated by mining operations including road use, on two ephemeral significant flora taxa, *Eragrostis crateriformis* (P3) and *Rothia indica* subsp. *australis* (P1). However, unlike Turner, Woodman Environmental reported that the dust levels on these taxa did not result in significant stress or death.

If appropriate dust suppression procedures are implemented during clearing and machinery movement, it is unlikely that dust deposition will significantly impact surrounding vegetation and flora taxa. Likewise, if dust suppression at Lamb Creek utilises groundwater that is fresh, run-off of saline water into adjacent vegetation, or overspray of saline water directly onto vegetation, is not anticipated.

4.3.1.2 Changes to Surface Water Hydrology

Altered surface water hydrology may result in the potential reduction or removal of seasonal surface water flows, leading to either death or loss of condition to individual plants or vegetation. Barriers to surface water flows, such as intersection of watercourses, may result in ponding upstream, interruption of sheet flows, and drainage shadow effects downstream of the barrier. Water ponding may have secondary effects, including the creation of new or modified environments due to the presence of waterlogging or permanent water, and increased presence of weed species. Vegetation at risk from drainage shadow includes both terrestrial vegetation that is reliant on sub-surface soil-water flow, and riparian vegetation that is at least partially reliant on water sources provided by creeklines and drainage areas.

4.3.1.3 Changes to Groundwater Levels (Groundwater Drawdown)

Open pit mines often extend below the natural position of the water table, and therefore groundwater surrounding such mines may be extracted to lower the water table and provide dry mining conditions. This may result in the death of phreatophytic taxa and change in composition of GDV. Loss of groundwater-dependant tree species may in turn affect overall vegetation condition as a result of increased light levels, altered vegetation structure, and vegetation-related soil moisture levels. Phreatophytic taxa in the Pilbara include *Melaleuca argentea* (strongly obligate phreatophyte), *Sesbania formosa* (obligate phreatophyte), *Eucalyptus camaldulensis* subsp. *refulgens* (can be obligate or a facultative phreatophyte depending on the situation), and facultative phreatophytes including *Atalaya hemiglauca, Acacia ampliceps, Melaleuca glomerata* and *Melaleuca linophylla.*

Natural seasonal fluctuations in groundwater levels may also serve to affect the health of phreatophytic taxa, with the greatest risk of stress likely to be prior to the start of the 'wet' season in the Pilbara (October-November). The effects of these fluctuations may be exacerbated by groundwater drawdown, potentially resulting in severe stress of phreatophytic taxa prior to significant rainfall (Groom *et al*., 2000).

Groundwater drawdown is proposed at Lamb Creek from mining inception for pit dewatering and to meet water supply demands (PSM, 2021). The depth of the water table in the resource area ranges from 25 to 60 m, which discounts the local presence of GDEs (PSM, 2021). In addition, within Umwelt's (in prep) Study Area, no GDV has been identified; the only GDV indicator taxon recorded from the Study Area was the facultative phreatophyte *Atalaya hemiglauca,* occurring occasionally in the riparian vegetation of Mine Creek (VT10). The presence of this taxon alone does not indicate the presence of GDV, with the depth of the water table indicating that the vegetation is unlikely to be dependent on groundwater.

4.3.1.4 Groundwater Discharge

Surplus water from groundwater dewatering may be discharged to the land surface as a controlled release into designated watercourses or wetlands. Impacts from groundwater discharge can be two-fold; during discharge activities, followed by impacts when discharge stops. Primary impacts from groundwater discharge include temporary creation of new or modified environments downstream of discharge points due to the presence of permanent water/waterlogging or extension of the time that water is present, followed by subsequent decline of these environments after cessation of discharge (CSIRO, 2015; MWH, 2009; Woodman Environmental, 2019). Senescence of plant species that cannot tolerate constant waterlogging may occur, as well as the introduction and/or spread of tolerant weed species. While it is likely that any species lost due to the surface saturation will re-colonise the area after environmental discharge has ceased, the re-colonisation may take many years (van Etten & Vellekoop, 2009; Woodman Environmental, 2019).

4.3.1.5 Fragmentation

Fragmentation is the process by which habitat loss results in the division of large, continuous habitats into smaller, more isolated habitat fragments. The main drivers of fragmentation impacts include reduced patch (habitat) area, increased edge effects (introduction of weeds and other degradation), altered patch shape, increased patch isolation and altered matrix structure. Smaller patches, including smaller populations of significant flora taxa, can result in reduction of reproductive success of individual species, and reduction of overall species composition. The length of time for which a patch has been isolated is also important, with species richness decreasing with increased time since fragmentation (Didham, 2010).

With respect to individual species, several traits may assist in predicting their sensitivity to fragmentation (Henle *et al.* (2004), referenced in Didham (2010)):

- Population size: smaller populations are more prone to extinction.
- Population variability: greater temporal variability in population size reduces the probability of population persistence.
- Competitive ability and sensitivity to disturbance: competitively-dominant species in undisturbed habitats may reduce at the expense of disturbance-opportunists.
- Degree of habitat specialisation: specialist species are more susceptible than generalist species.
- Rarity: rare, patchily distributed species are more susceptible than common species.
- Biogeographical location: tropical and Mediterranean biomes are more sensitive to fragmentation than temperate biomes.

Gene flow that is too low to sufficiently buffer the negative effects of inbreeding and genetic drift in fragmented populations may result in decreased population fitness and increased risk of extinction following further habitat fragmentation (Lienert, 2004; Luquet et al., 2012). Furthermore, taxa with genetic diversity that is already low may be at greater risk from habitat fragmentation than those with greater genetic diversity.

4.3.2 Indirect Impact Assessment

4.3.2.1 Edge Effects

The flora and vegetation in the IIAZ is at risk of edge effects as a result of the Project, including dust deposition, water ponding, runoff, drainage shadow and weeds (**Section 4.3.1**). The IIAZ encompasses a total area of 278 ha. Note that a figure for the IIAZ has not been prepared given the small buffer distance from the Disturbance Footprint.

Table 4.10 presents the number of locations and individuals of significant flora taxa recorded by the Baseline Survey within the IIAZ that are at risk of edge effects as a result of the Project.

A total of four significant flora taxa have records within the IIAZ **(Table 4.10).** Note that the Baseline Survey searched for significant taxa throughout the Development Envelope, which is a 20 – 40 m buffer on the majority of the Footprint. As such, it is considered likely that the majority of significant flora taxa present in the IIAZ were recorded by the Baseline Survey.

Table 4.10 Number of Locations and Individuals of Significant Flora Taxa Recorded by the Baseline Surveys Within the IIAZ

Taxon	Status*	Number of Locations	Number of Individuals
Aristida jerichoensis var. *subspinulifera*	P3	1	1
Aristida lazaridis	P2	168	217
Corchorus sp.	Potentially undescribed	-	-
Eremophila naaykensii	P3	-	-
Euphorbia ferdinandi s. lat.	Potentially undescribed	-	-
Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708)	P2	-	-
Rhagodia sp. Hamersley (M. Trudgen 17794)	P3	3	3
Rostellularia adscendens var. *latifolia*	P3	-	-
Seringia exastia	T	2	10

*Conservation status in WA under the BC Act, with the exception of *Seringia exastia* (T) which remains recognised only under the EPBC Act.

Table 4.11 presents the extent of VTs mapped by the Baseline Surveys in the IIAZ that is at risk of edge effects as a result of the Project. A total of nine VTs have been mapped within the IIAZ, as well as Cleared Land (not presented in **Table 4.11**). The total mapped extent of vegetation in the IIAZ is 119.64 ha.

Table 4.11 Mapped Extent of Vegetation Types in the IIAZ

Vegetation Type	Mapped Extent in IIAZ (ha)
1	52.02
2	6.39
3	3.27
4	0.17
5	-

Vegetation Type	Mapped Extent in IIAZ (ha)
6	0.87
7	28.82
8	4.35
9	14.29
10	8.21

4.3.2.2 Weeds

The condition of the vegetation of the Study Area was predominately rated as 'Excellent', as there was no or little evidence of impact to vegetation composition as a result of human activities, or there were only low levels of weed taxa. The vegetation condition of some areas was rated lower (Very Good to Good) due to the presence of moderate to large infestations of invasive weeds (in riparian areas) and or historical clearing (Umwelt, 2022).

If not adequately managed, Project activities could result in the introduction and/or spread of weeds, particularly in areas within close proximity to, or downstream of, the Disturbance Footprint, resulting in degradation of otherwise intact vegetation.

4.3.2.3 Changes to Surface Water Hydrology

A number of minor ephemeral watercourses intersect the Disturbance Footprint and will therefore be impacted by the Project. Sheet flow interruption may also occur. Most watercourses that will be impacted by the Disturbance Footprint are located on service corridors, and consequently it is expected that surface water flow in these areas can be adequately managed by appropriate design. However, for the larger watercourse of Mine Creek there is the potential for surface water drainage shadow impacts to downstream flora and vegetation if the flow is interrupted. Mine Creek and all drainage catchments within the resource area flow northward into Marillana Creek (RPS, 2017) which supports GDV (riparian vegetation and seasonal pools in the Flat Rocks area, about 24 km downstream of the Project) (PSM, 2021). Normal surface water flows and quality needs to be maintained to avoid impacts downstream.

One VT mapped in the Disturbance Footprint by the Baseline Survey represents riparian vegetation, being VT10, of which a combined 49 ha is potentially impacted (**Section 4.4.2**). The health of Mulga groves such as those that dominate VTs 7 and 8 are known to be dependent in part on surface water flows, including sheet flow (Davies, 2010). Other VTs (VT1 and VT9) include minor drainage features which support vegetation that depend on surface water flows to some degree (Umwelt, 2022).

There is potential for indirect impacts via interruption of surface water flows (including sheet flow) or changes in water quality to the following areas, where they occur downstream or downslope:

- The population of *Corchorus* sp. (potentially undescribed, and an assessed conservation significance rating of high (see **Section 4.1.1**));
- Riparian vegetation;
- Mulga grove vegetation (VT7, VT8);
- Populations of significant flora in the GNHI area;

- Any further significant taxa which have been assessed as 'possibly' occurring in the Study Area (**Appendix A**), which are dependent or partially dependent on surface water flows.

As these areas are reliant on surface water inputs, the flora and vegetation of these areas both within and downstream of the Disturbance Footprint are potentially at risk of impact through reduced availability of water. As the Lamb Creek development lies within the Marillana Creek catchment, disturbance of footprint areas, and any catchments blocked or trapped, are likely to decrease runoff into Marillana Creek and any GDEs downstream of the Project (RPS, 2017). The extent of potential impact to vegetation in terms of inducing drought stress as a result of a reduction in catchment area is unknown.

Where proposed mining and associated infrastructure will interrupt natural flows, the extent and significance of impacts will be dependent on the allowances made for surface water flows to pass under or around any barriers and the success of efforts to re-establish flows (Muller, 2005). Recommendations have been made by RPS (2017) to establish culverts and other drainage structures at creek crossings sufficient to minimise closure times during flooding events to acceptable operational levels. The design of drainage structures must also consider impacts to downstream vegetation and aim to re-establish both the volume and spread of water flows, particularly for the Mulga groves of VTs 7 and 8.

Other potential changes to surface water hydrology as a result of the Project include increased water runoff and sediment deposition from mining infrastructure and landforms, water ponding, and erosion in vegetation adjacent to the Disturbance Footprint. This can lead to secondary impacts including changes to vegetation structure and increased presence and severity of weeds. The potential impacts to significant flora and vegetation from these effects have been quantified and discussed in **Section 4.3.2.1** with reference to the IIAZ.

Surface water flow will need to be maintained over the course of construction and mine life. Similarly, the design and maintenance of the Haulage route will need to take into account surface water drainage features. The use of water for dust suppression must also consider water quality, in particular salinity, for potential impacts of runoff to adjacent vegetation, and avoid the use of hypersaline water (Davies, 2010).

4.3.2.4 Impacts through Groundwater Drawdown

No GDV has been identified as occurring within the Study Area (Umwelt, 2022) and depths to groundwater within the Project area are typically greater than 10 m (PSM, 2021). Although total depth of groundwater drawdown is predicted to be approximately 33m below the topographical surface (during the last four months of mine planning – months 23-26), groundwater drawdown to a depth of 1m is expected to occur across a range of 5.4km from the pit area under the Lower-bound scenario (most likely scenario); to an extent of 4.4km in the base case and 6.3km for the Upper-bound scenario (less likely). The groundwater drawdown is not expected to impact vegetation of the Study Area as no GDV has been identified in this area. As per PMK (2021), the proposed groundwater drawdown is not expected to influence nearby GDEs (calcretes at the confluence of the Marillana and Mine Creek), however that GDE area is outside the current Study Area and therefore outside the scope of this assessment and not assessed in this report.

4.3.2.5 Groundwater Discharge

It is unclear from PSM (2021) if groundwater discharge will be required (where groundwater abstraction is greater than the water requirements of the project). Figure 16 of PSM (2021) presents potential groundwater injection sites with regards to the upper-bound scenario (where pit dewatering produces more water than the project demands), which was described as being less-likely than the lower-bound

scenario (pit dewatering supplying less water than demand). These point injection sites are located on the Mine Creek, within the Study Area. It is recommended that this assessment be revisited if such discharge is required. Monitoring of the health of vegetation in the vicinity of the injection site is recommended to be undertaken if discharge is realised, given the terrestrial (non-phreatophytic) nature of the vegetation in this area.

4.3.2.6 Fragmentation

The impact of fragmentation to local populations of significant flora taxa is difficult to quantify at a site level. A brief qualitative assessment of the possible impacts of fragmentation by the Project has been undertaken.

Four taxa (*Aristida lazaridis* (P2), *Rhagodia* sp. Hamersley (M. Trudgen 17794) (P3), *Aristida jerichoensis* var. *subspinulifera* (P3) and *Euphorbia ferdinandi* s. lat (potentially undescribed)) only occur in the GNHI area, in which the Great Northern Highway and a railway line already intersect populations. The Disturbance Footprint in this area consists of a 30 – 75 m wide linear corridor, and a 15 m widening of Great Northern Highway into historically disturbed vegetation. Any potential impacts of fragmentation through separation (or increasing existing separation) are likely to be negligible and not significant for these four taxa.

The population of *Corchorus* sp. occurs only to the west (downslope) of the Disturbance Footprint and is unlikely to be impacted by fragmentation.

Targeted survey extent was limited to potential impact areas (the Development Envelope), and it is likely that targeted survey outside the DE would provide further data regarding the presence of additional existing linkages between populations, with suitable habitat for each taxon often occurring between currently known populations.

The impacts of fragmentation to vegetation types, if any, are unlikely to be significant.

4.4 Combined Impacts

The following sections present potential impacts to significant flora and vegetation as a combination of direct impacts in the Disturbance Footprint (**Section 4.2**) and indirect impacts in the IIAZ (**Section 4.3.2**). Note that the combined impact assessment assumes a worst-case scenario of total clearing of the Disturbance Footprint as well as complete loss of environmental values in the IIAZ.

4.4.1 Significant Flora

Predicted potential combined impacts to significant flora locations and individuals as a result of the Project are presented in **Table 4.13** and **Table 4.14**, respectively, while **Table 4.15** presents potential combined impacts to significant flora preferred habitat.

The combined impact to the preferred habitat of *Seringia exastia* is relatively low at <28% of the mapped habitat extent within the Study Area. This taxon is now recognised as widespread and common (**Table 4.1**), as is its preferred habitat (**Table 4.2**), which has been acknowledged at the state level by removal of its conservation listing under the BC Act. The loss of preferred habitat is considered an insignificant impact to the taxon in light of this and its impending change of conservation status under the EPBC Act (**Section 2.1**).

The combined impacts to preferred habitat of all other significant flora taxa are relatively low at < 30% of each habitat's mapped extent within the study area and therefore the combined impact is not likely to be significant.

Table 4.12 Potential Combined Impacts to Locations of Significant Flora Taxa

Taxon	Status*	Number of Locations in Local Area	Locations at Risk of Impact			Potential Combined Impact to Locations (%)
			Disturbance Footprint (Table 4.3)	IIAZ[c] (Table 4.10)	Total	
Aristida jerichoensis* var. *subspinulifera	P3	8[b]	-	1	1	12.5
Aristida lazaridis	P2	6,766[a]	63	168	231	3.4
***Corchorus* sp.**	Potentially undescribed	23[b]	-	-	-	-

Euphorbia ferdinandi s. lat.	Potentially undescribed	8	68.93	2.93	4.35	7.28	10.6
Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708)	P2	4	95.32	0.62	0.17	0.79	0.8
Rhagodia sp Hamersley (M. Trudgen 17794)	P3	7	523.39	13.88[a]	13.11[a]	26.99	12.4
Rostellularia adscendens var. *latifolia*	P3	1	1,429.16	343.39	52.02	395.41	27.7
Seringia exastia	T	1	1,429.16	343.39	52.02	395.41	27.7

[a] Preferred habitat is areas of preferred VTs in the GNH area only (Section 4.2.1.1)

c Area of significant flora preferred habitat that is at risk of edge effects as a result of the Project, including dust deposition, water ponding, runoff, drainage shadow and weeds.

* Conservation status in WA under the BC Act, with the exception of *Seringia exastia* (T) which remains recognised only under the EPBC Act.

4.4.2 Vegetation

Predicted potential combined impacts to VTs as a result of the Project are presented in **Table 4.16**. These impacts are unlikely to be significant, as the combined impact to any VT is relatively low (all VTs will be impacted by less than 28.2 % of the mapped extent in the Study Area, however the actual combined impacts are likely to be less than shown in **Table 4.16**), and the local significance of each VT are also relatively low (a local conservation significance rating of 1, or 2 as presented in **Table 4.2**).

The highest potential combined impact to vegetation of the Study Area as a result of the Project will be to VTs 7 (28.2%), 1 (27.7%), 10 (22.9%), 2 (21.6%), and 3 (19.9%). All other VTs had potential combined impacts that were less than 14 % (**Table 4.16**).

Table 4.15 Potential Combined Impacts to Vegetation Types

Vegetation Type	Mapped Extent of VT in Study Area (ha)	Extent of VT at Risk of Impact (ha)			Potential Combined Impact to VT (%)
		Disturbance Footprint (Table 4.7)	IIAZ (Table 4.11)*	Total	
1	1,429.16	341.73	52.02	395.41	27.7
2	382.30	75.53	6.39	82.69	21.6
3	48.16	6.39	3.27	9.59	19.9
4	95.32	0.62	0.17	0.79	0.8
5	100.95	-	-	-	-
6	316.61	0.84	0.87	1.71	0.5
7	523.39	119.01	28.82	147.70	28.2
8	68.93	2.69	4.35	7.28	10.6
9	600.81	66.78	14.29	82.57	13.7
10	215.50	41.11	8.21	49.32	22.9

* Area of VT that is at risk of edge effects as a result of the Project, including dust deposition, water ponding, runoff, drainage shadow and weeds.

5.0 Conclusion

A total of nine significant flora taxa have been recorded, and 10 VTs mapped, within the Study Area by the Baseline Surveys (Rapallo, 2021a, b; Umwelt, 2022). Direct impacts and edge effects to all nine taxa and their preferred habitats were assessed as unlikely to be significant at both the local and regional scale, due to the low percentage of plants and habitat impacted, the range of populations and the common and widespread nature of their preferred habitats. Likewise, direct impacts to vegetation are assessed as unlikely to be significant at both the local and regional scale, due to the relatively low percentage of each VT potentially impacted and the common and widespread nature of the vegetation system associations.

There is a potential for indirect impacts via interruption of surface water flows (including sheet flow) or changes in water quality to the following areas, where they occur downstream:

- The population of *Corchorus* sp. (potentially undescribed, and an assessed conservation significance rating of high (see **Section 4.1.1**);
- Riparian vegetation;
- Mulga grove vegetation (VT7);
- Populations of significant flora in the GNHI area, downstream of interrupted sheet flows.
- Any further significant taxa which have been assessed as 'possibly' occurring in the Study Area (Appendix A), which are dependent or partially dependent on surface water flows.

Whilst recommendations have been made by RPS (2017) to establish culverts and other drainage structures at creek crossings sufficient to minimise operational impacts, the design of drainage structures must also consider potential impacts to downstream flora and vegetation through interruption of surface water flow, and aim to re-establish both the volume and spread of water flows to avoid these potential impacts.

APPENDIX A

Likelihood of Occurrence of Further Significant Flora Taxa

A. Likelihood of Occurrence of Further Significant Flora Taxa

Table A.1 presents an assessment of the likelihood of occurrence of significant taxa within the Study Area and Disturbance Footprint. This list includes significant taxa identified as occurring (or potentially occurring) within the Desktop Study Area prior to the Baseline Surveys (Rapallo 2021b, Umwelt, 2022). The assessment considered whether a taxon was identifiable at the time of the surveys, the known range of the taxon, if habitat is present in the Study Area and/or Disturbance Footprint, proximity of known records to the Study Area and the extent of targeted survey undertaken within the Study Area and Disturbance Footprint, when determining the further potential for a taxon to occur in the Study Area and Disturbance Footprint.

A total of 62 taxa have been assessed within **Table A.1 including** two **Threatened taxa, 58 Priority listed taxa and two potentially undescribed taxa.** Of these, nine taxa were recorded within the Study Area by the Baseline Surveys, and two taxa were considered potentially not identifiable during the survey. *Arthropodium vanleeuwenii* (P2) is considered visible only when flowering in September as it grows up through *Triodia*. *Rhodanthe ascendens* (P1) is an annual taxon known from a limited number of records all of which were collected in August or September. It is possible that this taxon is present (and therefore identifiable) after significant rainfall; however, this cannot be confirmed based on existing information. It is considered that the 61 remaining taxa were identifiable during the 2022 survey, either because the survey period coincides with the taxon's flowering period, or the taxon can be identified reliably when in fruit or sterile.

The likelihood of occurrence assessment identified a total of 42 taxa which could Possibly occur within the Study Area due to suitable habitat occurring within the Study Area and the Study Area being within the known range of the taxon or within close proximity to its known range. All of these taxa were identifiable at the time of survey with the exception of *Arthropodium vanleeuwenii* (P2). Suitable habitat for this taxon is described as elevations above 900 m on south-facing hillslopes of Brockman Iron Formation (Dillon and Macfarlane 2020). This habitat occurs within the Study Area, at the highest elevation areas of VTs 4 and 6. The areas of VT 4 and 6 within the Disturbance Footprint and IIAZ are not considered to represent suitable habitat; these areas occur at or below 750 m elevation and are north and north-west facing.

It is worthy of note that 'suitable habitat' as used to inform the assessment has been determined using details recorded at known locations. However, for many of the taxa known from the general vicinity of the Study Area, suitable habitat is difficult to define, as available habitat information is often vague or very broad and difficult to interpret; for example an area described as a stony plains and flats with red or brown clay or clay loam could feasibly occur almost anywhere in the Pilbara. Therefore, a precautionary approach has been adopted when assessing whether suitable habitat for a species is present in the Study Area.

All 62 taxa assessed are considered unlikely to occur within the Disturbance Footprint due to their known range, the extent of targeted survey undertaken and/or the absence of suitable habitat within the Targeted Survey Area.

Table A.1 Likelihood of Occurrence of Further Significant Flora Taxa in the Study Area and Disturbance Footprint

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Acacia bromilowiana	P4	July to August	Rocky hills, breakaways, scree slopes, gorges, creek beds. Rocky red-brown loam with ironstone or laterite.	Yes	3.9 km W of Study Area	Possible – known record in close proximity to Study Area, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Acacia daweana	P3	July to September	Low rocky rises, along drainage lines. Red stony clay loam.	Yes	37 km W of Study Area	Possible – Study Area occurs outside of known range of taxon; however, suitable habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Acacia effusa	P3	May to August	Scree slopes of low ranges. Red-brown silty clay or clay loam with ironstone and quartz stones and pebbles.	Yes	1.6 km NW of Study Area	Possible – known record in close proximity to Study Area, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Acacia subtiliformis	P3	May to June	Rocky ridges, hills and slopes, often with calcrete. Light brown or brown loam or silty clay.	Yes	7.1 km NE of Study Area	Unlikely –potential habitat unlikely to be present in Study Area.	Unlikely – potential habitat unlikely to be present in Disturbance Footprint, all potential habitat searched.
Amaranthus centralis	P3	May to July	Plains, flats and granite outcrops. Gritty red clay loam.	Yes	23.5 km E of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Aristida jerichoensis var. *subspinulifera*	P3	likely after significant rainfall	Plains and flats. Red-brown loamy clay or cracking clay.	Yes	0.6 km W of Study Area	Recorded in the Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Aristida lazaridis	P2	likely after significant rainfall	Floodplains, drainage areas and plains. Red or red-brown clay loam, sometimes with ironstone.	Yes	Within Study Area	Recorded in the Study Area.	Recorded in the Disturbance Footprint.
Arthropodium vanleeuwenii	P2	September	Steep hill slopes and gorges. Red-brown or orange-brown loam, often with banded ironstone.	No	20.4 km W of Study Area	Possible – Study Area occurs outside of the known range of taxon; however, suitable habitat present in Study Area and taxon not identifiable during the survey.	Unlikely –taxon not identifiable during the survey however suitable habitat not present in Disturbance Footprint.
Cladium procerum	P2	likely year-round	Major creeks and gorges. Red gravelly sand.	Yes	33.2 km NNE of Study Area	Unlikely –Study Area occurs within known range of taxon; however, potential habitat unlikely to be present in Study Area.	Unlikely - potential habitat unlikely to be present in Disturbance Footprint.
Corchorus sp.	-	No data on *FloraBase* but flowering during the survey	No data on *FloraBase* (not formally described)*;* in the Study Area this entity was recorded within a drainage line in VT10 on sandy loam soils.	Yes	NA	Recorded in the Study Area.	Unlikely - all potential habitat has been searched within the Disturbance Footprint.
Dampiera metallorum	P3	June to October	High in the landscape on steep slopes, summits of hills. Red-brown stony clay loam over banded ironstone.	Yes	10.3 km E of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Dolichocarpa sp. Hamersley Station (A.A. Mitchell PRP 1479)	P3	May to September	Floodplains and crabhole plains. Red-brown or brown cracking clay.	Yes	11 km N of Study Area	Unlikely –Study Area occurs within known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 9; however the area of cracking clay has been searched.	Unlikely - potential habitat unlikely to be present in Disturbance Footprint.
Eragrostis crateriformis	P3	likely after significant rainfall	Creek banks, depressions. Gritty or gravelly brown sandy loam, red-brown clay loam.	Yes	20.7 km N of Study Area	Possible – Study Area occurs outside of the known range of taxon; however, suitable habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Eragrostis sp. Mt Robinson (S. van Leeuwen 4109)	P1	likely after significant rainfall	Steep slopes, summits. Brown or red-brown silty loam, often with banded ironstone.	Yes	16.7 km S of Study Area	Possible – Study Area occurs outside of the known range of taxon; however, suitable habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Eremophila magnifica subsp. *magnifica*	P4	August to November	Hillslopes and gullies. Rocky red-brown or brown sandy loam, often with ironstone.	Yes	11 km S of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Eremophila magnifica subsp. *velutina*	P3	August to September	Hillslopes and ridges. Red stony loam, often with ironstone or banded ironstone.	Yes	15.1 km SW of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Eremophila naaykensii	P3	June to August	Rocky hill slopes, crests and gorges. Rocky red-brown clay loam, sometimes over banded ironstone.	Yes	5.6 km E of Study Area	Recorded in the Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Eremophila pusilliflora	P2	March to July	Flats and plains. Red-brown sandy loam, often with ironstone.	Yes	13.9 km W of Study Area	Possible –Study Area occurs on eastern edge of range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Eremophila spongiocarpa	P3	May to September	Weakly saline alluvial plains and dune slopes on margins of marshes and saline flats. Red-brown clay loam.	Yes	38.2 km NE of Study Area	Unlikely –Study Area occurs outside of known range of taxon (known from plains adjacent to Fortescue Marsh), potential habitat unlikely to be present in Study Area.	Unlikely - potential habitat unlikely to be present in Disturbance Footprint.
Eremophila sp. West Angelas (S. van Leeuwen 4068)	P1	August to September	Hill slopes and crests. Brown or red silty loam over banded ironstone.	Yes	17.9 km S of Study Area	Possible – Study Area occurs outside of the known range of taxon; however, suitable habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Euphorbia australis var. *glabra*	P3	likely after significant rainfall	Drainage lines and flats. Red-brown clay loam, sometimes with calcrete or silcrete.	Yes	10.7 km N of Study Area	Possible – Study Area occurs outside of the known range of taxon; however, suitable habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Euphorbia clementii	P3	likely after significant rainfall	Fire responder. Recently burnt hills, slopes and undulating plains. Red-brown clay loam.	Yes	29.1 km S of Study Area	Unlikely –Study Area is outside of known range of taxon according to FloraBase (WA Herbarium (1998-)); the record of this taxon near the Study Area is potentially erroneous given it is not verified by a vouchered specimen and is a significantly disjunct record.	Unlikely – record near Study Area potentially erroneous, all potential habitat searched, however area not recently burnt.

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Euphorbia ferdinandi s. lat	-	No data on *FloraBase* but flowering during the survey	No data on *FloraBase* (not formally described); recorded on VTs 7 and 8 on red-brown clay to clay loam with ironstone pebbles on plains in the Study Area.	Yes	Unknown	Recorded in the Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Euphorbia inappendiculata var. *queenslandica*	P2	likely after significant rainfall	Flats and plains. Brown cracking clay, gilgai.	Yes	26 km W of Study Area	Unlikely –Study Area occurs within known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 9; however the area of cracking clay has been searched.	Unlikely - potential habitat unlikely to be present in Disturbance Footprint.
Euphorbia stevenii	P3	likely after significant rainfall	Gentle slopes and plains. Brown or red-brown clay and cracking clay.	Yes	31 km SSW of Study Area	Possible –Study Area occurs on eastern edge of range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Fimbristylis sieberiana	P3	May to June	Pool edges, sandstone cliffs and major creek lines. Brown or red-brown gritty sand.	Yes	33.7 km E of Study Area	Unlikely –Study Area occurs within known range of taxon; however, potential habitat unlikely to be present in Study Area.	Unlikely - potential habitat unlikely to be present in Disturbance Footprint.
Glycine falcata	P3	May to September	Along drainage depressions in crabhole plains and clay plains. Brown or red cracking clay.	Yes	11 km N of Study Area	Unlikely –Study Area occurs outside of known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 9; however the area of cracking clay has been searched.	Unlikely - potential habitat unlikely to be present in Disturbance Footprint.

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Goodenia lyrata	P3	likely after significant rainfall	Claypans and plains. Red or brown sandy loam or clay loam.	Yes	1.5 km S of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Goodenia sp. East Pilbara (A.A. Mitchell PRP 727)	P3	likely after significant rainfall	Low undulating plains, swampy plains. Red-brown clay soil, calcrete pebbles.	Yes	6.6 km NE of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Grevillea saxicola	P3	February to June	Rocky hills, slopes and gullies. Red-brown sandy loam.	Yes	20 km S of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Gymnanthera cunninghamii	P3	February to May, October to December	Drainage lines. Brown or red-brown sand or sandy loam.	Yes	24.1 km NE of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708)	P2	April to August, October	Rocky gullies, drainage lines and gorges. Loamy skeletal soil.	Yes	26.6 km SW of Study Area	Recorded in the Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Indigofera gilesii	P3	May, August	Rocky slopes, hills, creeklines and outcrops. Red or orange loam, often with ironstone.	Yes	13.3 km W of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Iotasperma sessilifolium	P3	May to September	Edges of waterholes, plains, Cracking clay, black loam.	Yes	23.3 km N of Study Area	Unlikely –Study Area occurs outside of known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 9; however the area of cracking clay has been searched.	Unlikely - potential habitat unlikely to be present in Disturbance Footprint.
Ipomoea racemigera	P2	April to June	Drainage lines and flats. Brown silty loam.	Yes	11.9 km NE of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Isotropis parviflora	P2	June to August	Rocky hills, slopes and undulating plains. Red or brown sandy loam, often with ironstone.	Yes	8.2 km SE of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Kohautia australiensis	P2	likely after significant rainfall	Plains and hills. Brown or orange clay with calcrete.	Yes	11.8 km N of Study Area	Unlikely – Study Area occurs outside the known range of taxon, potential habitat unlikely to be present in the Study Area.	Unlikely – potential habitat unlikely to be present in Disturbance Footprint.
Lepidium catapycnon	P4	September	Rocky hills and slopes. Red or brown loam or sandy loam, often with ironstone.	Yes	15.6 km S of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Olearia mucronata	P3	July to August	Rocky hills, gullies and creeklines. Red-brown or orange-brown silty clay or sandy clay loam with ironstone.	Yes	26.1 km SW of Study Area	Possible –Study Area occurs on eastern edge of range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Oxalis sp. Pilbara (M.E. Trudgen 12725)	P2	May to July	Gorges, gullies, drainage lines and slopes. Red loam or sandy loam, often with ironstone.	Yes	15.6 km S of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Pilbara trudgenii	P3	September to October	Hill summits, steep slopes, screes, cliff faces. Skeletal red stony soil over ironstone.	Yes	15.8 km S of Study Area	Possible –Study Area occurs north of known range of taxon; however, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Ptilotus mollis	P4	July to September	Rocky hills and screes with red or brown clay loam, often with ironstone.	Yes	16.9 km S of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Rhagodia sp. Hamersley (M. Trudgen 17794)	P3	March to May, September	Plains and alluvial plains. Red or brown clay loam, often with ironstone gravel.	Yes	Within Study Area	Recorded in the Study Area.	Recorded in the Disturbance Footprint.
Rhodanthe ascendens	P1	August to September	Flats. Cracking clay and sand over clay.	Unknown – limited information	32.1 km SW of Study Area	Unlikely –Study Area occurs within known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 8; however the area of cracking clay has been searched.	Unlikely - potential habitat unlikely to be present in Disturbance Footprint. Study Area is outside known range.
Rhynchosia bungarensis	P4	May to November	Rocky hill slopes, drainage lines, gorges. Orange brown loam, often with ironstone.	Yes	21 km NE of Study Area	Possible –Study Area occurs on southern edge of known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Rostellularia adscendens var. *latifolia*	P3	April to May	Rocky hills, gullies, floodplains and drainage lines. Red/brown sandy loam.	Yes	8.6 km NNE of Study Area	Recorded in the Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Seringia exastia	T		Sandy soils on plains, creeks, rocky areas.	Yes	5 km south of the Study Area	Recorded in the Study Area.	Recorded in the Disturbance Footprint.
Sida sp. Barlee Range (S. van Leeuwen 1642)	P3	likely after significant rainfall	Rocky hills, gullies and gorges. Red or brown sandy loam, often with ironstone.	Yes	13.9 km S of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Sida sp. Hamersley Range (K. Newbey 10692)	P3	likely after significant rainfall	Ironstone gullies, slopes and breakaways. Skeletal red loam.	Yes	37.4 km SSW of Study Area	Possible –Study Area occurs outside of known range of taxon; however, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Solanum kentrocaule	P3	May to September	Steep rocky gullies, slopes, gorges. Skeletal red loam.	Yes	16.1 km S of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Stackhousia clementii	P3	April to September	Floodplains and flats. Clay loam, sometimes saline or with calcrete.	Yes	20.6 km W of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Stylidium weeliwolli	P3	March to September	Drainage lines, pool edges, seepage areas. Sandy loam or clay.	Yes	32.2 km E of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Swainsona thompsoniana	P3	April to August	Floodplains and flats. Red or brown cracking clay, clay loam.	Yes	18.1 km W of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Synostemon hamersleyensis	P1	April to November	Steep hills, slopes, screes. Rocky red or brown sandy loam with ironstone or banded ironstone.	Yes	23.7 km NE of Study Area	Possible –Study Area occurs outside (south) of known range of taxon; however, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Tetratheca fordiana	P2	April to July	Cliffs, ridges and breakaways. Skeletal soil with ironstone.	Yes	26.8 km W of Study Area	Possible –Study Area occurs outside (east) of known range of taxon; however, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Teucrium pilbaranum	P2	April to September	Flats, clay pans and crabhole plains. Red or brown sandy loam, clay or cracking clay, sometimes with calcrete.	Yes	15.4 km SSW of Study Area	Unlikely –Study Area occurs within known range of taxon, west of Study Area is area of cracking clay which extends into the western edge of VT 9; however the area of cracking clay has been searched.	Unlikely - potential habitat unlikely to be present in Disturbance Footprint.
Themeda sp. Hamersley Station (M.E. Trudgen 11431)	P3	May to July	Floodplains, drainage lines and flats. Red or brown clay loam, clay or cracking clay.	Yes	4.6 km S of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Thryptomene wittweri	T	April to August	Breakaways and cliffs. Skeletal red-brown soil with sandstone or ironstone.	Yes	22.9 km SW of Study Area	Possible –Study Area occurs outside (east) of known range of taxon; however, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.

Taxon	Status	Flowering Period*	Habitat*	Identifiable During Survey?	Nearest Known Location to Study Area (DBCA 2022c)	Likelihood of Occurrence in Study Area	Likelihood of Occurrence in Disturbance Footprint
Triodia sp. Karijini (S. van Leeuwen 4111)	P1	likely after significant rainfall	Hill crests, moderate to steep hill slopes. Grey, brown or red sandy loam or silty loam, often with ironstone.	Yes	3.7 km W of Study Area	Possible –Study Area occurs on eastern edge of known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Triodia sp. Mt Ella (M.E. Trudgen 12739)	P3	likely after significant rainfall	Rocky slopes, gullies, ridges gorges and associated drainage lines/floodplains. Red or brown sandy clay loam, often with ironstone.	Yes	12.3 km SW of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Vittadinia sp. Coondewanna Flats (S. van Leeuwen 4684)	P1	March to September	Floodplains and drainage areas. Red or brown clay loam or silty loam.	Yes	1.7 km S of Study Area	Possible –Study Area occurs within known range of taxon, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint; however, all potential habitat searched.
Xerochrysum boreale	P3	July, September	Stony plains and flats. Red or brown clay or clay loam.	Yes	21.6 km SW of Study Area	Possible –Study Area occurs outside (north) of known range of taxon; however, potential habitat present in Study Area.	Unlikely – potential habitat present in Disturbance Footprint, however, all potential habitat searched.

2.4 Reserves and environmentally sensitive areas 15

2.5 Fire history 15

3 Methods **17**

3.1 Desktop study 17

3.2 Field Survey 20

3.2.1 Specimen collection and identification 21

3.3 Personnel and licensing 22

3.4 Nomenclature and conservation listing 22

4 Results **24**

4.1 Flora desktop study 24

4.1.1 Conservation significant taxa 24

4.1.2 Conservation significant vegetation 25

4.2 Field survey results 28

4.2.1 Conservation significant flora species recorded 28

5 Discussion 32
5.1 Significant flora species recorded during the survey 32
5.1.1 Seringia exastia (Critically Endangered) 34
5.1.2 Aristida lazaridis (Priority 2) 34
5.1.3 Aristida jerichoensis var. subspinulifera (Priority 3) 36
5.1.4 Eremophila sp. Hamersley Range (K. Walker KW 136) (Priority 3) 37
5.1.5 Rhagodia sp. Hamersley (M.E. Trudgen 17794) (Priority 3) 38
5.1.6 Rostellularia adscendens var. latifolia (Priority 3) 39
5.1.7 Goodenia nuda (Priority 4) 40
5.1.8 Euphorbia aff. ferdinandi (potentially undescribed) 41
5.2 Significant species not recorded 41
5.2.1 Acacia bromilowiana (Priority 4) 41
5.2.2 Acacia effusa (Priority 3) 42
5.2.3 Eremophila magnifica subsp. magnifica (Priority 4) 42
5.2.4 Eremophila pusilliflora (Priority 2) 43
5.2.5 Indigofera gilesii (Priority 3) 43
5.2.6 Isotropis parviflora (Priority 2) 44
5.2.7 Nicotiana umbratica (Priority 3) 44
5.2.8 Themeda sp. Hamersley Station (M.E. Trudgen 11431) (Priority 3) 45
5.2.9 Triodia sp. Mt Ella (M.E. Trudgen 12739) (Priority 3) 45
5.2.10 Triodia sp. Karijini (S. van Leeuwen 4111) (Priority 1) 46
5.2.11 Vittadinia sp. Coondewanna Flats (S. van Leeuwen 4684) (Priority 1) 46
5.3 Survey adequacy and limitations 47
5.3.1 Level of assessment and survey timing 47
5.3.2 Assessment against EPA technical guidance 47
5.3.3 Survey limitations table 48
5.4 Impacts and management 50
5.4.1 Direct clearing 50
5.4.2 Alteration to surface flow 50
5.4.3 Weeds 50

Executive summary

Mineral Resources Limited (MRL) proposes to develop an iron ore mine with associated haul road and infrastructure at Lamb Creek. The Lamb Creek project area is located approximately 130 kilometres north-west of Newman in the East Pilbara Region of Western Australia and is accessed via the Great Northern Highway.

The Lamb Creek project area is defined as retention licence R47/19 and miscellaneous licences L47/736, L47/974, L47/1008, and M47/1592. Together these tenements cover an area of 2199 hectares. There is significant overlap between the tenements hence this number is not cumulative.

A targeted conservation significant flora survey was conducted over two phases, from 15-29 April 2020 and 12-17 May 2021. The project area at the time of the survey only included R47/19 and L47/736 and the survey area was based on footprint V1 which has now been superseded. The current footprint V3 extends outside of the survey area by 236 hectares (36%).

The targeted survey covered the following survey areas:

- Mining footprint and haul road corridor within R47/19 (271 hectares) – April 2020
- Haul road corridor within L47/736 (388 hectares) – April 2020
- Intersection version B located within L47/974 (57 hectares) – April 2020
- Great Northern Highway intersection within L47/974 (156 hectares) – May 2021

The entire survey area was covered on foot via systematic parallel traverses. Additional searches on foot and via helicopter were made outside the survey area boundaries to map the population extent of target taxa where these extended outside the survey area, and to search opportunistically for target taxa outside of the proposed project footprint.

The survey recorded one threatened flora taxon (*Seringia exastia* – Critically Endangered) from two locations near the Great Northern Highway. The listing of this species is due to a taxonomic revision where a widespread and a Threatened taxon were merged. Communications from the Department of Biodiversity, Conservation and Attractions (DBCA) confirm that the species is likely to be delisted.

Six species of Priority Flora listed by the Department of Biodiversity, Conservation and Attractions (DBCA) were recorded during the survey, comprising one Priority 2 species (*Aristida lazaridis*), four Priority 3 species (*Aristida jerichoensis* var. *subspinulifera*, *Eremophila* sp. Hamersley Range, *Rhagodia* sp. Hamersley (M.E. Trudgen 17794) *Rostellularia adscendens* var. *latifolia* and one Priority 4 species (*Goodenia nuda*).

One potentially undescribed taxon, *Euphorbia* aff. *ferdinandi* was recorded from the Great Northern Highway intersection area. This taxon may represent a new species.

The most significant finding of the survey was an extensive population of the priority two grass *Aristida lazaridis* from the Great Northern Highway intersection area.

1 Introduction

1.1 Project overview

The Lamb Creek Iron Ore Project comprises a proposed mining area, haul road, and associated infrastructure. The project is situated approximately 130 kilometres north-west of Newman in the Pilbara region of Western Australia.

Mineral Resources Limited (MRL) commissioned Rapallo Environmental (Rapallo) to conduct a targeted conservation significant flora survey of the Lamb Creek Iron Ore Project. The work was commissioned in two phases, with fieldwork completed in April 2020 and May 2021. The surveys covered a combined area of 872 hectares, hereafter referred to as the targeted survey area or simply the survey area.

The project area as well as the proposed footprint have undergone several changes since the surveys were completed, as outlined in section 1.3.

The current Lamb Creek project area (January 2022) comprises retention licence R47/19, miscellaneous licences L47/736, L47/974, L47/1008, and mining lease M47/1592. Together these tenements cover an area of 2199 hectares. There is significant overlap between the tenements (see Figure 1.1 and Table 1.2), hence this number is not cumulative.

1.2 Scope and objectives

The scope of the targeted conservation significant flora survey included:

- Review and refine desktop information on conservation significant flora taxa recorded previously within 30 kilometres of the Lamb Creek project area.
- Produce a list of target taxa for the field survey, based on the latest distribution information and habitat requirements of these species.
- Systematic searches for conservation significant flora across the targeted survey area.
- Mapping point locations and population boundaries of conservation significant flora found within the survey area, and extending outside the survey area where relevant.

The objective of the survey was to provide baseline information on conservation significant flora within the Lamb Creek project (survey area only) in order to inform project planning and environmental impact assessment (EIA), to support approval applications.

1.3 Project area, survey area, and survey periods

1.3.1 April 2020

The first targeted survey took place from 15-19 April 2020. The project area at the time comprised retention licence R47/19 and miscellaneous licence L47/736. A proposed disturbance footprint was provided by MRL in March 2020 (footprint V1).

The April 2020 targeted survey covered the entirety of footprint V1 plus an alternative intersection area for the haul road with the Great Northern Highway, referred to as intersection version B. The survey area covered in April 2020 was 716 hectares. Survey effort is mapped in Figure 3.2.

1.3.2 May 2021

The second targeted survey was completed from 12-17 May 2021. Based on the findings from the 2020 targeted survey, MRL identified an additional area near the Great Northern Highway to be covered by targeted surveys. The May 2021 survey area covered an additional area of 156 hectares.

Total area covered by the April 2020 and May 2021 surveys was 872 hectares (Table 1.1). This area will hereafter be referred to as the targeted survey area. Survey effort is mapped in Figure 3.2.

Table 1.1 Survey areas covered by the targeted flora survey

Survey area description	Survey period	Area size [1]
Mining footprint and part of haul road corridor within R47/19	15-29 April 2020	271 ha
Haul road corridor within L47/736	15-29 April 2020	388 ha
Intersection version B	15-29 April 2020	57 ha
Additional areas near the Great Northern Highway	12-17 May 2021	156 ha
Total area covered by the targeted survey		**872 ha**

Footnotes: 1) The targeted survey area extends by 3 hectares outside of the current December 2021 project area.

An updated project footprint (footprint V2) was provided in July 2021 after both field surveys had been completed. Earlier drafts of this report were based on footprint V2. However, this footprint has now been superseded by footprint V3 as outlined in section 1.3.3.

1.3.3 December 2021

A revised project area and proposed footprint (footprint V3) were provided to Rapallo in December 2021. The revised project area included two new miscellaneous licences, which overlapped significantly with the existing tenements. Table 1.2 lists all tenements included in the Lamb Creek Iron Ore project as per December 2021. A map showing tenements and their overlap is presented in Figure 1.1.

Table 1.2 Tenements of the Lamb Creek Iron Ore project

Tenement	Type	Size	Description
R47/19	Retention Licence	1200 ha	Contains proposed mining area, infrastructure, and the eastern terminus of the haul road.
L47/736	Miscellaneous Licence	390 ha	Contains proposed haul road alignment of footprint V1. Now falls mostly within L47/1008 (2 ha outside)
L47/974	Miscellaneous Licence	120 ha	Adjacent to Great Northern Highway, includes intersection version B. Falls entirely within L47/1008
L47/1008	Miscellaneous Licence	999 ha	Proposed haul road and associated infrastructure areas. Covers majority of L47/736 and all of L47/974.
M47/1592	Mining Lease	1200 ha	Same area as R47/19 (pending conversion)

The project area as per December 2021 is 2199 hectares in size. Since there are significant overlaps between the five tenements listed in Table 1.2, this number is not cumulative.

The latest project footprint, provided in December 2021 (footprint V3) is 657 hectares in size. It extends outside of the areas coved by the targeted survey by 236 hectares, hence 36% of proposed footprint V3 remains unsurveyed. The majority of the unsurveyed parts are located in R47/19.

1.4 Definitions

To aid interpretation of this report and associated mapping, Table 1.3 provides explanation of the various components of the Lamb Creek project and associated survey areas, as listed in Table 1.2, and mapped in Figure 1.1 and Figure 1.2.

Table 1.3 Project and survey area definitions

Component	Description
Project area	Project area as per December 2021, comprising tenements R47/19 (pending conversion into M47/1592), L47/736, L47/974, and L47/1008 as listed in Table 1.2. The project area has a total size of 2199 hectares. There is significant overlap between the tenements, so this number is not cumulative.
Survey area	Combined areas covered by the targeted conservation significant flora surveys completed in April 2020 (716 ha) and May 2021 (156 ha) as listed in Table 1.1, totalling an area of 872 hectares. Also referred to as the targeted survey area or the defined survey area, depending on context.
Resource area	General description of R47/19 (M47/1592) in which the proposed mine pit and associated infrastructure will be located.
Haul road corridor	General description of the area in L47/736 in which most of the proposed haul road will be located.
Great Northern Highway intersection (GNHI)	General name given to the area where the proposed haul road intersects the Great Northern Highway. Multiple versions of the intersection have been investigated since March 2020; hence this area is much wider than the rest of the haul road corridor.
Footprint V1	Proposed disturbance footprint provided by MRL in March 2020 and used to develop the initial survey area as defined in section 1.3.
Footprint V2	Revised disturbance footprint provided by MRL in July 2021.
Footprint V3	Revised disturbance footprint provided by MRL in December 2021 and used to calculate impacts to conservation significant flora recorded during the survey.
Adjacent to footprint V3	Within 100 metres of the December 2021 disturbance footprint (footprint V3).
Targeted survey	The combined surveys of April 2020 and May 2021.
Opportunistic records outside of survey area	Individual plants or populations of conservation significant flora recorded outside of the defined survey area, either through mapping of population extent beyond survey area boundaries, ground-truthing helicopter records, or by walking traverses through suitable habitats outside of footprint V1.

Figure 1.2

Location of the Lamb Creek project and delineation of the targeted survey area

2 Regional context

2.1 Climate and weather

The Lamb Creek project is situated in the Hamersley subregion (PIL03) of the Pilbara IBRA region, which is part of the Eremaean province (Beard 1990). The climate of the Hamersley IBRA subregion (PIL03) is described as semi-desert tropical. The average rainfall is 300 mm per year, usually in summer cyclonic or thunderstorm events. Winter rain is not uncommon (Kendrick 2001). Cyclones develop off the north-west coast and often cross the coastline between Karratha and Port Hedland and move inland over the Fortescue Valley system towards Newman (Beard 1990).

The closest Bureau of Meteorology (BOM) weather station to the survey area is at Newman Airport (station number 007176), located 130 kilometres south-east of the survey area (Figure 1.2). This weather station has been recording rainfall data since 1971 and temperature data since 1996.

Data recorded at Newman Airport (Figure 2.1) shows a mean annual rainfall of 324.3 millimetres (mm). Mean monthly rainfall is highest in February at 70.2 mm, and lowest in September at 3.7 mm. The hottest month is December with a mean maximum temperature of 39.3°C and a mean minimum temperature of 24.1°C. The annual wind records from 9am and 3pm show a dominant easterly throughout the day, with the strongest winds recorded in the morning of up to 30 km/hour (BOM 2021).

Evaporation rates are not recorded at the Newman Airport Weather Station. However, evaporation in the Central Pilbara Region is estimated to be between 2000 mm and 3500 mm per annum, which is approximately ten times greater than annual rainfall (Gardiner 2003). This disparity maintains a typically arid landscape, except for areas located in proximity to river systems and shallow groundwater resources.

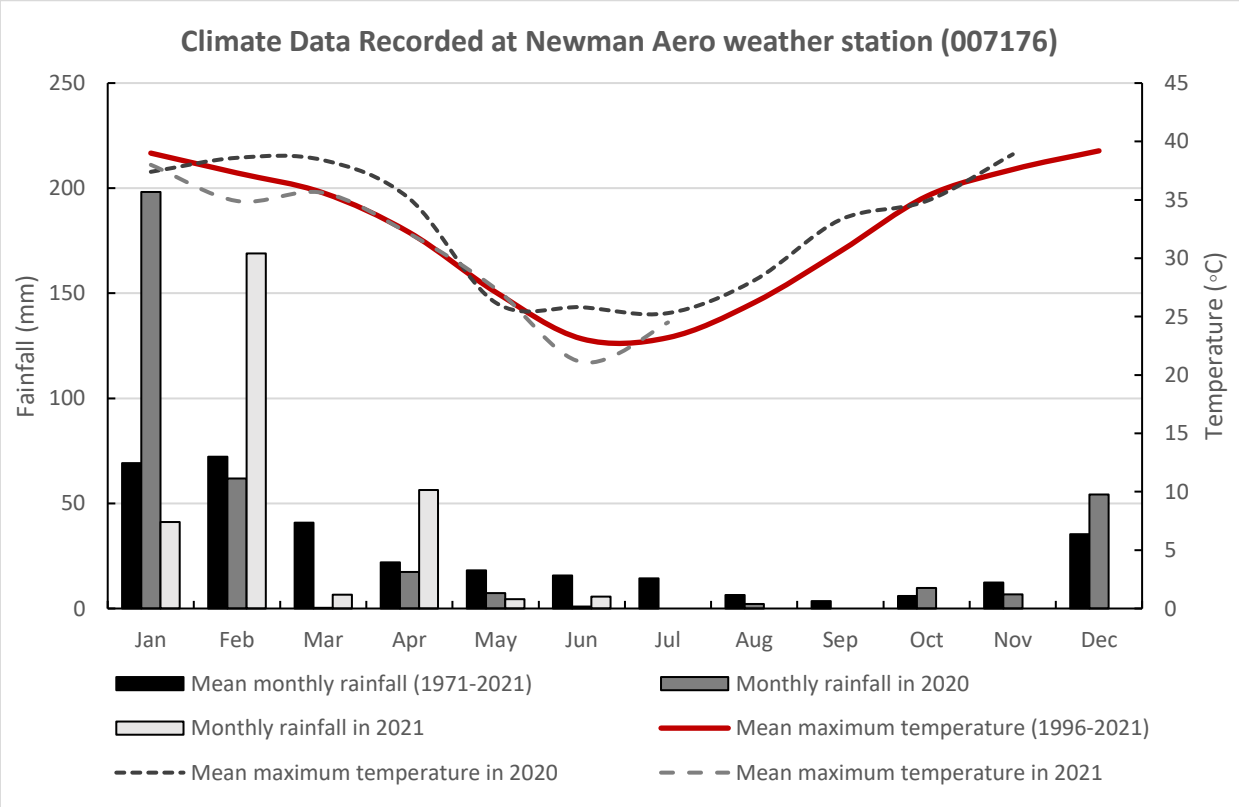

Figure 2.1 Long-term average monthly rainfall and maximum temperature, and 2020 and 2021 monthly rainfall and maximum temperatures recorded at Newman Aero weather station

The 2020 targeted survey was from 15 to 29 April 2020. Rainfall in the three months preceding the survey was higher than average for the region, with a total of 277.8 mm from January to March 2020. Temperatures during the survey were generally warm during the day, ranging from 33.9 °C to 39.7 °C during the day, and mild at night, ranging from 22.9 °C to 26.6 °C (BOM 2021).

The 2021 targeted survey was from 12-17 May 2021. Rainfall over the three months preceding the survey was above average with substantial falls recorded in February (169mm) and April (56.4 mm). Maximum mean temperatures in the month prior to the survey was 32.1 °C in line with the average. Minimum mean temperatures 17.7 °at night as per the average for Newman.

2.2 Biogeography

2.2.1 IBRA bioregions

The bioregions of Australia are described in the Interim Biogeographic Regionalisation for Australia (IBRA) (Thackway & Cresswell 1995). Bioregions are large, geographically distinct areas of land with common characteristics such as geology, landform patterns, climate, ecological features and plant and animal communities. The latest version, IBRA7, classifies Australia's landscapes into 89 large geographically distinct bioregions and 419 subregions (Department of the Environment and Energy (DotEE) 2012).

The Lamb Creek project is located in the Hamersley (PIL3) subregion of the Pilbara bioregion. The Hamersley subregion comprises the southern section of the Pilbara Craton. It is a mountainous area of Proterozoic sedimentary ranges and plateaux, dissected by gorges (basalt, shale and dolerite). Geographically it is synonymous with the Hamersley vegetation system as described by Beard (1990). The dominant vegetation is mulga low woodland over bunch grasses on fine textured soils in valley floors, and Eucalyptus leucophloia (snappy gum) over *Triodia brizoides* on skeletal soils of the ranges. Regional vegetation is further described in section 2.3. Drainage runs into either the Fortescue River to the north, the Ashburton river to the south, or the Robe river to the west (Kendrick 2001).

2.2.2 Land systems

The Lamb Creek project area traverses five land systems, as mapped by the Western Australian Land Information Authority (2018) and described by Van Vreeswyk *et al*. (2004). These are listed and summarised in Table 2.1.

The majority of the project area falls within the Boolgeeda land system, comprising stony slopes, plains, hills, and drainage floors with spinifex (Table 2.1). This land system underlies the majority of the haul road and resource area.

The Newman land system, comprising rugged mountains, ridges, and plateaux, was the second dominant, intersecting the haul road in two places and covering the south-west and south-eastern corners of the resource area. The McKay and Platform land system occurred in the north-eastern part of the resource area, while the Wannamunna land system only appeared in the southernmost part of the haul road corridor where it intersects the highway.

The vegetation in all but the Wannamunna land system is typified by spinifex grasslands. Wannamunna is characterised by hardpan plains and internal drainage tracts supporting mulga shrublands and woodlands (and occasionally eucalypt woodlands).

Table 2.1 Land systems of the Lamb Creek project area

Name	Land type	Description	Extent
Boolgeeda Land System	Stony plains with spinifex grasslands	Stony lower slopes, stony plains below hills, and narrow sub-parallel drainage floors. Supports hard and soft spinifex grasslands or mulga shrublands. Often occurs below hill systems such as Newman and Rocklea	1330 ha
McKay Land System	Hills and ranges with spinifex grasslands	Hills, ridges, plateaux remnants and breakaways of meta sedimentary and sedimentary rocks supporting hard spinifex grasslands. Relief up to 100 m	44 ha
Newman Land System	Hills and ranges with spinifex grasslands	Rugged high mountains, ridges and plateaux with near vertical escarpments of jaspilite, chert and shale, supporting hard spinifex grasslands. Relief up to 400 m.	499 ha
Platform Land System	Stony plains with spinifex grasslands	Stony upper plains, dissected slopes and drainage floors, supporting hard spinifex grasslands. Erosional surfaces formed by partial dissection of the old tertiary surface. The gently inclined upper plains have extensive marginal dissection zones with gently inclined to steep slopes. Floors incised up to 30 m with steep stable marginal slopes becoming wider downslope.	198 ha
Wannamunna Land System	Wash plains on hardpan with mulga shrublands	Hardpan plains and internal drainage tracts supporting mulga shrubland and woodlands, and occasionally eucalypt woodlands. Depositional surfaces, level hardpan wash plains subject to overland sheet flow. Broad internal drainage flats receiving run-on from adjacent hardpan surfaces; rare channelled tracts but mostly not organised through drainage. Relief up to 5 m.	126 ha

2.2.3 Geology

The project area is located in the south-west corner of the Roy Hill 1:250,000 Geological Survey Sheet (SF50-12: Thorne & Tyler 1997). The geology of the project area is generally defined by the assemblage of prehnite, pumpellyite, epidote, actinolite. Basement rocks comprise the early Proterozoic Brockman Iron Formation and Weeli Wolli Formation. The Brockman Iron Formation consists of banded iron formation (BIF) and shale, while the Weeli Wolli formation consists of BIF separated by shale and siltstone bands, with younger dolerite sills that intersect the sedimentary sequence.

Regionally, the fresh basement rocks are typically overlain by weathered basement rocks which occur as lateritic and basal gravel and/or conglomerate deposits. These weathered deposits underlie early Tertiary Channel Iron Deposits (CID), which are the dominant economic-grade iron deposits in the region. The CID is typically overlain by younger alluvial and colluvial gravels and sediments (Thorne & Tyler 1997).

The project area overlies the following geological units (Thorne & Tyler 1997).

- Brockman Iron Formation (PLHB): banded iron-formation, chert, and pelite (661 hectares);
- Quaternary Alluvium (Qa): unconsolidated silt, sand, and gravel; in drainage channels and on adjacent floodplains;
- Quaternary Alluvium and Colluvium (Qw): red-brown sandy and clayey soil; on low slopes and sheetwash areas; and
- Cainozoic Colluvium (Czc): partly consolidated quartz and rock fragments in silt and sand matrix; old valley-fill deposits.

2.2.4 Soils

The project area is located within the Fortescue botanical district of the Pilbara region (Beard 1990). This region is mountainous, with soils ranging from shallow, stony sandy loams along slopes, to cracking clays, stripped hardpans and calcareous loams along active waterways (Beard 1990).

The landforms of the project area are typical of the eastern Pilbara with rocky hills, small gorges, mostly seasonal watercourses and gravelly loam valleys. The soils are typified by hard red alkaline soils on plains, pediments and alluvial areas, while shallow, skeletal soils are common on ranges that rise to 1,250 metres (Beard 1990). The southern part of eastern Pilbara region is characterised by earthy loams underlain by red-brown hardpan (Beard 1975, 1990).

The project area has two distinct soil and landform assemblages. The eastern and western edges of R47/19 and the majority of the proposed haul road are characterised as soil unit Fa13 (1039 hectares). The central parts of R47/19 and the area adjacent to the Great Northern Highway are characterised as soil unit Fb3 (1160 hectares). These soil units are defined as follows (CSIRO Australia 2018):

- Fa13 – Ranges of banded jaspilite and chert along with shales, dolomites, and iron ore formations with some areas of ferruginous duricrust as well as occasional narrow winding valley plains and steeply dissected pediments. This unit is largely associated with the Hamersley and Ophthalmia Ranges. The soils are frequently stony and shallow and there are extensive areas without soil cover: chief soils are shallow stony earthy loams (Um5.51) along with some (Uc5.11) soils on the steeper slopes. Associated are (Dr2.33, Dr2.32) soils on the limited areas of dissected pediments, while (Um5.52) and (Uf6.71) soils occur on the valley plains; and
- Fb3 – High-level valley plains set in extensive areas of unit Fa13. There are extensive areas of pisolitic limonite deposits: principal soils are deep earthy loams (Um5.52) along with small areas of (Gn2.12) soils.

2.2.5 Hydrology

Within the Hamersley (PIL3) subregion drainage runs into either the Fortescue River to the north, the Ashburton river to the south, or the Robe river to the west (Kendrick 2001). The majority of the project area falls within the Fortescue River Upper Catchment with a smaller portion occurring within the Ashburton River Catchment. Nine intermittent creek lines bisect the survey area, draining into the larger Marillana Creek, and ultimately into Weeli Wooli Creek within the Fortescue River basin.

2.2.6 Topography

The project area occurs within the central Hamersley Ranges which dominate the sub-region (Thorne & Tyler 1997). The topography of the region is highly mountainous comprising three smaller ranges: Packsaddle Range in the centre, Jirrpalpur Range in the south and the Hancock Range to the north. The uplands of the survey area fall within the western edge of the Hancock Range.

The project area is located on the western edge of the Hancock Range, a location predominantly characterised by plain and valley floor. The south-eastern corner of the survey area contains significant rocky landforms associated with the Hancock Range.

2.3 Vegetation Communities

2.3.1 Botanical district

The Lamb Creek project area is situated in the Fortescue botanical district of the Pilbara region (Beard 1990), which forms part of the Eremaean Botanical Province. The Pilbara region receives a slightly higher than average rainfall compared to most of the Eremaean, due to the prevalence of cyclones off the coast, but this is not enough to modify the essentially desert appearance of the plant cover (Beard 1990).

The Fortescue botanical district consists predominantly of tree and shrub steppe communities with Eucalyptus trees, Acacia shrubs and spinifex grasses including *Triodia pungens* and *T. wiseana* (Beard 1975). Mulga (species of the *Acacia aneura* complex) occurs in valleys and short-grass plains may be present on alluvial soils (Beard 1990).

2.3.2 Vegetation system-associations

Digital maps (shapefiles) of pre-European vegetation communities, based on state-wide mapping by J.S. Beard at 1:250,000 scale, are published by the Department of Primary Industries and Regional Development (Beard 2018).

Vegetation of the Hamersley (PIL3) IBRA subregion is generally low Mulga woodland over bunch grasses on fine textured soils in the valleys with snappy gums (*Eucalyptus leucophloia*) over *Triodia brizoides* on skeletal soils of the ranges (Kendrick 2001). The mountain tops and gorges of the Hamersley subregion provide refugia for humidophile and/or fire intolerant flora, and support a diversity of range-restricted species (Kendrick 2001).

Beard (1975) mapped the vegetation system-associations of the project area as Hamersley 18: Low woodland of Acacia aneura, and Hamersley 82: Hummock-grass (*Triodia wiseana*) steppe with irregularly scattered *Eucalyptus brevifolia* trees; and Hamersley 18: Low woodland of *Acacia aneura*.

Table 2.2 Beard vegetation system-associations within the Lamb Creek project area (R47/19 and L47/736)

Beard Vegetation System and Association	Extent in project area	Total current extent in Australia (ha) [1)]	Pre-European extent remaining (%) [1)]
Hamersley 18	1297 ha	575 852 ha	99.2%
Hamersley 82	902 ha	2 157 841 ha	99.4%

Footnotes: 1) Numbers from 2018 Statewide Vegetation Statistics (DBCA 2019)

Vegetation that is not a Threatened or Priority Ecological Community may still be considered significant if it has a restricted distribution, or has experienced a degree of historical impact from threatening processes (EPA 2016a). Vegetation types retaining less than 30% of their pre-European extent generally experience accelerated species loss at an ecosystem level (EPA 2000) and are regarded as being 'vulnerable', while vegetation types retaining less than 10% of their original extent are regarded as being 'endangered' (EPA 2000, Shepherd *et al.* 2002, DER 2014a, 2016a).

As presented in Table 2.2, the Hamersley 18 and Hamersley 82 vegetation system-associations intersected by the project area still have close to 100% of their original extent remaining, and would be considered 'least concern' (DER 2014a).

2.3.3 Lamb Creek vegetation mapping

To date two detailed flora and vegetation surveys have been completed at Lamb Creek, in 2012 and 2021, as summarised in Table 2.3. The survey areas partially overlapped, together covering 1605 hectares (73%) of the project area. Approximately 594 hectares (27%) of the current Lamb Creek project area remains unsurveyed (beyond Rapallo's scope of works).

Table 2.3 Existing flora and vegetation surveys

Report title	Survey dates	Survey coverage over project area
Rapallo (2012) Level 2 flora and vegetation survey of the Lamb Creek project	March-April 2012	1394 hectares (63%) of the current project area including entirety of R47/19 and 45% of L47/746
Rapallo (2021a) Detailed flora and vegetation survey of the Great Northern Highway intersection area of the Lamb Creek project	May 2021	252 hectares (11%) of the current project area, comprising southern end of L47/1008

The majority of the project area has been burnt over recent years (after the 2012 survey), with some parts burnt several times (section 2.5). Floristic data and site photos collected in 2020 and 2021 indicate that these fires have changed both vegetation structure and floristic composition relative to 2012 (Rapallo 2021a). The 2021 survey was completed post-fire, but only overlapped with the 2012 survey area by 41 hectares. Re-surveying the 2012 vegetation mapping was beyond Rapallo's scope of works.

2.3.3.1 Lamb Creek flora and vegetation survey March-April 2012

The 2012 flora survey recorded six vegetation types, as listed in Table 2.4. The most widely occurring vegetation type in 2012 was VT1 described as *Eucalyptus gamophylla* woodland over hummock grassland (Table 2.4).

Table 2.4 Vegetation types of the Lamb Creek project area recorded in 2012 (Rapallo 2012).

Type	Vegetation description (2012)	Substrate/Landform	Land System
VT1 – *Eucalyptus gamophylla* woodland over hummock grassland	*Eucalyptus gamophylla* low open woodland over *Acacia elachantha* or **Acacia hilliana*, *Senna glutinosa* subsp. *pruinosa* open shrubland over *Triodia brizoides*, *Triodia wiseana* hummock grassland.	Clay loams with BIF and ironstone pebbles and gravel on open plains and gentle rises.	Boolgeeda, McKay, Newman, Platform
VT2 – *Eucalyptus leucophloia* subsp. *leucophloia* woodland over mixed shrubs over *Triodia wiseana* grassland	*Eucalyptus leucophloia* subsp. *leucophloia*, *Eucalyptus gamophylla* low open woodland over mixed species (typically *Gossypium robinsonii*, *Acacia hilliana*, *Grevillea wickhamii*, *Seringia nephrosperma*) scattered shrubs over *Triodia wiseana* hummock grassland.	Clays and clay loams with BIF and ironstone pebbles, cobbles, and sheetrock in gorges and rocky creeklines and on hillsides and breakaways.	Boolgeeda, Platform
VT3 – *Acacia* shrubland over hummock grassland	*Acacia bivenosa* or *Acacia adsurgens* open shrubland over *Triodia vanleeuwenii*, *Triodia wiseana* hummock grassland.	Sandy clay with ironstone gravel and pebbles on gentle slopes at bases of hills.	Boolgeeda, Newman
VT4 – *Acacia tumida* var. *pilbarensis* scrub in creeklines	*Acacia tumida* var. *pilbarensis* tall open scrub over *Themeda triandra* tussock grassland and *Triodia wiseana* open hummock grassland.	Clay loam and sandy clay with laterite pebbles in drainage lines.	Boolgeeda, Platform

Type	Vegetation description (2012)	Substrate/Landform	Land System
VT5 – Wannamunna Mulga grove	*Acacia aptaneura* low woodland over *Themeda triandra*, *Cymbopogon ambiguus*, *Chrysopogon fallax* open tussock grassland.	Sandy clay and clay on flat plains.	Boolgeeda, Wannamunna
VT6 – *Acacia aptaneura* over hummock grassland	*Acacia aptaneura* and/or *Corymbia deserticola* low woodland over *Acacia elachantha* and mixed *Eremophila* species over *Triodia wiseana* very open hummock grassland.	Broad open drainage system through stony plains with clay soils.	Boolgeeda, Wannamunna

2.3.3.2 Lamb Creek flora and vegetation survey May 2021

The 2021 survey was completed post-fire. Six vegetation types were recorded, and vegetation mapping was revised for the overlap area with the 2012 survey. The entirety of the 2012 vegetation type VT6 has been superseded by 2021 vegetation types C and D, while VT5 occurring in the overlap area has been superseded by 2021 vegetation types A, B, C and D.

Table 2.5 Vegetation types of the Great Northern Highway intersection recorded in 2021 (Rapallo 2021a)

Type	Vegetation description (2021)	Substrate	Land System
A - Low open *Eucalyptus gamophylla* woodland over *Triodia melvillei* and *T. pungens* on stony plain	*Eucalyptus gamophylla* (mallee) and *Corymbia deserticola* subsp. *deserticola* low open woodland; over *Acacia pruinocarpa*, *A. ancistrocarpa*, *A. atkinsiana* sparse shrubland; over isolated low shrubs; over isolated dwarf shrubs; over *Ptilotus calostachyus*, *Ptilotus obovatus*, *Trichodesma zeylanicum* var. *zeylanicum* sparse forbland; over *Triodia melvillei* and *Triodia pungens* sparse hummock grassland.	Stony plain	Boolgeeda (primarily), Wannamunna (minor extent)
B - Mulga and acacia low open woodland over open tussock grassland on gently sloping (drainage) plain with variable rock cover	*Acacia aptaneura* and *A. pruinocarpa* low open woodland; over sparse tall shrubland including *Eremophila longifolia* and *Santalum lanceolatum*; over mixed isolated shrubs to sparse shrubland; over isolated forbs to open forbland dominated by *Pterocaulon sphacelatum*, *Ptilotus obovatus*, and *Arivela viscosa*; over sparse to medium-dense tussock grassland dominated by *Aristida inaequiglumis*, *A. contorta* and *Themeda triandra*.	Gently sloping clay-loam plain with minor drainage channels and surface drainage	Boolgeeda
C - Mulga and acacia low open woodland over open spinifex and tussock grassland on flat plain with medium rock cover	*Acacia aptaneura*, *A. pruinocarpa* low open woodland with occasional *Corymbia deserticola*; over isolated tall shrubs to sparse tall shrubland dominated by *Hakea lorea* subsp. *lorea*, *Acacia elachantha*, *A. aptaneura*, *A. pruinocarpa*, *Santalum lanceolatum*; over isolated medium to dwarf shrubs; over sparse forbland dominated by *Pterocaulon sphacelatum*, *Arivela viscosa*, *Ptilotus obovatus*; over *Triodia pungens* and *T. melvillei* open hummock grassland, with *Themeda triandra*, *Aristida inaequiglumis*, and *A. contorta* open tussock grassland.	Clay-loam plain	Boolgeeda (primarily) Wannamunna (minor extent)

Type	Vegetation description (2021)	Substrate	Land System
D - Mulga, *Hakea lorea*, and *Eucalyptus xerothermica* low open woodland over closed tussock grassland on gently sloping clay-loam plain (no rocks)	Low open woodland of *Acacia aptaneura*, *Hakea lorea* subsp. *lorea*, and *Eucalyptus xerothermica*; over isolated tall to dwarf shrubs; over sparse forbland to isolated forbs dominated by *Pterocaulon sphacelatum*; over closed tussock grassland dominated by *Themeda triandra*, with *Aristida inaequiglumis* and *A. contorta*.	Gently sloping clay-loam plain without rocks	Wannamunna (primarily), Boolgeeda (minor extent)
E - Low mulga woodland over sparse understorey on stony plain	*Acacia aptaneura* low mulga woodland; over *Acacia pachyacra* and *A. ?sibirica* sparse shrubland; over isolated dwarf shrubs; over isolated forbs and ferns; over *Digitaria ammophila*, *Chrysopogon fallax*, *Aristida inaequiglumis* sparse tussock grassland.	Flat stony plain	Boolgeeda
F - *Triodia wiseana* hummock grassland with emergent shrubs and low trees on gently sloping stony plain	*Corymbia hamersleyana* and *Corymbia deserticola* subsp. *deserticola* isolated low trees; over isolated tall shrubs; over *Acacia ancistrocarpa* and mixed *Acacia* spp. sparse shrubland; over isolated dwarf shrubs; over isolated forbs; over *Triodia wiseana* hummock grassland.	Gently sloping stony plain	Boolgeeda

2.3.4 Weeds recorded in the Lamb Creek project area

Eleven weed species have been recorded from the Lamb Creek project to date during the 2012 and 2021 detailed flora and vegetation surveys, as listed in Table 2.6. Weed status is as per the Western Australian Organism List maintained by the Department of Agriculture and Food (DAFWA 2021). None of these weeds are listed as a Declared Pest under the Biosecurity and Agriculture Management Act 2007 (Australian Government 2012, DAFWA 2021).

Table 2.6 Weeds recorded during the 2012 and 2021 detailed flora surveys

Taxonomic Name 2021	Common name	Status 2021 (WAOL)	2012	2021
**Acacia hilliana*	Hill's tabletop wattle	Permitted - s11	9	
**Aerva javanica*	Kapok bush	Permitted - s11		1
**Bidens bipinnata*	Bipinnate beggartick	Permitted - s11	9	16
**Cenchrus ciliaris*	Buffel grass	Permitted - s11	1	30
**Cenchrus setiger*	Birdwood grass	Permitted - s11		12
**Chloris virgata*	Feathertop Rhodes grass	Permitted - s11	1	
**Malvastrum americanum*	Spiked malvastrum	Permitted - s11	1	15
**Melinis repens*	Red natal grass	Permitted - s11		1
**Portulaca oleracea*	Purslane	Permitted - s11	9	9
**Solanum lasiophyllum*	Flannel bush	Permitted - s11	24	6
**Stylosanthes hamata*	Southern pencilflower	Permitted - s11		2

*Footnotes: * indicates a flora taxon is alien to Western Australia, as per FloraBase (WA Herbarium 1998)*

2.4 Reserves and environmentally sensitive areas

Environmentally sensitive areas (ESAs) are protected under the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004* and are selected for their environmental values at state or national levels. The project area does not occur within an ESA, nor are there any ESAs within five kilometres of the project area, as shown by the Department of Environment Regulation (DER) Native Vegetation Map Viewer (DER 2014b).

Karijini National Park is located to the west of the project area, approximately 18 kilometres west of the intersection of the proposed haul road and the Great Northern Highway. Mungaroona Range Nature Reserve is approximately 100 kilometres northwest of the project area. The nearest Nationally Important Wetland is the Fortescue Marsh located 52 km north of the survey area (AWE 2021).

Survey data from 2012 and 2021 indicates that no currently listed Threatened or Priority Ecological Communities (TEC-PEC) occur within the surveyed parts of the Lamb Creek project (Rapallo 2012, 2021a). Further details in section 4.1.2.

2.5 Fire history

Fire mapping for Australia is available from the Northern Australia and Rangelands Fire Information (NAFI 2021) website, with fire scar data available from 2000 to present. The NAFI service displays maps of fire activity based on information from satellites, such as hotspots (locations of recently burning fires) and fire scars (maps of recently burnt country).

The majority of the project area has been burnt over recent years (after the 2012 survey), with some parts burnt several times (NAFI 2021), resulting in a mosaic of different fire ages. Floristic data and site photos collected in 2020 and 2021 indicate that these fires have changed both vegetation structure and floristic composition relative to 2012 (Rapallo 2021b).

Fire mapping over the project area between 2012 and 2021 (NAFI 2021) is shown in Figure 2.2. It must be noted that NAFI data is very broad-scale and does not show the fine-scale mosaic within the project area, nor does the mapping indicate fire intensity.

3 Methods

3.1 Desktop study

The flora desktop study comprised a search of paid and free databases, and a review of available literature relevant to the survey area. The desktop review served to compile a list of conservation significant flora taxa with the potential to occur within the survey area. Conservation codes for Australian flora are detailed Appendix I. Database search parameters are outlined in Table 3.1.

Table 3.1 Flora database search parameters

Source of information	Search area
DBCA (2021a) Threatened and Priority Flora Database (including WA Herbarium database records)	60 km radius centred on project area
DBCA (2021b) Threatened and Priority Ecological Communities (TEC-PEC) database	50 km radius centred on project area
DBCA (2021c) NatureMap online database	40 km radius centred on the project area
Department of Agriculture Water and the Environment (AWE) (2021) Protected Matters search tool	50 km radius centred on the project area

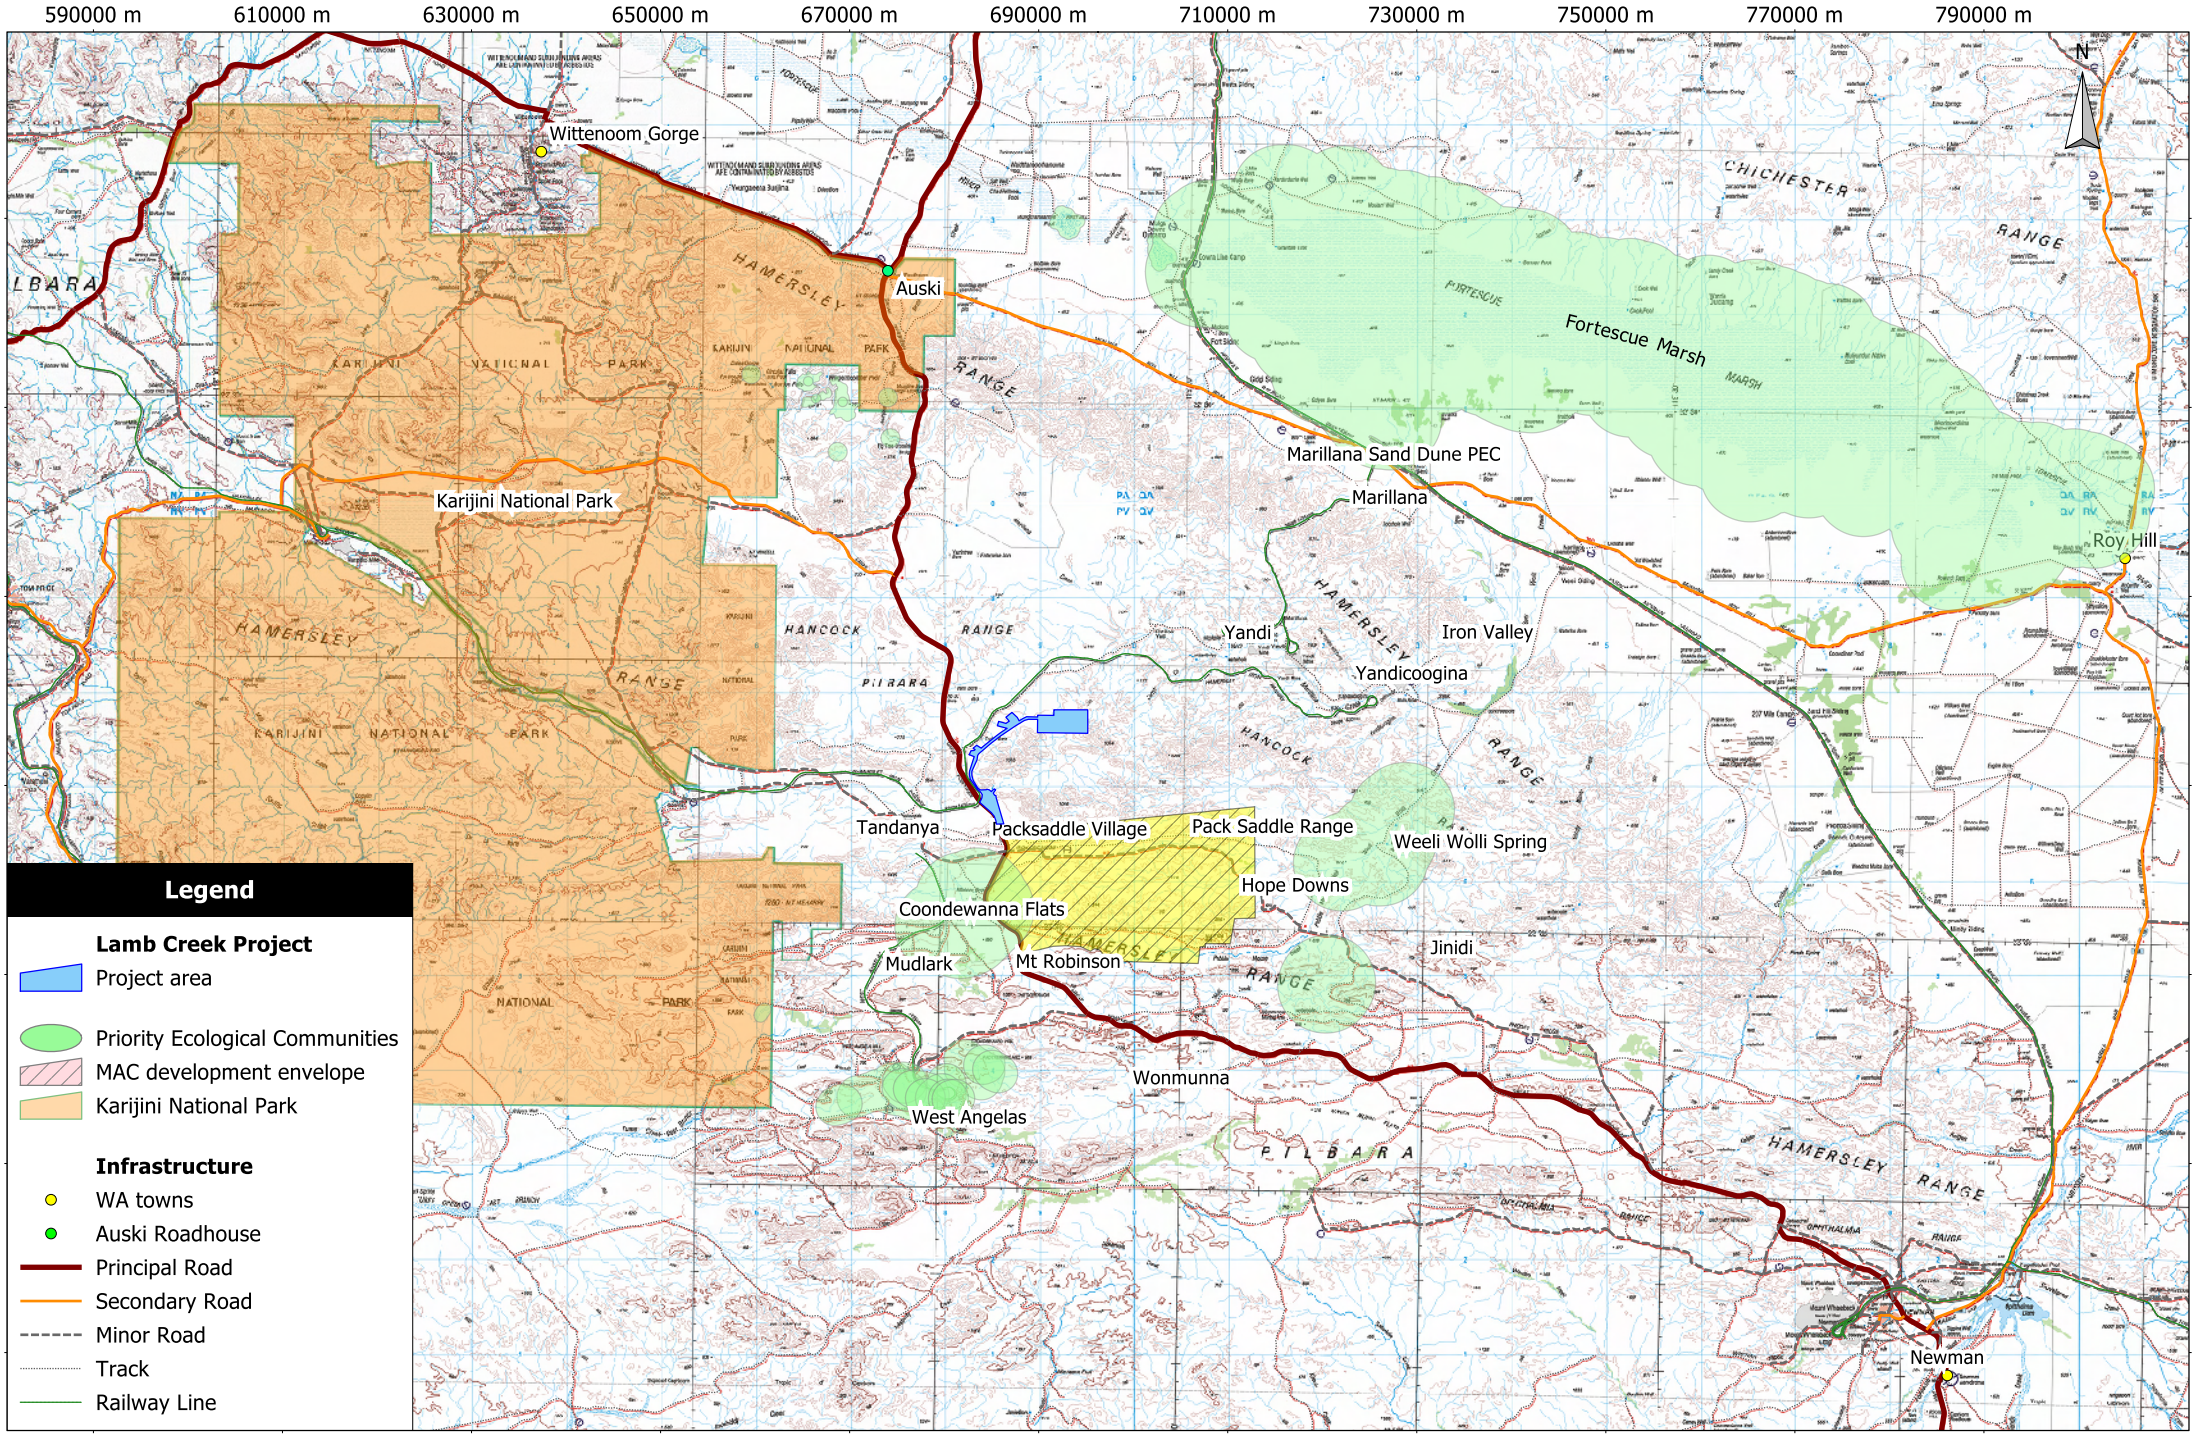
The region has had considerable flora survey effort over the last 20 years predominantly due to flora and vegetation surveys completed within, or partly within, the boundary of the Mining Area C (MAC) Development Envelope between 1997 and 2014. The MAC Development Envelope is approximately 10 kilometres (km) south of R47/19 as showed in the inset map of Figure 1.2 and in Figure 1.3 which provides regional context for the Lamb Creek project. The surveys used as part of the literature review are listed in Appendix II and generally occurred within 50 kilometres of the Lamb Creek project area.

The conservation significant taxa identified in the desktop were reviewed for likelihood of occurrence within the survey area, based on the likelihood categories outlined in Table 3.2. Field based habitat information was only available for 73% of the project area (section 2.3.3). Likelihood scores for the areas not visited by the field team are based on desktop information only. Desktop results and likelihood assessment are presented Appendix II.

Table 3.2 Likelihood assessment criteria

Rank	Criteria
Confirmed	1. The species was recorded on the project area; or 2. The species was recorded directly adjacent (within 500 m) of the project area from habitat continuing into the project area.
Likely to occur	1. There are existing records of the species in close proximity to the project area (within 20 km); and • the species is strongly linked to a specific habitat, which is present in the project area; or • the species has more general habitat preferences, and suitable habitat is present.
May potentially occur	1. There are existing records of the species from the region (within 30 km), however: • the species is strongly linked to a specific habitat, of which only a small amount is present in the project area; or • the species has more general habitat preferences, but only some suitable habitat is present.

Rank	Criteria
	2. There is suitable habitat in the project area, but there are very few or only very old (1999 or before) records from the region.
Unlikely to occur	1. The species is linked to a specific habitat, which is absent from the project area; or 2. Suitable habitat is present, however there are no existing records of the species from the locality despite reasonable previous search effort in suitable habitat; or 3. There is some suitable habitat in the project area, however the species is very infrequently recorded in the locality.
Highly unlikely to occur	1. The species is strongly linked to a specific habitat, which is absent from the project area; and/or 2. The species' range is very restricted and would not include the project area.



Rapallo environmental	Mineral Resources Limited Lamb Creek Project	Lamb Creek Iron Ore Project Targeted conservation significant flora survey (April 2020, May 2021)	Original Size: A4 Scale: 1:800,000 Datum: MGA94 Zone 50 0 25 km	**Figure 3.1** Regional localities

3.2 Field Survey

The survey area was searched over two survey periods, with each period covering a different part, as outlined in section 1.3 and Table 1.3, and mapped in Figure 3.2. The survey teams are listed in Table 3.3. The first survey period was 15-19 April 2020, and the second survey period was 12-17 May 2021.

The survey methods were in accordance with EPA (2016b) *Technical Guidance – Flora and Vegetation Surveys for Environmental Impact Assessment* and aligned with the criteria for a targeted survey.

The targeted survey area as defined in section 1.3 was searched via systematic parallel traverses, spaced approximately 50 meters apart (Figure 3.2). Traverse lines were drawn in a GIS program prior to the survey and uploaded onto hand-held Garmin GPS units for ease of navigation. The spacing of the traverses was determined with consideration given to the openness of the vegetation being surveyed, and the size and visibility of the target species. Where a target species was encountered, survey effort was intensified to locate additional individuals and/or map the extent of populations. Survey effort was also intensified within restricted or unusual landforms such as creek lines, outcroppings, or distinctive soil types.

Additional searches outside of the defined survey areas listed in Table 1.1 were completed to map the extent of conservation significant flora populations beyond the survey area boundaries, as per EPA (2016b) technical guidance, and to opportunistically search areas outside of the 2020 footprint.

During the 2020 survey, additional areas within R47/19 outside the defined survey area were searched opportunistically on foot by means of two traverses selected to sample habitats suitable to several of the target taxa which were not (well) represented in the defined survey area. These habitats included gorges and gullies, elevations greater than 900 m, south facing slopes, and larger creek lines.

Additional reconnaissance work was also completed by helicopter in 2020 to determine the extent of a large population of *Aristida lazaridis* (P2) recorded in the area adjacent to the Great Northern Highway. Identification of this grass from the air was possible because it was noted during the survey that clumps of *A. lazaridis* are distinctly visible from the air when in flower, as shown in Plate 1. During the reconnaissance flights, GPS waypoints were taken from the air, with selective waypoints subsequently ground-truthed on foot.

During the May 2021 survey, helicopters were not provided, and the survey area was small and directly adjacent to a major road. For this reason, searches for conservation significant taxa and mapping population boundaries outside of the defined survey area occurred on foot and from a vehicle.

Plate 1 ***Aristida lazaridis*** **clumps in flower as visible from the air during the 2020 field survey.**

3.2.1 Specimen collection and identification

Flora specimens were collected and pressed as per Western Australian Herbarium (2008) guidelines. Each specimen was assigned a unique field name and field number and was marked with a plant tag containing specimen and location information. All specimens were pressed and dried on the day of collection. Fragile material such as flowers, seed capsules, or very small specimens were sealed in paper bags which were marked as per the plant tags.

Taxonomic identification of flora specimens was completed by Sharnya Thomson-Yates (Table 3.3) (who was also a member of the 2021 field survey team) with the use of the WA Herbarium reference collection, latest flora identification keys, and recent scientific publications.

As per section 7.2 of EPA (2016b) and under flora licence conditions, suitable voucher specimens will be lodged with the Western Australian Herbarium.

3.3 Personnel and licensing

The personnel involved in the field survey, taxonomic identification, and the preparation of this report are listed in Table 3.3. Flora specimens were collected under Flora Taking (Biological Assessment) Licences pursuant to Regulation 62 of the *Biodiversity Conservation Regulations 2018*. As part of the license requirements, a copy of this report will be forwarded to the DBCA.

3.4 Nomenclature and conservation listing

Flora taxonomy and nomenclature follows FloraBase (WAH 1998-). FloraBase, the Western Australian Herbarium database (via NatureMap DBCA 2021c and the Threatened and Priority Flora database search DBCA 2021a) was utilised to verify conservation codes, distribution records, habitat requirements, and flowering times for the target taxa. Conservation codes cited in this report are as per Appendix I. Conservation codes on FloraBase are the most up to date, whereas the DBCA Threatened (Declared Rare) and Priority Flora List (DBCA 2018) was last updated on 5 December 2018.

4 Results

4.1 Flora desktop study

4.1.1 Conservation significant taxa

The desktop study found 86 significant vascular flora taxa from within 60 kilometres of the project area, with proximal records mapped in Figure 4.1. An assessment was completed as per Table 3.2 in section 3.1 to estimate the likelihood of occurrence within the project area for each of the conservation significant species identified via the database searches and literature review. Likelihood ranking was updated post-field based on habitat information.[1] Search results and likelihood ranking are presented in Appendix II and summarised in Table 4.1.

Table 4.1 Summary of Lamb Creek desktop results for conservation significant taxa

Likelihood ranking	Status[1]						Total taxa
	VU[2]	CR[3]	P1	P2	P3	P4	
Confirmed	1			1	4	1	**7**
Likely to occur			1	1	3	2	**7**
May potentially occur			1	1	2		**4**
Unlikely to occur		1	7	14	32	4	**58**
Highly unlikely to occur			4	1	5		**10**
Grand Total	**1**	**1**	**13**	**18**	**46**	**7**	**86**

Footnotes:
1. P = Priority (administered by DBCA; Biodiversity Conservation Act 2016 (BC Act)), VU = Vulnerable, CR = Critically Endangered.
2. Listed under the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) and BC Act,
3. Listed BC Act only. Refer to Appendix I for detailed explanation of conservation codes.

Two species listed as vulnerable and critically endangered were returned via the threatened and priority flora database search (DBCA 2021a) and the protected matters search (AWE 2021).

- *Thryptomene wittweri* listed as vulnerable under the BC Act and EPBC Act was assessed as unlikely to occur due to habitat requirements and distance of records from the project area (>20 kilometres). This species is not discussed further in this report.
- *Seringia exastia* listed as critically endangered under the BC Act is discussed in section 5.1.1.

Most records were DBCA listed priority flora taxa and the greater majority (80%) were ranked as unlikely to highly unlikely to occur within the Lamb Creek project area (Appendix II). These priority taxa are not discussed further in this report.

Seven conservation significant taxa were confirmed to occur, these are discussed in section 5.1. Eleven significant taxa were assessed as likely to occur, or may potentially occur on the project area, and are discussed in section 5.2.

[1] Habitat information is only available for 73% of the project area, the majority of which has been collected pre-fire.

4.1.2 Conservation significant vegetation

4.1.2.1 Listed conservation significant vegetation

Survey data from 2012 and 2021 indicates that no currently listed TEC or PEC occur within the surveyed parts (73%) of the Lamb Creek project. The nearest known PEC is subtype 2 of the Coolibah-Lignum Flats vegetation community, with the edge of the buffer zone located less than five kilometres south of the survey area (DBCA 2021b) as shown in Figure 4.1.

The Coolibah-Lignum Flats vegetation complex is described as: Woodland or forest of *Eucalyptus victrix* (coolibah) over thicket of *Duma florulenta* (lignum) on red clays in run-on zones. Associated species include *Eriachne benthamii*, *Themeda triandra*, *Aristida latifolia*, *Eulalia aurea* and *Acacia aneura* (DBCA 2021d).

Three sub-types have been identified, of which sub-type 2 occurs near the project with the edge of the buffer zone less than five kilometres from the southern edge of the project area (Figure 3.1, Figure 4.1).

1. Coolibah and mulga (*Acacia aneura*) woodland over lignum and tussock grasses on clay plains (Coondewanna Flats and Wanna Munna Flats) – Priority 3
2. Coolibah woodlands over lignum (*Duma florulenta*) over swamp wandiree (Lake Robinson is the only known occurrence) – Priority 1
3. Coolibah woodland over lignum and silky browntop (*Eulalia aurea*); two occurrences known on Mt Bruce Flats – Priority 1

The 2012 flora and vegetation survey concluded that the Coolibah-Lignum Flats PEC is unlikely to occur in the survey area because neither Coolibah (*E. victrix*) nor lignum species were recorded (Rapallo 2012). These results were supported by the 2021 detailed flora survey (Rapallo 2021a).

Onshore (2013b) reviewed vegetation mapping within Coodewanna Flats and Lake Robinson and confirmed fine-scale mapping for the two sub-types of the Coolibah-lignum Flats. They concluded that the Priority 1 sub-type 2 lies at the lowest point of the Coondewanna Flats associated with Lake Robinson, and the Priority 3(i) sub-type 1 occurs on alluvial flats (Coondewanna Flats) around Lake Robinson, to the south and found that the Great Northern Highway divides the PEC to the west from the MAC Development Envelope. Based on the Onshore (2013b) mapping, the PEC occurs ca. 12 kilometres to the south of the Lamb Creek project area.

4.1.2.2 Locally significant vegetation

Vegetation may be of significance for reasons other than a listing as a TEC or a PEC. This may include, although is not limited to, scarcity, combination of species, role as a refuge, restricted distribution and vegetation extent being below a threshold level (EPA 2004).

Local significance can be determined where a vegetation type is confined to a specialised habitat and/or landform that is not common in the local area or the vegetation types are supporting conservation significant species or groundwater dependent species.

Vegetation types A, B, C and D recorded in the 2021 survey of the Great Northern Highway intersection area are considered locally significant due to supporting the Priority 2 listed grass *Aristida lazaridis*, as well as other conservation significant species (Rapallo 2021a).

Vegetation types B, C, D and E are also considered locally significant because they contain *Acacia aptaneura* (mulga) as the dominant upper storey species on stony or clay plains and floodplains (Rapallo

2021a). This matches the broad description of ‘valley floor mulga’ which is listed by Kendrick as one of the “ecosystems at risk” (Kendrick 2001).

None of the flora taxa recorded during the 2012 and 2021 flora surveys were indicative of groundwater dependent vegetation. It must be noted that these surveys only covered 73% of the current project aera.

Goodenia nuda	Priority 4	50		50			50
Rhagodia sp. Hamersley (M. Trudgen 17794)	Priority 3	49	1	49	1	5	45
Rostellularia adscendens var. *latifolia*	Priority 3	1		1			1
Euphorbia aff. *ferdinandi*	Potentially undescribed	4		4			4

Footnotes:
1) Numbers represent the estimated number of individual plants recorded.
2) Numbers outside the defined survey area were counted opportunistically and while mapping population boundaries.
3) The targeted survey covered 869 hectares (40%) of the project area.
4) The targeted survey covered 421 hectares (64%) of footprint V3.

An overview map of all conservation significant flora recorded during the 2020 and 2021 targeted flora survey is presented in Figure 4.2. The greatest number of different conservation significant flora taxa, as well as the greatest number of individual plants, was recorded in the Great Northern Highway intersection area, as mapped in Figure 4.3. The opportunistic traverses into habitats not covered by the defined survey area recorded an additional two taxa as mapped in Figure 4.4. Conservation significant flora recorded during the survey are described further in section 5.1.

5 Discussion

This section discusses the survey results from a project area, local and regional perspective.

5.1 Significant flora species recorded during the survey

Seven DBCA listed conservation significant flora taxa, and one potentially undescribed taxon, were recorded during the 2020 and 2021 field surveys, both from within the defined survey area and from locations outside and adjacent to the survey area while mapping population boundaries.

Recent flora and vegetation mapping (post-fire) was available for the Great Northern Highway intersection part of the survey area, as described in Rapallo (2021a), while old (pre-fire) mapping was available for the resource area and part of the haul road (Rapallo 2012). The vegetation composition and structure in the 2012 mapped areas has changed as a result of the fire (Rapallo 2021b), which must be kept in mind when interpreting significant flora locations relative to habitat. The vegetation types recorded in 2012 and 2021 are described in section 2.3.3.

The estimated number of individual plants of each conservation significant taxon per vegetation type is presented in Table 5.1 below. Where there is overlap between 2012 and 2021 vegetation mapping, only the 2021 mapping is considered. Mapping completed in 2012, which has limited relevance to flora recorded in 2020 and 2021, is only used where no current 2021 mapping is available.

Approximately 31% of the individual plants recorded were outside of any vegetation mapping. The greater majority of these were *Aristida lazaridis* (P2) records collected when mapping population boundaries outside of the defined targeted survey area. The single record of *Rostellularia adscendens* var. *latifolia* (P3) was also outside of any mapped areas. Interestingly, both records of *Seringia exastia* (CR) were from a previously cleared and revegetated area, and not from a mapped vegetation type.

No conservation significant flora were recorded from 2021 vegetation type F and from 2012 vegetation types VT3 and VT4. The entirety of the 2012 vegetation type VT6 has been superseded by 2021 vegetation types C and D.

The Great Northern Highway Intersection part of the survey area supported the overwhelming majority of conservation significant flora records, and five of the total eight taxa recorded. The overwhelming majority of these records were *Aristida lazaridis* (P2).

The greatest number of conservation significant flora records were from 2021 vegetation types C and D. Outside of 2021 mapping, the greatest number of conservation significant flora records were from 2012 vegetation type VT5. Where there was overlap between the 2012 and 2021 mapping, the 2012 vegetation type VT5 has been superseded by 2021 vegetation types A, B, C and D. The absence of a clear-cut link between 2012 and 2021 vegetation polygons is indicative of the significant changes that have occurred since the 2015 fire. As such, the 2012 vegetation mapping has limited relevance to the habitat that was present during the targeted survey.

Aristida jerichoensis var. *subspinulifera* (P3) and *Eremophila* sp. Hamersley Range (P3) were only recorded from the retention licence R47/19 from areas mapped in 2012 as VT1 and VT2. Both taxa occurred more than a kilometre outside of footprint V3. The retention licence was burnt in 2017, and no current vegetation information is available. However, the land forms associated with vegetation types VT1 and VT2 are unlikely to have changed, and would present some indication of habitat for these taxa.

Table 5.1 Conservation significant flora records relative to 2021 and 2012 vegetation types

Taxon	Status	2021 vegetation types [1]							2012 vegetation types (pre-fire) [2]					Outside of mapped areas	Total
		A	B	C	D	E	F	X	VT1	VT2	VT3	VT4	VT5

Footnotes:

1. 2021 vegetation types:

A - Low open Eucalyptus gamophylla woodland over Triodia melvillei and T. pungens on stony plain

B - Mulga and acacia low open woodland over open tussock grassland on gently sloping (drainage) plain with variable rock cover

C - Mulga and acacia low open woodland over open spinifex and tussock grassland on flat plain with medium rock cover

D - Mulga, Hakea lorea, and Eucalyptus xerothermica low open woodland over closed tussock grassland on gently sloping clay-loam plain (no rocks)

E - Low mulga woodland over sparse understorey on stony plain

F - Triodia wiseana hummock grassland with emergent shrubs and low trees on gently sloping stony plain

X – Not a vegetation type. Cleared, rehabilitated, Road

2: 2012 vegetation types:

VT1 – Eucalyptus gamophylla woodland over hummock grassland

VT2 – Eucalyptus leucophloia subsp. leucophloia woodland over mixed shrubs over Triodia wiseana grassland

VT3 – Acacia shrubland over hummock grassland

VT4 – Acacia tumida var. pilbarensis scrub in creeklines

VT5 – Wannamunna Mulga grove

5.1.1 *Seringia exastia* (Critically Endangered)

Seringia exastia (fringed fire-bush) is a small spreading shrub growing up to 1.5 metres tall but usually recorded around 0.5 metres (DBCA 2021c). It has been recorded in flower year-round (WAH 1998-, DBCA 2021a). The species is currently listed as Critically Endangered, but this is due to a taxonomic revision where a threatened and a common species were merged, and the name of the former was adopted as the new name, with the conservation status still attached. The current distribution map published on FloraBase (Western Australian Herbarium 1998) incorporates this revision, showing *Seringia exastia* as widespread across northern Western Australia, ranging from the Coolgardie and Murchison IBRA regions in the south to the Dampierland IBRA region in the north.

Seringia exastia was recorded at two locations near the Great Northern Highway intersection (Figure 4.3). Both locations are outside of footprint V3. The habitat was cleared and disturbed vegetation, and not mapped as a vegetation type (Rapallo 2021a). There is a threatened and priority flora database record of this taxon within the project area, on the south-western side of the Great Northern Highway (DBCA 2021a). This location was visited during the targeted survey, but the taxon was not found.

Communications received from DBCA (24/08/2021) confirm that the species is common and widespread, and that a nomination to delist the species has been prepared and considered by the WA Threatened Species Scientific Committee (TSSC). However, until changes are officially made to the Threatened species list, *S. exastia* is still legally listed as threatened flora, and authorisation to take under section 40 of the *Biodiversity Conservation Act 2016* is still required.

5.1.2 *Aristida lazaridis* (Priority 2)

Aristida lazaridis is a tufted perennial grass ranging from 0.4 to 1.5 m in height which generally flowers in April and May (WAH 1998-, DBCA 2021a). The species has been recorded in clay /loam soils on drainage lines and on slopes. The habitat often comprises mulga low open woodland with or without eucalypts, over a variety of shrubs and herbs, often over tussock grassland but sometimes with *Triodia* hummock grassland (DBCA 2021c).

A large population of *Aristida lazaridis* was recorded on the un-incised loamy valley floor drainage at the southern end of the survey area proximal to the Great Northern Highway (Figure 4.3). An estimated population of 12773 plants from 6757 point locations was recorded over the 2020 and 2021 survey periods combined. The species was recorded from all 2021 vegetation types except type F, with the greatest number of records from vegetation types B, C and D (Rapallo 2021a). Out of the total records for this species, only 75 fall within footprint V3.

Aristida lazaridis occurs as scattered plants to dense patches several hundred to a thousand plants that locally dominate or co-dominate the ground cover. The highest population estimates were recorded where *Aristida lazaridis* occurs as a co-dominant of the tussock grassland understory within vegetation types B, C, and D (Rapallo 2021a). Searches outside the survey area on foot and from helicopter recorded the species extending outside the project area within the narrow valley that runs between the two hill systems that terminate at the southern end of the haul road corridor. Populations and scattered plants identified as potential *Aristida lazaridis* have also been observed from helicopter to the southwest on the western side of the Great Northern Highway. At the time of survey in 2020 the species was in flower and could be spotted from a helicopter. However, due to the presence of six other *Aristida* species recorded from Lamb Creek during the 2012 and 2021 surveys, only ground-truthed records are presented in this

report and mapped in Figure 4.2. Plate 2 shows *Aristida lazaridis* (P2) within its habitat on the loamy drainage floor of the survey area.

Locally, a significant population of *Aristida lazaridis* has been recorded in deep loam soils along an un-incised drainage line north and west of the BHP Packsaddle Village, approximately 7 kilometres south-east of the Lamb Creek population. Onshore (2011a) reported a total of 2405 plants from 94 point locations from this population occurring within six vegetation types with the largest populations occurring within the tussock Grassland with Low Woodland of *Eucalyptus xerothermica* and *Acacia aptaneura*, *Acacia* Low Open Forest and *Triodia* Hummock Grassland vegetation communities (Onshore 2017). The closest threatened flora database records are the *Aristida lazaridis* record from the project area collected in 2012 and a 2018 record of 500+ plants from low open woodland of *Acacia aptaneura* with occasional *Acacia pruinocarpa* and *Eucalyptus xerothermica* over scattered shrubs of *Eremophila longifolia*, *Senna artemisioides* subsp. *oligophylla* and *Senna artemisioides* subsp. *helmsii* over open tussock grassland on red clay loam on floodplains and drainage areas (DBCA 2021a).

Further afield, the species has been recorded from Lake Robinson on the eastern fringe of the Coondewanna Flats (up to 20% cover, Onshore 2013c), Mudlark (up to 15% cover, (Onshore 2013b), Tandanya (up to 20% cover , (Onshore 2013c), and South Flank (13 plants, (Onshore 2012a) and West Angeles (Rio Tinto 2018).

There are 20 specimen records within the Western Australian Herbarium database, with collections from locations across approximately 130 kilometres extending from the Rangers Station at Karijini National Park to near Newman (DBCA 2021c). There are 43 records from the Rio Tinto Priority Flora database (Rio Tinto 2018) extending over 60 kilometres. In addition to these records, this species occurs over a 2,500 kilometre range across the Northern Territory and Queensland (Atlas of Living Australia 2021).

Plate 2 ***Aristida lazaridis*** **(P2) and its habitat**

5.1.3 Aristida jerichoensis var. *subspinulifera* (Priority 3)

Aristida jerichoensis var. *subspinulifera* is a compact tufted perennial grass ranging in height from 0.3 to 0.8 metres (WAH 1998-). Flowering has been recorded in the post-wet season (May) and in the dry season (July, September) (DBCA 2021a). It often occurs in mulga woodlands or acacia shrublands over *Trioda* and/or tussock grassland (DBCA 2021c).

A population of approximately 50 plants was recorded opportunistically in 2020 from a single location in the south-east corner of R47/19 within 2012 vegetation type VT2 (Figure 4.4). This area falls outside of the defined survey area, and the plants were recorded opportunistically during two selective traverses. The population was observed on a south facing rocky slope of a gorge/gully at 820 metres elevation. This location is more than a kilometre outside of footprint V3.

Locally, there is a Western Australian Herbarium record of *Aristida jerichoensis* var. *subspinulifera* from 800 metres northwest of the survey area, from a level plain of orange light clay (DBCA 2021a). *Aristida jerichoensis var. subspinulifera has been recorded* as scattered individuals or more commonly in groups of up to 300 plants within the MAC Development envelope (Onshore 2017) on red brown clay loam on hardpan intergrove plains open mulga woodland and from the Coondewanna Flats PEC (Onshore 2013a).

Compared with the collections made from the MAC Development envelope, and the habitat data in the Western Australian Herbarium database (predominantly collections from clay/loam plains/flats), the Lamb Creek habitat of high elevation, rocky gorge seems odd, however the species has been recorded near Newman on rocky upper hillslope (DBCA 2021c).

Regionally, *Aristida jerichoensis* var. *subspinulifera* has been recorded from BHP Billiton Iron Ore project areas including Area C West to Yandi (scattered plants, Onshore 2014b), Mudlark (up to 100 percent cover, (Onshore 2013b) and the Tandanya tenements up to 100 percent cover, (Onshore 2013c).

There are 39 specimen records within the Western Australian Herbarium database, with collections from locations spread across 290 kilometres extending between Nammuldi to Newman, with outliers in the Little Sandy Desert and Murchison, as well as collections from the Northern Territory and Queensland (DBCA 2021c; (Atlas of Living Australia 2021).

Plate 3 *Aristida jerichoensis* var. *subspinulifera* (P3) in rocky gorge habitat

5.1.4 *Eremophila sp. Hamersley Range (K. Walker KW 136) (Priority 3)*

Eremophila sp. Hamersley Range (K. Walker KW 136) is an erect perennial shrub to 2.5 metres that has been recorded flowering in the post-wet season (June) and dry season (August, September) (WAH 1998-, DBCA 2021a)

Within the survey area, two populations (in close proximity of each other) and one single plant were recorded from the eastern part of R47/19 (Figure 4.4). This area falls outside of footprint V3 by at least one kilometre. The two populations of 23 and 12 individual plants were recorded on the eastern and western slopes of a small gorge/gully within respectively 2012 vegetation types VT1 and VT2 (Plate 4). The single individual was also recorded growing on the flanks of a gorge within VT2. Most plants were 0.5 metres in height, but one individual was greater than 3 metres tall. None of the plants were in flower at the time of the survey, which occurred outside of the common flowering period for this taxon. *Eremophila* sp. Hamersley Range (K. Walker KW 136) is similar to *E. tietkensii*, primarily differing in leaf indumentum and also in floral characters (Biota 2014).

All records of *Eremophila* sp. Hamersley Range were outside of the targeted survey area, and were recorded during two selective traverses through habitat identified as potential for this taxon. Note that only a tiny fraction of potential habitat was searched, and the searches were not systematic. The aerial photograph shows that R47/19 contains a large number of gorge/gullies similar to where this taxon was recorded, including in the south-western corner of R47/19 where the current 2021 footprint extends into unsurveyed areas. It is highly likely that further populations of *Eremophila* sp. Hamersley Range occur within R47/19 including potentially within the unsurveyed part of footprint V3.

Locally, *Eremophila* sp Hamersley Range was not recorded on the MAC development envelope to the south (Onshore 2017), however it has been recorded in the ranges ca. eight kilometres south of the Lamb Creek retention licence (DBCA 2021a) and from Baby Hope Downs ca. 35 kilometres to the southeast of Lamb Creek from five locations in rocky gullies and gorges (Biota 2014).

There are fifteen specimen records within Western Australia, with Western Australian herbarium records from locations spread across 220 kilometres from Paraburdoo to Newman (WAH 1998-) and 345 records, within the Rio Tinto database; recorded from Eastern Range, Channar, Turee Syncline, Karijini National Park, West Angelas, Angelo Central and Hope Downs 1 (Rio Tinto 2016).

Plate 4 *Eremophila* sp. Hamersley Range and its north facing rocky hillside habitat

5.1.5 *Rhagodia sp. Hamersley (M.E. Trudgen 17794) (Priority 3)*

Rhagodia sp. Hamersley is an erect spindly shrub to 2 metres high, found on red sandy clay loam plains and floodplains growing in association with mulga (Western Australian Herbarium 1998-, DBCA 2021a)

Fifty plants were recorded from the Great Northern Highway area (Figure 4.3), often in association with *Acacia aptaneura* (mulga). Records occurred in every 2021 vegetation type except F (Rapallo 2021a). Records to the east of the 2021 survey area were from 2012 vegetation types VT2 and VT5, which may now no longer be relevant.

DBCA and WA Herbarium records for *Rhagodia* sp. Hamersley show flowering for this taxon in the late wet season, post-west season, and dry season. However, the majority of records year-round are of non-flowering plants, which suggest that this taxon is readily recognisable without flowers, and that it may respond to rainfall rather than season. The taxon was recorded in flower during the 2020 and 2021 targeted surveys, as shown in Plate 5.

Locally, 13 populations of *Rhagodia* sp. Hamersley (M. Trudgen 17794) have been recorded within the MAC Development Envelope, the closest 3 kilometres south east of the Lamb Creek project area, from four vegetation communities associated with mulga and tussock grassland (Onshore 2017).

Regionally, the species is widespread on mulga plains on BHP Billiton Iron Ore's Mudlark (192 plants, (Onshore 2013b) and Tandanya (496 plants, (Onshore 2013c), tenements to the west and south-west of the MAC Development Envelope, and from the Jinidi tenement ca. 50 kilometres to the south east of Lamb Creek (scattered plants) (Onshore 2011b).

There are 63 specimen records in the Western Australian Herbarium database, with collection locations spread approximately 290 kilometres extending between Tom Price and Newman (DBCA 2021c).

Plate 5 ***Rhagodia* sp Hamersley (M.E. Trudgen 17794) in flower and growing beneath mulga on the survey area in 2020 (L) and 2021 (R).**

5.1.6 Rostellularia adscendens var. latifolia (Priority 3)

Rostellularia adscendens var. *latifolia* is an erect herb or shrub, 0.1-0.3 meters high , often recorded from loams associated with drainage/floodplain, but also from hillslopes (DBCA 2021c). Flowering has primarily been recorded in the post-wet season (April-May) but also occasionally in the dry season (August) (WAH 1998-, DBCA 2021a)

A single plant was recorded from the bank of a dry rocky creek midway along the proposed haul road alignment within L47/736 (Figure 4.2). No vegetation mapping exists for this location. The specimen was recorded in flower at the time of the survey, as shown in Plate 6. The record occurred approximately 80 meters outside of footprint V3.

Locally there are 13 populations of *Rostellularia adscendens* var. *latifolia* recorded from the MAC Development Envelope, occurring as scattered individuals or populations of up to a maximum of 82 plants across a variety of vegetation types (Onshore 2017), approximately 20 kilometres south east of the Lamb Creek retention licence.

Regionally, the species has been recorded from a number of BHP Billiton Iron Ore's project areas including Area C West to Yandi (67 plants, Onshore 2014), Mudlark (Onshore 2013b) , Tandanya (60 plants, (Onshore 2013c), Jinidi to Mainline (<2 percent cover within Weeli Wolli Creek, Onshore 2012b) and Yandi (<1 percent cover, (Onshore 2011c).

There are 39 specimen records within the Western Australian Herbarium database, with collections from locations spread across approximately 280 kilometres extending between Nammuldi and the Jimblebar to Yandi Railway, with outliers extending to Nullagine (DBCA 2021c).

There are 205 records of *Rostellularia adscendens* var. *latifolia*, within the Rio Tinto database from numerous locations (Rio Tinto 2016).

Plate 6 *Rostellularia adscendens* var. *latifolia* on rocky creek bank within the survey area

5.1.7 Goodenia nuda (Priority 4)

Goodenia nuda is a small herb, approximately 20-30 centimetres tall with yellow flowers. The species is often recorded from seasonally inundated clay soils and drainage lines, often in mulga and has been recorded flowering in the late wet and post-wet season (March-June) but also in the dry season (up until August) (WAH 1998-, DBCA 2021c).

A small population of approximately 50-100 plants was recorded during the 2021 detailed flora survey, from quadrat Q27 (Figure 4.3). This quadrat was situated on the southern side of the Great Northern Highway, and falls outside of footprint V3. *Goodenia nuda* is small, and indistinct without flowers, which indicates that additional plants or populations may have been present at the time of the survey.

Quadrat 27 falls within vegetation type D (Rapallo 2021) and is situated less than 2 kilometres south-east of a WA Herbarium record from a level plain of orange light clay recorded in 2011 (DBCA 2021a). Aerial photos show the soil colour of this clay plain quite clearly, and it extends into the GNHI survey area where Q27 was positioned. The soil at Q27 is described as clay (Plate 7).

There are 101 specimen records within the Western Australian Herbarium database, with collections from locations spread across the Pilbara with outliers in the Great Sandy Desert and Gascoyne and from 808 records, within the Rio Tinto database (Rio Tinto 2018). *Goodenia nuda* is relatively widespread across the Pilbara, recorded from a variety of habitats many associated with drainage WAH 1998-).

Plate 7 ***Goodenia nuda***

5.1.8 Euphorbia aff. ferdinandi (potentially undescribed)

This taxon was recorded from four locations near the Great Northern Highway (Figure 4.3). It was only recognised as a potentially undescribed species, and different from any known species, when the specimen was compared in detail with other *Euphorbia* specimens at the Western Australian Herbarium. Further advice was sought from Steve Dillon at the WA Herbarium, who advised that the specimen differed from *Euphorbia ferdinandi* by having broader seeds and a stigma opposite from what has been described for this species (S. Dillon *pers. comm*., September 2021). All locations of this taxon were within the current project area, but outside of footprint V3.

5.2 Significant species not recorded

Seven species ranked in the desktop as 'likely to occur' and four species ranked as 'may potentially occur (Appendix II) were not recorded during the survey. These taxa are discussed below.

5.2.1 Acacia bromilowiana (Priority 4)

Acacia bromilowiana is a shrub or tree growing to 12 metres that has been recorded on a variety of landforms in the Pilbara including: rocky hills, breakaways, scree slopes, gorges and creek beds, occurring in red skeletal stony loam, orange-brown pebbly gravel loam laterite, banded ironstone and basalt (WAH 1998-; DBCA 2021c). The species generally flowers in the dry season (July-August) but has also been recorded in flower in the post-west season (May) (WAH 1998-, DBCA 2021c).

There is a Western Australian Herbarium record dated 1992 of *Acacia bromilowiana* within 5 kilometres of the project area, recorded from the western side of the Great Northern Highway from high elevation. The species was collected from steep rocky ironstone scree, high in landscape, positioned on the edge of cliff (DBCA 2021a).

Regionally it has been recorded within the MAC Development Envelope, from the upper reaches of a gorge (Onshore 2017) and from the northern slopes of Mount Robinson (>100 plants (Onshore 2012c)). The species also occurs at surrounding BHP Billiton Iron Ore tenements and project areas including Tandanya (167 plants, (Onshore 2013c)), Mudlark 30 plants, (Onshore 2013b) and Area C West to Yandi (30 plants (Onshore 2014a)).

There are 29 specimen records within the Western Australian Herbarium database, with collections recorded from over a 320 kilometre range between Newman and 130 kilometres northwest of Tom Price, with outlying records from west of Rudall River National Park (DBCA 2021c). There are records in the Rio Tinto database from Brockman, Vivash, West Turner Syncline, Tom Price, Karijini National Park, Angelo River, West Angleas, Minga Yard, Rhodes Ridge, Shovellana, Hope Downs and Noreena Downs (Rio Tinto 2016).

Acacia bromilowiana was not recorded during the survey, and was ranked as likely to occur, on the higher elevation areas of the project area, most of which fell outside of the targeted survey area. The species has distinctive dark grey fibrous bark and glaucous and slightly pruinose phyllodes and would have been readily identifiably in the field as a taxon to collect during the survey if present in the areas surveyed. It is possible that *Acacia bromilowiana* occurs in the project area outside the area covered by the current targeted survey, including potentially in the unsurveyed part of the footprint V3.

5.2.2 *Acacia effusa* (Priority 3)

Acacia effusa is a dense, wide-spreading, multi-stemmed, domed or flat-topped, somewhat viscid shrub 0.3–1.2 metres tall. It has grey or greyish red 'minniritchi' bark (Maslin et al. 2010). It flowers May-August (WAH 1998-, DBCA 2021c).

The DBCA threatened and priority flora database shows a record of this *Acacia effusa* taxon within the current project area (Figure 4.1). The record was from 2011, with the site described as a gently inclined footslope with brown sandy loam soil (DBCA 2021a). The location where this taxon was recorded fell outside of the project area at the time of the surveys, and was not visited. No flora and vegetation surveys have been completed over this part of the project area.

Regionally the species has been recorded at Mudlark (Onshore 2013b) and from Area C West to Yandi tenements (Onshore 2014a).

There are 31 specimen records within the Western Australian Herbarium database, with collections recorded from a patchy 110 kilometre range between Marandoo and West Angeles (DBCA 2021c), it is known from a large number of records within the central southern sector of the Pilbara bioregion, including Karijini National Park. Habitat is described as lower scree slopes of low rocky ranges or alluvial plains at the base of banded ironstone ranges. It is often common where it occurs (BHP 2016).

The species was not recorded during the survey and was ranked as likely to occur on the low hills, stony plain and loamy drainage flats proximal to the Great Northern Highway. However, the targeted survey only covered 40% of the current project area.

Acacia effusa is a low spreading shrub with 'minniritchi bark and would have been readily identifiable in the field if it has been present within the survey area.

5.2.3 *Eremophila magnifica subsp. magnifica* (Priority 4)

A mid stratum shrub occurring up to 1.5 metres in height, it has been recorded on skeletal soils over ironstone and occurs on rocky scree slopes (WAH 1998-). Often occurs high in the landscape on steep to moderate slopes, summits, gullies, skeletal red gritty soil over massive banded ironstone. (DBCA 2021c). It generally flowers August to November but has also been recorded flowering in June (WAH 1998-, DBCA 2021c)

Eremophila magnifica subsp. *magnifica* is known to occur 14 kilometres west south-west of the project area from a very steep gully of silty brown loam (DBCA 2021a). There were nine populations of Eremophila magnifica subsp. magnifica represented within the MAC Development (Onshore 2017). Locally it is widespread across ranges in BHP Billiton Iron Ore's Mudlark (Onshore 2013b), Tandanya (Onshore 2013c), and Jinidi tenements (Onshore 2011b), situated to the west, south-west and east of the Proposed MAC Development Envelope. Plant density ranges from scattered individuals to populations of greater than 1,000 plants. The species typically occurs on steep to moderately sloping rocky hill slopes, hill crests, gullies and rocky drainages. *Eremophila magnifica* subsp. *magnifica* is widely collected from similar habitat at BHP Billiton Iron Ore's Eastern (Onshore 2012c) and (Onshore 2014b) operations near Newman.

There are 42 specimen records within the Western Australian Herbarium database, with collections recorded from over a 310 kilometre range between Newman and Mt Farquhar (DBCA 2021c) and 940 records, within the Rio Tinto database (Rio Tinto 2016).

Eremophila magnifica subsp. *magnifica* is a distinctive species, its leaves smell of nutmeg when crushed. It readily distinguishable from the closely related (Priority 3 listed) *E. magnifica* subsp. *velutina* by having glabrous leaves (with ciliate leaf margins) whilst *E. magnifica* subsp. *velutina* has a velvety leaf surface. The species flowers purple, primarily in August to November and would not have been flowering during the survey, however it is identifiable from vegetative material, habit, habitat and leaf surface and would have been readily identifiable in the field as a taxon to collect during if it had been encountered.

The species was not recorded during the targeted survey, and was ranked as likely to occur, on the higher elevation areas of the project area, most of which fell outside of the targeted survey area. It is possible that *Eremophila magnifica* subsp. *magnifica* occurs within the project area, and potentially within the unsurveyed part of footprint V3.

5.2.4 Eremophila pusilliflora (Priority 2)

A low-growing, open shrub 30–50 centimetres high, 50–100 centimetres wide, found on seasonally inundated alluvial plains, growing in red-brown sandy loam soils in open low shrubland with *Acacia aneura, Ptilotus nobilis*, *Goodenia* and *Triodia* species (Buirchell & Brown 2016).

Eremophila pusilliflora was recorded in 1977, 15 kilometres west of the project area on a flat plain with thin soil underlain by partly consolidated colluvium near Packsaddle Bore (DBCA 2021a).

The species is infrequently collected and was not recorded from the MAC development area, despite habitat being present (Onshore 2017).

There are 14 specimen records within the Western Australian Herbarium database, with collections recorded from over a 120 kilometre range between Auki and West Angeles (DBCA 2021c) and records ranging across 60 kilometres from the Rio Tinto Priority Flora database (Rio Tinto 2017).

The species was not recorded during the survey and was ranked as may potentially occur on the project area, noting that the targeted survey only covered 40% of the project area.

Formerly known as *Eremophila forrestii* subsp. Pingandy (M.E. Trudgen 2662), *Eremophila pusilliflora* is related to *E. forrestii*, from which it may be distinguished by its lower-growing habit, consistently smaller leaves, shorter corolla and distinctively pustulate sepals with a glabrous inner surface. The sepals turn reddish pink with age whereas those in E. *forrestii* remain the same colour (Buirchell & Brown 2016).

The species predominantly flowers between April and September but may also flower at other times of the year in response to rainfall (Buirchell & Brown 2016). The timing and conditions were suitable during the survey for flowering and due to its size, it would have been visible to collect if encountered.

5.2.5 Indigofera gilesii (Priority 3)

Indigofera gilesii is an erect perennial shrub to 1.5 metres tall with purple-pink flowers (WAH 1998-). This taxon was recorded in 1997 from a location fifteen kilometres west of the project area, from a broad open gully on the south side of a low hill. It is often recorded high in the landscape on skeletal soils in gorge or gully habitats and has been recorded flowering recorded post-wet season (June) and dry season (August) (DBCA 2021a).

There are 25 specimen records within the Western Australian Herbarium database, with collections sporadically recorded from over a 120 kilometre range from Packsaddle Bore to Newman (DBCA 2021c).

The species was not recorded during the survey, and was ranked as "may potentially occur", on the higher elevation areas of the project area, most of which fell outside of the targeted survey area. The species has been recorded flowering in the post-wet season (May, June) and dry season (August) (WAH 1998-, DBCA 2021c). The timing and conditions were suitable during the survey for flowering and due to its size, it would have been visible to collect if it was encountered.

5.2.6 Isotropis parviflora (Priority 2)

Isotropis parviflora is a low perennial herb or shrub to 0.1 metres in height flowering white to pink during March. Occurs on stony plain, lower slopes, hillcrest/upper slopes (DBCA 2021c). It is known to be a short-lived disturbance species that responds to fire and is often recorded along the berms of access tracks.

There is a record from Packsaddle Village 10 kilometres south of the project area from upper-slope, ironstone outcropping (DBCA 2021a) and it has been recorded from Billiton Iron Ore's Jinidi tenements (Onshore 2011b).

There are 28 specimen records within the Western Australian Herbarium database, with collections recorded from over a 210-kilometre range between Wittenoom Gorge and Newman. Outlier records occur in the Great Sandy Desert and the Tanami (DBCA 2021c)

The species was not recorded during the survey and was ranked as likely to occur on the project area on stony plain, lower slopes, upper slopes and hillcrests.

This species flowers predominantly in the late wet season (March), but flowering has been recorded through to the early dry season (August) (WAH 1998-, DBCA 2021c). The timing and conditions were suitable during the survey. However, due to its small size this taxon could have been overlooked. It is also short-lived post disturbance and may be under-surveyed. The possibility of this taxon occurring in the project area cannot be discounted.

5.2.7 Nicotiana umbratica (Priority 3)

Nicotiana umbratica is an erect, short-lived annual or perennial, herb, 0.3-0.7 metres high that flowers white, April to June and inhabits shallow soils, rocky outcrops (WAH 1998-). This taxon was not flagged in the DBCA search; however, one individual plant was recorded from the MAC development envelope growing under an overhang in a narrow gorge (Onshore 2011a). There are currently 23 records within the Pilbara extending approximately 180 kilometres from Shay gap to Bamboo Springs with an outlier near Karratha (DBCA 2021c).

The species was not recorded during the survey, and was ranked as "may potentially occur" on the project area.

The project area falls outside of the known distribution, however *Nicotiana umbratica* is short-lived and thus may be under-surveyed. This species has been recorded as scattered occurrence in very low numbers across similar habitat in the broader locality. Therefore, if present, it would only occur in low number. The timing and conditions were suitable during the survey however due to its small size this taxon could have been overlooked during the survey.

5.2.8 *Themeda sp. Hamersley Station (M.E. Trudgen 11431) (Priority 3)*

Themeda sp. Hamersley Station (M.E. Trudgen 11431) is a robust tall grass. There are 45 specimen records within the Western Australian Herbarium database, with collections recorded from over a 450 kilometre range from Damper to Newman, with an outlier in the Little Sandy. This species occurs in red clay pans and grass plains (DBCA 2021c). It generally flowers in August, but has been recorded flowering in July and September also (WAH 1998-, DBCA 2021c).

There is a record from the flats on the western side of the Great Northern Highway, six kilometres south of the project area from the Coondewanna Flats (DBCA 2021a) and it has been recorded from Billiton Iron Ore's Mudlark tenements (Onshore 2013b) and Tandanya tenements , (Onshore 2013c).

Themeda sp. Hamersley Station is difficult to distinguish in the field from larger individuals of the common and widespread *Themeda triandra*, which was recorded from 26 locations throughout the project area during the 2012 and 2021 surveys combined (Rapallo 2012, Rapallo 2021a) and formed a dominant component of vegetation types B, C and D of the Great Northern Highway intersection (Rapallo 2021a).

Themeda sp. Hamersley Station (M.E. Trudgen 11431) flowers in August, and the timing of the 2012, 2020 and 2021 surveys (which occurred in April and May) was outside of this flowering period. The species was not recorded during the survey, but was ranked as highly likely to occur within the loamy drainage flats proximal to the Great Northern Highway. Surveys in August are required to determine this.

5.2.9 *Triodia sp. Mt Ella (M.E. Trudgen 12739) (Priority 3)*

Triodia sp. Mt. Ella (M.E Trudgen 12739) is a perennial hummock grass to 30–60 centimetres high, 40–80 centimetres wide, very resinous and sometimes conspicuously stoloniferous. Fertile collections have been made in February and March (Barrett & Trudgen 2018) and also in September (DBCA 2021c). *Triodia* sp. Mt. Ella (M.E Trudgen 12739) a is known to occur 17 kilometres west of the project area proximal to the eastern boundary of Karijini National Park (DBCA 2021a).

The taxon has been recorded from the southern central sector of BHP Billiton Iron Ore's MAC Development Envelope (Onshore 2017). BHP Billiton Iron Ore's Mudlark (Onshore 2013b) and Tandanya, (Onshore 2013c), tenements, and from Rio Tinto's West Angelas project (Trudgen & Casson 1998). Individual occurrences in the Hamersley Range are small in area, mainly occurring at the bases of open to slight gullies on the mid- to upper slopes of large hills; however, some records are from gorges and ridges. Some occurrences are associated with iron-rich substrate in the West Angelas mining area, but the main factor affecting distribution is likely to be the deeper (moisture retaining) soils at the bases of gullies. Most records are from outcropping ironstone or ironstone gravel; the Rudall River occurrence is from creek beds on unknown geology (Barrett & Trudgen 2018). This means that the species is likely to occur, on the higher elevation areas of the project area rather than the stony plain and loamy drainage flats proximal to the Great Northern Highway.

There are 35 specimen records within the Western Australian Herbarium database, with collections recorded from locations extending over 200 kilometres from Karijini National Park to 30 kilometres east of Newman, with an outlying record from Rudall River National (DBCA 2021c). *Triodia* sp. Mt. Ella (M.E Trudgen 12739) is considered to be geographically restricted and uncommon, but unlikely to be rare (Trudgen & Casson 1998).

The species was not recorded during the survey, however, was ranked as likely to occur, on the higher elevation areas of the project area, which fell outside of the targeted survey area. In the field, *Triodia* sp.

Mt. Ella (M.E Trudgen 12739) can be separated from co-occurring species by its spreading form, extremely resinous surfaces and very strong smell of resin (Barrett & Trudgen 2018).

5.2.10 Triodia sp. Karijini (S. van Leeuwen 4111) (Priority 1)

Triodia sp. Karijini (S. van Leeuwen 4111) is a wispy perennial hummock grass to 50–100 centimetres high, non-resinous (DBCA 2021c). *Triodia karijini* belongs to the soft group, sharing the epistomatous (soft type) leaf blades (Barrett et al. 2017).

This taxon was recorded in 2011 four kilometres west of the project area, from a very steep hillslope of grey silty loam (DBCA 2021a) and has been recorded from BHP Billiton Iron Ore's Mudlark tenements (Onshore 2013b). All Western Australian Herbarium records are from high in the landscape; it occurs on or near outcropping ironstone, on summits or steep hillslopes of mountains (Barrett et al. 2017). The species has been recorded flowering recorded during the dry season (September), but most WA Herbarium records do not indicate flowering times (DBCA 2021c) .

There are 16 specimen records within the Western Australian Herbarium database, with collections sporadically recorded from over a 215 kilometre range from Brockman to Mt Robinson, (DBCA 2021c). Populations can be dense but are patchy and restricted to mountain tops and sides (Barrett et al. 2017).

The species was not recorded during the survey, and was ranked as "may potentially occur", on the higher elevation areas of the project area, which fell outside of the targeted survey.

Triodia sp. Karijini may be confused in the field with the common and widespread *Triodia melvillei* which flowers July-October. The latter species occurs within the range of *T. karijini* but can be distinguished by having prominently awned lemmas with midlobe 10–14 millimetres metre long (acute to sub-awned with midlobe 2.0–3.0 millimetre metres long in T*. karijini*), and resinous foliage (non-resinous in *T. karijini*). *Triodia melvillei* also usually occurs on red loam flats, and only rarely on rock on high mountains (Barrett et al. 2017). *Triodia melvillei* was recorded during the 2012 survey from quadrats across the project area (Rapallo 2012), however all flora surveys at Lamb Creek to date have occurred outside of the flowering periods of both species. Therefore *T.* sp. Karijini may potentially occur in the project area.

5.2.11 Vittadinia sp. Coondewanna Flats (S. van Leeuwen 4684) (Priority 1)

Vittadinia sp. Coondewanna Flats (S. van Leeuwen 4684) is a small annual herb to 30 centimetres recorded flowering post-wet (May) and during the dry season (July, September) This taxon has been recorded three kilometres south of the project area, west of the Great Northern Highway and locally this species has been recorded on the Coondewanna Flats (DBCA 2021a).

There are 17 specimen records within the Western Australian Herbarium database, with collections sporadically recorded from over a 280 kilometre range from Brockman to Newman. This species occurs in woodland to open forest of variety of mulga species and other acacias, or shrubland of acacias and other species, sometimes with eucalyptus, over diverse shrubland, often over open Triodia. Habitat is grassland mulga plain, floodplain, drainage, sandy-clay loam, (DBCA 2021c).

The species was not recorded during the survey, however, was ranked as likely to occur within the loamy plains of the project area, proximal to the Great Northern Highway. This species has been recorded as scattered occurrence in very low numbers across similar habitat in the broader locality. Therefore, if present, it would only occur in low number. The timing and conditions were suitable during the survey however due to its small size this taxon could have been overlooked.

5.3 Survey adequacy and limitations

5.3.1 Level of assessment and survey timing

Survey level and timing were as per client request. A targeted survey was initiated after a desktop review and 2012 survey results indicated a high potential for conservation significant flora occurring in the project area. The survey timing aligned with the recommended primary survey period for the Eremaean Botanical Province (EPA 2016b), and overlapped with the flowering period of the majority of flora taxa identified in the desktop as potential to occur in the survey area. The 2021 survey occurred over a smaller additional area (Table 1.1), and was specifically timed to record further individuals and populations of *Aristida lazaridis* in the area near the Great Northern Highway intersection (Appendix II).

5.3.2 Assessment against EPA technical guidance

The targeted flora survey was conducted in accordance with Environmental Protection Authority (EPA) *Technical Guidance – Flora and Vegetation Surveys for Environmental Impact Assessment* and aligned with criteria for a targeted survey (EPA 2016b). The EPA technical guidance does not specify recommended methods or survey intensity for targeted surveys. However, it describes traverses of appropriate spacing as a potential method. EPA criteria specific for a targeted survey, and an assessment of the survey against these criteria, is provided in Table 5.2 below.

Table 5.2 Assessment of the survey against EPA technical guidance

EPA (2016b) criteria for targeted flora surveys	Survey met EPA criterion	Details
Targeted surveys should be undertaken when the targeted flora and/or vegetation are most detectable and identifiable in the field, usually when in flower.	Yes	The survey was completed in April 2020 and May 2021 which in the Pilbara is the post-wet season. Out of the 18 taxa identified in the likelihood assessment as confirmed, likely to occur, and may occur in the Lamb Creek project area (section 4.1 and Appendix II) the greater majority (12) had flowering periods that overlapped with the survey periods of April and May. The survey did not overlap with the flowering period for *Eremophila* sp. Hamersley Range, but this taxon could be identified without flowers. Two other taxa were recorded flowering just outside the survey periods, and therefore could possibly flower in April and May because very few records were available. Only two taxa had flowering recorded in the dry season only. In summary, the survey timing was considered appropriate to capture the flowering time of the greater majority of potential flora taxa.
All potentially suitable habitats should be systematically searched	Yes for footprint V1 Partial for footprint V3 No for project area	The survey covered the entirety of the survey area, defined in section 1.3, and thus covered all potentially suitable habitats within. However, the survey area was based on footprint V1 which has now been superseded. The current footprint V3 extends outside of the survey area, with 236 hectares (36%) not surveyed. Based on the 2012 vegetation maps, potentially suitable habitat exists in the areas not covered by the targeted survey. The targeted survey only covered 869 hectares (40%) of the project area, and did not include all the available habitats within. The current project area includes a database record of *Acacia effusa* (Priority 3) which was not visited because it fell outside of the project area at the time of the survey.

EPA (2016b) criteria for targeted flora surveys	Survey met EPA criterion	Details
Sufficient resources should be allocated for field time	Yes	The entirety of the survey area was covered by systematic traverses spaced approximately 50 m apart. EPA guidance only provides recommendations on traverse spacing for the South West Botanical Province (10 m), stating that wider transect widths may be considered acceptable for other Botanical Provinces.
Where the habitat extends outside the survey area, the full extent of a population or community should be surveyed	Yes	*Aristida lazaridis* and *Rhagodia* sp. Hamersley were found to extend beyond the boundaries of the survey area, and mapped accordingly. Extent of the *A. lazaridis* population was mapped up until 1 km north-east of the survey area boundaries. It may extend further. Rhagodia sp. Hamersley was also mapped outside the 2020 survey area, however, the majority of these records subsequently fell within the expanded survey area boundaries searched in 2021. *Rhagodia* sp. Hamersley occurred as individual shrubs spaced widely apart across the 2021 survey area, rather than as patches / populations, hence mapping population boundaries was not applicable.

5.3.3 Survey limitations table

Table 5.3 Limitations of the targeted flora survey

Aspect	Limitation	Discussion
Availability of contextual information at a regional and local scale	No	Sufficient flora and vegetation information was available for the Hamersley subregion (of the Pilbara Bioregion) to place the project area in a regional context. At a local scale, sufficient (publicly available) flora and vegetation surveys have been completed in the vicinity of the project area. This is reflected in the DBCA TPFL and Western Australian Herbarium database results, which yielded over 700 conservation significant flora records within 60 km of the survey area. In addition, there has been a significant body of work completed at Mining Area C which is in close proximity to the Lamb Creek project.
Competency/experience of the team carrying out the survey, including experience in bioregion surveyed	No	Both the 2020 and 2021 surveys were completed by a team of experienced botanists. Individually, the botanists involved in the field survey and reporting work have between 7-20 years' experience completing flora and vegetation surveys throughout Western Australia and in the Pilbara. Sharnya Thomson-Yates is also an experienced botanical taxonomist.
Proportion of flora recorded and/or collected, any identification issues	No	The targeted survey was designed to record specific taxa. The survey timing for both survey periods was within the recommended period for the Eremaean botanical province, and the majority of the target taxa were found to be in flower, enabling a full and positive identification. *Eremophila* sp. hamersley, although not in flower during the survey, could be confidently identified from vegetative material. Based on desktop results the greater majority of the taxa rated as may occur to highly likely to occur in the survey area would have been in flower and readily identifiable during the survey.

Aspect	Limitation	Discussion
Was the appropriate area fully surveyed (effort and extent)	Yes	Survey intensity was considered adequate and appropriate for recording the presence and extent of conservation significant flora in the survey area defined prior to the 2020 and 2021 field surveys. However, this survey area was based on footprint V1 which has since changed. Footprint V3 was provided after the fieldwork has been completed, with 236 hectares (36%) of footprint V3 not covered by the targeted survey. The survey area only covered 869 hectares (40%) of the current project area, with the remaining 60% containing potential habitats for several (additional) conservation significant taxa. The desktop review and likelihood scores of potential conservation significant taxa, as presented in Appendix II, were determined based on field information available for those areas covered by surveys. The current project area contains a 27% portion that has never been surveyed, including a location that contains a DBCA record *of Acacia effusa* (Priority 3). Likelihood scores for the areas not visited by the field team are based on desktop information only.
Access restrictions within the survey area	No	The majority of the project area was accessible by helicopter and some areas were accessible by vehicle. The entirety of the survey area was covered on foot. There were no survey limitations due to access restrictions.
Survey timing, rainfall, season of survey	No	The two field surveys were completed in April 2020 and May 2021, which falls within the primary recommended timing for surveys in the Eremaean botanical province (EPA 2016b), and overlaps with the flowering period of the majority of flora taxa identified in the desktop as potential to occur (see also Table 5.2). The survey area experienced good rainfall over the months preceding both surveys, and nearly all the target taxa recorded were in flower. Overall, survey timing was deemed to be appropriate for the survey area and the region, and for the taxa targeted.
Disturbances that may have affected the results of the survey (e.g. fire, flooding, clearing)	No	The majority of the survey area has been affected by fire, however the purpose of the survey work was to record what is currently present in the project area. Some taxa are fire responders, or favour disturbed conditions.

5.4 Impacts and management

Development within the proposed footprint V3 has the potential to impact conservation significant flora and vegetation through:

- Direct removal of conservation significant flora and vegetation during clearing and earthworks;
- Alteration to the volume of surface water flows causing decline to sheet flow dependent vegetation drainage flats that contain priority flora;
- Increased weed species diversity and density.

5.4.1 Direct clearing

Footprint V3 impacts several priority flora species (Table 4.2). It is recommended that infrastructure be placed to avoid significant conservation flora where possible. Where populations cannot be avoided, as may be the case with *Aristida lazaridis* it is recommended that the infrastructure be placed to avoid the highest densities, provided surface flow is maintained (section 5.4.2).

Existing management strategies used by MRL at their surrounding mining operations such as internal ground disturbance approvals system are important tools for minimising direct clearing impacts and should be applied to the Lamb Creek Iron Ore Project.

5.4.2 Alteration to surface flow

Design of the haul road and mining development should consider surface water flow to minimise obstruction to seasonal overland water flows to the loamy drainage flats proximal to the Great Northern Highway that contain the priority species *Aristida lazaridis* and *Rhagodia* sp. Hamersley and the potential for *Themeda sp. Hamersley Station* (M.E. Trudgen 11431) and *Vittadinia* sp. Coondewanna Flats (S. van Leeuwen 4684).

5.4.3 Weeds

Increasing vehicular access combined with vegetation clearing for the project has the potential to introduce and/or spread weed species that can compete with native vegetation and reduce species diversity. Existing management strategies used by MRL at their surrounding mining operations are important tools for minimising potential impacts.

It is recommended that general and species-specific weed management, hygiene, and monitoring is conducted in accordance with MRL's existing weed management procedures. Management measures may include the following:

- Mobile machinery and equipment brought to site in a clean state;
- Regular inspections for the presence of weeds within areas of disturbance, particularly in high moisture environments such as the loamy drainage flats proximal to the Great Northern Highway and
- Seasonal weed control programmes to be implemented if necessary.

Appendix I Conservation codes for Australian flora

Threatened species under the Commonwealth EPBC Act

Threatened fauna and flora may be listed under Section 178 of the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) in any one of the following categories:

EX Extinct

EW Extinct in the wild

CR Critically endangered

EN Endangered

VU Vulnerable

CD Conservation dependent

Conservation codes for Western Australian flora under the Western Australian *Biodiversity Conservation Act 2016*

Threatened, Extinct and Specially Protected fauna or flora are species which have been adequately searched for and are deemed to be, in the wild, threatened, extinct or in need of special protection, and have been gazetted as such.

The *Wildlife Conservation (Specially Protected Fauna) Notice 2018* and the *Wildlife Conservation (Rare Flora) Notice 2018* have been transitioned under regulations 170, 171 and 172 of the *Biodiversity Conservation Regulations 2018* to be the lists of Threatened, Extinct and Specially Protected species under Part 2 of the *Biodiversity Conservation Act 2016*.

Categories of Threatened, Extinct and Specially Protected fauna and flora are:

Threatened species

Listed by order of the Minister as Threatened in the category of critically endangered, endangered or vulnerable under section 19(1), or is a rediscovered species to be regarded as threatened species under section 26(2) of the *Biodiversity Conservation Act 2016* (BC Act).

Threatened flora is that subset of 'Rare Flora' listed under schedules 1 to 3 of the *Wildlife Conservation (Rare Flora) Notice 2018* for Threatened Flora.

The assessment of the conservation status of these species is based on their national extent and ranked according to their level of threat using IUCN Red List categories and criteria as detailed below.

CR Critically endangered species

Threatened species considered to be "facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with criteria set out in the ministerial guidelines". Listed as critically endangered under section 19(1)(a) of the BC Act in accordance with the criteria set out in section 20 and the ministerial guidelines.

Published under **schedule 1** of the *Wildlife Conservation (Rare Flora) Notice 2018* for critically endangered flora.

EN Endangered species

Threatened species considered to be "facing a very high risk of extinction in the wild in the near future, as determined in accordance with criteria set out in the ministerial guidelines". Listed as endangered under section 19(1)(b) of the BC Act in accordance with the criteria set out in section 21 and the ministerial guidelines. Published under **schedule 2** of the the *Wildlife Conservation (Rare Flora) Notice 2018 for endangered flora*.

VU Vulnerable species

Threatened species considered to be "facing a high risk of extinction in the wild in the medium-term future, as determined in accordance with criteria set out in the ministerial guidelines". Listed as vulnerable under section 19(1)(c) of the BC Act in accordance with the criteria set out in section 22 and the ministerial guidelines.

Published under **schedule 3** of the *Wildlife Conservation (Rare Flora) Notice 2018* for vulnerable flora.

Priority species

Priority species are possibly threatened species that do not meet survey criteria, or are otherwise data deficient, are added to the Priority Flora Lists under Priorities 1, 2 or 3. These three categories are ranked in order of priority for survey and evaluation of conservation status so that consideration can be given to their declaration as threatened fauna or flora.

Species that are adequately known, are rare but not threatened, or meet criteria for near threatened, or that have been recently removed from the threatened species or other specially protected fauna lists for other than taxonomic reasons, are placed in Priority 4. These species require regular monitoring.

Assessment of Priority codes is based on the Western Australian distribution of the species, unless the distribution in WA is part of a contiguous population extending into adjacent States, as defined by the known spread of locations. In this report, priority species are given the codes P1, P2, P3 and P4.

P1 Priority 1: Poorly-known species

Species that are known from one or a few locations (generally five or less) which are potentially at risk. All occurrences are either: very small; or on lands not managed for conservation, e.g. agricultural or pastoral lands, urban areas, road and rail reserves, gravel reserves and active mineral leases; or otherwise under threat of habitat destruction or degradation. Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements and appear to be under immediate threat from known threatening processes. Such species are in urgent need of further survey.

P2 Priority 2: Poorly-known species

Species that are known from one or a few locations (generally five or less), some of which are on lands managed primarily for nature conservation, e.g. national parks, conservation parks, nature reserves and other lands with secure tenure being managed for conservation. Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements and appear to be under threat from known threatening processes. Such species are in urgent need of further survey.

P3 Priority 3: Poorly-known species

Species that are known from several locations, and the species does not appear to be under imminent threat, or from few but widespread locations with either large population size or significant remaining areas of apparently suitable habitat, much of it not under imminent threat. Species may be included if they are comparatively well known from several locations but do not meet adequacy of survey requirements and known threatening processes exist that could affect them. Such species are in need of further survey.

P4 Priority 4: Rare, Near Threatened and other species in need of monitoring

(a) **Rare**. Species that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection but could be if present circumstances change. These species are usually represented on conservation lands.

(b) **Near Threatened**. Species that are considered to have been adequately surveyed and that are close to qualifying for vulnerable but are not listed as Conservation Dependent.

(c) Species that have been removed from the list of threatened species during the past five years for reasons other than taxonomy.

Appendix II Flora desktop results: Conservation significant flora and likelihood assessment

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at Lamb Creek?	Distance to project area	Likelihood ranking
Acacia bromilowiana	P4	Tree or shrub to 12 m high	WAH and TPFL : High in landscape, Slope, cliff, gully, crest, summit , very steep	Red skeletal stony loam, orange-brown pebbly,gravel loam, laterite, banded ironstone, basalt. Rocky hills, breakaways, scree slopes, gorges, creek beds.	May, July, August	Yes but off footprint	Within 20 km	**Likely to occur**
Acacia daweana	P3	Shrub from 0.3- 2m.	WAH: Gentle slopes, Along diffuse drainage area where it leaves low rocky hills. Low shrubland with Triodia basedowii, Acacia bivenosa, A. validinervia and A. maitlandii.	Stony red loamy soils. Low rocky rises, along drainage lines	July-October	Yes	Not within 20km	Unlikely to occur
Acacia effusa	P3	Low, dense, spreading, somewhat viscid shrub, 0.3-1 m high.	WAH: Scree, gentle slope, footslope, creeklines, low iron stone hill, stony plain base of hills , skeletal soils, red brown, Red brown clay loam.	Stony red loam. Scree slopes of low ranges.	May-August	Yes	Recorded in project area in 2011	**Likely to occur**
Acacia subtiliformis	P3	Spindly, slender, erect shrub, to 3.5 m	WAH: Calcrete slope, rise, plain	On rocky calcrete plateau.	April-June	No	Within 20 km	Unlikely to occur
Adiantum capillus-veneris	P2	Perennial small herb from 0.1-0.2m. Frond 1-2 pinnate	WAH: In wet rocky crevices, associated with gorges or springs.	Moist sheleted sites in gorges and on cliff walls.	March, September	No	Not within 20km	Unlikely to occur
Amaranthus centralis	P3	Annual Herb	WAH: Tussock grassland of Themeda triandra, Eulalia aurea and Aristida inaequiglumis with open woodland of Eucalyptus victrix and Corymbia aspera over low open woodland of Corymbia aspera and Hakea lorea subsp. lorea over high open shrubland of Gossypium robi. Low in the landscape, alluvial flats, River banks, Mulga woodland[3]	no info	No info	Yes	Not within 20km	Unlikely to occur
Ampelopteris prolifera	P3	Perennial herb/fern to 4m	no info	Near water or in wet ground.	No info	No	Not within 20km	Unlikely to occur
Aristida jerichoensis var. subspinulifera	P3	Compactly tufted perennial, grass-like or herb, 0.3-0.8 m high	WAH: Plain or Flat, clay/loam. Often mulga woodlands or acacia shrublands over spinifex and/or tussock grassland.	Hardpan plains	May, July, September	Yes	Confirmed	**Confirmed**
Aristida lazaridis	P2	Tufted perennial, grass-like or herb, 0.4-1.5 m high.	WAH: Plain, clay /loam, drainage, slope; often mulga low open woodland with or without Eucalypts, over variety of shrubs and herbs, often over tussock grassland but sometimes with Triodia hummock grassland.	Sand or loam	April, May	Yes	Confirmed	**Confirmed**
Arthropodium vanleeuwenii	P2	Perennial herb 0.3 to nearly 1m.	WAH. Moderately steep facing slopes including banded and Brockman ironstone formations on red-brown, orange-brown loams and sandy loams. Low open woodland of Eucalyptus leucophloia subsp and Corymbia hamersleyana over hummock grassland of Triodia brizoides. Other tussock grassland species include Themeda triandra. Known from two small populations growing above 900 m on south-facing hillslopes of Brockman Iron Formation in the Pilbara bioregion of Western Australia. Associated vegetation includes Eucalyptus leucophloia subsp. leucophloia, Corymbia hamersleyana, Indigofera fractiflexa, Triodia spp. and Themeda triandra. Often found growing under the Triodia and occasionally under the Themeda, very rarely growing in the open. Flowering from mid- to late September. Fruiting from late September to mid-October[4]	No info	October	Yes but off footprint	Not within 20km	Unlikely to occur
Atriplex flabelliformis	P3	Monoecious, erect, rounded perennial, herb, to 0.35 m high.	WAH: Saline areas. Often salt tolerant shrublands, over low open heath.	Clay loam, loam. Saline flats or marshes.	No info	No	Not within 20km	Highly unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at Lamb Creek?	Distance to project area	Likelihood ranking
Barbula ehrenbergii	P1	Moss	Moss. Shaded moist environment on rock face 1.A species of hydric environments [2]	No info	No info	No	Not within 20km	Highly unlikely to occur
Calotis squamigera	P1	Procumbent annual, herb, to 0.21 m high.	WAH: Flat. Red brown loam clay, Stony plain with sandy loam soil. Low woodland of Acacia aptaneura, over open tussock grassland of Aristida contorta and Chrysopogon fallax with high open shrubland of Acacia synchronicia and Psydrax latifolia.	Pebbly loam	July	Yes	Not within 20km	Unlikely to occur
Cladium procerum	P2	Densely tufted perennial, grass-like or herb (sedge), 2 m high.	WAH: Major creeklines , Eucalyptus camaldulensis and Melaleuca argentea open woodland	Perennial pools	July, October, November	No	Not within 20km	Highly unlikely to occur
Dampiera anonyma	P3	Multi-stemmed perennial herb, 0.5 - 1m. Blue purple flower	WAH: Hillside; rocky red ironstone.	Skeletal red-brown gravelly soil over banded ironstone, basalt, shale and Jaspilite. Hills, summits and upper slopes (>1000m)	June, July, September	No	Not within 20km	Unlikely to occur
Dampiera metallorum	P3	Rounded, multi-stemmed perennial, herb, to 0.5 m high.	WAH: Summit of hill, high in landscape, steep slope, skeletal red gritty soil over massive banded ironstone.	Skeletal red-brown gravelly soil over banded ironstone. Steep slopes, summits of hills.	April-October	Yes but off footprint	Not within 20km	Unlikely to occur
Dolichocarpa sp. Hamersley Station (A.A. Mitchell PRP 1479)	P3	no info	WAH: Cracking clay	Spreading annual herb to 10 cm tall, with blue flowers in March; occurs on cracking clay on flat to gently undulating plains with large surface rock	March, May, July	No	Within 20 km	Unlikely to occur
Dysphania congestiflora	P3	no info	WAH: Saline floodplain. Recorded from the western side of Fortescue Marsh from flats on the margin and towards the centre of seasonally inundated flood plains and lake beds, on saline, deep, light-medium to heavy clay soils. A single collection has also been recorded from the Lyndon River in close proximity to Lake Macleod [5]	No info	June, July	No	Not within 20km	Highly unlikely to occur
Eleocharis papillosa	P3	Annual, herb.	WAH: Claypan low dune/berm on eastern edge of wetland.	Red clay over granite, open clay flats. Claypans.	November	No	Not within 20km	Unlikely to occur
Eragrostis crateriformis	P3	Annual, grass-like or herb, 0.17-0.42 m high	WAH: Drainage area / floodplain.	Clayey loam or clay. Creek banks, depressions.	January-July	Yes	Not within 20km	Unlikely to occur
Eragrostis sp. Erect spikelets (P.K. Latz 2122)	P3	Erect perennial grass-like or herb to 0.3 m high	WAH: Near samphire flat. Associated species: Goodenia omeriana, G. forrestii, Cullen cinereum, Scaevola spinescens, Acacia tetragonophylla, A. victoriae. Associated species: Halosarcia spp., Eragrostis falcata (mostly as first year plants), Nicotiana sp., Swainsona sp., Angianthus sp. Low calcrete platforms/rises [12]	No info	No	No	Not within 20km	Highly unlikely to occur
Eragrostis sp. Mt Robinson (S. van Leeuwen 4109)	P1	Tussock-forming perennial, grass-like or herb, to 0.3 m high	WAH and TPFL: Open mallee shrubland; Summit of hill, steep western slopes. Skeletal gritty soil. Massive banded Brockman Iron Formation.	Red-brown skeletal soils, ironstone. Steep slopes, summits.	September	No	Not within 20km	Unlikely to occur
Eremophila magnifica subsp. magnifica	P4	Shrub, 0.5-1.5 m high.	WAH: High in landscape, steep slopes, summits, gullies, skeletal red gritty soil over massive banded ironstone of the Brockman Iron Formation.	Skeletal soils over ironstone. Rocky screes.	June-November	Yes but off footprint	Within 20 km	**Likely to occur**
Eremophila magnifica subsp. velutina	P3	Shrub, 0.5-1.5 m high.	WAH: Summit of steep hill, high in landscape, steep slopes, rock screes and cliff faces, skeletal red stony soil over massive ironstone of the Brockman Iron Formation.	Skeletal soils over ironstone. Summits.	July-October	Yes but off footprint	Not within 20km	Unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at Lamb Creek?	Distance to project area	Likelihood ranking
Eremophila pusilliflora	P2	Shrub to 0.5m	WAH: Low lying associated with drainage lines on red/brown clay loams and ironstone. Low open woodlands scattered with Corymbia hamersleyana and with Acacia aneura, A. inaequlatera, A. pyrifolia over hummock grasslands of T. wiseana, T. pungens and T. brizoides. TPFL: Low lying in valleys, gibber plains above drainage line with Goodenia over red clay loams. Open woodlands of Acacia aneura with Ptilotus exaltatus and Ptilotus helipteroides. Found on seasonally inundated alluvial plains between Turee Creek, Pingandy Creek and drainage systems leading into the Ashburton River, growing in red-brown sandy loam soils in open low shrubland with Acacia aneura, Ptilotus nobilis, Goodenia and Triodia species[6]	No info	April-September and after rainfall	Yes	Within 20 km	May potentially occur
Eremophila sp. Hamersley Range (K. Walker KW 136)	P3	no info	WAH: Rocky gullies and gorges. Steep rocky hill slopes and summits, high in the landscape	No info	June, August, September	Yes but off footprint	Confirmed	**Confirmed**
Eremophila sp. West Angelas (S. van Leeuwen 4068)	P1	no info	WAH: TPFL Summits and slopes of hills, high in the landscape.	No info	August, September	Yes but off footprint, infrequently recorded ain locality	Not within 20km	Unlikely to occur
Eremophila spongiocarpa	P3	Compact, succulent-leaved shrub, to 1 m high.	WAH and TPFL: Saline , Alluvial margin of marsh. Edge of marsh, saline flats, broad plain, floodplain, claypan, Slope of linear dune.	Weakly saline alluvial plain on margins of marsh.	May, August, September	No	Not within 20km	Unlikely to occur
Eremophila youngii subsp. lepidota	P4	Dense, spreading shrub, (0.2-)1-3 m high.	WAH: Mulga woodland or acacia shrublands. Can grow near salt marshes in combination with Atriplex and other chenopods.	Stony red sandy loam. Flats plains, floodplains, sometimes semi-saline, clay flats.	January-March or August, September	Yes	Not within 20km	Unlikely to occur
Euphorbia australis var. glabra	P3	Prostrate herb, 10cm	WAH: Vegetation dominated by Acacia aptaneura. Acacia aff. aneura (long, flat, recurved; F. .MR 35.3), (Eucalyptus xerothermica) low woodland over *Malvastrum americanum, Sida aff. fibulifera low open shrubland over Sporobolus australasicus scattered bunch grasses. Associated Species: Acacia tetragonophylla. Broad, flat plain; calcrete platform to west and major creekline to east. Flat, red brown loam.	Prostrate annual herb. Typically occurs on cracking clay and clay plains	No	Possible	Not within 20km	Unlikely to occur
Euphorbia clementii	P3	Erect herb to 0.6m	TPFL; Sparse low woodland over Senna spp. moderately dense low shrubland over Triodia spp. and other grasses. Rock (Laterite) and red sand. Occasional Eucalyptus leucophloia. TPFL Taxon has been recorded on plains and outwash slopes, and in minor drainage lines or areas of sheet flow. This taxon is typically a fire-responder (and relatively short-lived) and can be observed in large numbers in recently burnt areas. [7]	Gravelly hillsides, stony grounds	May-July	Yes, would be obvious but as is a big post fire coloniser	Not within 20km	Unlikely to occur
Euphorbia inappendiculata var. inappendiculata	P2	small prostrate, much branched annual herb	Acacia aptaneura dominated vegetation. Flat, red brown loam. Recorded in cracking claypans of red sandy clay at Miralga Creek [7]	No info	No info	Yes, infrequently recorded	Not within 20km	Unlikely to occur
Euphorbia inappendiculata var. queenslandica	P2	prostrate annual herb	WAH: Tussock grassland of Astrebla elymoides, Chrysopogon fallax and Urochloa occidentalis var. occidentalis with open herbs of Polymeria longifolia, with high open shrubland of Acacia synchronicia. Cracking clay soil, Gilgai plain.	No info	No info	No	Not within 20km	Unlikely to occur
Euphorbia stevenii	P3	Succulent perennial herb from 0.1-0.5	Gently sloping area to gently undulating. Soils include: Red-brown cracking clay with scattered pebbles and cobbles on the surface. Occurs with many grasses including Astrebla sp, Themeda sp and Aristida sp.	Clay, sandy soils	June	Yes, infrequently recorded in locality	Not within 20km	Unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at Lamb Creek?	Distance to project area	Likelihood ranking
Fimbristylis sieberiana	P3	Shortly rhizomatous, tufted perennial, grass-like or herb (sedge), 0.25-0.6 m high.	WAH: Major drainage, edge of watercourse. With Eleocharis sp. Eucalyptus camaldulensis and Melaleuca argentea open woodland over Acacia pyrifolia var. pyrifolia; Acacia tumida var. pilbarensis and Clerodendrum tomentosum mid sparse shrubland over Cladium procerum and Cyperus vaginatus sedges and Cenchrus ciliaris. Woodland to forest of Eucalyptus camaldulensis and/or Melaleuca leucadendra and Acacia coriacea subsp. pendens over high shrubland.	Mud, skeletal soil pockets. Pool edges, sandstone cliffs.	May-August	No	Not within 20km	Unlikely to occur
Geijera salicifolia	P3	Tree from 1.5m-6m	WAH: Growing in flood area at base of gorge wall. Stony.	Skeletal soils, stony soils; Massive rock scree and gorges	September	N	Not within 20km	Unlikely to occur
Glycine falcata	P3	Mat-forming perennial, herb, to 0.2 m high	WAH: Sump, low in landscape. With Cullen and Vittadinia sp., Goodenia pascua and Bulbine pendula. Often low grassland or herbland with Acacia shrublands and hummock grassland, sometimes Eucalypts. Clay soils, cracking clays	Black clayey sand. Along drainage depressions in crabhole plains on river floodplains.		No	Within 20 km	Unlikely to occur
Gompholobium karijini	P2	Low shrub growing to 70 cm tall, with coarsely fibrous, grey bark.	Eucalyptus leucophloia subsp. leucophloia over Triodia sp. Triodia hummock grassland with scattered shrubs and trees on ironstone gravel 9 Breakaway habitats and associated rocky slopes, the top edge of mesas, broadly rocky and rugged upland habitats, and incised gullies/ rocky gullies of the upland areas' and 'mesa top habitat consisting of hill top, mesa top, and broad rolling hill habitats. [10]	Typically occurs on rocky crests and slopes of hill	January, August-September	Yes but rarely collected in locality	Not within 20km	Unlikely to occur
Goodenia lyrata	P3	Prostrate herb with lyrate leaves. Ephemeral	Broad drainage tract in hardpan plain. Mulga woodland. Mulga woodland or acacia shrublands, sometimes with E. victrix, over open shrubland, herbs.	Red sandy loam. Near claypan	May, August, October	No	Within 20 km	Unlikely to occur
Goodenia nuda	P4	Erect to ascending herb, to 0.5 m high.	WAH and TPFL : Variety of habitats	No info	March-August	Yes	Confirmed	**Confirmed**
Goodenia sp. East Pilbara (A.A. Mitchell PRP 727)	P3	Open, erect annual or biennial, herb, to 0.2 m high.	WAH and TPFL : Variety of habitats with calcrete , Grassland on crabhole clay flats.	Red-brown clay soil, calcrete pebbles. Low undulating plain, swampy plains.	March-May and after rainfall	No	Within 20 km	Unlikely to occur
Grevillea saxicola	P3	Tall shrub or tree	WAH: High in landscape, steep and undulating terrain, skeletal red-brown gritty soil over massive banded ironstone of the Brockman Iron Formation. Mulga woodlands over shrublands with Eremophilas and other species, over Scaevola. No mention of Triodia. Skeletal red-brown sandy loam on steep slopes, rocky hills and ridges, usually growing with Mulga 10	No info	February, March	No	Not within 20km	Unlikely to occur
Gymnanthera cunninghamii	P3	Erect shrub, 1-2 m high.	WAH: South facing ironstone scree slope adjacent to Weeli Wolli Creek.	Sandy soils on islands in river and creek channels	Year-round	No, very scattered distribution.	Not within 20km	Unlikely to occur
Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708)	P2	Shrub to 3m.	Gorges and Gullies associated with ironstone (inc: Brockman ironstone) outcroppings and boulders. Soils include Red-brown loams amongst boulders. Rocky ground high in the landscape. Gullies and gorges. [10]	No info	No info	Yes but off footprint	Not within 20km	Unlikely to occur
Indigofera gilesii	P3	Shrub, to 1.5 m high.	WAH: Near summit of hill, high in landscape, skeletal red-brown stony soil over massive ironstone of the Brockman Iron Formation, Gorge / gully. Red brown skeletal. Continuous ironstone pebbles, Breakaway. Red dry soil.	Pebbly loam. Amongst boulders & outcrops, hills.	May, June, August	No	Within 20 km	May potentially occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at Lamb Creek?	Distance to project area	Likelihood ranking
Indigofera ixocarpa	P2	Shrub to 1m	WAH: Dry creekline. Ironstone rocks and loamy soil	Skeletal red soils over massive ironstone	May, June, August	Possible, very little info, infrequently recorded at locality	Not within 20km	Unlikely to occur
Iotasperma sessilifolium	P3	Erect herb	WAH: Sump, low in landscape, flat terrain, cracking red clay-loam.	Cracking clay, black loam. Edges of waterholes, plains.	September	N	Not within 20km	Highly unlikely to occur
Ipomoea racemigera	P2	Creeping annual, herb or climber.	WAH: Medium drainage line, fringing vegetation. Open forest of Eucalyptus camaldulensis and Melaleuca argentea	No info	June	N	Not within 20km	Unlikely to occur
Isotropis parviflora	P2	Shrub, 0.1 m high.	WAH: Stony plain, lower slopes, Hillcrest/upper slope.	Valley slope of ironstone plateaus, hill slopes and stony plains.	March-August	Yes	Within 20 km	**Likely to occur**
Kohautia australiensis	P2	Erect sparsely or much-branched annual, herb, 0.1-0.5 m high..	WAH: Calcrete plains, hills and rises	No info	March-May	No	Not within 20km	Unlikely to occur
Lepidium catapycnon	P4	Open, woody perennial, herb or shrub, 0.2-0.3 m high, stems zigzag.	Variety of vegetation types, typically with E. leucophloia over Acacias over Triodia. Strong habitat preference for steep upper breakaway slopes of mesa hills where it grows in skeletal light brown loam or sandy loam soils with a large proportion of loose rocks at the surface (50-100 percent) comprising a mixture of banded iron formation (BIF), banded chert and siltstone [11]	Skeletal soils. Hillsides.	May, June, August-November	No	Not within 20km	Unlikely to occur
Lindernia sp. Pilbara (M.N. Lyons & L. Lewis FV 1069)	P1	Annual or perennial herb, to 0.6 cm high	WAH: Claypan, low dune, edge of wetland.	No info	No info	No	Not within 20km	Unlikely to occur
Myriocephalus scalpellus	P1	Semi-erect herb, 0.03-0.08 m high.	WAH: At edge of claypan, In fringing vegetation.	Claypan	June	N	Not within 20km	Unlikely to occur
Nicotiana umbratica	P3	Erect, short-lived annual or perennial, herb, 0.3-0.7 m high. Fl. white, Apr to Jun. Shallow soils. Rocky outcrops.	no info	Shallow soils. Rocky outcrops.	April-June	Yes but off footprint	Not within 20km	Unlikely to occur
Olearia mucronata	P3	Densely branched, unpleasantly aromatic shrub (0.6-1m)	WAH: Steep upper slope, Soil: Red-brown scree boulders (ironstone), stones, base of south facing ironstone cliff, bordering a large scree slope.	Schistose hills along drainage channels	July-January	Yes but off footprint	Not within 20km	Unlikely to occur
Oxalis sp. Pilbara (M.E. Trudgen 12725)	P2	Small annual herb to 10 cm tall. Leaves green above, purple below	WAH: Gorge, gully, cliff	No info	May, July	Yes but off footprint	Not within 20km	Unlikely to occur
Pentalepis trichodesmoides subsp. Hispida	P2	Compact shrub to 1m	WAH: Summit of ridge, high in landscape, steep terrain, skeletal brown gritty soil over metabasaltic pillow lava, breccia; metatuff and minor cherts of the Bunjinah Formation, altitude ca. = 1020 m.	No info	August, September	No	Not within 20km	Unlikely to occur
Pilbara trudgenii	P3	Gnarled, aromatic shrub, to 1 m high.	WAH: Skeletal soil Summit, slopes, screes and cliffs. Brockman Iron Formation. With Eucalyptus leucophloia, E. gamophylla.	Skeletal, red stony soil over ironstone. Hill summits, steep slopes, screes, cliff faces.	July, September	Yes but off footprint	Not within 20km	Unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at Lamb Creek?	Distance to project area	Likelihood ranking
Ptilotus mollis	P4	Compact, perennial shrub, to 0.5 m high, soft grey foliage.	WAH: Steep, rocky scree slope, laterite.	Stony hills and screes.	May, July, September	Yes	Not within 20km	Unlikely to occur
Rhagodia sp. Hamersley (M. Trudgen 17794)	P3	A spindly shrub growing to 2 m tall;	WAH: Mulga over mixed grassland. Emergent eucalypts and Triodia grassland. Very open mulga woodland over patchy mixed grasses. Floodplains, hardpan plains.	Red sandy clay loam plains and floodplains growing in association with Mulga (Acacia aneura)	March, May, September	Yes	Confirmed	**Confirmed**
Rhodanthe ascendens	P1	Ascending annual herb to 0.1m	WAH: Flat terrain, low in landscape, stony gibber with red cracking clay soils. Acacia aneura over Open Tussock Grass of Aristida spp.	Clay, roadside verge	August, September	Yes, infrequently collected	Not within 20km	Unlikely to occur
Rhynchosia bungarensis	P4	Compact, prostrate shrub, to 0.5 m high.	WAH: Creekline in a gorge	Pebbly, shingly coarse sand amongst boulders. Banks of flow line in the mouth of a gully in a valley wall.	November	No	Not within 20km	Unlikely to occur
Rostellularia adscendens var. latifolia	P3	Herb or shrub, 0.1-0.3 m high.	Acacia shrubland, sometimes with Eucalypts and Corymbias, over shrublands and herblands, over tussock grassland, or Triodia pungens hummock grassland.	Ironstone soils. Near creeks, rocky hills.	April, June, August		Confirmed	**Confirmed**
Samolus sp. Fortescue Marsh (A. Markey & R. Coppen FM 9702)	P1	Erect perennial herb, 0.3-1.0 m high	Margins of semi-permanent/permanent freshwater pools and the margins of samphire shrublands where creeks discharge freshwater following periods of high rainfall. [13]	No info	September	No	Not within 20km	Highly unlikely to occur
Scaevola sp. Hamersley Range basalts (S. van Leeuwen 3675)	P2	Shrub, to 1 m high	Steep slopes and screes. Growing in Regenerating Open Shrub Mallee of Eucalyptus kingsmillii and E. gamophylla over Dwarf Scrub C/D of Triumfetta sp, Corchorus sp, Hibiscus sp. and Acacia bivenosa over Open Hummock Grass of Triodia sp.	Skeletal, brown gritty soil over basalt. Summits of hills, steep hils.	July-August	No	Not within 20km	Unlikely to occur
Seringia exastia	CR	Shrub	Variety of mulga woodlands, sometimes with Eucalypts, over Acacia shrublands over Trioda pungens hummock grassland. Gully - washout. Red sand/laterite over sandstone.	No info	Year-round	Yes	Confirmed	**Confirmed**
Sida sp. Barlee Range (S. van Leeuwen 1642)	P3	Spreading shrub, to 0.5 m high.	WAH: Cliff line and scree slopes, gorge and steep gully	Skeletal red soils pockets. Steep slope.	August	Yes but off footprint	Not within 20km	Unlikely to occur
Sida sp. Hammersley Range basalts (K. Newbey 10692)	P3	Herb or shrub to 0.15m	Plants growing amongst rocks along the south side of a small ironstone breakaway. Low open woodland over hummock grassland of Triodia sp.	No info	May, August, October	Possible, very little info, infrequently recorded at locality	Not within 20km	Unlikely to occur
Solanum kentrocaule	P3	Perennial shrub to 2.5m	WAH: Near summit of hill, high in landscape, skeletal red-brown stony soil over massive ironstone of the Brockman Iron Formation, steep slopes, steep gullies	No info	May, July, August	No	Not within 20km	Unlikely to occur
Stackhousia clementii	P3	Dense broom-like perennial, herb, to 0.45 m high.	Acacia shrubland, sometimes with E. victrix, over Acacia sclerosperma. WAH: Clay loam plains, drainage plains	Skeletal soils. Sandstone hills.	April, September		Not within 20km	Unlikely to occur
Streptoglossa sp. Cracking clays (S. van Leeuwen et a. PBS 7353)	P3	Multi stemmed annual herb	Cracking clay, Acacia aneura var. longicarpa high open shrubland over Rhagodia eremaea scattered shrubs over Aristida latifolia and Astrebla elymoides scattered tussock grasses. Acacia aneura var. longicarpa 3-5 m < 1-5%; Rhagodia eremaea 0.4-1.2 m < 1%; Aristida latifolia.	No info	June	No	Not within 20km	Unlikely to occur
Stylidium weeliwolli	P3	Annual, herb, 0.1-0.25 m high, throat appendages 4, rod-shaped.	WAH: In damp soil in rock clefts of river bed, permanent pools.	Damp soil in rock clefts of river bed, permanent pools, edge of water courses	July-October	No	Not within 20km	Unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at Lamb Creek?	Distance to project area	Likelihood ranking
Swainsona thompsoniana	P3	Prostrate annual herb to 10 cm high	WAH: Gently sloping area to gently undulating. Soil: Red-brown cracking clay with scattered pebbles and cobbles on the surface. Includes a flowline. Varies to areas of orange-brown cracking clay. Colluvial and alluvial gravels in fan or floodplain	No info	April, June, August	No	Not within 20km	Unlikely to occur
Synostemon hamersleyensis	P1	no info	WAH: Steep scree slope below banded iron formation cliff line with brown sandy loam soil. Steep hillslope, narrow gorge	No info	No info	Yes but off footprint	Not within 20km	Unlikely to occur
Tecticornia globulifera	P1	no info	WAH: Saline flats and marsh with light medium clay soil.	No info	No info	No	Not within 20km	Highly unlikely to occur
Tecticornia medusa	P3	no info	WAH: Growing on the lake bed a few 100 metres from the shoreline. Red clayey sand., Claypan	No info	November	No	Not within 20km	Highly unlikely to occur
Tecticornia sp. Christmas Creek (K.A. Shepherd & T. Colmer et al. KS 1063)	P1	no info	Samphire flats.	No info	No info	No	Not within 20km	Highly unlikely to occur
Tetratheca fordiana	P2	Dwarf shrub; 0.3-0.4m	WAH: Vertical cliff faces amongst ironstone. Breakaways on Skeletal soils. Scattered low trees of Eucalyptus leucophloia, E. kingsmillii over scattered shrubs of Acacia hamersleyensis over open hummock grassland of Triodia epactia, Triodia wiseana and Triodia sp. Mt Ella (M.E. Trudgen 12739) with scattered tussock grasses of Eriachne mucronata.	Shale pocket amongst ironstone	April, May	No	Not within 20km	Unlikely to occur
Teucrium pilbaranum	P2	Upright shrub, 0.2 m high	WAH: High shrubland of Acacia sclerosperma, Acacia synchronicia, Eremophila longifolia and Acacia citrinoviridis over open herbs of Malvastrum americanum, Corchorus tridens and Cleome viscosa with low open woodland of Acacia citrinoviridis and Acacia aptaneura. Plain with brown clay loam soil.	Crab hole plain in a river floodplain, margin of calcrete table.	May, September	No	Not within 20km	Unlikely to occur
Themeda sp. Hamersley Station (M.E. Trudgen 11431)	P3	Tussocky perennial, grass-like or herb, 0.9-1.8 m high.	Variety of habitats including Mulga woodlands and mixed shrublands. Cracking clays, Red clay. Clay pan, grass plain.	Red clay. Clay pan, grass plain.	July-September	Yes	Within 20 km	**Likely to occur**
Thryptomene wittweri	VU	Spreading or rounded shrub from 0.5 - 1.5(2.1m)	WAH: Growing on tops of cliffs, ledges along cliff, in rock crevices and on boulder screes in shades southerly situations. Skeletal red stony soil. Ironstone. High in landscape, rocks on edge of cliff face and growing on face itself, S aspect, skeletal red-brown soil over massive banded ironstone of the Brockman Iron Formation, lots of rock and large sheets of ironstone on surface.	Skeletal red stony soils. Breakaways, stony creek beds.	April-August	No	Not within 20km	Unlikely to occur
Triodia basitricha	P3	no info	WAH Rehabilitation adjacent to Coondewanna airstrip, Mining Area C: Isolated Eucalyptus victrix and Corymbia hamersleyana, OR isolated Corymbia opaca trees over open to sparse Acacia aptaneura, A. bivenosa, A. pruinocarpa, and other shrubs, sometimes over Triodia, sometimes over low shrubs.	No info	No info	No	Within 20 km	Unlikely to occur
Triodia sp. Karijini (S. van Leeuwen 4111)	P1	no info	WAH: Triodia hummock grassland, variety of species including T. pungens, T. wiseana, often with emergent eucalypts and Corymbias, with Acacia shrublands. Very steep hillslope of grey silty loam.	No info	September	No	Within 20 km	May potentially occur
Triodia sp. Mt Ella (M.E. Trudgen 12739)	P3	Perennial, grass-like or herb, 0.4 m high.	WAH: Rocky creeklines, often grows together with Triodia pungens. With E. leucophloia and C. hamersleyana.	Light orange-brown, pebbly loam. Amongst rocks & outcrops, gully slopes.	February, March, September	Yes	Within 20 km	**Likely to occur**

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at Lamb Creek?	Distance to project area	Likelihood ranking
Vittadinia sp. Coondewanna Flats (S. van Leeuwen 4684)	P1	Annual daisy	WAH: Woodland to open forest of variety of mulga species and other acacias, OR shrubland of acacias and other species, sometimes with Eucalypts, over diverse shrubland, often over open Triodia grassland (T. pungens, T. melvillei). Plain, floodplain, drainage, sandy-clay loam,	No info	May, July, September	Yes	Within 20 km	**Likely to occur**
Xerochrysum boreale	P3	no info	WAH: Mulga, stony plain	No info	No info	Yes but rarely collected in locality	Not within 20km	Unlikely to occur

Executive Summary

Mineral Resources Limited (MRL) commissioned Rapallo Environmental (Rapallo) to conduct a single-phase detailed vegetation and flora survey of the Great Northern Highway Intersection area associated with the Lamb Creek Project.

The Great Northern Highway intersection survey area (the survey area) comprised 254 hectares, beginning at the Great Northern Highway and extending north-westwards.

The objectives of the survey were to complete a desktop study and single-phase detailed flora and vegetation survey to map vegetation types, describe floristic diversity, verify desktop information, and assess whether the habitats of the survey area contain conservation significant flora and vegetation. Conservation significant flora taxa are presented in a separate targeted report (Rapallo 2021).

Methods

The single-phase flora and vegetation survey was completed by a team of three botanists over a period of six days. The work was completed in conjunction with a targeted conservation significant flora survey, which is reported on separately (Rapallo 2021).

A total of nineteen flora quadrats (50 by 50 meters) and one relevé were sampled. Additional flora taxa were recorded opportunistically while traversing between quadrats, and during the targeted survey. Preliminary vegetation boundaries were mapped in the field using aerial photographs and GPS waypoints with associated vegetation notes.

Desktop results

The desktop study returned 800 vouchered vascular plant taxa (species and subspecies) within 40 kilometres of the survey area, representing 252 genera and 79 families.

The desktop study found 86 conservation significant vascular flora taxa from within 60 kilometres of the Lamb Creek project area. A likelihood assessment was based on proximity of records and availability of habitat in the survey area. The assessment identified eleven taxa that were either confirmed, likely to occur, or may potentially occur in the survey area. Five of these were recorded during the survey.

The desktop study identified forty-eight introduced taxa (weeds). Nine of these taxa were recorded during the field survey.

The desktop returned one Priority Ecological Community (PEC) within 5 km of the survey area. This was subtype 2 of the Coolibah-Lignum Flats vegetation community, which is listed Priority 1. Results from previous surveys of the Lamb Creek project (Rapallo 2012) and the current field survey confirmed that the PEC does not occur in the survey area.

Field survey results

The survey recorded 187 flora taxa from 35 different families. These included 178 native taxa and nine introduced taxa (weeds: section 4.2.3). The most well-represented families were Poaceae (40 taxa), Fabaceae (37 taxa), and Malvaceae (16 taxa).

Of the 187 flora taxa recorded, 26 taxa (14%) were annuals, 18 (10%) were annual or short-lived perennial, 131 (70%) were perennials. Twelve taxa (6%) did not have life cycle information available.

Five conservation significant flora taxa were recorded from the survey area, as listed below. These are described and mapped in Rapallo (2021):

- *Aristida lazaridis*: Priority 2
- *Rhagodia* sp. Hamersley (M. Trudgen 17794): Priority 3
- *Goodenia nuda*: Priority 4
- *Seringia exastia*: Critically Endangered
- *Euphorbia* aff. ferdinandi: Potentially undescribed

The most commonly recorded taxon was *Aristida lazaridis*, which occurred throughout the survey area, within vegetation types A, B, C and D. *Seringia exastia*, although currently listed Critically Endangered, is listed as a result of a taxonomic revision and is likely to be de-listed in the future (DBCA communication received 24/08/2021)

Vegetation of the survey area

The vegetation across the survey area generally comprised low open woodland to isolated trees dominated by mulga (*Acacia aptaneura*) or other acacia species, over an understorey of either spinifex, tussock grasses, or a combination thereof, on a flat to gently sloping clay-loam plain. The dominant spinifex species was *Triodia pungens*, however patches dominated by *Triodia wiseana* occurred throughout the survey area, with some patches large enough to be mapped.

The vegetation of the survey area has been affected by fire, as visible on the ground during the survey, and supported by NAFI data which maps the entire survey area as having been burnt in 2015 (NAFI 2021). Disturbance notes taken during the survey indicated that fire killed between 5% and 90% of (tall) shrubs and trees in the area.

Vegetation condition across the survey area varied from Very Good to Degraded, with most of the quadrats ranked as Good (EPA 2016a: Table 2). The main reason for this ranking was fire.

Vegetation types

Vegetation types were identified and described through a combination of manual classification and statistical analysis using PATN software. Results of PATN matched well with manual classification.

Six vegetation types were mapped and described across the survey area:

- Vegetation type A – Low open *Eucalyptus gamophylla* woodland over *Triodia melvillei* and *T. pungens* on stony plain (39 ha)
- Vegetation type B – Mulga and acacia low open woodland over open tussock grassland on gently sloping (drainage) plain with variable rock cover (49 ha)
- Vegetation type C – Mulga and acacia low open woodland over open spinifex and tussock grassland on flat plain with medium rock cover (84 ha)
- Vegetation type D – Mulga, Hakea lorea, and *Eucalyptus xerothermica* low open woodland over closed tussock grassland on gently sloping clay-loam plain (no rocks) (51 ha)
- Vegetation type E – Low mulga woodland over sparse understorey on stony plain (9 ha)
- Vegetation type F – *Triodia wiseana* hummock grassland with emergent shrubs and low trees on gently sloping stony plain (4 ha)

Twenty hectares of the survey area was cleared, disturbed, contained roads, or contained regrowth or revegetation with native species. These areas did not represent a vegetation type.

Site selection and vegetation mapping was limited by the absence of a recent aerial photograph showing the current state of the vegetation within the survey area. The most recent aerials available were dated 2009 and 2013, which pre-dated the 2015 fire.

Not all vegetation types were represented adequately with quadrats, with vegetation types A and E only represented by a single quadrat, while vegetation type F was only sampled with a relevé. Additional quadrats are likely to improve vegetation community definition and mapping.

Of the six vegetation types identified in the survey area, four (A, B, C and D) were identified as being of moderate local significance due to the presence of *Aristida lazaridis* which is listed Priority 2.

1 Introduction

1.1 Project overview

The Lamb Creek Iron Ore Project comprises a proposed mining area and an associated haul road, located approximately 130 kilometres (km) north-west of Newman in the Pilbara region of Western Australia. The project occurs within retention licence R47/19 and miscellaneous licence 47/736.

Mineral Resources Limited (MRL) commissioned Rapallo Environmental (Rapallo) to conduct a single phase detailed vegetation and flora survey of the Great Northern Highway Intersection area associated with the Lamb Creek Project. The location and extent of the survey area is described in section 1.2.

The detailed vegetation and flora survey, in conjunction with a targeted survey, was completed by a team of three botanists over a period of six days, from 12th to 17th May 2021.

The targeted survey for conservation significant species is presented in (Rapallo 2021).

1.2 Survey Area

The Great Northern Highway intersection survey area comprised 254 hectares, beginning at the Great Northern Highway and extending north-westwards (Figure 1.1). Hereafter, this area will be referred to as the GNHI survey area, or simply the survey area.

The survey area enveloped various intersection options investigated for a proposed haul road connecting the Lamb Creek resource area with the highway. It was not bounded by a registered tenement at the time of survey, but enclosed the southern end of miscellaneous licence L47/736.

1.3 Scope and objectives

The objectives of the detailed flora and vegetation survey were to:

- Complete a desktop study to identify conservation significant flora and ecological communities that may occur in the survey area.
- Conduct a single-phase detailed flora and vegetation survey of the GNHI survey area, to map broad-scale vegetation types, describe floristic diversity, verify desktop information, and assess whether the habitats of the survey area contain conservation significant flora and vegetation.

Figure 1.1

Location of the Lamb Creek project and delineation of the survey area

2 Regional context

2.1 Climate and weather

The Lamb Creek project is situated in the Hamersley subregion (PIL03) of the Pilbara IBRA region, which is part of the Eremaean province (Beard 1990). The climate of the Hamersley IBRA subregion (PIL03) is described as semi-desert tropical. The average rainfall is 300 mm per year, usually in summer cyclonic or thunderstorm events. Winter rain is not uncommon (Kendrick 2001). Cyclones develop off the north-west coast and often cross the coastline between Karratha and Port Hedland and move inland over the Fortescue Valley system towards Newman (Beard 1990).

The closest Bureau of Meteorology (BOM) weather station to the survey area is at Newman Airport (station number 007176), located 130 kilometres south-east of the survey area. This weather station has been recording rainfall data since 1971 and temperature data since 1996.

Data recorded at Newman Airport (BoM 2021) (Figure 2.1) shows a mean annual rainfall of 324.3 millimetres. Mean monthly rainfall is highest in February at 70.2 millimetres, and lowest in September at 3.7 millimetres. The hottest month is December with a mean maximum temperature of 39.3°C and a mean minimum temperature of 24.1°C. The annual wind records from 9am and 3pm show a dominant easterly throughout the day, with the strongest winds recorded in the morning of up to 30 kilometres/hour.

Evaporation rates are not recorded at the Newman Airport Weather Station. However, evaporation in the Central Pilbara Region is estimated to be between 2000 millimetres and 3500 millimetres per annum, which is approximately ten times greater than annual rainfall (Gardiner 2003). This disparity maintains a typically arid landscape, except for areas located in proximity to river systems and shallow groundwater resources.

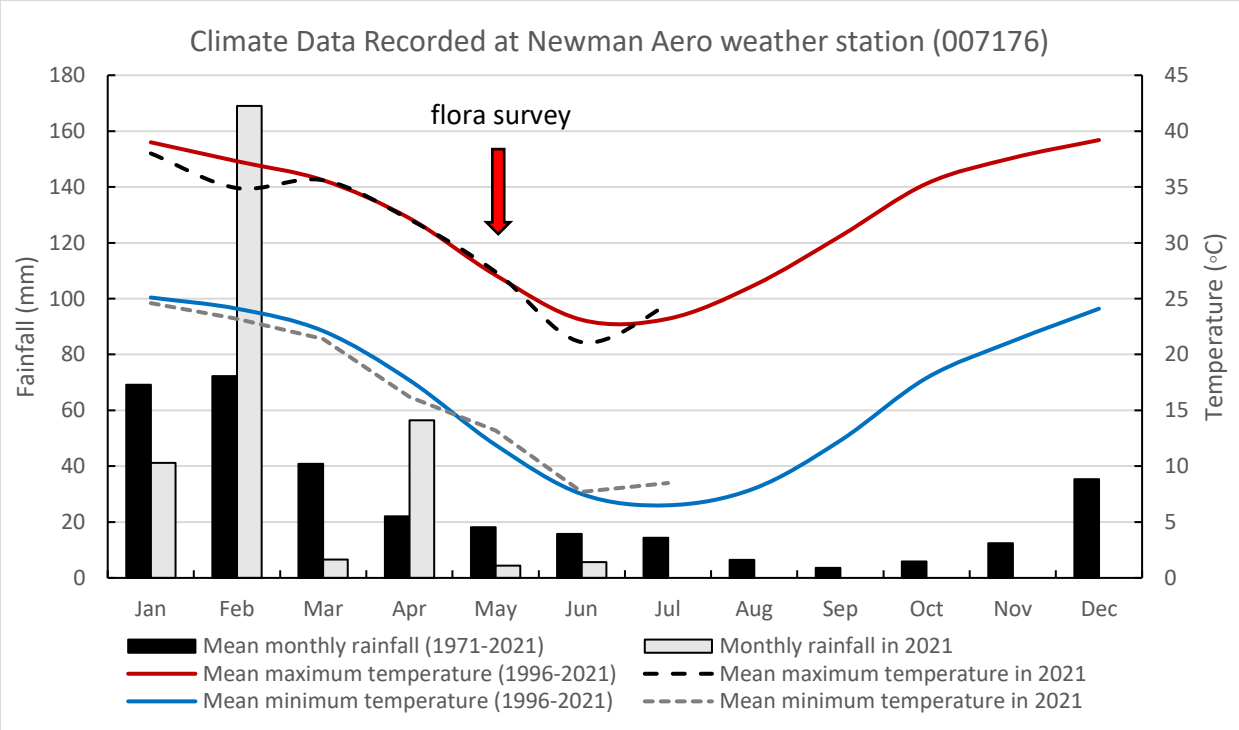

Figure 2.1 Long-term average monthly rainfall and maximum temperature, and 2021 monthly rainfall and maximum temperatures recorded at Newman Aero weather station

Rainfall over the three months preceding the survey was above average with substantial rainfall recorded in February 2021 (169 millimetres) and April (56.4 millimetres). Mean maximum and minimum temperatures during the survey (May 2021) were in line with the average, at respectively 27.4 °C during the day, and 13.2 °C at night.

2.2 Biogeography

2.2.1 IBRA bioregions

The bioregions of Australia are described in the Interim Biogeographic Regionalisation for Australia (IBRA) (Thackway & Cresswell 1995). Bioregions are large, geographically distinct areas of land with common characteristics such as geology, landform patterns, climate, ecological features and plant and animal communities. The latest version, IBRA7, classifies Australia's landscapes into 89 large geographically distinct bioregions and 419 subregions (Department of the Environment and Energy (DotEE) 2012).

The Lamb Creek project is located in the Hamersley (PIL3) subregion of the Pilbara bioregion. The Hamersley subregion comprises the southern section of the Pilbara Craton. It is a mountainous area of Proterozoic sedimentary ranges and plateaux, dissected by gorges (basalt, shale and dolerite). Geographically it is synonymous with the Hamersley vegetation system as described by Beard (1990). The dominant vegetation is mulga low woodland over bunch grasses on fine textured soils in valley floors, and *Eucalyptus leucophloia* (snappy gum) over *Triodia brizoides* on skeletal soils of the ranges. Regional vegetation is further described in section 2.3. Drainage runs into either the Fortescue River to the north, the Ashburton river to the south, or the Robe river to the west (Kendrick 2001).

2.2.2 Land System

The land systems of the Pilbara region are classified according to similarities in landform, soil, vegetation, geology and geomorphology, following van Vreeswyk *et al.* (2004). Three land systems occur on the survey area, as listed and summarised in Table 2.1.

The majority of the survey area falls within the Boolgeeda land system, comprising stony slopes, plains, hills, and drainage floors with spinifex followed by the Wannamunna land system; characterised by hardpan plains and internal drainage tracts supporting mulga shrublands and woodlands (and occasionally eucalypt woodlands). A small portion of the Newman land system, comprising rugged mountains, ridges, and plateaux, intersects the southern edge of the survey area .

Table 2.1 Land systems of the survey area

Name	Land type	Description	Extent in survey area
Boolgeeda Land System	Stony plains with spinifex grasslands	Stony lower slopes, stony plains below hills, and narrow sub-parallel drainage floors. Supports hard and soft spinifex grasslands or mulga shrublands. Often occurs below hill systems such as Newman and Rocklea	182 ha
Wannamunna Land System	Wash plains on hardpan with mulga shrublands	Hardpan plains and internal drainage tracts supporting mulga shrubland and woodlands, and occasionally eucalypt woodlands. Depositional surfaces, level hardpan wash plains subject to overland sheet flow. Broad internal drainage flats receiving run-on from	69 ha

Name	Land type	Description	Extent in survey area
		adjacent hardpan surfaces; rare channelled tracts but mostly not organised through drainage. Relief up to 5 m.	
Newman Land System	Hills and ranges with spinifex grasslands	Rugged high mountains, ridges and plateaux with near vertical escarpments of jaspilite, chert and shale, supporting hard spinifex grasslands. Relief up to 400 m.	3 ha

2.2.3 Geology

The survey area is located in the south-west corner of the Roy Hill 1:250,000 Geological Survey Sheet (SF50-12: Thorne & Tyler 1997). The geology of the survey area is generally defined by the assemblage of prehnite, pumpellyite, epidote, actinolite. Basement rocks comprise the early Proterozoic Brockman Iron Formation and Weeli Wolli Formation. The Brockman Iron Formation consists of banded iron formation (BIF) and shale, while the Weeli Wolli formation consists of BIF separated by shale and siltstone bands, with younger dolerite sills that intersect the sedimentary sequence.

Regionally, the fresh basement rocks are typically overlain by weathered basement rocks which occur as lateritic and basal gravel and/or conglomerate deposits. These weathered deposits underlie early Tertiary Channel Iron Deposits (CID), which are the dominant economic-grade iron deposits in the region. The CID is typically overlain by younger alluvial and colluvial gravels and sediments (Thorne & Tyler 1997).

The survey area overlies the following geological units (Stewart *et al.* 2008), as described below.

- Quaternary Colluvium (Qrc): Colluvium, sheetwash, talus; gravel piedmonts and aprons over and around bedrock; clay-silt-sand with sheet and nodular kankar; alluvial and aeolian sand-silt-gravel in depressions and broad valleys in Canning Basin; local calcrete, reworked laterite.
- Brockman Iron Formation (Lchk): Banded iron-formation, chert, mudstone and siltstone of Palaeozoic age

2.2.4 Soils

The survey area is located within the Fortescue botanical district of the Pilbara region (Beard 1990). This region is mountainous, with soils ranging from shallow, stony sandy loams along slopes, to cracking clays, stripped hardpans and calcareous loams along active waterways (Beard 1990).

The landforms of the survey area are typical of the eastern Pilbara with rocky hills, small gorges, mostly seasonal watercourses and gravelly loam valleys. The soils are typified by hard red alkaline soils on plains, pediments and alluvial areas, while shallow, skeletal soils are common on ranges that rise to 1,250 metres (Beard 1990). The southern part of eastern Pilbara region is characterised by earthy loams underlain by red-brown hardpan (Beard 1975, 1990).

The survey area has two distinct soil and landform assemblages. The greater majority of the survey area is characterised as soil unit Fb3, while the southern tip of the survey area falls within soil unit Fa13. These are defined as follows (CSIRO Australia 2018):

- Fb3 – High-level valley plains set in extensive areas of unit Fa13. There are extensive areas of pisolitic limonite deposits: principal soils are deep earthy loams (Um5.52) along with small areas of (Gn2.12) soils.

- Fa13 – Ranges of banded jaspilite and chert along with shales, dolomites, and iron ore formations with some areas of ferruginous duricrust as well as occasional narrow winding valley plains and steeply dissected pediments. This unit is largely associated with the Hamersley and Ophthalmia Ranges. The soils are frequently stony and shallow and there are extensive areas without soil cover: chief soils are shallow stony earthy loams (Um5.51) along with some (Uc5.11) soils on the steeper slopes. Associated are (Dr2.33, Dr2.32) soils on the limited areas of dissected pediments, while (Um5.52) and (Uf6.71) soils occur on the valley plains.

2.2.5 Hydrology

Within the Hamersley (PIL3) subregion drainage runs into either the Fortescue River to the north, the Ashburton river to the south, or the Robe river to the west (Kendrick 2001). The Great Northern Highway intersection survey area falls within the Ashburton River Catchment. One mapped intermittent creek line enters the survey area from the north-east, with the much of the survey area characterised by non-incised drainage plain, receiving run-on from adjacent hills.

2.2.6 Topography

The survey area occurs within the central Hamersley Ranges which dominate the sub-region (Thorne & Tyler 1997). The topography of the region is highly mountainous comprising three smaller ranges: Packsaddle Range in the centre, Jirrpalpur Range in the south and the Hancock Range to the north. The survey area skirts the western edge of the Hancock Range, with the survey area predominantly characterised by plain and valley floor.

2.3 Regional vegetation

2.3.1 Botanical district

The survey area is located in the Fortescue botanical district of the Pilbara region (Beard 1990), which forms part of the Eremaean Botanical Province. The Pilbara region receives a slightly higher than average rainfall than most of the Eremaean Province, due to the prevalence of cyclones off the coast, but this is not enough to modify the essentially desert appearance of the plant cover (Beard 1990).

The Fortescue district consists predominantly of tree and shrub steppe communities with *Eucalyptus* trees, *Acacia* shrubs and spinifex grasses including *Triodia pungens* and *T. wiseana* (Beard, (1975). Mulga (species of the *Acacia aneura* complex) occurs in valleys and short-grass plains may be present on alluvial soils (Beard 1990).

2.3.2 Vegetation system association

Digital maps (shapefiles) of pre-European vegetation communities, based on state-wide mapping by J.S. Beard at 1:250,000 scale, are published by the Department of Primary Industries and Regional Development (Beard 2018).

Vegetation of the Hamersley (PIL3) IBRA subregion is generally low Mulga woodland over bunch grasses on fine textured soils in the valleys with snappy gums (*Eucalyptus leucophloia*) over *Triodia brizoides* on skeletal soils of the ranges (Kendrick 2001). The mountain tops and gorges of the Hamersley subregion provide refugia for humidophile and/or fire intolerant flora, and support a diversity of range-restricted species (Kendrick 2001).

(Beard, (1975) mapped the vegetation system-associations of the survey area as Hamersley 18: Low woodland of Acacia aneura, and Hamersley 82: Hummock-grass (*Triodia wiseana*) steppe with irregularly scattered *Eucalyptus brevifolia* trees; and Hamersley 18: Low woodland of *Acacia aneura* (Table 2.2).

Table 2.2 Pre-European vegetation within the survey area

Beard Vegetation System and Association	Extent in survey area	Total current extent in Australia (1)	Pre-European extent remaining (1)
Hamersley 18	209 ha	575 852 ha	99.96
Hamersley 82	46 ha	2 157 841 ha	99.99

Footnotes: 1) Numbers from 2018 Statewide Vegetation Statistics (DBCA 2019)

Vegetation that is not a Threatened or Priority Ecological Community may still be considered significant if it has a restricted distribution, or has experienced a degree of historical impact from threatening processes (EPA 2016b). Vegetation types retaining less than 30% of their pre-European extent generally experience accelerated species loss at an ecosystem level (EPA 2000) and are regarded as being 'vulnerable', while vegetation types retaining less than 10% of their original extent are regarded as being 'endangered' (EPA 2000, Shepherd *et al.* 2002, DER 2014a, 2016b).

As presented in Table 2.2, the Hamersley 18 and Hamersley 82 vegetation system-associations intersected by the survey area still have close to 100% of their original extent remaining, and would be considered 'least concern' (DER 2014a).

2.4 Reserves and environmentally sensitive areas

Environmentally sensitive areas (ESAs) are protected under the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004* and are selected for their environmental values at state or national levels. The survey area does not occur within an ESA, nor are there any ESAs within five kilometres of the survey area, as shown by the Department of Environment Regulation (DER) Native Vegetation Map Viewer (DER 2014b).

Karijini National Park is located to the west of the survey area, approximately 18 kilometres west of the intersection of the proposed haul road and the Great Northern Highway. Mungaroona Range Nature Reserve is approximately 100 kilometres northwest of the survey area. The nearest Nationally Important Wetland is the Fortescue Marsh located 52 km north of the survey area (AWE 2021).

Threatened Ecological Communities and Priority Ecological Communities are addressed in section 3.1.

3 Methods

3.1 Desktop study

The desktop study comprised a search of paid and free databases, and a review of available literature relevant to the survey area. The desktop served to compile a list of conservation significant flora taxa and vegetation communities with the potential to occur within the survey area. Database search parameters are outlined in Table 3.1 below. Conservation codes for Australian flora are detailed Appendix I.

Table 3.1 Flora database search parameters

Source of information	Search area
DBCA (2021a) Threatened and Priority Flora Database (including WA Herbarium database records)	60 km radius centred on the Lamb Creek project area
DBCA (2021b) Threatened and Priority Ecological Communities (TEC-PEC) database	50 km radius centred on the Lamb Creek project area
DBCA (2021c) NatureMap online database	40 km radius centred on the Lamb Creek project area
Department of Agriculture Water and the Environment (AWE) (2021) Protected Matters search tool	50 km radius centred on the Lamb Creek project area

The region has had considerable flora survey effort over the last 20 years predominantly due to flora and vegetation surveys completed within, or partly within, the boundary of the Mining Area C (MAC) Development Envelope between 1997 and 2014. The MAC Development Envelope is approximately 1.3 kilometres south of the survey area (Figure 1.1: Inset Map). The surveys used as part of the literature review are listed in Appendix II and generally occurred within 50 kilometres of the survey area. Figure 3.1 provides regional context.

The conservation significant taxa identified in the desktop were reviewed for likelihood of occurrence within the GNHI survey area, based on the likelihood categories outlined in Table 3.2. Desktop results and likelihood assessment are presented in Appendix II.

Table 3.2 Likelihood assessment criteria

Rank	Criteria
Confirmed	1. The species was recorded on the survey area; or 2. The species was recorded directly adjacent (within 500 m) of the survey area from habitat continuing into the survey area.
Likely to occur	1. There are existing records of the species in close proximity to the survey area (within 20 km); and • the species is strongly linked to a specific habitat, which is present in the survey area; or • the species has more general habitat preferences, and suitable habitat is present.
May potentially occur	1. There are existing records of the species from the region (within 30 km), however: • the species is strongly linked to a specific habitat, of which only a small amount is present in the survey area; or • the species has more general habitat preferences, but only some suitable habitat is present. 2. There is suitable habitat in the survey area, but there are very few or only very old (1999 or before) records from the region.

Rank	Criteria
Unlikely to occur	1. The species is linked to a specific habitat, which is absent from the survey area; or 2. Suitable habitat is present, however there are no existing records of the species from the locality despite reasonable previous search effort in suitable habitat; or 3. There is some suitable habitat in the survey area, however the species is very infrequently recorded in the locality.
Highly unlikely to occur	1. The species is strongly linked to a specific habitat, which is absent from the survey area; and/or 2. The species' range is very restricted and would not include the survey area.

Regional localities

3.2 Field survey

A single-phase detailed flora and vegetation survey was completed by a team of three botanists over a period of six days, from 12 to 17 May 2021. The survey was completed in conjunction with a targeted conservation significant flora survey, as reported in Rapallo (2021). The survey area was accessed by four-wheel drive vehicle using existing tracks and surveyed on foot.

The survey was carried out in a manner consistent with the following documents developed by the Western Australian Environmental Protection Authority (EPA):

- Environmental Protection Authority (EPA) *Technical Guidance Flora and Vegetation Surveys for Environmental Impact Assessment* (EPA 2016a)

3.2.1 Quadrats

Nineteen 50 by 50 metre quadrats were sampled, as mapped in Figure 3.2. Quadrats were selected within all vegetation types discernible through aerial photography interpretation, topography, and pre-European vegetation and landform mapping, in combination with on-ground observations. It was noted while in the field that the aerial photograph available was dated, and no longer representative of the vegetation seen on the ground.

The following information was recorded at each quadrat:

- Site name, date, photographs, central GPS coordinate
- Landform, aspect, slope
- Soil type, soil colour
- Rock type, rock cover, rock size
- Vegetation condition rating (as per Table 2 in EPA 2016a)
- Disturbances noted in the area including estimated fire history
- Vascular plant species – including height and approximate foliage cover

3.2.2 Relevés

A single relevé (R01) was sampled within the only patch of *Triodia wiseana* that was large enough to sample (Figure 3.2). Patches dominated by this spinifex species were found throughout the survey area, but were generally too small to sample. Information recorded at the relevé was the same as that recorded for quadrats, but for an unbounded area.

3.2.3 Opportunistic records and field notes

Additional flora taxa were recorded opportunistically while traversing between quadrats, and during the targeted survey. The targeted component of the survey (as reported in Rapallo 2021) involved walking transects across approximately two-thirds of the detailed survey area, which enabled many additional flora records of both conservation significant and common flora taxa.

Preliminary vegetation boundaries were mapped in the field using aerial photographs and GPS waypoints with associated vegetation notes.

3.2.4 Specimen collection and identification

Flora specimens were collected and pressed and as per Western Australian Herbarium (2008) guidelines. Each specimen was assigned a unique field name and field number and was marked with a plant tag containing specimen and location information. All specimens were pressed and dried on the day of collection. Fragile material such as flowers, seed capsules, or very small specimens were sealed in paper bags which were marked as per the plant tags.

Taxonomic identification of flora specimens was completed by Sharnya Thomson-Yates (Table 3.3) with the use of the WA Herbarium reference collection, latest flora identification keys, and recent scientific publications. As per section 7.2 of EPA (2016a) and under flora licence conditions, suitable voucher specimens will be lodged with the Western Australian Herbarium.

3.2.5 Vegetation classification and mapping

Vegetation types of the survey area were classified and mapped using a combination of statistical analysis, manual classification, and field-based observations.

Quadrats were initially grouped into interim vegetation types based on quadrat data collected on species composition, vegetation structure, fire history, landform, soil, rock cover, and site photographs. Next, PATN software was used to group the quadrats based on a statistical measure of similarity of species presence and density. Finally, the grouping of quadrats produced by the PATN analysis was augmented by the interim vegetation types, quadrat data as listed above, and interpretation of aerial photography, in order to derive the final vegetation types.

3.2.5.1 PATN analysis procedure

Statistical analysis to support classification of vegetation types was carried out using PATN software (Belbin 2013). The analysis was completed using data from all 19 survey quadrats. Taxa that were alien were removed from the dataset, and the analysis was conducted using the 149 remaining taxa. The analysis was undertaken using the density code values from the quadrat occurrence records. A two-step association measure was used to classify flora taxa into 13 groups.

A further analysis was done using these groups, which were then refined by removing taxa with Kruskall Wallis values (KW values) lower than 1.0. This resulted in 14 taxa being removed from the analysis. The final association of sites used the Agglomerative Hierarchical Fusion classification strategy, the Flexible UPGMA classification technique and the Bray and Curtis association measure, with beta of -0.1, producing 6 groups of sites. PATN results are presented in section 4.2.5.1 and Figure 4.1.

3.2.5.2 Personnel and licensing

The personnel involved in the field survey, data entry and analysis, and the preparation of this report are listed in Table 3.3. The field survey was conducted under was conducted under Flora Taking (Biological Assessment) Licences FB62000183, FB6200067-3, and FB62000331 pursuant to Regulation 62 of the *Biodiversity Conservation Regulations 2018.* As part of the license conditions, a list of flora and fauna species recorded in the survey will be forwarded to the DBCA.

Table 3.3 Personnel

Linda Dalgliesh[2]	Senior Botanist	•			
Joshua Gilovitz[3]	Senior Botanist Senior Data Analyst	•		•	

Footnotes: 1 = License number FB62000183; 2 = License number FB6200067-3; 3 = License number FB62000331.

3.2.6 Nomenclature and conservation listing

Flora taxonomy and nomenclature follows FloraBase (Western Australian Herbarium 1998). FloraBase was also accessed to verify conservation codes, distribution records, habitat requirements, and flowering times. Conservation codes cited in this report are as per detailed Appendix I. Note that the conservation codes on FloraBase are the most up to date, whereas the DBCA Threatened (Declared Rare) and Priority Flora List (DBCA 2018) was last updated on 5 December 2018.

4 Results and Discussion

4.1 Desktop results

The desktop study returned 800 vouchered vascular plant taxa (species and sub species) within 40 kilometres of the survey area, representing 252 genera and 79 families. Conservation significant flora, weeds, and conservation significant vegetation are discussed in sections 4.1.1, 4.1.2, and 4.1.3.

4.1.1 Conservation significant flora

The desktop study found 86 significant vascular flora taxa from within 60 kilometres of the Lamb Creek project area. An assessment was completed to estimate the likelihood of occurrence within the Great Northern Highway intersection area for each of these conservation taxa. Desktop results are summarised in Table 4.1 and complete search results and likelihood ranking presented in Appendix II.

Note that the likelihood scores presented in this report are different from those presented in the targeted report (Rapallo 2021), because the latter considered the Lamb Creek project as a whole, while the GNHI survey area covered a small subset of this area containing far fewer habitats. This led to a down-grading of likelihood scores for all taxa for which the GNHI survey area did not contain habitat.

Table 4.1 Summary of Lamb Creek desktop results for conservation significant taxa

Likelihood ranking	Status[1]						Total taxa
	VU[2]	CR[3]	P1	P2	P3	P4	
Confirmed	1			1	2	1	**5**
Likely to occur			1	1	3		**5**
May potentially occur				1			**1**
Unlikely to occur		1	7	11	32	6	**57**
Highly unlikely to occur			5	4	9		**18**
Grand Total	**1**	**1**	**13**	**18**	**46**	**7**	**86**

Footnotes:
1. P = Priority (administered by DBCA; Biodiversity Conservation Act 2016 (BC Act)), VU = Vulnerable, CR = Critically Endangered.
2. Listed under the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) and BC Act,
3. Listed BC Act only. Refer to Appendix I for detailed explanation of conservation codes.

Two species listed as vulnerable and critically endangered were returned via the threatened and priority flora database search (DBCA 2021a) and the protected matters search (AWE 2021).

- *Thryptomene wittweri* listed as vulnerable under the BC Act and EPBC Act was assessed as unlikely to occur due to habitat requirements and distance of records from the survey area (>20 kilometres). This species is not discussed further in this report.
- *Seringia exastia* listed as critically endangered under the BC Act is. However, this taxon is only listed as a result of a taxonomic revision and is likely to be delisted (section 4.2.2.

Most records were DBCA listed priority flora taxa and the greater majority (87%) were ranked as unlikely to highly unlikely to occur within the survey area (Appendix II). These taxa are not discussed further in this report. Five conservation significant taxa were confirmed to occur within the Great Northern Highway intersection area during the targeted flora survey (section 4.2.2). Conservation significant taxa recorded

in the Lamb Creek project area are discussed in detail in the targeted survey report (Rapallo 2021), with the discussion not repeated in this report.

4.1.2 Introduced flora (weeds)

4.1.2.1 Weed classification in Western Australia

The *Biosecurity and Agriculture Management Act 2007* (BAM Act) categorises the weeds of Western Australia into four main classifications:

- Declared Pests (under Section 22 of the Act);
- Permitted (under Section 11 of the Act);
- Prohibited (under Section 12 of the Act); and
- Permitted requiring a permit (Section 73, BAM Regulations 2013).

Under the BAM Act all declared plant pests are placed in one of three categories:

- C1 (Exclusion) — Pests will be assigned to this category if they are not established in Western Australia and control measures are to be taken, including border checks, in order to prevent them entering and establishing in the State;
- C2 (Eradication) — Pests will be assigned to this category if they are present in Western Australia in low enough numbers or in sufficiently limited areas that their eradication is still feasible; and
- C3 (Management) — Pests will be assigned to this category if they are established in Western Australia but it is feasible, or desirable, to manage them in order to limit their damage. Control measures can prevent a C3 pest from increasing in population size.

Fifteen introduced taxa have been identified by DBCA as 'Priority Alerts' for the Pilbara region, including **Azadirachta indica, *Calotropis procera, *Chloris gayana, *Clitoria ternatea, *Cryptostegia grandiflora, *Cylindropuntia spp., *Euphorbia tirucalli, *Jatropha gossypifolia, *Lantana camara, *Moringa oleifera, *Ricinus communis, *Schinus molle var. areira, *Vachellia nilotica, *Washingtonia robusta and *Xanthium strumarium* (DPaW 2014). None of these taxa were recorded during the survey.

4.1.2.2 Weeds identified in the desktop study

The desktop study identified forty-nine introduced taxa from the vicinity of the survey area, as presented in Appendix III. The greater majority of weeds recorded in the desktop were listed as Permitted – s11, with one weed (**Argemone mexicana*) listed as Declared Pest (Prohibited) – s12 category C2 (Eradication) under the *Biosecurity and Agriculture Management Act 2007* (DAFWA 2021).

No Weeds of National Significance (WONS) were returned from the desktop search (Centre for Invasive Species Solutions 2021).

4.1.3 Conservation significant vegetation

The survey area is not located within a known TEC or PEC. The nearest known PEC is subtype 2 of the Coolibah-Lignum Flats vegetation community, with the edge of the buffer zone located less than five kilometres south of the survey area (DBCA 2021b) as shown in Figure 3.1.

The Coolibah-Lignum Flats vegetation complex is described as: Woodland or forest of *Eucalyptus victrix* (coolibah) over thicket of *Duma florulenta* (lignum) on red clays in run-on zones. Associated species include *Eriachne benthamii*, *Themeda triandra*, *Aristida latifolia*, *Eulalia aurea* and *Acacia aneura* (DBCA 2021d).

Three sub-types have been identified, of which sub-type 2 occurs near the project with the edge of the buffer zone less than five kilometres from the southern edge of the survey area (Figure 3.1).

1. Coolibah and mulga (*Acacia aneura*) woodland over lignum and tussock grasses on clay plains (Coondewanna Flats and Wanna Munna Flats) – Priority 3
2. Coolibah woodlands over lignum (*Duma florulenta*) over swamp wandiree (Lake Robinson is the only known occurrence) – Priority 1
3. Coolibah woodland over lignum and silky browntop (*Eulalia aurea*); two occurrences known on Mt Bruce Flats – Priority 1

A detailed flora and vegetation survey of the Lamb Creek project completed in 2012 (Rapallo 2012) concluded that the Coolibah-Lignum Flats PEC is unlikely to occur in the survey area because neither Coolibah (*E. victrix*) nor lignum species were recorded.

Onshore (2013b) reviewed vegetation mapping within Coodewanna Flats and Lake Robinson and confirmed fine-scale mapping for the two sub-types of the Coolibah-lignum Flats. Onshore (2013b) concluded that the Priority 1 sub-type 2 lies at the lowest point of the Coondewanna Flats associated with Lake Robinson, and the Priority 3(i) sub-type 1 occurs on alluvial flats (Coondewanna Flats) around Lake Robinson, to the south and found that the Great Northern Highway divides the PEC to the west from the MAC Development Envelope MAC. Based on the Onshore (2013b) mapping, the PEC occurs ca. 12 kilometres to the south of the survey area.

4.2 Field survey results

4.2.1 Flora taxa recorded during the survey

The survey recorded 187 flora taxa from 35 different families, as presented in Appendix IV. These included 178 native taxa and nine introduced taxa (weeds: section 4.2.3). The most well-represented families were Poaceae (40 taxa), Fabaceae (37 taxa), and Malvaceae (16 taxa).

Of the 187 flora taxa recorded, 26 taxa (14%) were annuals, 18 (10%) were annual or short-lived perennial, 131 (70%) were perennials. Twelve taxa (6%) did not have life cycle information available. The full list of taxa is presented in Appendix IV.

Five conservation significant flora taxa were recorded from the Great Northern Highway intersection area during the targeted. These are discussed in detail in Rapallo (2021) and briefly described in section 4.2.2.

A list of quadrat locations is presented in Appendix V and quadrat data is provided in Appendix VI.

4.2.2 Conservation significant flora

Five conservation significant flora taxa were recorded from the Great Northern Highway intersection area during both the detailed and targeted survey, as listed in Table 4.2. Conservation significant flora are described and mapped in detail in the targeted flora survey report (Rapallo 2021).

The desktop study identified eleven conservation significant flora taxa that were considered likely or highly likely to occur in the survey area, based on proximity of records and availability of habitats in the survey area (section 4.1.1, Appendix II).

The vegetation types of the survey area (section 4.2.5) all comprised varieties of acacia and/or mulga (*Acacia aptaneura*) woodland over either spinifex (*Triodia* spp.), mixed tussock grasses, or a combination thereof, located on a flat or gently sloping plain. The limited habitat information provided for the conservation significant taxa identified in the desktop did not allow a distinction in likelihood scores between the vegetation types recorded within the GNHI survey area. Hence, the likelihood assessment presented in Appendix II refers to the survey area as a whole.

Table 4.2 Conservation significant flora taxa recorded during the survey

Taxon	Conservation status	Locations recorded per vegetation type							
		A	B	C	D	E	F	X	O
Aristida lazaridis	Priority 2	9	28	38	196			1	31
Rhagodia sp. Hamersley (M. Trudgen 17794)	Priority 3		4	11					
Goodenia nuda	Priority 4				1				
Seringia exastia	Critically Endangered							2	
Euphorbia aff. *ferdinandi*	Potentially undescribed			3	1				

The most commonly recorded conservation significant taxon was *Aristida lazaridis* (Priority 2) which is species of grass recorded throughout vegetation types A and D. Numbers in Table 4.2 above refer to the number of locations this grass was recorded in 2021, not the total number of plants.

Seringia exastia is only listed as a results of a taxonomic revision, which merged a common and a restricted species. DBCA communications (24/08/2021) confirmed that the species is "considered common and widespread" and likely to be delisted in the future.

4.2.3 Introduced flora taxa (weeds)

Nine introduced flora taxa (weeds) were recorded during the survey, these are listed in Table 4.3 below. The weeds were recorded in five of the six vegetation types identified during the survey, as well as from disturbed areas and outside of the survey area. The greater majority of weed records were from vegetation type B which occurred on a gently sloping drainage plain intersected by minor creek lines.

Table 4.3 Weeds recorded during the survey

Taxon	WAOL status	Locations recorded per vegetation type							
		A	B	C	D	E	F	X	O
**Aerva javanica*	Permitted - s11		1						
**Bidens bipinnata*	Permitted - s11	1	6	2	6			1	
**Stylosanthes hamata*	Permitted - s11				1				
**Malvastrum americanum*	Permitted - s11		11	2				2	
**Cenchrus ciliaris*	Permitted - s11	1	25	1		1		1	1
**Cenchrus setiger*	Permitted - s11		10	1					1
**Melinis repens*	Permitted - s11	1							
**Portulaca oleracea*	Permitted - s11	1	2	5	1				
**Solanum lasiophyllum*	Permitted - s11	1	3	2					

The most frequently recorded weed was **Cenchrus ciliaris* (buffel grass) which was recorded from three quadrats as well as opportunistically across the survey area from four different vegetation types. Vegetation types A, B, and C were the most heavily affected, especially type B which supported seven different weed species recorded from a total of 58 locations.

4.2.4 Flora of other significance

Flora species, subspecies, varieties, hybrids, and ecotypes may be considered significant for reasons other than listing as a Threatened or Priority flora taxon. This may include, but is not limited to, range extensions, keystone species, relic status, local endemism and anomalous features (EPA 2004). Based on these features, *Euphorbia* aff. *ferdinandi* recorded during the survey may be considered flora of "other" significance, as it represents a potentially undescribed species with unknown and potentially restricted distribution range. This taxon is discussed in Rapallo (2021).

4.2.5 Vegetation of the survey area

The vegetation across the survey area generally comprised low open woodland to isolated trees dominated by mulga (*Acacia aptaneura*) or other acacia species, over an understorey of either spinifex, tussock grasses, or a combination thereof, on a flat to gently sloping clay-loam plain. The dominant spinifex species was *Triodia pungens*, however patches dominated by *Triodia wiseana* occurred throughout the southern part of the survey area, with some patches large enough to be mapped.

The vegetation of the survey area has been affected by fire, as visible on the ground during the survey, and supported by NAFI data which maps the entire survey area as having been burnt in 2015 (NAFI 2021). Disturbance notes taken during the survey indicated that fire killed between 5% and 90% of (tall) shrubs and trees in the area. Comparison of vegetation data recorded in 2012 over a subset of the current survey area , as well as direct field observations noting many burnt trees and shrubs, strongly indicate that the 2015 fire has altered vegetation structure and composition of the survey area. This was further supported by comparison of vegetation structure and boundaries visible on the ground, with those shown on the available aerial photographs of the survey aera, which were taken pre-fire (2009 and 2013).

The absence of a recent aerial photograph presented a limitation with respect to both survey planning and vegetation mapping, as the vegetation visible on the aerials no longer reflected the actual vegetation on the ground. Vegetation mapping therefore relied heavily on field notes, photographs, and associated GPS coordinates.

Vegetation condition across the survey area varied from Very Good to Degraded (EPA 2016a: Table 2), with the greater majority of the quadrats ranked as Good (Appendix VI).

4.2.5.1 PATN classification of quadrats

The PATN analysis results in six quadrat groups, as presented in Figure 4.1. The grouping derived by PATN aligned well with manual classification of the sites, as outlined in Table 4.4. PATN groups 5 and 6 were manually combined into vegetation type D, based on floristic composition, land form, and site photos.

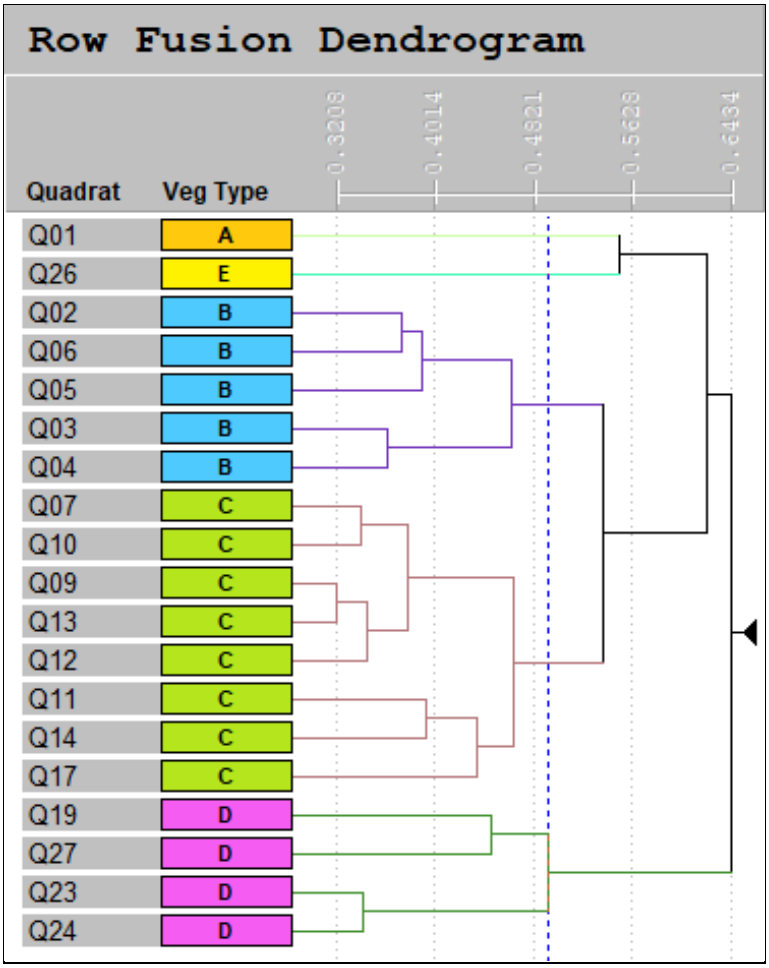

Figure 4.1 PATN dendrogram

Table 4.4 Comparison of PATN results with manual classification of vegetation types

PATN group	Vegetation types	Sites
1	Vegetation type A	Q01
2	Vegetation type E	Q26
3	Vegetation type B	Q02, Q03, Q04, Q05, Q06
4	Vegetation type C	Q07, Q09, Q10, Q11, Q12, Q13, Q14, Q17
5	Vegetation type D	Q19, Q27
6	Vegetation type D	Q23, Q24
n/a	Vegetation type F	R01

4.2.5.2 Vegetation types

Six vegetation types were mapped and described across the survey area, as summarised in Table 4.5 and mapped in Figure 4.2. The vegetation types of the survey area are described in detail in Table 4.6.

The vegetation types across the survey area were assessed as having moderate significance, based on criteria outlined in Appendix VII. This ranking was primarily due to the Priority 2 listed grass *Aristida lazaridis*, which was recorded in high numbers across the survey area, especially in vegetation type D, and also in types C, B, and A. Refer to Rapallo (Rapallo 2021) for further details on *Aristida lazaridis* populations within the survey area.

Table 4.5 Summary of vegetation types

Code	Vegetation type	Landform	Area (ha)
A	Low open *Eucalyptus gamophylla* woodland over *Triodia melvillei and T. pungens* on stony plain	Stony plain	39 ha
B	Mulga and acacia low open woodland over open tussock grassland on gently sloping (drainage) plain with variable rock cover	Gently sloping clay-loam plain with minor drainage channels and surface drainage	49 ha
C	Mulga and acacia low open woodland over open spinifex and tussock grassland on flat plain with medium rock cover	Clay-loam plain	84 ha
D	Mulga, *Hakea lorea*, and *Eucalyptus xerothermica* low open woodland over closed tussock grassland on gently sloping clay-loam plain (no rocks)	Gently sloping clay-loam plain without rocks	51 ha
E	Low mulga woodland over sparse understorey on stony plain	Flat stony plain	9 ha
F	*Triodia wiseana* hummock grassland with emergent shrubs and low trees on gently sloping stony plain	Gently sloping stony plain	4 ha
X	(not a vegetation type)	Disturbed / cleared / road	20 ha

Table 4.6 Vegetation types of the survey area

Type	Vegetation description	Photo
A	**Low open *Eucalyptus gamophylla* woodland over *Triodia melvillei* and *T. pungens* on stony plain** Description: *Eucalyptus gamophylla* (mallee) and *Corymbia deserticola* subsp. *deserticola* low open woodland; over *Acacia pruinocarpa*, *A. ancistrocarpa*, *A. atkinsiana* sparse shrubland; over isolated low shrubs; over isolated dwarf shrubs; over *Ptilotus calostachyus*, *Ptilotus obovatus*, *Trichodesma zeylanicum* var. *zeylanicum* sparse forbland; over *Triodia melvillei* and *Triodia pungens* sparse hummock grassland. Extent and landform: This vegetation type covers 38 hectares (15%) of the survey area. It occurs in the north-western part of the survey area, and along the Great Northern Highway. Vegetation type A falls primarily within the Boolgeeda land system. It occurs on a flat stony plain over a red-brown clay-loam plain. Rock cover is high, at approximately 90%. Quadrats: Q05 Vegetation condition: Good Disturbances: Tracks, clearing, recent fire, weeds Conservation significant flora: *Aristida lazaridis* (P2) Weeds: **Bidens bipinnata*, **Cenchrus ciliaris*, **Melinis repens*, **Portulaca oleracea*, **Solanum lasiophyllum* Significance: Local, Moderate	 **Site Q01** (Condition: Good)

Type	Vegetation description	Photo
B	**Mulga and acacia low open woodland over open tussock grassland on gently sloping (drainage) plain with variable rock cover** Description: *Acacia aptaneura* and *A. pruinocarpa* low open woodland; over sparse tall shrubland including *Eremophila longifolia* and *Santalum lanceolatum*; over mixed isolated shrubs to sparse shrubland; over isolated forbs to open forbland dominated by *Pterocaulon sphacelatum*, *Ptilotus obovatus*, and *Arivela viscosa*; over sparse to medium-dense tussock grassland dominated by *Aristida inaequiglumis*, *A. contorta* and *Themeda triandra*. Extent and landform: Covers 49 hectares (19%) of the survey area. It occurs in the north of the survey area, on flat to gently sloping drainage plain, within the Boolgeeda land system. It is intersected by minor drainage lines, with mulga vegetation becoming denser along drainage lines. Soils are red-brown clay loam with generally low rock cover (2-10%) but with some areas of very high rock cover (90%). Quadrats: Q02, Q03, Q04, Q05, Q06 Vegetation condition: Good to Degraded Disturbances: Fire has killed on average 50% of trees and tall shrubs. Weeds. Conservation significant flora: *Aristida lazaridis* (P2), *Rhagodia* sp. Hamersley (P3) Weeds: **Aerva javanica*, **Bidens bipinnata*, **Malvastrum americanum*, **Cenchrus ciliaris*, **Cenchrus setiger*, **Portulaca oleracea*, **Solanum lasiophyllum*. Significance: Local, Moderate	 **Site Q04** (Condition: Good) **Site Q05** (Condition: Good)

Type	Vegetation description	Photo
C	**Mulga and acacia low open woodland over open spinifex and tussock grassland on flat plain with medium rock cover** Description: *Acacia aptaneura*, *A. pruinocarpa* low open woodland with occasional *Corymbia deserticola*; over isolated tall shrubs to sparse tall shrubland dominated by *Hakea lorea* subsp. *lorea*, *Acacia elachantha*, *A. aptaneura*, *A. pruinocarpa*, *Santalum lanceolatum*; over isolated medium to dwarf shrubs; over sparse forbland dominated by *Pterocaulon sphacelatum*, *Arivela viscosa*, *Ptilotus obovatus*; over *Triodia pungens* and *T. melvillei* open hummock grassland, with *Themeda triandra*, *Aristida inaequiglumis*, and *A. contorta* open tussock grassland. Extent and landform: The most common vegetation type, covering 84 hectares (33%) of the survey area. Flat clay-loam plain with medium (10-60%) rock cover. This vegetation type occurs primarily in the Boolgeeda land system, with a minor extent in the Wannamunna land system. Quadrats: Q07, Q09, Q10, Q11, Q12, Q13, Q14, Q17 Vegetation condition: Good (one quadrat rated Very Good) Disturbances: Fire has killed 10-50% of tall shrubs and trees. Conservation significant flora: *Aristida lazaridis* (P2), *Rhagodia* sp. Hamersley (P3) *Euphorbia* aff. *ferdinandi* (potentially undescribed) Weeds: **Bidens bipinnata*, **Malvastrum americanum*, **Cenchrus ciliaris*, **Cenchrus setiger*, **Portulaca oleracea*, **Solanum lasiophyllum* Significance: Local, Moderate	 **Site Q07** (Condition: Good) **Site Q17** (Condition: Good)

Type	Vegetation description	Photo
D	**Mulga, *Hakea lorea*, and *Eucalyptus xerothermica* low open woodland over closed tussock grassland on gently sloping clay-loam plain (no rocks)** Description: Low open woodland of *Acacia aptaneura*, *Hakea lorea* subsp. *lorea*, and *Eucalyptus xerothermica*; over isolated tall to dwarf shrubs; over sparse forbland to isolated forbs dominated by *Pterocaulon sphacelatum*; over closed tussock grassland dominated by *Themeda triandra*, with *Aristida inaequiglumis* and *A. contorta*. Extent and landform: Covers 51 hectares (20%) of the survey area, occurring only within the Wannamunna land system, with vegetation boundaries closely matching the land system boundaries. Flat clay-loam plain without rocks. Quadrats: Q19, Q23, Q24, Q27 Vegetation condition: Good Disturbances: Fire has killed on average 50% of trees and tall shrubs. Conservation significant flora: *Aristida lazaridis* (P2), *Goodenia nuda* (P4), *Euphorbia* aff. *ferdinandi* (potentially undescribed. Weeds: **Bidens bipinnata*, **Portulaca oleracea*, **Stylosanthes hamata* Significance: Local, Moderate	 **Site Q19** (Condition: Good) **Site Q23** (Condition: Good)

Type	Vegetation description	Photo
E	**Low mulga woodland over sparse understorey on stony plain** Description: *Acacia aptaneura* low mulga woodland; over *Acacia pachyacra* and *A. ?sibirica* sparse shrubland; over isolated dwarf shrubs; over isolated forbs and ferns; over *Digitaria ammophila*, *Chrysopogon fallax*, *Aristida inaequiglumis* sparse tussock grassland. Extent and landform: Covers 9 hectares (4% of the survey area). Flat stony plain with high (90%) rock cover on red-brown clay loam. Occurs in the western part of the survey area, along the Great Northern Highway, within the Boolgeeda land system. Quadrats: Q26 Vegetation condition: Good Disturbances: Fire, some evidence of clearing Conservation significant flora: None Weeds: **Cenchrus ciliaris* Significance: Negligible	 **Site Q26** (Condition: Good)
F	***Triodia wiseana* hummock grassland with emergent shrubs and low trees on gently sloping stony plain** Description: *Corymbia hamersleyana* and *Corymbia deserticola* subsp. *deserticola* isolated low trees; over isolated tall shrubs; over *Acacia ancistrocarpa* and mixed *Acacia* spp. sparse shrubland; over isolated dwarf shrubs; over isolated forbs; over *Triodia wiseana* hummock grassland. Extent and landform: Occurs across in patches throughout the survey area on a gentle sloping stony plain with high (80%) rock cover. Patches large enough to map cover a combined area of 4 hectares (1%) of the survey area, but the actual extent is greater than this. Quadrats: None. Represented only by relevé R01. Vegetation condition: Good Disturbances: Fire, berms, rubbish from highway, intersected by cleared areas. Conservation significant flora: None (patches too small) Weeds: None (patches too small) GDV indicator species: None Significance: Negligible	 **Site R01** (Condition: Good)

Type	Vegetation description	Photo
X	**Disturbed / cleared / road** Description: this is not a vegetation type. It includes roads, completely cleared or heavily disturbed areas, and areas with regrowth or revegetation of native species. It covers 20 hectares (8%) of the survey area. Conservation significant flora: *Seringia exastia* (CR), *Aristida lazaridis* (P2) Weeds: **Bidens bipinnata*, **Malvastrum americanum*, **Cenchrus ciliaris*	(no photo)
Vegetation Types were ranked for significance (High, Moderate, Low or Very Low) according to the criteria in Appendix VII

detailed flora survey (May 2021)

Original Size: A4 Scale: 1:20,000
Datum: MGA94 Zone 50
0 800 m

Figure 4.2

Vegetation types recorded in the survey area

4.2.6 Listed conservation significant vegetation

None of the vegetation types listed Table 4.5 and described in Table 4.6 aligned with listed PEC for the Pilbara region (DBCA 2021d). Neither Coolibah nor species of lignum were recorded in the survey area, supporting supports conclusions from (Rapallo 2012) and the desktop (section 4.1.3) that the Coolibah-Lignum flats PEC does not intersect the survey area.

4.2.7 Locally significant vegetation

Vegetation may be of significance for reasons other than a listing as a TEC or a PEC. This may include, although is not limited to, scarcity, combination of species, role as a refuge, restricted distribution and vegetation extent being below a threshold level (EPA 2004).

Local significance can be determined where a vegetation type is confined to a specialised habitat and/or landform that is not common in the local area or the vegetation types are supporting conservation significant species or groundwater dependent species.

Vegetation types retaining less than 30% of their pre-European extent generally experience accelerated species loss at an ecosystem level (EPA 2000) and are regarded as being 'vulnerable', while vegetation types retaining less than 10% of their original extent are regarded as being 'endangered' (EPA 2000, 2016b, Shepherd *et al.* 2002, DER 2014a).

The Hamersley 18 and Hamersley 82 vegetation system-associations intersected by the survey still have close to 100% of their original extent remaining, and would be considered 'least concern' (DER 2014a).

No vegetation considered to provide refugia for flora taxa (for example, vegetation associated with gorges or seepage areas), or otherwise providing an important function required to maintain ecological integrity of a significant ecosystem (as defined by EPA 2016a) was recorded in the survey area.

4.2.7.1 Mulga Vegetation on Floodplains

Mulga (species in the *Acacia aneura* complex) is widespread across arid and semi-arid regions of Western Australia, covering approximately 37 percent of the surface area of Western Australia (Fox 1980). Grove-intergrove Mulga communities of the eastern Hamersley range are considered as "ecosystems at risk" by (Kendrick 2001) because it is thought that sensitivity to disturbance is greatest at the northern limit mulga's distribution (Fox 1980), related to the dominant summer rainfall pattern of the Pilbara (Fox 1980, Kendrick 2001, Maslin & Reid 2012).

Kendrick (2001) lists a number of 'ecosystems at risk' including grove/inter-grove mulga of the eastern Hamersley range, and 'valley floor mulga' within the Hamersley IBRA subregion. Given the lack of detail provided by Kendrick, it is not possible to determine if the mulga vegetation at Lamb Creek match the mulga ecosystems at risk. However, vegetation types B, C, D and E (Table 4.6) do contain *Acacia aptaneura* as dominant upper storey on stony or clay plains and floodplains, which matches the broad description of 'valley floor mulga'.

Regionally, (Biota 2014) consider "valley floor mulga" to extend over a range of approximately 350 kilometres through the southern half of the Pilbara (Biota, unpublished data, cited in Biota 2014) and Onshore (2017) conclude that mulga vegetation of *Acacia catenulata* subsp. *occidentalis* and *Acacia aptaneura* that aligns with valley floor mulga' on the MAC Development Envelope is common on plains between Newman and Roy Hill (approximate range 150 kilometres).

Onshore (2017) concluded that seven other vegetation associations within BHP Billiton Iron Ore's consolidated vegetation mapping database support *Acacia catenulata* subsp. o*ccidentalis* and *Acacia aptaneura* as dominant upper storey components, and are considered to be closely affiliated with the mulga communities recorded on the lower stony plains of the MAC development area. As such Onshore (2017) does not considered the mulga communities within the MAC Development Area to be locally endemic or unique.

Neither the vegetation association nor related ecosystem of "valley floor mulga" has been nominated as a PEC by DBCA since identified as an ecosystem at risk by Kendrick (2001b) suggesting a low level of perceived conservation significance.

4.2.7.2 Vegetation supporting conservation significant species

Irrespective of whether the vegetation types of the survey area align with mulga vegetation as identified by (Kendrick (2001b) (section 4.2.7.1), vegetation types A, B, C and D are considered locally significant due to supporting the Priority 2 listed grass *Aristida lazaridis*, as well as other conservation significant species. For further information on conservation listed species refer to Rapallo (Rapallo 2021). Vegetation types A, B, C, and D are regarded as moderate significance, and types E and F as negligible significance, based on the criteria presented in Appendix VII,

4.2.8 Watercourses and groundwater dependent vegetation

No groundwater dependent taxa were recorded during the survey.

4.3 Survey adequacy and limitations

4.3.1 Level of assessment and survey timing

The flora survey was conducted in accordance with EPA (2016a) *Technical Guidance – Flora and Vegetation Surveys for Environmental Impact Assessment*, and conformed to requirements for a single-season detailed flora survey.

Survey level and timing were as per client request. Survey timing was primarily aimed to intercept the flowering period of several conservation significant taxa identified in the desktop and recorded during previous surveys of the Lamb Creek project. The survey period of May 2021 aligned with the recommended timing for vegetation surveys in the Eremaean Botanical Province, and fell within the primary survey period (EPA 2016a).

4.3.2 Survey completeness

To provide an indication of survey completeness of the detailed flora survey, the software program EstimateS (Version 9.1.0) (Colwell 2013) was used to generate species accumulation curves and to calculate predicted species richness. Species accumulation curves represent a theoretical model of the relationship between survey effort and species accumulation: as the number of quadrats increases, the accumulation of flora taxa decreases until the curve reaches an asymptote (Gotelli & Colwell 2011).

Since models can only be generated from data collected through systematic methods, the species accumulation curve and predicted species richness could only be calculated from quadrat data. Analyses were conducted on presence-absence data from the quadrats (152 taxa from 19 quadrats), using the default settings, with the following exceptions:

- Accumulations (runs) were randomised 1,000 times without replacement.
- Upper abundance limit for rare or infrequent species was set to 5.

The species accumulation curve is presented in Figure 4.3, plotting number of flora taxa (y-axis) against the number of quadrats surveyed (x-axis). Observed species richness is presented as a sample-based rarefaction curve, computing the mean expected number of flora taxa (S(est)) over all possible combinations of 1, 2, and up to 19 quadrats (Colwell *et al.* 2012). Predicted species richness was calculated by taking the average of the estimators ICE, Chao 2, Jackknife 1, and Jackknife 2.

Predicted species richness was 185 taxa, which indicates that 82% of the (estimated) total flora taxa present in the survey area were recorded in the quadrats. This is reflected in the species accumulation curve, which after 19 quadrats is approaching an asymptote (Figure 4.3).

Opportunistic collections and relevé data yielded an additional 35 taxa not recorded in quadrats, hence the actual number of taxa recorded (187 taxa) exceeds the predicted total. Since predicted species richness calculated by EstimateS is based on quadrat data, and cannot take into account opportunistic and relevé records, the predicted number of 185 taxa appeared to be a slight underestimation of the actual species richness in the survey area.

The fact that 19% of the taxa recorded during the survey were from opportunistic collections rather than quadrats supports the observation that not all vegetation types of the survey area were adequately sampled (see Table 4.4, and section 4.3.3 and 4.3.4), with types A and E only represented by a single quadrat, and type F only sampled by a single relevé.

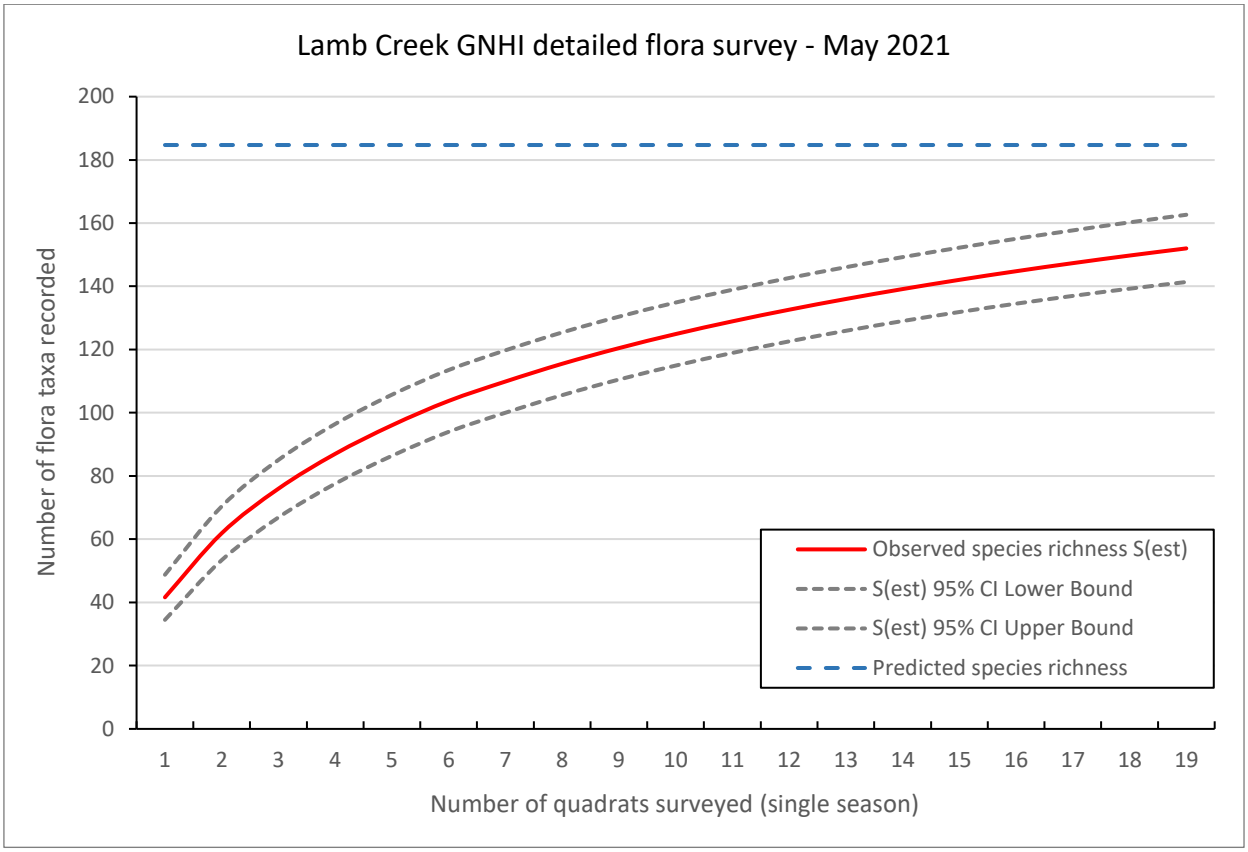

Figure 4.3 Species accumulation curve based on presence-absence quadrat data

In summary, although the survey effort appeared to have been adequate to sample the flora species richness present in the survey area at the time of survey, additional quadrats are expected to improve vegetation type classification and mapping.

4.3.3 Assessment against EPA technical guidance

The detailed flora and vegetation survey was conducted in accordance with Environmental Protection Authority (EPA) *Technical Guidance – Flora and Vegetation Surveys for Environmental Impact Assessment* and aligned with criteria for a detailed flora survey (EPA 2016a). An assessment of the survey against EPA criteria for detailed flora and vegetation surveys, and for quadrat sampling, is provided in Table 4.7.

Table 4.7 Assessment of the survey against EPA technical guidance

EPA (2016a) criteria for detailed flora surveys	Survey met EPA criterion	Details
Surveys should be conducted during optimal survey timing for the botanical province.	Yes	The survey was completed in May 2021 which in the Pilbara is the post-wet season and is the primary survey season for the Eremaean botanical province.
Adequate survey may necessitate multiple sampling events in the same season or in different seasons.	No	The survey was completed during a single season. Additional surveys during the supplementary survey period (after winter rainfall) are likely to yield additional taxa.
Where desktop results indicate that there is insufficient local and regional	Yes	Sufficient local and regional information is available.

EPA (2016a) criteria for detailed flora surveys	Survey met EPA criterion	Details
information, the survey must extend beyond the proposal area.		
Interpretation of vegetation boundaries and selection of sampling sites should be conducted with the use of aerial photography at 1:10,000 – 1:40,000 scale.	No	The aerial photograph available was of 1:80,000 scale and not recent enough to enable accurate interpretation of vegetation boundaries.
Quadrats should be placed at representative locations throughout the survey area considering landform, geology, elevation, slope, aspect, surface or groundwater expression, and soil type, as well vegetation structure, composition, and condition.	Yes	Quadrats were positioned at representative locations within preliminary vegetation types identified at the time of survey.
Quadrats should be positioned to avoid the boundary or transition zone between vegetation units and to minimise the influence of edge effects.	Yes	Quadrats were positioned away from vegetation boundaries.
Where possible, quadrats should be located in intact mature vegetation and in areas of best condition.	Yes	The entire survey area was affected by fire, and it was not possible to avoid these areas. Quadrats were positioned in the best quality representative areas within.
Survey design should consider disturbance events (such as fire)	Yes	Disturbances were present throughout the survey area and could not be avoided.
Quadrat size should be appropriate for the bioregion.	Yes	Quadrats were 50 by 50 metres, as is appropriate for the Pilbara.
The survey effort should be adequate to characterise the flora and vegetation within the survey area.	Partial	The species accumulation curve indicates that survey effort was adequate to sample the floristic diversity of the survey area, however additional quadrats are required to adequately describe and map vegetation types.
A minimum of three quadrats should be sampled in each vegetation unit. Quadrats within a widespread vegetation unit should be located to sample throughout its geographic range.	No	Six vegetation types were identified within the survey area. Of these, only three were sampled with three or more quadrats. Vegetation types A and E were sampled with a single quadrat only, while type F was only represented by a relevé. This occurred due to the quality and age of aerial photograph available to plan the survey.
Opportunistic collections, systematic transects and targeted inspections of potential habitat are required to verify that the survey area has been well characterised and important values identified.	Yes	Extensive opportunistic collections and mapping notes were taken during the detailed survey as well as the targeted survey.
Survey effort should be intensified in areas with unusual habitat or potential to provide habitat for conservation significant flora and or vegetation.	Yes	A targeted survey was completed to supplement the detailed survey results.

4.3.4 *Survey limitations table*

Table 4.8 Limitations of the targeted flora survey

Aspect	Limitation	Discussion
Availability of contextual information at a regional and local scale	No	Sufficient flora and vegetation information was available for the Hamersley subregion (of the Pilbara Bioregion) to place the survey area in a regional context. At a local scale, sufficient (publicly available) flora and vegetation surveys have been completed in the vicinity of the survey area. There has been a significant body of work completed at Mining Area C which is in close proximity to the Lamb Creek project.
Competency/experience of the team carrying out the survey, including experience in bioregion surveyed	No	The survey was completed by a team of senior botanists, each with between 10-20 years' experience completing flora and vegetation surveys throughout Western Australia. Sharnya Thomson-Yates is also an experienced botanical taxonomist.
Proportion of flora recorded and/or collected, any identification issues	No	There were no identification issues.
Was the appropriate area fully surveyed (effort and extent)	Partial	The entirety of the survey area was visited by the team. However, results of PATN analysis indicates that not all vegetation types were adequately sampled with at least three quadrats. The absence of a representative aerial photograph made it difficult to determine whether all vegetation types were adequately covered, and also limited vegetation mapping post-survey.
Access restrictions within the survey area	No	The entirety of the survey area was readily accessible by vehicle and on foot. There were no survey limitations due to access restrictions.
Survey timing, rainfall, season of survey	No	The field survey was completed in May 2021, which falls within the primary recommended timing for surveys in the Eremaean botanical province (EPA 2016a). The survey area experienced good rainfall over the months preceding both surveys, and this was reflected in the relatively high number of annuals and short-lived perennials present in the dataset, making up 23% of the dataset. Overall, survey timing was deemed to be appropriate for the survey area and the region.
Disturbances that may have affected the results of the survey (e.g. fire, flooding, clearing)	Yes	The survey area has been affected by a fire which burnt across the entirety of the survey area in 2015. No recent aerial photographs are available that show the current state of the survey area, and this limited both site selection before and during the field survey, and also the detail with which the vegetation boundaries could be mapped. Vegetation mapping relied heavily on mapping notes which did not always match vegetation boundaries visible on the aerial photographs which were taken in 2009 and 2013, pre-fire. The fire history of the survey area appears to have altered vegetation structure and composition of the vegetation types, which is supported by site photos and notes indicating between 5-90% of trees and tall shrubs had been killed by fire. The survey area was also affected by weeds, especially vegetation type B.

5 Conclusion

A single-season detailed flora and vegetation survey was completed across the Great Northern Highway intersection area of the Lamb Creek project over a period of six days, from 12 to 17 May 2021. The survey was completed in conjunction with a targeted conservation significant flora survey (Rapallo 2021). All preliminary vegetation types present in the survey area were visited and sampled through a total of 19 quadrats, one relevé, opportunistic collections, and mapping notes.

The detailed flora survey recorded 187 vascular flora taxa from 35 families, including 178 native species and nine introduced taxa. One Threatened flora taxon was recorded, *Seringia exastia*. This taxon is currently listed as Critically Endangered, but this ranking is due to a taxonomic revision. The DBCA (communications received 24/08/2021) considers the taxon common and widespread and likely to be delisted. Three Priority flora taxa were recorded, these were *Aristida lazaridis* (Priority 2), *Rhagodia* sp. Hamersley (Priority 3) and *Goodenia nuda* (Priority 4). One other taxon, *Euphorbia* aff. *ferdinandi*, is considered significant because it represents a potentially undescribed taxon.

The survey recorded nine weeds, none of which were Declared Pests. No Threatened or Priority Ecological Communities (TEC-PEC) were recorded from the survey area. None of the taxa recorded during the survey were indicative of groundwater dependent vegetation.

Six broad vegetation types were identified and mapped across the survey area. Vegetation types A, B, C and D were considered moderately significant because they supported populations of *Aristida lazaridis*. This further discussed in the Targeted report (Rapallo 2021).

The survey area was affected by a fire which burnt across the entire survey area in 2015. Vegetation condition ranged from Very Good to Degraded, with most quadrats ranked as Good. The main reason for this ranking was fire.

Appendix I Conservation codes for Australian flora

Threatened species under the Commonwealth EPBC Act

Threatened fauna and flora may be listed under Section 178 of the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) in any one of the following categories:

EX Extinct

EW Extinct in the wild

CR Critically endangered

EN Endangered

VU Vulnerable

CD Conservation dependent

Conservation codes for Western Australian flora under the Western Australian *Biodiversity Conservation Act 2016*

Threatened, Extinct and Specially Protected fauna or flora are species which have been adequately searched for and are deemed to be, in the wild, threatened, extinct or in need of special protection, and have been gazetted as such.

The *Wildlife Conservation (Specially Protected Fauna) Notice 2018* and the *Wildlife Conservation (Rare Flora) Notice 2018* have been transitioned under regulations 170, 171 and 172 of the *Biodiversity Conservation Regulations 2018* to be the lists of Threatened, Extinct and Specially Protected species under Part 2 of the *Biodiversity Conservation Act 2016*.

Categories of Threatened, Extinct and Specially Protected fauna and flora are:

Threatened species

Listed by order of the Minister as Threatened in the category of critically endangered, endangered or vulnerable under section 19(1), or is a rediscovered species to be regarded as threatened species under section 26(2) of the *Biodiversity Conservation Act 2016* (BC Act).

Threatened flora is that subset of 'Rare Flora' listed under schedules 1 to 3 of the *Wildlife Conservation (Rare Flora) Notice 2018* for Threatened Flora.

The assessment of the conservation status of these species is based on their national extent and ranked according to their level of threat using IUCN Red List categories and criteria as detailed below.

CR Critically endangered species

Threatened species considered to be "facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with criteria set out in the ministerial guidelines". Listed as critically endangered under section 19(1)(a) of the BC Act in accordance with the criteria set out in section 20 and the ministerial guidelines.

Published under **schedule 1** of the *Wildlife Conservation (Rare Flora) Notice 2018* for critically endangered flora.

EN Endangered species

Threatened species considered to be "facing a very high risk of extinction in the wild in the near future, as determined in accordance with criteria set out in the ministerial guidelines". Listed as endangered under section 19(1)(b) of the BC Act in accordance with the criteria set out in section 21 and the ministerial guidelines. Published under **schedule 2** of the the *Wildlife Conservation (Rare Flora) Notice 2018 for endangered flora*.

VU Vulnerable species

Threatened species considered to be "facing a high risk of extinction in the wild in the medium-term future, as determined in accordance with criteria set out in the ministerial guidelines". Listed as vulnerable under section 19(1)(c) of the BC Act in accordance with the criteria set out in section 22 and the ministerial guidelines.

Published under **schedule 3** of the *Wildlife Conservation (Rare Flora) Notice 2018* for vulnerable flora.

Priority species

Priority species are possibly threatened species that do not meet survey criteria, or are otherwise data deficient, are added to the Priority Flora Lists under Priorities 1, 2 or 3. These three categories are ranked in order of priority for survey and evaluation of conservation status so that consideration can be given to their declaration as threatened fauna or flora.

Species that are adequately known, are rare but not threatened, or meet criteria for near threatened, or that have been recently removed from the threatened species or other specially protected fauna lists for other than taxonomic reasons, are placed in Priority 4. These species require regular monitoring.

Assessment of Priority codes is based on the Western Australian distribution of the species, unless the distribution in WA is part of a contiguous population extending into adjacent States, as defined by the known spread of locations. In this report, priority species are given the codes P1, P2, P3 and P4.

P1 Priority 1: Poorly-known species

Species that are known from one or a few locations (generally five or less) which are potentially at risk. All occurrences are either: very small; or on lands not managed for conservation, e.g. agricultural or pastoral lands, urban areas, road and rail reserves, gravel reserves and active mineral leases; or otherwise under threat of habitat destruction or degradation. Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements and appear to be under immediate threat from known threatening processes. Such species are in urgent need of further survey.

P2 Priority 2: Poorly-known species

Species that are known from one or a few locations (generally five or less), some of which are on lands managed primarily for nature conservation, e.g. national parks, conservation parks, nature reserves and other lands with secure tenure being managed for conservation. Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements and appear to be under threat from known threatening processes. Such species are in urgent need of further survey.

P3 Priority 3: Poorly-known species

Species that are known from several locations, and the species does not appear to be under imminent threat, or from few but widespread locations with either large population size or significant remaining areas of apparently suitable habitat, much of it not under imminent threat. Species may be included if they are comparatively well known from several locations but do not meet adequacy of survey requirements and known threatening processes exist that could affect them. Such species are in need of further survey.

P4 Priority 4: Rare, Near Threatened and other species in need of monitoring

(a) **Rare**. Species that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection but could be if present circumstances change. These species are usually represented on conservation lands.

(b) **Near Threatened**. Species that are considered to have been adequately surveyed and that are close to qualifying for vulnerable but are not listed as Conservation Dependent.

(c) Species that have been removed from the list of threatened species during the past five years for reasons other than taxonomy.

Appendix II Flora desktop results: Conservation significant flora and likelihood assessment

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at in GNHI survey area?	Distance to survey area	Likelihood ranking
Acacia bromilowiana	P4	Tree or shrub to 12 m high	WAH and TPFL : High in landscape, Slope, cliff, gully, crest, summit , very steep	Red skeletal stony loam, orange-brown pebbly,gravel loam, laterite, banded ironstone, basalt. Rocky hills, breakaways, scree slopes, gorges, creek beds.	May, July, August	No	Within 20 km	Unlikely to occur
Acacia daweana	P3	Shrub from 0.3- 2m.	WAH: Gentle slopes, Along diffuse drainage area where it leaves low rocky hills. Low shrubland with Triodia basedowii, Acacia bivenosa, A. validinervia and A. maitlandii.	Stony red loamy soils. Low rocky rises, along drainage lines	July-October	Yes	Not within 20km	Unlikely to occur
Acacia effusa	P3	Low, dense, spreading, somewhat viscid shrub, 0.3-1 m high.	WAH: Scree, gentle slope, footslope, creeklines, low iron stone hill, stony plain base of hills , skeletal soils, red brown, Red brown clay loam.	Stony red loam. Scree slopes of low ranges.	May-August	No	Within 20 km	Unlikely to occur
Acacia subtiliformis	P3	Spindly, slender, erect shrub, to 3.5 m	WAH: Calcrete slope, rise, plain	On rocky calcrete plateau.	April-June	No	Within 20 km	Unlikely to occur
Adiantum capillus-veneris	P2	Perennial small herb from 0.1-0.2m. Frond 1-2 pinnate	WAH: In wet rocky crevices, associated with gorges or springs.	Moist sheleted sites in gorges and on cliff walls.	March, September	No	Not within 20km	Unlikely to occur
Amaranthus centralis	P3	Annual Herb	WAH: Tussock grassland of Themeda triandra, Eulalia aurea and Aristida inaequiglumis with open woodland of Eucalyptus victrix and Corymbia aspera over low open woodland of Corymbia aspera and Hakea lorea subsp. lorea over high open shrubland of Gossypium robi. Low in the landscape, alluvial flats, River banks, Mulga woodland[3]	no info	No info	Yes	Not within 20km	Unlikely to occur
Ampelopteris prolifera	P3	Perennial herb/fern to 4m	no info	Near water or in wet ground.	No info	No	Not within 20km	Unlikely to occur
Aristida jerichoensis var. subspinulifera	P3	Compactly tufted perennial, grass-like or herb, 0.3-0.8 m high	WAH: Plain or Flat, clay/loam. Often mulga woodlands or acacia shrublands over spinifex and/or tussock grassland.	Hardpan plains	May, July, September	Yes	Recorded elsewhere in Lamb Creek project	Likely to occur
Aristida lazaridis	P2	Tufted perennial, grass-like or herb, 0.4-1.5 m high.	WAH: Plain, clay /loam, drainage, slope; often mulga low open woodland with or without Eucalypts, over variety of shrubs and herbs, often over tussock grassland but sometimes with Triodia hummock grassland.	Sand or loam	April, May	Yes	Confirmed	Confirmed
Arthropodium vanleeuwenii	P2	Perennial herb 0.3 to nearly 1m.	WAH. Moderately steep facing slopes including banded and Brockman ironstone formations on red-brown, orange-brown loams and sandy loams. Low open woodland of Eucalyptus leucophloia subsp and Corymbia hamersleyana over hummock grassland of Triodia brizoides. Other tussock grassland species include Themeda triandra. Known from two small populations growing above 900 m on south-facing hillslopes of Brockman Iron Formation in the Pilbara bioregion of Western Australia. Associated vegetation includes Eucalyptus leucophloia subsp. leucophloia, Corymbia hamersleyana, Indigofera fractiflexa, Triodia spp. and Themeda triandra. Often found growing under the Triodia and occasionally under the Themeda, very rarely growing in the open. Flowering from mid- to late September. Fruiting from late September to mid-October[4]	No info	October	Yes but off footprint	Not within 20km	Unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at in GNHI survey area?	Distance to survey area	Likelihood ranking
Atriplex flabelliformis	P3	Monoecious, erect, rounded perennial, herb, to 0.35 m high.	WAH: Saline areas. Often salt tolerant shrublands, over low open heath.	Clay loam, loam. Saline flats or marshes.	No info	No	Not within 20km	Highly unlikely to occur
Barbula ehrenbergii	P1	Moss	Moss. Shaded moist environment on rock face 1.A species of hydric environments [2]	No info	No info	No	Not within 20km	Highly unlikely to occur
Calotis squamigera	P1	Procumbent annual, herb, to 0.21 m high.	WAH: Flat. Red brown loam clay, Stony plain with sandy loam soil. Low woodland of Acacia aptaneura, over open tussock grassland of Aristida contorta and Chrysopogon fallax with high open shrubland of Acacia synchronicia and Psydrax latifolia.	Pebbly loam	July	Yes	Not within 20km	Unlikely to occur
Cladium procerum	P2	Densely tufted perennial, grass-like or herb (sedge), 2 m high.	WAH: Major creeklines , Eucalyptus camaldulensis and Melaleuca argentea open woodland	Perennial pools	July, October, November	No	Not within 20km	Highly unlikely to occur
Dampiera anonyma	P3	Multi-stemmed perennial herb, 0.5 - 1m. Blue purple flower	WAH: Hillside; rocky red ironstone.	Skeletal red-brown gravelly soil over banded ironstone, basalt, shale and Jaspilite. Hills, summits and upper slopes (>1000m)	June, July, September	No	Not within 20km	Unlikely to occur
Dampiera metallorum	P3	Rounded, multi-stemmed perennial, herb, to 0.5 m high.	WAH: Summit of hill, high in landscape, steep slope, skeletal red gritty soil over massive banded ironstone.	Skeletal red-brown gravelly soil over banded ironstone. Steep slopes, summits of hills.	April-October	No	Not within 20km	Unlikely to occur
Dolichocarpa sp. Hamersley Station (A.A. Mitchell PRP 1479)	P3	no info	WAH: Cracking clay	Spreading annual herb to 10 cm tall, with blue flowers in March; occurs on cracking clay on flat to gently undulating plains with large surface rock	March, May, July	No	Within 20 km	Unlikely to occur
Dysphania congestiflora	P3	no info	WAH: Saline floodplain. Recorded from the western side of Fortescue Marsh from flats on the margin and towards the centre of seasonally inundated flood plains and lake beds, on saline, deep, light-medium to heavy clay soils. A single collection has also been recorded from the Lyndon River in close proximity to Lake Macleod [5]	No info	June, July	No	Not within 20km	Highly unlikely to occur
Eleocharis papillosa	P3	Annual, herb.	WAH: Claypan low dune/berm on eastern edge of wetland.	Red clay over granite, open clay flats. Claypans.	November	No	Not within 20km	Unlikely to occur
Eragrostis crateriformis	P3	Annual, grass-like or herb, 0.17-0.42 m high	WAH: Drainage area / floodplain.	Clayey loam or clay. Creek banks, depressions.	January-July	Yes	Not within 20km	Unlikely to occur
Eragrostis sp. Erect spikelets (P.K. Latz 2122)	P3	Erect perennial grass-like or herb to 0.3 m high	WAH: Near samphire flat. Associated species: Goodenia omeriana, G. forrestii, Cullen cinereum, Scaevola spinescens, Acacia tetragonophylla, A. victoriae. Associated species: Halosarcia spp., Eragrostis falcata (mostly as first year plants), Nicotiana sp., Swainsona sp., Angianthus sp. Low calcrete platforms/rises [12]	No info	No	No	Not within 20km	Highly unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at in GNHI survey area?	Distance to survey area	Likelihood ranking
Eragrostis sp. Mt Robinson (S. van Leeuwen 4109)	P1	Tussock-forming perennial, grass-like or herb, to 0.3 m high	WAH and TPFL: Open mallee shrubland; Summit of hill, steep western slopes. Skeletal gritty soil. Massive banded Brockman Iron Formation.	Red-brown skeletal soils, ironstone. Steep slopes, summits.	September	No	Not within 20km	Unlikely to occur
Eremophila magnifica subsp. magnifica	P4	Shrub, 0.5-1.5 m high.	WAH: High in landscape, steep slopes, summits, gullies, skeletal red gritty soil over massive banded ironstone of the Brockman Iron Formation.	Skeletal soils over ironstone. Rocky screes.	June-November	No	Within 20 km	Unlikely to occur
Eremophila magnifica subsp. velutina	P3	Shrub, 0.5-1.5 m high.	WAH: Summit of steep hill, high in landscape, steep slopes, rock screes and cliff faces, skeletal red stony soil over massive ironstone of the Brockman Iron Formation.	Skeletal soils over ironstone. Summits.	July-October	No	Not within 20km	Highly unlikely to occur
Eremophila pusilliflora	P2	Shrub to 0.5m	WAH: Low lying associated with drainage lines on red/brown clay loams and ironstone. Low open woodlands scattered with Corymbia hamersleyana and with Acacia aneura, A. inaequlatera, A. pyrifolia over hummock grasslands of T. wiseana, T. pungens and T. brizoides. TPFL: Low lying in valleys, gibber plains above drainage line with Goodenia over red clay loams. Open woodlands of Acacia aneura with Ptilotus exaltatus and Ptilotus helipteroides. Found on seasonally inundated alluvial plains between Turee Creek, Pingandy Creek and drainage systems leading into the Ashburton River, growing in red-brown sandy loam soils in open low shrubland with Acacia aneura, Ptilotus nobilis, Goodenia and Triodia species[6]	No info	April-September and after rainfall	Yes	Within 20 km	May potentially occur
Eremophila sp. Hamersley Range (K. Walker KW 136)	P3	no info	WAH: Rocky gullies and gorges. Steep rocky hill slopes and summits, high in the landscape	No info	June, August, September	No	Recorded elsewhere in Lamb Creek project	Unlikely to occur
Eremophila sp. West Angelas (S. van Leeuwen 4068)	P1	no info	WAH: TPFL Summits and slopes of hills, high in the landscape.	No info	August, September	Yes but off footprint, infrequently recorded ain locality	Not within 20km	Unlikely to occur
Eremophila spongiocarpa	P3	Compact, succulent-leaved shrub, to 1 m high.	WAH and TPFL: Saline , Alluvial margin of marsh. Edge of marsh, saline flats, broad plain, floodplain, claypan, Slope of linear dune.	Weakly saline alluvial plain on margins of marsh.	May, August, September	No	Not within 20km	Unlikely to occur
Eremophila youngii subsp. lepidota	P4	Dense, spreading shrub, (0.2-)1-3 m high.	WAH: Mulga woodland or acacia shrublands. Can grow near salt marshes in combination with Atriplex and other chenopods.	Stony red sandy loam. Flats plains, floodplains, sometimes semi-saline, clay flats.	January-March or August, September	Yes	Not within 20km	Unlikely to occur
Euphorbia australis var. glabra	P3	Prostrate herb, 10cm	WAH: Vegetation dominated by Acacia aptaneura. Acacia aff. aneura (long, flat, recurved; F. .MR 35.3), (Eucalyptus xerothermica) low woodland over *Malvastrum americanum, Sida aff. fibulifera low open shrubland over Sporobolus australasicus scattered bunch grasses. Associated Species: Acacia tetragonophylla. Broad, flat plain; calcrete platform to west and major creekline to east. Flat, red brown loam.	Prostrate annual herb. Typically occurs on cracking clay and clay plains	No	Yes	Not within 20km	Unlikely to occur
Euphorbia clementii	P3	Erect herb to 0.6m	TPFL; Sparse low woodland over Senna spp. moderately dense low shrubland over Triodia spp. and other grasses. Rock (Laterite) and red sand. Occasional Eucalyptus leucophloia. TPFL Taxon has been recorded on plains and outwash slopes, and in minor drainage lines or areas of sheet flow. This taxon is typically a fire-responder (and relatively short-lived) and can be observed in large numbers in recently burnt areas. [7]	Gravelly hillsides, stony grounds	May-July	Yes, would be obvious but as is a big post fire coloniser	Not within 20km	Unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at in GNHI survey area?	Distance to survey area	Likelihood ranking
Euphorbia inappendiculata var. inappendiculata	P2	small prostrate, much branched annual herb	Acacia aptaneura dominated vegetation. Flat, red brown loam. Recorded in cracking claypans of red sandy clay at Miralga Creek [7]	No info	No info	Yes, infrequently recorded	Not within 20km	Unlikely to occur
Euphorbia inappendiculata var. queenslandica	P2	prostrate annual herb	WAH: Tussock grassland of Astrebla elymoides, Chrysopogon fallax and Urochloa occidentalis var. occidentalis with open herbs of Polymeria longifolia, with high open shrubland of Acacia synchronicia. Cracking clay soil, Gilgai plain.	No info	No info	No	Not within 20km	Unlikely to occur
Euphorbia stevenii	P3	Succulent perennial herb from 0.1-0.5	Gently sloping area to gently undulating. Soils include: Red-brown cracking clay with scattered pebbles and cobbles on the surface. Occurs with many grasses including Astrebla sp, Themeda sp and Aristida sp.	Clay, sandy soils	June	Yes, infrequently recorded in locality	Not within 20km	Unlikely to occur
Fimbristylis sieberiana	P3	Shortly rhizomatous, tufted perennial, grass-like or herb (sedge), 0.25-0.6 m high.	WAH: Major drainage, edge of watercourse. With Eleocharis sp. Eucalyptus camaldulensis and Melaleuca argentea open woodland over Acacia pyrifolia var. pyrifolia; Acacia tumida var. pilbarensis and Clerodendrum tomentosum mid sparse shrubland over Cladium procerum and Cyperus vaginatus sedges and Cenchrus ciliaris. Woodland to forest of Eucalyptus camaldulensis and/or Melaleuca leucadendra and Acacia coriacea subsp. pendens over high shrubland.	Mud, skeletal soil pockets. Pool edges, sandstone cliffs.	May-August	No	Not within 20km	Unlikely to occur
Geijera salicifolia	P3	Tree from 1.5m-6m	WAH: Growing in flood area at base of gorge wall. Stony.	Skeletal soils, stony soils; Massive rock scree and gorges	September	No	Not within 20km	Unlikely to occur
Glycine falcata	P3	Mat-forming perennial, herb, to 0.2 m high	WAH: Sump, low in landscape. With Cullen and Vittadinia sp., Goodenia pascua and Bulbine pendula. Often low grassland or herbland with Acacia shrublands and hummock grassland, sometimes Eucalypts. Clay soils, cracking clays	Black clayey sand. Along drainage depressions in crabhole plains on river floodplains.		No	No	Within 20 km
Gompholobium karijini	P2	Low shrub growing to 70 cm tall, with coarsely fibrous, grey bark.	Eucalyptus leucophloia subsp. leucophloia over Triodia sp. Triodia hummock grassland with scattered shrubs and trees on ironstone gravel 9 Breakaway habitats and associated rocky slopes, the top edge of mesas, broadly rocky and rugged upland habitats, and incised gullies/ rocky gullies of the upland areas' and 'mesa top habitat consisting of hill top, mesa top, and broad rolling hill habitats. [10]	Typically occurs on rocky crests and slopes of hill	January, August-September	No	Not within 20km	Unlikely to occur
Goodenia lyrata	P3	Prostrate herb with lyrate leaves. Ephemeral	Broad drainage tract in hardpan plain. Mulga woodland. Mulga woodland or acacia shrublands, sometimes with E. victrix, over open shrubland, herbs.	Red sandy loam. Near claypan	May, August, October	No	Within 20 km	Unlikely to occur
Goodenia nuda	P4	Erect to ascending herb, to 0.5 m high.	WAH and TPFL : Variety of habitats	No info	March-August	Yes	Confirmed	Confirmed
Goodenia sp. East Pilbara (A.A. Mitchell PRP 727)	P3	Open, erect annual or biennial, herb, to 0.2 m high.	WAH and TPFL : Variety of habitats with calcrete , Grassland on crabhole clay flats.	Red-brown clay soil, calcrete pebbles. Low undulating plain, swampy plains.	March-May and after rainfall	No	Within 20 km	Unlikely to occur
Grevillea saxicola	P3	Tall shrub or tree	WAH: High in landscape, steep and undulating terrain, skeletal red-brown gritty soil over massive banded ironstone of the Brockman Iron Formation. Mulga woodlands over shrublands with Eremophilas and other species, over Scaevola. No mention of Triodia. Skeletal red-brown sandy loam on steep slopes, rocky hills and ridges, usually growing with Mulga 10	No info	February, March	No	Not within 20km	Unlikely to occur
Gymnanthera cunninghamii	P3	Erect shrub, 1-2 m high.	WAH: South facing ironstone scree slope adjacent to Weeli Wolli Creek.	Sandy soils on islands in river and creek channels	Year-round	No, very scattered distribution.	Not within 20km	Unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at in GNHI survey area?	Distance to survey area	Likelihood ranking
Hibiscus sp. Gurinbiddy Range (M.E. Trudgen MET 15708)	P2	Shrub to 3m.	Gorges and Gullies associated with ironstone (inc: Brockman ironstone) outcroppings and boulders. Soils include Red-brown loams amongst boulders. Rocky ground high in the landscape. Gullies and gorges. [10]	No info	No info	No	Not within 20km	Highly unlikely to occur
Indigofera gilesii	P3	Shrub, to 1.5 m high.	WAH: Near summit of hill, high in landscape, skeletal red-brown stony soil over massive ironstone of the Brockman Iron Formation, Gorge / gully. Red brown skeletal. Continuous ironstone pebbles, Breakaway. Red dry soil.	Pebbly loam. Amongst boulders & outcrops, hills.	May, June, August	No	Within 20 km	Unlikely to occur
Indigofera ixocarpa	P2	Shrub to 1m	WAH: Dry creekline. Ironstone rocks and loamy soil	Skeletal red soils over massive ironstone	May, June, August	No	Not within 20km	Highly unlikely to occur
Iotasperma sessilifolium	P3	Erect herb	WAH: Sump, low in landscape, flat terrain, cracking red clay-loam.	Cracking clay, black loam. Edges of waterholes, plains.	September	No	Not within 20km	Highly unlikely to occur
Ipomoea racemigera	P2	Creeping annual, herb or climber.	WAH: Medium drainage line, fringing vegetation. Open forest of Eucalyptus camaldulensis and Melaleuca argentea	No info	June	No	Not within 20km	Unlikely to occur
Isotropis parviflora	P2	Shrub, 0.1 m high.	WAH: Stony plain, lower slopes, Hillcrest/upper slope.	Valley slope of ironstone plateaus, hill slopes and stony plains.	March-August	Yes	Within 20 km	Likely to occur
Kohautia australiensis	P2	Erect sparsely or much-branched annual, herb, 0.1-0.5 m high..	WAH: Calcrete plains, hills and rises	No info	March-May	No	Not within 20km	Unlikely to occur
Lepidium catapycnon	P4	Open, woody perennial, herb or shrub, 0.2-0.3 m high, stems zigzag.	Variety of vegetation types, typically with E. leucophloia over Acacias over Triodia. Strong habitat preference for steep upper breakaway slopes of mesa hills where it grows in skeletal light brown loam or sandy loam soils with a large proportion of loose rocks at the surface (50-100 percent) comprising a mixture of banded iron formation (BIF), banded chert and siltstone [11]	Skeletal soils. Hillsides.	May, June, August-November	No	Not within 20km	Unlikely to occur
Lindernia sp. Pilbara (M.N. Lyons & L. Lewis FV 1069)	P1	Annual or perennial herb, to 0.6 cm high	WAH: Claypan, low dune, edge of wetland.	No info	No info	No	Not within 20km	Unlikely to occur
Myriocephalus scalpellus	P1	Semi-erect herb, 0.03-0.08 m high.	WAH: At edge of claypan, In fringing vegetation.	Claypan	June	No	Not within 20km	Unlikely to occur
Nicotiana umbratica	P3	Erect, short-lived annual or perennial, herb, 0.3-0.7 m high. Fl. white, Apr to Jun. Shallow soils. Rocky outcrops.	no info	Shallow soils. Rocky outcrops.	April-June	No	Within 20km	Unlikely to occur
Olearia mucronata	P3	Densely branched, unpleasantly aromatic shrub (0.6-1m)	WAH: Steep upper slope, Soil: Red-brown scree boulders (ironstone), stones, base of south facing ironstone cliff, bordering a large scree slope.	Schistose hills along drainage channels	July-January	No	Not within 20km	Highly unlikely to occur
Oxalis sp. Pilbara (M.E. Trudgen 12725)	P2	Small annual herb to 10 cm tall. Leaves green above, purple below	WAH: Gorge, gully, cliff	No info	May, July	No	Not within 20km	Highly unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at in GNHI survey area?	Distance to survey area	Likelihood ranking
Pentalepis trichodesmoides subsp. Hispida	P2	Compact shrub to 1m	WAH: Summit of ridge, high in landscape, steep terrain, skeletal brown gritty soil over metabasaltic pillow lava, breccia; metatuff and minor cherts of the Bunjinah Formation, altitude ca. = 1020 m.	No info	August, September	No	Not within 20km	Unlikely to occur
Pilbara trudgenii	P3	Gnarled, aromatic shrub, to 1 m high.	WAH: Skeletal soil Summit, slopes, screes and cliffs. Brockman Iron Formation. With Eucalyptus leucophloia, E. gamophylla.	Skeletal, red stony soil over ironstone. Hill summits, steep slopes, screes, cliff faces.	July, September	No	Not within 20km	Highly unlikely to occur
Ptilotus mollis	P4	Compact, perennial shrub, to 0.5 m high, soft grey foliage.	WAH: Steep, rocky scree slope, laterite.	Stony hills and screes.	May, July, September	No	Not within 20km	Unlikely to occur
Rhagodia sp. Hamersley (M. Trudgen 17794)	P3	A spindly shrub growing to 2 m tall;	WAH: Mulga over mixed grassland. Emergent eucalypts and Triodia grassland. Very open mulga woodland over patchy mixed grasses. Floodplains, hardpan plains.	Red sandy clay loam plains and floodplains growing in association with Mulga (Acacia aneura)	March, May, September	Yes	Confirmed	Confirmed
Rhodanthe ascendens	P1	Ascending annual herb to 0.1m	WAH: Flat terrain, low in landscape, stony gibber with red cracking clay soils. Acacia aneura over Open Tussock Grass of Aristida spp.	Clay, roadside verge	August, September	Yes, infrequently collected	Not within 20km	Unlikely to occur
Rhynchosia bungarensis	P4	Compact, prostrate shrub, to 0.5 m high.	WAH: Creekline in a gorge	Pebbly, shingly coarse sand amongst boulders. Banks of flow line in the mouth of a gully in a valley wall.	November	No	Not within 20km	Unlikely to occur
Rostellularia adscendens var. latifolia	P3	Herb or shrub, 0.1-0.3 m high.	Acacia shrubland, sometimes with Eucalypts and Corymbias, over shrublands and herblands, over tussock grassland, or Triodia pungens hummock grassland.	Ironstone soils. Near creeks, rocky hills.	April, June, August	Yes	Confirmed	Confirmed
Samolus sp. Fortescue Marsh (A. Markey & R. Coppen FM 9702)	P1	Erect perennial herb, 0.3-1.0 m high	Margins of semi-permanent/permanent freshwater pools and the margins of samphire shrublands where creeks discharge freshwater following periods of high rainfall. [13]	No info	September	No	Not within 20km	Highly unlikely to occur
Scaevola sp. Hamersley Range basalts (S. van Leeuwen 3675)	P2	Shrub, to 1 m high	Steep slopes and screes. Growing in Regenerating Open Shrub Mallee of Eucalyptus kingsmillii and E. gamophylla over Dwarf Scrub C/D of Triumfetta sp, Corchorus sp, Hibiscus sp. and Acacia bivenosa over Open Hummock Grass of Triodia sp.	Skeletal, brown gritty soil over basalt. Summits of hills, steep hils.	July-August	No	Not within 20km	Unlikely to occur
Seringia exastia	CR	Shrub	Variety of mulga woodlands, sometimes with Eucalypts, over Acacia shrublands over Trioda pungens hummock grassland. Gully - washout. Red sand/laterite over sandstone.	No info	Year-round	Yes	Confirmed	Confirmed
Sida sp. Barlee Range (S. van Leeuwen 1642)	P3	Spreading shrub, to 0.5 m high.	WAH: Cliff line and scree slopes, gorge and steep gully	Skeletal red soils pockets. Steep slope.	August	No	Not within 20km	Highly unlikely to occur
Sida sp. Hammersley Range basalts (K. Newbey 10692)	P3	Herb or shrub to 0.15m	Plants growing amongst rocks along the south side of a small ironstone breakaway. Low open woodland over hummock grassland of Triodia sp.	No info	May, August, October	Possible, very little info, infrequently recorded at locality	Not within 20km	Unlikely to occur
Solanum kentrocaule	P3	Perennial shrub to 2.5m	WAH: Near summit of hill, high in landscape, skeletal red-brown stony soil over massive ironstone of the Brockman Iron Formation, steep slopes, steep gullies	No info	May, July, August	No	Not within 20km	Unlikely to occur
Stackhousia clementii	P3	Dense broom-like perennial, herb, to 0.45 m high.	Acacia shrubland, sometimes with E. victrix, over Acacia sclerosperma. WAH: Clay loam plains, drainage plains	Skeletal soils. Sandstone hills.	April, September		Not within 20km	Unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at in GNHI survey area?	Distance to survey area	Likelihood ranking
Streptoglossa sp. Cracking clays (S. van Leeuwen et a. PBS 7353)	P3	Multi stemmed annual herb	Cracking clay, Acacia aneura var. longicarpa high open shrubland over Rhagodia eremaea scattered shrubs over Aristida latifolia and Astrebla elymoides scattered tussock grasses. Acacia aneura var. longicarpa 3-5 m < 1-5%; Rhagodia eremaea 0.4-1.2 m < 1%; Aristida latifolia.	No info	June	No	Not within 20km	Unlikely to occur
Stylidium weeliwolli	P3	Annual, herb, 0.1-0.25 m high, throat appendages 4, rod-shaped.	WAH: In damp soil in rock clefts of river bed, permanent pools.	Damp soil in rock clefts of river bed, permanent pools, edge of water courses	July-October	No	Not within 20km	Unlikely to occur
Swainsona thompsoniana	P3	Prostrate annual herb to 10 cm high	WAH: Gently sloping area to gently undulating. Soil: Red-brown cracking clay with scattered pebbles and cobbles on the surface. Includes a flowline. Varies to areas of orange-brown cracking clay. Colluvial and alluvial gravels in fan or floodplain	No info	April, June, August	No	Not within 20km	Unlikely to occur
Synostemon hamersleyensis	P1	no info	WAH: Steep scree slope below banded iron formation cliff line with brown sandy loam soil. Steep hillslope, narrow gorge	No info	No info	No	Not within 20km	Highly unlikely to occur
Tecticornia globulifera	P1	no info	WAH: Saline flats and marsh with light medium clay soil.	No info	No info	No	Not within 20km	Highly unlikely to occur
Tecticornia medusa	P3	no info	WAH: Growing on the lake bed a few 100 metres from the shoreline. Red clayey sand., Claypan	No info	November	No	Not within 20km	Highly unlikely to occur
Tecticornia sp. Christmas Creek (K.A. Shepherd & T. Colmer et al. KS 1063)	P1	no info	Samphire flats.	No info	No info	No	Not within 20km	Highly unlikely to occur
Tetratheca fordiana	P2	Dwarf shrub; 0.3-0.4m	WAH: Vertical cliff faces amongst ironstone. Breakaways on Skeletal soils. Scattered low trees of Eucalyptus leucophloia, E. kingsmillii over scattered shrubs of Acacia hamersleyensis over open hummock grassland of Triodia epactia, Triodia wiseana and Triodia sp. Mt Ella (M.E. Trudgen 12739) with scattered tussock grasses of Eriachne mucronata.	Shale pocket amongst ironstone	April, May	No	Not within 20km	Unlikely to occur
Teucrium pilbaranum	P2	Upright shrub, 0.2 m high	WAH: High shrubland of Acacia sclerosperma, Acacia synchronicia, Eremophila longifolia and Acacia citrinoviridis over open herbs of Malvastrum americanum, Corchorus tridens and Cleome viscosa with low open woodland of Acacia citrinoviridis and Acacia aptaneura. Plain with brown clay loam soil.	Crab hole plain in a river floodplain, margin of calcrete table.	May, September	No	Not within 20km	Unlikely to occur
Themeda sp. Hamersley Station (M.E. Trudgen 11431)	P3	Tussocky perennial, grass-like or herb, 0.9-1.8 m high.	Variety of habitats including Mulga woodlands and mixed shrublands. Cracking clays, Red clay. Clay pan, grass plain.	Red clay. Clay pan, grass plain.	July-September	Yes	Within 20 km	Likely to occur
Thryptomene wittweri	VU	Spreading or rounded shrub from 0.5 - 1.5(2.1m)	WAH: Growing on tops of cliffs, ledges along cliff, in rock crevices and on boulder screes in shades southerly situations. Skeletal red stony soil. Ironstone. High in landscape, rocks on edge of cliff face and growing on face itself, S aspect, skeletal red-brown soil over massive banded ironstone of the Brockman Iron Formation, lots of rock and large sheets of ironstone on surface.	Skeletal red stony soils. Breakaways, stony creek beds.	April-August	No	Not within 20km	Unlikely to occur
Triodia basitricha	P3	no info	WAH Rehabilitation adjacent to Coondewanna airstrip, Mining Area C: Isolated Eucalyptus victrix and Corymbia hamersleyana, OR isolated Corymbia opaca trees over open to sparse Acacia aptaneura, A. bivenosa, A. pruinocarpa, and other shrubs, sometimes over Triodia, sometimes over low shrubs.	No info	No info	No	Within 20 km	Unlikely to occur

Taxon	Status	Growth Form	Habitat from DBCA database records	Habitat from FloraBase	Flowering period	Habitat present at in GNHI survey area?	Distance to survey area	Likelihood ranking
Triodia sp. Karijini (S. van Leeuwen 4111)	P1	no info	WAH: Triodia hummock grassland, variety of species including T. pungens, T. wiseana, often with emergent eucalypts and Corymbias, with Acacia shrublands. Very steep hillslope of grey silty loam.	No info	September	No	Within 20 km	Unlikely to occur
Triodia sp. Mt Ella (M.E. Trudgen 12739)	P3	Perennial, grass-like or herb, 0.4 m high.	WAH: Rocky creeklines, often grows together with Triodia pungens. With E. leucophloia and C. hamersleyana.	Light orange-brown, pebbly loam. Amongst rocks & outcrops, gully slopes.	February, March, September	Yes	Within 20 km	Likely to occur
Vittadinia sp. Coondewanna Flats (S. van Leeuwen 4684)	P1	Annual daisy	WAH: Woodland to open forest of variety of mulga species and other acacias, OR shrubland of acacias and other species, sometimes with Eucalypts, over diverse shrubland, often over open Triodia grassland (T. pungens, T. melvillei). Plain, floodplain, drainage, sandy-clay loam,	No info	May, July, September	Yes	Within 20 km	Likely to occur
Xerochrysum boreale	P3	no info	WAH: Mulga, stony plain	No info	No info	Yes but rarely collected in locality	Not within 20km	Unlikely to occur

Appendix VI Quadrat Data

Site	Q01	Site photo
Date	14/05/21	Flora_Quadrat/PhotoP5140012
Vegetation type	A - Low open Eucalyptus gamophylla woodland over Triodia melvillei and T. pungens on stony plain	
Landform	Plain	
Slope	Negligible	
Soil	Clay, Dark red/brown	
Rock type	Shale, Quartzite, Laterite	
Rock size	Up to 8cm	
Rock cover	90%	
Vegetation cover	10%	
Condition	Good	
Disturbances	Fire killed off 50% of shrubs >2m, Acacias, e.g. A. pruinocarpa	
Easting (MGA94 Zone 51)	684008	
Northing (MGA94 Zone 51)	7469197	
Vegetation description	*Eucalyptus gamophylla* (mallee) and *Corymbia deserticola* subsp. *deserticola* low open woodland; over *Acacia pruinocarpa*, *A. ancistrocarpa*, A. atkinsiana sparse shrubland; over isolated low shrubs; over isolated dwarf shrubs; over *Ptilotus calostachyus*, *Ptilotus obovatus*, *Trichodesma zeylanicum* var. zeylanicum sparse forbland; over *Triodia melvillei* and *Triodia* pungens sparse hummock grassland

Appendix VII Significance Assessment Criteria (Vegetation)

Score	Criteria
High	Supports threatened flora species/ threatened ecological community listed under the EPBC Act and/ or BC Act or supports a: unique or regionally significant population of Priority 1 or Priority 2 species; a unique or regionally significant priority ecological community or occurs in association with a major river or creek system.
Moderate	Supports a population of priority 1, priority 2 flora species or an unlisted species that is restricted and warrants listing/ priority ecological community or occurs in association with a major river or creek system or supports a unique/ unusual floral assemblage not recognised by DBCA as a PEC.
Low	Supports a population of priority 3 or priority 4 species / priority ecological community or occurs in association with a medium ephemeral river or creek system with sensitive obligate phreatophytic vegetation or supports a unique/ unusual floral assemblage or disturbance sensitive communities such as mulga on sheet flow, or occurs in association with a unique/ unusual landform or refugia such as gorges, high ranges, outcrops or seepage areas not common in the IBRA subregion
Very Low	Vegetation and landform is widespread/common and does not solely support priority 3 or priority 4 flora species. May contain, presumed facultative phreatophytic vegetation species not in association with a river or creek system typically in association with un-incised drainage lines and flood plains.
Negligible	Vegetation and landform is widespread/common and does not support priority flora species. May contain presumed facultative phreatophytic vegetation.

EXECUTIVE SUMMARY

Process Minerals International (PMI) proposes to develop a small iron ore mine with associated haul roads and infrastructure at Lamb Creek. The Lamb Creek project area is located approximately 130 kilometres (km) north-west of Newman in the East Pilbara Region of Western Australia, and is accessed via the Great Northern Highway.

A Level 2 flora and vegetation survey was completed in the approximately 20 km^2 survey area, comprising a desktop search and a single-phase comprehensive field survey from 27 March to 1 April 2012 by a team of three botanists. 46 survey quadrats were established.

A total of 230 species, from 110 genera and 42 families, were recorded during the survey of the Lamb Creek area, from 414 specimens collected. Of those, 209 were collected within survey quadrats; the rest were collected opportunistically.

No species of Threatened Flora (Declared Rare Flora) pursuant to the Western Australian *Wildlife Conservation Act* 1950, and no species listed as Threatened pursuant to the Commonwealth *Environmental Protection and Biodiversity Conservation Act 1999* were recorded in the project area.

Three species of Priority Flora listed by DEC were recorded during the survey, comprising one Priority 1 species (*Brachyscome* sp. Wanna Munna Flats (S. van Leeuwen 4662)) and two Priority 2 species (*Aristida calycina* var. *calycina* and *Aristida lazaridis*). These taxa were found only in the far south-west of the survey area in the vicinity of the intersection of the proposed access/haul roads with the Great Northern Highway.

Five species of introduced flora were recorded in the survey area: *Bidens bipinnata* (Bipinnate Beggartick), *Cenchrus ciliaris* (Buffel Grass), *Chloris virgata* (Feathertop Rhodes Grass), *Malvastrum americanum* (Spiked Malvastrum), and *Portulaca oleracea* (Purslane).

None of these taxa were listed as Declared Plants by the WA Department of Agriculture and Food pursuant to section 37 of the *Agricultural and Related Resources Protection Act 1976* (Western Australia). None of these taxa were listed as Weeds of National Significance by the Commonwealth Department of Sustainability, Environment, Water, Population and Communities (SEWPaC 2012).

Vegetation mapping was conducted by statistical analysis using the software PATN combined with field observations of vegetation boundaries and visual classification of aerial photography. The most widespread vegetation type was *Eucalyptus gamophylla* woodland over hummock grassland which was estimated to cover approximately 46% of the survey area.

Six main vegetation communities were recognised and mapped following field observations and statistical analysis of the field data.

No Threatened or Priority Ecological Communities listed by the DEC were recorded.

1. INTRODUCTION

1.1. PROJECT BACKGROUND

Process Minerals International (PMI) proposes to develop a small iron ore mine with associated haul roads and infrastructure at Lamb Creek. The Lamb Creek project area is located approximately 130 kilometres (km) north of Newman in the East Pilbara Region of Western Australia, and is accessed via the Great Northern Highway.

An overview of the tenements in which the project is located is presented in Table 1. The project is currently in the design phase; hence alternative locations for elements such as the accommodation facility appear in several tenements.

Table 1 Tenements in which the project area is located

Tenement	**Project Elements** (as per April 2012)	**Size**
M47/1468	Mining area	1201 ha
L47/635	Bore field, accommodation facility, pipeline, power line, taking water.	82 ha
L47/636	Bore field, accommodation facility, pipeline, power line, taking water.	64 ha
L47/637	Bore field, pipeline, power line, road, taking water.	149 ha
L47/638	Bore field, pipeline, power line, road, taking water.	30 ha
L47/639	Bore field, pipeline, power line, road, taking water.	276 ha
L47/640	Bore field, pipeline, power line, road, taking water.	156 ha
L47/641	Bore field, pipeline, power line, road, truck parking bay, taking water.	42 ha
E47/1238	Exploration licence including M47/1468	44 blocks
E47/1239	Pending: Currently held by Rio Tinto	64 blocks

1.2. SCOPE AND OBJECTIVES OF THE SURVEY

As part of the environmental approvals process, Rapallo conducted a single phase Level 2 flora and vegetation survey of the proposed Lamb Creek iron ore mine, two alternative haul road routes (120 metre buffer either side) and three alternative accommodation village sites. For the purpose of this report this area will hereafter be referred to as the "survey area" (Figure 1). The area surveyed comprised approximately 20 km^2, although the actual project footprint will be smaller.

The aims of the survey were to:

- characterise the flora and vegetation within the survey area;
- identify and map the vegetation communities;
- identify and map all Threatened and Priority Flora Species.

This information will be used to assist with environmental assessment of the project and, and to guide environmental management plans.

The flora and vegetation survey was designed according to Environmental Protection Authority (EPA) *Guidance Statement No. 51: Terrestrial Flora and Vegetation Surveys for Environmental Impact Assessment in Western Australia* (2004). This guidance indicates that a project in the Pilbara region with an impact greater than 50 ha requires a Level 2 flora and vegetation survey.

1.3. LEGISLATION AND SURVEY GUIDANCE

1.3.1. COMMONWEALTH LEGISLATION AND CONSERVATION CATEGORIES

Native flora and ecological communities are protected at a federal level under the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act). The EPBC Act provides a legal framework to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places, defined as matters of national environmental significance. Under the EPBC Act, actions that have, or are likely to have, a significant impact on a matter of national environmental significance need to be referred to the Australian Government Minister for Sustainability, Environment, Water, Population and Communities (SEWPaC) for assessment and approval.

The EPBC Act protects Australia's native species and ecological communities by providing for identification and listing of threatened species and ecological communities. The conservation status of native species and communities is assessed by the Commonwealth Threatened Species Scientific Committee criteria outlined in the *EPBC Act 1999* and the *Environment Protection and Biodiversity Conservation Regulations 2000*.

The following categories of threatened flora are recognised: Extinct (EX), Critically Endangered (CR), Endangered (EN) and Vulnerable (VU).

Ecological communities are unique and naturally occurring groups of plants and animals. Their presence can be determined by factors such as soil type, position in the landscape, climate and water availability. The following categories of Threatened Ecological Communities are recognised: Critically Endangered (CR), Endangered (EN), and Vulnerable (VU).

1.3.2. WESTERN AUSTRALIAN LEGISLATION AND CONSERVATION CATEGORIES

At a state level, native flora and vegetation communities are protected under the *Wildlife Conservation Act 1950*, the *Western Australian Environmental Protection Act 1986* and the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004*.

Threatened and Priority Flora

All native vegetation in Western Australia is protected under the *Environmental Protection Act 1986* and the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004*. Under the Act and Regulations, clearing of native vegetation is prohibited unless a clearing permit is granted or the clearing is for a purpose defined under Regulation 5 as an exempt activity.

Flora that are threatened, rare or otherwise in need of protection, are protected under the *Wildlife Conservation Act 1950*. Threatened (Declared Rare) Flora species are listed under Schedule 1. Extinct flora are listed under Schedule 2. The species listed under Schedules 1 and 2 are published in the WA Government Gazette *Wildlife Conservation (Rare Flora) Notices*, the most recent dated 17 February 2012 (Western Australian Government 2012).

Threatened (Declared Rare) Flora listed on Schedule 1 are further ranked by the Department of Environment and Conservation (DEC) according to their level of threat using IUCN Red List criteria. The following categories of threatened flora are recognised: Critically Endangered (CR), Endangered (EN) and Vulnerable (VU).

The DEC also recognises Priority Flora, comprising taxa that have not yet been adequately surveyed to be listed as Threatened, but for which the DEC believes there is cause for concern. Priority flora listings can be found on the FloraBase website (Western Australian Herbarium 2012). Priority flora species recognised as having conservation significance and are given consideration when developments are

proposed within their distributions and known habitats. There are 5 levels of Priority flora: Priorities 1, 2 or 3 (not yet adequately surveyed), Priority 4 (rare, near threatened or in need of monitoring), and Priority 5 (conservation dependent) (Appendix 1).

Environmentally Sensitive Areas

Environmentally sensitive areas (ESAs) are protected under the *Environmental Protection (Clearing of Native Vegetation) Regulation 2004* and are listed for their environmental values at state or national levels. ESAs in Western Australia are listed in the *Environmental Protection (Environmentally Sensitive Areas) Notice 2005*. (Western Australian Government 2005). These include:

- Declared World Heritage property sites
- Bush Forever sites
- Defined wetlands and riparian vegetation within 50 metres of the wetland
- Area of vegetation within 50 metres of Declared Rare Flora
- Areas covered by Threatened Ecological Communities

Exemptions offered for clearing under Regulation 5 of the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004* do not apply within an ESA.

Threatened and Priority Ecological Communities

An Ecological Community is defined by the DEC as a naturally occurring biological assemblage that occurs in a particular type of habitat. In Western Australia there is currently no legislation covering the conservation of Threatened Ecological Communities (TEC). However, TEC are indirectly protected under the *Environmental Protection Act 1986* and the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004* through protection of individual flora species. Under the Regulations TEC are defined as Environmentally Sensitive Areas, and therefore the exemptions from requiring a clearing permit do not apply in a TEC.

The DEC (2010) defines a Threatened Ecological Community as one that fits into one of the following categories: Presumed Totally Destroyed (PD), Critically Endangered (CR), Endangered (EN) and Vulnerable (VU).

Ecological communities that do not meet TEC criteria are listed on the Priority Ecological Community (PEC) list. Priorities 1, 2 and 3 are communities that are possibly threatened but not yet adequately surveyed. Priority 4 comprised communities that are in need of monitoring, and Priority 5 are communities that are conservation dependent (DEC 2010, 2012b).

1.3.3. National and Western Australian Weed Strategies

Invasive weeds are a serious threat to Australia's natural environment and can have major economic and social impacts, causing damage to natural landscapes, agricultural lands, waterways and coastal areas. A weed can either be an exotic (introduced) species, or a native species that colonises and ecosystem where it does not naturally occur (Commonwealth of Australia 2012a).

Federal Weeds of National Interest

The Federal government departments responsible for weed issues are SEWPaC and the Department of Agriculture, Fisheries and Forestry (DAFF). Weeds of national interest are published on one of several lists, with the nature of weeds and the national actions required determining on which list a species appears. The Federal lists are:

- Weeds of National Significance (WONS) – Published in the *Australian Weeds Strategy* (Commonwealth of Australia 2007) these 20 weeds are considered to be Australia's most significant environmental weeds;
- The National Environmental Alert List – 28 plant species in the early stages of establishment, which have the potential to become a significant threat to biodiversity if they are not managed;
- Sleeper weeds – Exotic plants that currently have established small populations but which have the potential to spread widely and affect agricultural or natural environments;
- Species targeted for national eradication under the Natural Resource Management Ministerial Council's National Cost-sharing Eradication Programme;
- Species targeted for biological control.

Western Australian Declared and Environmental Weeds

In addition to the weeds of national interest, state and territory governments have their own lists of noxious weeds. In Western Australia, the principal legislation pertaining to weeds is the *Agriculture and Related Resources Protection Act 1976* (ARRPA).

The Department of Agriculture and Food has published a list of *Declared Plants* under the ARRPA (DAFWA 2011). There are five categories of declared plants defined under the ARRPA with the following management actions and aims associated with them:

Priority 1 – Prohibiting movement of plants and/or their seeds through the prevention of trade, sale or movement of plants into the State or that area of the State;

Priority 2 – Eradication of plants from the State or that area of the State;

Priority 3 – Controlling infestations by reducing area and/or density of infestation from the State or that area of the State;

Priority 4 – Preventing infestations spreading beyond existing boundaries of infestation; and

Priority 5 – Infestations must be controlled on public land or land under the control of a local government.

The DEC (previously Department of Conservation and Land Management, CALM) has published the *Environmental Weed Strategy for Western* Australia (CALM 1999). The strategy itself is still considered relevant but the *List of Environmental Weed Species of Actual and Potential Significance in WA* (Appendix 3 to the Strategy) is now out-dated (DEC 2012a).

More recently the DEC published a series of lists of Environmental Weeds in each of the DEC regions, based on workshops held between 2008 and 2010. These lists do not assign a single "priority" classification to each weed, but instead outline the relative threat in each region based on a number of criteria including their distribution, ecological impact and rate of dispersal. The DEC points out that at present these lists should be used as a guide only (DEC 2012a).

At the time of writing, FloraBase (WA Herbarium 2012) lists 1,358 taxa that may be considered weed species of actual or potential significance in Western Australia, of which 107 in the Pilbara region. These figures are subject to change as a result of ongoing changes to taxon nomenclature.

1.3.4. ENVIRONMENTAL PROTECTION AUTHORITY GUIDANCE

The Western Australian Environment Protection Authority (EPA) has produced a series of position statements and guidance statements to aid in assessing the environmental impacts of developments in Western Australia.

The following statements outline the minimum expectations of the EPA in regards to consideration of terrestrial flora and vegetation communities in an environmental impact assessment.

- *EPA Position Statement No. 2: Clearing of Native Vegetation, with Particular Reference to the Agricultural Area* (EPA 2000);
- *EPA Position Statement No. 3: Terrestrial Biological Surveys as an Element of Biodiversity Protection* (EPA 2002);
- *EPA Guidance Statement No. 51: Terrestrial Flora and Vegetation Surveys for Environmental Impact Assessment in Western Australia* (EPA 2004).

Combined, these guidance and position statements provide general recommendations for consideration for planning environmental surveys, including the level of survey required, design and intensity factors, survey limitations and reporting criteria.

2. EXISTING ENVIRONMENT

2.1. BIOGEOGRAPHY

The survey area lies within the Hamersley (PIL3) subregion of the Pilbara Interim Biogeographic Regionalisation of Australia (IBRA) region (SEWPaC 2012a), covering the southern section of the Pilbara Craton (Kendrick 2002). The Hamersley subregion is a mountainous area of Proterozoic sedimentary ranges and plateaux, dissected by gorges of basalt, shale and dolerite (Kendrick 2002).

2.1.1. LAND SYSTEMS

The survey area traverses five different land systems within the Hamersley subregion, as described by Van Vreeswyk *et al*. (2004). These are:

- **Boolgeeda** – Stony lower slopes and stony plains and narrow drainage floors and channels, supporting hard and soft spinifex grasslands and mulga shrublands., level stony plains and narrow sub-parallel drainage floors, relief up to 20 m. Often occurs below hill systems such as Newman and Rocklea.
- **McKay** – Hills, ridges, plateaux remnants and minor breakaways of sedimentary and meta sedimentary rocks supporting hard spinifex grasslands; relief up to 100 m.
- **Newman** – Rugged high mountains, ridges and plateaux with near vertical escarpments of jaspilite, chert and shale, supporting hard spinifex grasslands; relief up to 400 m.
- **Platform** – Stony upper plains, dissected slopes and drainage floors, supporting hard spinifex grasslands. Erosional surfaces formed by partial dissection of the old tertiary surface. The gently inclined upper plains have extensive marginal dissection zones with gently inclined to steep slopes. Floors incised up to 30m with steep stable marginal slopes becoming wider downslope.
- **Wannamunna** – Hardpan plains and internal drainage tracts supporting mulga shrubland and woodlands, and occasionally eucalypt woodlands). Depositional surfaces, level hardpan wash plains subject to overland sheet flow. Broad internal drainage flats receiving run-on from adjacent hardpan surfaces; rare channelled tracts but moistly no organised through drainage; relief up to 5m.

The approximate area of each land system within the Pilbara region and within the survey area is presented in Table 2.

Table 2 Land systems of the survey area

Land System	Total area in Pilbara (km^2)	Area within survey area (km^2)	Percentage of total within survey area
Boolgeeda	7,748	11.58	0.15 %
McKay	4,202	0.44	0.01 %
Newman	14,580	2.77	0.02 %
Platform	1,570	1.98	0.12 %
Wannamunna	577	0.27	0.04 %

2.1.2. GEOLOGY

The survey area is located in the south-west corner of the Roy Hill 1:250,000 Geological Survey Sheet (SF50-12: Thorne & Tyler 1997). The geology of the survey area is generally defined by the assemblage of prehnite, pumpellyite, epidote, actinolite. Basement rocks comprise the early Proterozoic Brockman

Iron Formation and Weeli Wolli Formation. The Brockman Iron Formation consists of banded iron formation (BIF) and shale, while the Weeli Wolli formation consists of BIF separated by shale and siltstone bands, with younger dolerite sills that intersect the sedimentary sequence.

Regionally, the fresh basement rocks are typically overlain by weathered basement rocks which occur as lateritic and basal gravel and/or conglomerate deposits. These weathered deposits underlie early Tertiary Channel Iron Deposits (CID), which are the dominant economic-grade iron deposits in the region. The CID is typically overlain by younger alluvial and colluvial gravels and sediments (Thorne & Tyler 1997).

The survey geology comprises the following geological units (Thorne & Tyler 1997).

- **Brockman Iron Formation** (PLHB): banded iron-formation, chert, and pelite;
- **Quaternary Alluvium** (Qa): unconsolidated silt, sand, and gravel; in drainage channels and on adjacent floodplains;
- **Quaternary Alluvium and Colluvium** (Qw): red-brown sandy and clayey soil; on low slopes and sheetwash areas; and
- **Cainozoic Colluvium** (Czc): partly consolidated quartz and rock fragments in silt and sand matricx; old valley-fill deposits.

2.1.3. SOILS AND LANDFORMS

The survey area is located within the Fortescue botanical district of the Pilbara region (Beard 1990). This region is mountainous, with soils ranging from shallow, stony sandy loams along slopes, to cracking clays, stripped hardpans and calcareous loams along active waterways (Beard 1990).

The survey area is typical of the eastern Pilbara with rocky hills, small gorges, mostly seasonal watercourses and gravelly loam valleys. It is typified by hard red alkaline soils on plains, pediments and alluvial areas, while shallow, skeletal soils are common on ranges that rise to 1,250 m (Beard 1990). The southern part of eastern Pilbara region is characterised by earthy loams underlain by red-brown hardpan (Beard 1975; 1990).

The survey area has two distinct soil and landform assemblages. The majority of the potential haul road alignment and the edges of the mine tenement are characterised as landform unit Fa13. The central part of the mine tenement and small portion of the potential haul road alignment is characterised as landform unit Fb3. These are defined as follows (CSIRO Australia 2006–):

- **Fa13 –** Ranges of banded jaspilite and chert along with shales, dolomites, and iron ore formations with some areas of ferruginous duricrust as well as occasional narrow winding valley plains and steeply dissected pediments. This unit is largely associated with the Hamersley and Ophthalmia Ranges. The soils are frequently stony and shallow and there are extensive areas without soil cover: chief soils are shallow stony earthy loams (Um5.51) along with some (Uc5.11) soils on the steeper slopes. Associated are (Dr2.33, Dr2.32) soils on the limited areas of dissected pediments, while (Um5.52) and (Uf6.71) soils occur on the valley plains; and
- **Fb3** – High-level valley plains set in extensive areas of unit Fa13. There are extensive areas of pisolitic limonite deposits: principal soils are deep earthy loams (Um5.52) along with small areas of (Gn2.12) soils.

2.1.4. HYDROLOGY

Regional stream flow in the Pilbara is ephemeral, related to intense rainfall from with cyclonic activity or localised thunderstorms. Stream flow decays rapidly once rainfall has ceased. The drainage system upstream of the Fortescue Marsh has negligible base flow with stream flow and water table recharge following rainfall events (Van Vreeswyk *et al*. 2004).

The proposed mining area (tenement M47/1468) contains four minor non-perennial (type 2) watercourses. The southern proposed haul route option (L47/638, L47/639, L47/641) and two prospective accommodation areas (L47/635, L47/636) are crossed by eight minor non-perennial watercourses. Seven non-perennial watercourses cross the northern proposed haul road option (L47/637, L47/640) and the northern prospective accommodation area (E47/1329). No major or perennial drainage lines occur within or directly adjacent to the survey area (Commonwealth of Australia 2012b).

2.2. REGIONAL VEGETATION

The survey area is located in the Fortescue botanical district of the Pilbara region (Beard 1990), which forms part of the Eremaean Province. The Pilbara region receives a slightly higher than average rainfall than most of the Eremaean Province, due to the prevalence of cyclones off the coast, but this is not enough to modify the essentially desert appearance of the plant cover (Beard 1990).

The Fortescue district consists predominantly of tree and shrub steppe communities with *Eucalyptus* trees, *Acacia* shrubs and spinifex grasses including *Triodia pungens* and *T. wiseana* (Beard 1975). Mulga (*Acacia aneura*) occurs in valleys and short-grass plains may be present on alluvial soils (Beard 1990).

Vegetation of the Hamersley (PIL3) IBRA subregion is generally low Mulga woodland over bunch grasses on fine textured soils in the valleys with snappy gums (*Eucalyptus leucophloia*) over *Triodia brizoides* on skeletal soils of the ranges (Kendrick 2002). The mountain tops and gorges of the Hamersley subregion provide refugia for humidophile and/or fire intolerant flora, and support a diversity of range-restricted species (Kendrick 2002).

Beard (1975) mapped the area of the flora survey as Hamersley 82: hummock-grass (*Triodia wiseana*) steppe with irregularly scattered *Eucalyptus brevifolia* trees; and Hamersley 18: Low woodland of *Acacia aneura*.

Table 3 Beard (1975) vegetation areas of the Lamb Creek survey area

Beard (1970) vegetation type	Total area in WA (km^2)*	Area within survey area (km^2)	Percentage of total within survey area*
Hamersley 82	246,591.1	8.67	0.0035 %
Hamersley 18	29,209.1	12.01	0.0411 %

*Note: areas of vegetation types are taken from Shepherd *et al.* (2001). This document is now over ten years old, and significant vegetation clearing has taken place in the Pilbara region in the time since its publication. Area values given should be considered optimistic estimates rather than actual areas.

2.3. CLIMATE

The Pilbara region of Western Australia experiences an arid tropical climate with most rain falling during the hot summers between January and March (Beard 1990). Rainfall occurs in sporadic heavy rainfall events that occur during or immediately following cyclones. Cyclones develop off the north-west coast and often cross the coastline between Karratha and Port Hedland and move inland over the Fortescue Valley system towards Newman.

The closest Bureau of Meteorology (BOM) weather station to the survey area is at Newman Airport (station number 007176), located 130 km south-east of the survey area. This weather station has been recording rainfall data since 1971 and temperature data since 1996.

Data recorded at Newman Airport (Figure 2) shows a mean annual rainfall of 313.2 millimetres (mm). Mean monthly rainfall is highest in February at 77.3 mm, and lowest in September at 4.5 mm. The hottest month is January with a mean maximum temperature of 39.2°C and a mean minimum temperature of 23.9°C. The annual wind records from 9am and 3pm show a dominant easterly throughout the day, with the strongest winds recorded in the morning of up to 30 km/hour (BOM 2012).

Evaporation rates are not recorded at the Newman Airport Weather Station. However, evaporation in the Central Pilbara Region is estimated to be between 2000 mm and 3500 mm per annum, which is approximately ten times greater than annual rainfall (Gardiner 2003). This disparity maintains a typically arid landscape, with the exception of areas located in proximity to river systems and shallow groundwater resources.

The flora and vegetation survey of the survey area took place from 27 March to 1 April 2012. Rainfall in the three months preceding the survey was higher than average for the region, with a total of 307.8 mm recorded for the months of January to March 2012 combined, of which 239.4 was recorded in January 2012. Temperatures during the survey were generally warm during the day, ranging from 33.8 °C to 36.8 °C during the day, and mild at night, ranging from 22.1 °C to 25.2 °C (BOM 2012).

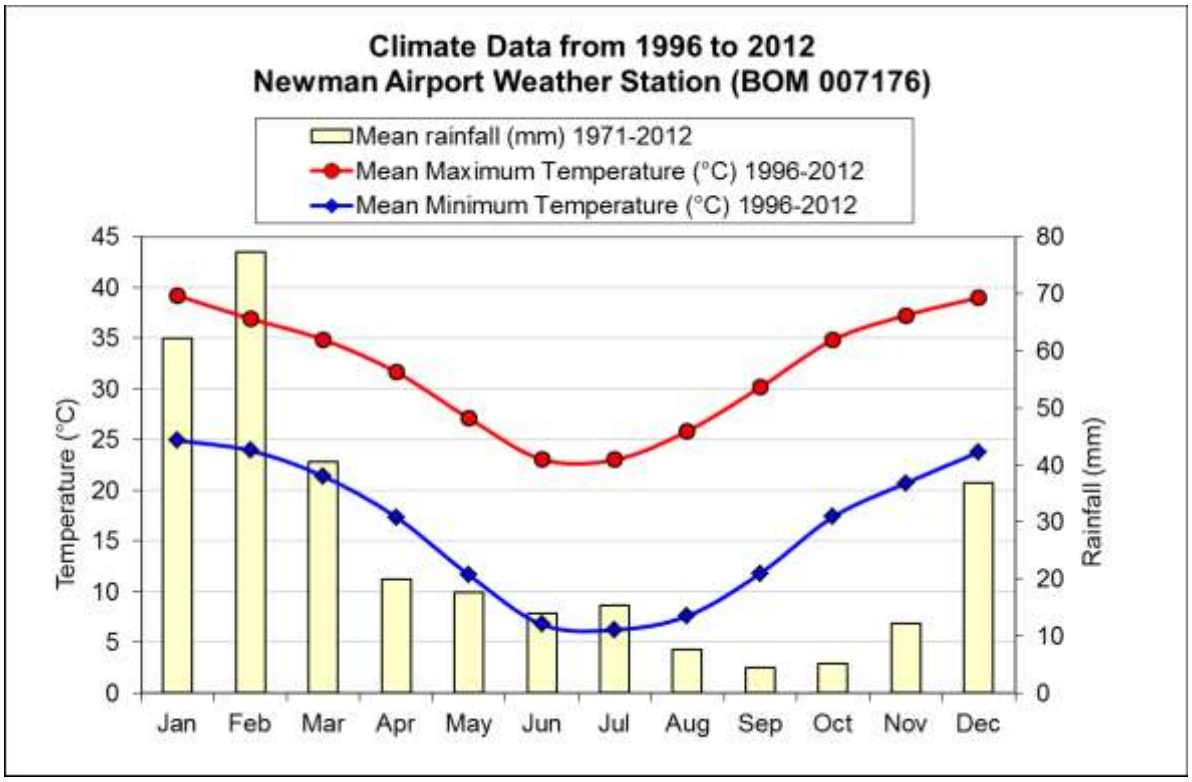

Figure 2 Newman Airport Weather Station – Average temperatures and rainfall

2.4. RESERVES AND ENVIRONMENTALLY SENSITIVE AREAS

Environmentally Sensitive Areas

The survey area is not situated within an ESA as defined under the Environmental Protection (Environmentally Sensitive Areas) Notice 2005 (Western Australian Government 2005).

There are no ESAs within 5 km of the survey area. The nearest Nationally Important Wetland is the Fortescue Marshes, located 52 km north of the survey area (SEWPaC 2012c).

Conservation Reserves

The survey area does not occur within a conservation reserve. The nearest nature reserves to the survey area (within a 100 km radius) are listed below (SEWPaC 2012c).

- Karijini National Park (DEC) – 26 km west of the survey area;
- Mungaroona Range National Park (DEC) – 52 km north of the survey area.

Threatened and Priority Ecological Communities

The project area is not located within a known TEC or PEC. The nearest known PEC is the Coolibah-Lignum Flats vegetation community, with the edge of the buffer zone located 6 km south of the survey area (DEC Threatened and Priority Communities database, search reference 35-0212EC).

The Coolibah-Lignum Flats vegetation complex is described as: Woodland or forest of *Eucalyptus victrix* (coolibah) over thicket of *Muehlenbeckia florulenta* (lignum) on red clays in run-on zones. Associated species include *Eriachne benthamii*, *Themeda triandra*, *Aristida latifolia*, *Eulalia aurea* and *Acacia aneura* (DEC 2012b). A series of sub-types have been identified:

- Coolibah and mulga (*Acacia aneura*) woodland over lignum and tussock grasses on clay plains (Coondewanna Flats and Wanna Munna Flats) – Priority 3
- Coolibah woodlands over lignum (*Muehlenbeckia florulenta*) over swamp wandiree; Lake Robinson is the only known occurrence – Priority 1
- Coolibah woodland over lignum and silky browntop (*Eulalia aurea*); two occurrences known on Mt Bruce Flats – Priority 3

3. METHODS

A Level 2 flora and vegetation survey was completed in the survey area, comprising a desktop search and a single-phase comprehensive field survey. Throughout this report taxonomy and taxonomic nomenclature follows the Western Australian Herbarium FloraBase website (Western Australian Herbarium 2012).

3.1. DESKTOP SEARCH

A desktop search was completed in preparation for the field survey, in order to provide a local context for the survey results, and to identify flora species and vegetation communities of conservation significance in the vicinity of the project area. The desktop search included a database search and a review of publically accessible literature and relevant survey reports within 100 km of the project area.

The database search included a combined search of the DEC Threatened (Declared Rare) and Priority Flora database, the WA Herbarium Specimen database, and the DEC Threatened and Priority Flora List (DEC reference number 38-0212FL); the NatureMap online search tool (DEC 2012); and the Protected Matters online search tool (SEWPaC 2012c) (Table 4).

Following completion of the field survey and taxonomic identifications, a follow-up database search was requested from the DEC (search reference number 04-0512FL) to obtain full details of all populations of the Priority species recorded during the survey in order to calculate the potential conservation impact of the project on these species (Table 4).

Table 4 Database Searches

Database Name	Latitude	Longitude	Search Area
DEC Threatened and Priority Flora database WA Herbarium database DEC Threatened and Priority Flora Species List	Search area based on shapefile of project area		40 km buffer around shapefile boundary
NatureMap	22°50’18” S	118°50’17” E	40 km buffer around coordinates
SEWPaC Protected Matters	22°53’28” S 22°50’28” S 22°47’44” S 22°50’20” S	118°48’09” E 118°47’16” E 118°58’05” E 118°51’54” E	10 km buffer around coordinates
DEC Species Specific search	Search carried out by species, not location		

Published literature and reports reviewed for the desktop search are listed in Table 5.

3.2. FIELD SURVEY

A single-phase Level 2 flora and vegetation survey was completed in the survey area from 27 March to 1 April 2012. The timing of the survey in autumn, following a period of significant rainfall or the region (section 2.3) is considered an appropriate time for conducting flora surveys in the Pilbara bioregion (EPA 2004). This is the time when the majority of plant species are flowering, fruiting and have foliage that allows identification, and provides the best opportunities for recording ephemeral or cryptic species.

The survey was completed by a team of three suitably qualified and experienced botanists. Geographic information system (GIS) data and aerial photography were used to demark the project area and to identify potential areas of interest. Survey areas were accessed by helicopter and were surveyed on foot.

The survey activities included:

- Flora quadrat surveys;
- Vegetation mapping;
- Opportunistic flora collections.

All specimens collected in the field were identified at the Western Australian Herbarium by Rapallo botanists, assisted by expert taxonomists where required (Table 7). Taxonomic identifications were completed using specialist texts, floral identification keys and comparisons with reference specimens held at the Western Australian Herbarium.

Specimens of conservation significant species, species found outside their normal range and other species of interest were lodged with the Western Australian Herbarium.

3.2.1. FLORA QUADRATS

Quadrat surveys involved a detailed and comprehensive search of a 50 by 50 m quadrat. Within each quadrat all flora taxa were recorded and specimens were collected of each species or subspecies when they were first encountered during the survey. Hence, specimens were collected for all taxa recorded in

the first quadrat, while specimen collection from subsequent quadrats only comprised taxa that had not been collected from previous quadrats unless considered possible to be different taxa. All species were thus collected at least once.

The following data were recorded for each quadrat:

- Location coordinates and elevation (on Garmin GPS units (MGA50, GDA94) and datasheet);
- Botanist name and Date – The name of the botanist involved in sampling the quadrat and the survey date;
- Species – all vascular plant species present, including introduced species were recorded;
- Percentage Foliar Cover – the percentage cover was estimated for each species within the quadrat;
- Height – the maximum height of each taxon was recorded;
- Soil and geology description including soil colour and type, and rock percentage cover, type, and size;
- Terrain and topography description;
- Vegetation condition - assessed in accordance to the Vegetation Condition Classification of Keighery 1994 – Appendix II);
- Vegetation Description - vegetation was described according to Aplin's (1979) modification of the vegetation classification system of Specht (1970) and the National Vegetation Invenotry System, Level 5 (Department of Environment and Heritage 2003 (Appendix V);
- Digital photographs of the quadrats were taken from different directions;

A total 46 of flora quadrats were established during the survey, with sites located in each of the five land systems within the project area. The number of sites (quadrats) per land system are listed in (Table 6) below and mapped in **Error! Reference source not found.**.

Table 6 Survey site established in each land system in the Lamb Creek survey area

Land system	Number of sites	Site names
Boolgeeda	14	LCF10, LCF11, LCF12, LCF14, LCF15, LCF21, LCF24, LCF26, LCF27, LCF35, LCF39, LCF40, LCF41, LCF42, LCF52
McKay	18	LCF05, LCF06, LCF16, LCF17, LCF18, LCF19, LCF20, LCF22, LCF23, LCF25, LCF28, LCF29, LCF30, LCF31, LCF32, LCF36, LCF37, LCF38
Newman	3	LCF01, LCF02, LCF43, LCF46
Platform	5	LCF03, LCF04, LCF07, LCF08, LCF09, LCF45
Wannamunna	2	LCF33, LCF34, LCF51

3.2.2. VEGETATION MAPPING

The boundaries of vegetation communities were established by ground-truthing the imagery of aerial photographs. Transition boundaries of vegetation communities were recorded manually on an aerial photograph of the project area, and waypointed with a GPS. Vegetation classification was carried out using the statistical analysis program PATN (Belbin 1989). Digital maps of vegetation communities were produced by Rapallo in a geographic information system (GIS) program using the results of the PATN analysis as a guide, with field-collected data serving to clarify and interpret the PATN results where required.

3.2.3. OPPORTUNISTIC FLORA COLLECTIONS

Opportunistic flora collections were made while traversing the project area between survey quadrats and during vegetation mapping. Opportunistic collections provide a valuable complement to the other collections and survey data, as they may be used to improve the botanical knowledge of the area.

Specimens were collected of all species that had not been recorded during the quadrat surveys. For each opportunistic collection, the following data were recorded: GPS location, density or numbers at location, growth form, and height of the plant. Digital photographs were taken where necessary for identification purposes and whenever a species was thought to be a conservation significant taxon.

3.3. STATISTICAL ANALYSIS

3.3.1. PATN ANALYSES

Survey sites were grouped into clusters of similar vegetation communities, based on the presence and density of the taxa recorded, by using the software program PATN v3.12 (Belbin 1989).

Analysis was done using Bray and Curtis association, a flexible UPGMA classification with a beta of -0.1, and seven final groups. Ordination was done using the default settings.

Kruskal-Wallis statistics were used to identify the taxa that were producing the most statistical noise; these taxa were then removed from the analysis. This process was repeated until the ordination stress values produced by the analysis were considered sufficiently low (ideally below 0.15). The Kruskal-Wallis values were then used to determine which species contributed most strongly to each vegetation group in order to describe the vegetation types.

3.3.2. ESTIMATES

The software program EstimateS (Windows Version 8.20) (Colwell 2006) was used to estimate survey completeness by generating species accumulation curves, and by calculating predicted total species richness. Analyses were conducted on presence-absence data from flora survey quadrats (46 quadrats, 214 taxa), using the default settings, with the following exceptions:

- Accumulations (runs) were randomised 10,000 times without replacement;
- Upper abundance limit for rare or infrequent species was set to 5;

The species accumulation curve was plotted as the number of species recorded (y-axis) against the number of flora quadrats surveyed (x-axis). Predicted species richness was calculated by taking the average of the estimators Jacknife 1, Jacknife 2 and Bootstrap.

Predicted species richness was compared with observed species richness, comprising all species recorded from quadrats (214 taxa), and with observed species richness comprising total number of species recorded during the survey, including opportunistic records (223 taxa).

3.4. SURVEY PERSONNEL AND LICENSING

The following people were involved with the survey and the preparation of this report:

Table 7 Personnel involved in the survey

Staff	Role	Flora License
Linda Dalgliesh	Botanist for Rapallo Environmental	SL009472
Joshua Gilovitz	Botanist for Rapallo Environmental	SL009605
Marieke Weerheim	Environmental Scientist for Rapallo Environmental	SL009964
Dr Eleanor Bennett	Taxonomist for Bennett Environmental Consulting	n/a
Sharnya Thompson	Consultant Taxonomist	n/a

Collection of specimens for the flora and vegetation survey was licensed under the Western Australian *Wildlife Conservation Act 1950* "Licence to take Flora for Scientific or Other Prescribed Purposes". As part of the license requirements, a copy of this report will be forwarded to the DEC.

3.5. SURVEY LIMITATIONS

The potential limitations of the survey, as outlined in EPA *Guidance Statement No. 51* (2004) are discussed in Table 8.

Table 8 Potential limitations and discussion of their relevance to the survey

Potential Limitation	Discussion
Sources of information and availability of contextual information (i.e. pre-existing background vs. new material)	Government database records were obtained for the area, although some of the species recorded in the field were not present in those data. Multiple similar flora surveys exist for surrounding areas, including one completed by Rapallo.
Scope (i.e. what life forms, etc., were sampled).	All vascular plant species were recorded when found in survey quadrats or encountered while traversing the area on foot.
Proportion of flora collected and identified (based on sampling, timing and intensity).	Statistical analysis shows that 86% of the predicted species richness was recorded during the survey, with a near-asymptotic species accumulation curve (Section 4.2.1). Specimen quality was high: of the 414 specimens collected, 96.4% could be identified to species or infraspecific level.
Completeness and further work which might be needed (e.g. was the relevant area fully surveyed).	The survey area is considered well sampled, with the exception of two areas within the main mining area that were poorly sampled. These areas are considered unlikely to contain different vegetation or species than those that were recorded throughout the rest of the survey area based on helicopter flyovers and satellite photographs.
Mapping reliability.	High quality satellite photographs of the area were available, and various other mapping resources (soils, geology, vegetation) were also available.
Timing, weather, season, cycle.	The survey was carried out in late March - early April, which is considered to be an appropriate time for the area. Rainfall was above average in the three months preceding the survey, and floristic diversity was high.

Potential Limitation	Discussion
Disturbances (fire, flood, accidental human intervention etc.).	The survey area occurs in an active pastoral lease, and some sites were noted as disturbed by cattle, as well as infrastructure associated with the pastoral lease and recent mineral exploration. Evidence of old (>5 years) fire was noted in some areas, however the majority of the survey area was relatively undisturbed and long unburnt.
Intensity (in retrospect, was the intensity adequate).	Statistical analysis demonstrates that survey intensity was adequate floristically; however more intensive sampling of some minor vegetation types may have resulted in more precise mapping.
Resources.	The field staff had adequate resources for the survey including reports of previous botanical surveys of the area, lists and information outlining all Declared Rare and Priority Flora, maps, GPS information supplied by the client, handheld GPS units, cameras, and the necessary equipment for botanical collection.
Experience levels (e.g. degree of expertise in plant identification to taxon level).	Herbarium identification was carried out by a combination of Rapallo staff and experienced external contractors (Eleanor Bennet and Sharnya Thomson). All specimen identifications were verified by a second botanist/taxonomist following initial identification.

4. RESULTS

4.1. DESKTOP SEARCH RESULTS

The combined review of databases, survey reports and published literature yielded a total of 68 taxa of conservation significant flora taxa previously recorded from within 100 km of the survey area. The majority of these (57 taxa) were recorded in the various databases, while an additional 11 taxa were recorded in previous surveys within 100 km of the survey area (Table 9).

Table 9 Number of conservation significant taxa recorded in databases and previous surveys

Conservation Status	Databases (within 40 km)	Survey reports (within 100 km)	Total taxa
Threatened (Declared Rare) Flora	2	1	2
Priority 1	11	2	11
Priority 2	14	3	15
Priority 3	26	12	34
Priority 4	4	5	6
Totals	**57**	**23**	**68**

Two species of Threatened (Declared Rare) flora were recorded within 40 km of the survey area. These were *Lepidium catapycnon* (Hamersley Lepidium) and *Thryptomene wittweri* (Mountain Thryptomene); both taxa are listed under the EPBC Act as Vulnerable, and listed under the Wildlife Conservation Act as Schedule 1 – rare or likely to become extinct.

In addition, 66 taxa listed by the DEC as Priority Flora were recorded in the desktop search; these comprised 11 Priority 1 species, 15 Priority 2 species, 34 Priority 3 species, and six Priority 4 species.

The complete list of conservation significant flora recorded in the desktop search is presented in Table 10. Please note that the DEC Threatened (Declared Rare) and Priority Flora database (TPFL) lists populations, and the WA Herbarium database (WAHerb) lists individual specimens. All other databases and reports listed in Table 10 represent presence or absence of a particular taxon within the search area.

4.2. FIELD SURVEY RESULTS

4.2.1. FLORA TAXA RECORDED IN THE SURVEY

Summary Statistics

A total of 414 specimens were collected during the survey. Following taxonomic identification, these were found to represent 230 species or infraspecies. Of all specimens collected, 15 could not be identified to species level due to absence of suitable fruiting or flowering material. Specimens that could not be positively identified to species or subspecies level were only counted in the final species list if they were thought likely to represent a taxon that was not otherwise recorded. The total species list is presented in Appendix III.

The average number of flora taxa per survey quadrat was 25.83. This number is relatively high for surveys in the Pilbara area and was influenced by the presence of many annual / ephemeral species in at the sites, due to the survey being completed within three months following significant rainfall events, and also due to the presence of some extremely species-rich sites that increased the overall average.

Table 11 Summary statistics of taxa recorded in the survey area

Taxonomic level	Number of taxa	Most common taxa (number of species)
Family	42	Poaceae (41), Fabaceae (41), Malvaceae (26)
Genus	110	Acacia (23), Ptilotus (11), Senna (9)
Species	230	-

The average Keighery (1994) vegetation condition was 2.51 (excellent - very good). The most common disturbances observed were grazing by cattle, vehicle tracks and mineral exploration impact, and weeds.

Survey Completeness

The species richness estimators calculated with EstimateS indicate that 81% of the predicted number of flora taxa were recorded during the survey at Lamb Creek. This is reflected in the species accumulation curve, which approached an asymptote as the number of sites increased (Figure 3).

The predicted species richness was 264.9 based on the average of the estimators Jacknife 1, Jacknife 2 and Bootstrap, with observed species richness of 214 representing the number of species recorded from flora quadrats. Opportunistic flora collections made while walking between sites included another 16 species that had not been recorded in the quadrats. Hence, the total number of 230 flora species represents 86.8% of predicted species richness.

These figures suggest that increased survey effort, i.e. more flora quadrats, and/or more transects, may have produced a higher number of species recorded from the survey area. However, the fact that the accumulation curve reached a near-asymptote indicates that a large increase in the number of survey quadrats would have been required to reach a figure about 90% survey completeness. Furthermore, the fact that 93% of all taxa recorded during the survey were collected from the quadrat sites indicates that the sites were well placed within the survey area to sample all available vegetation types.

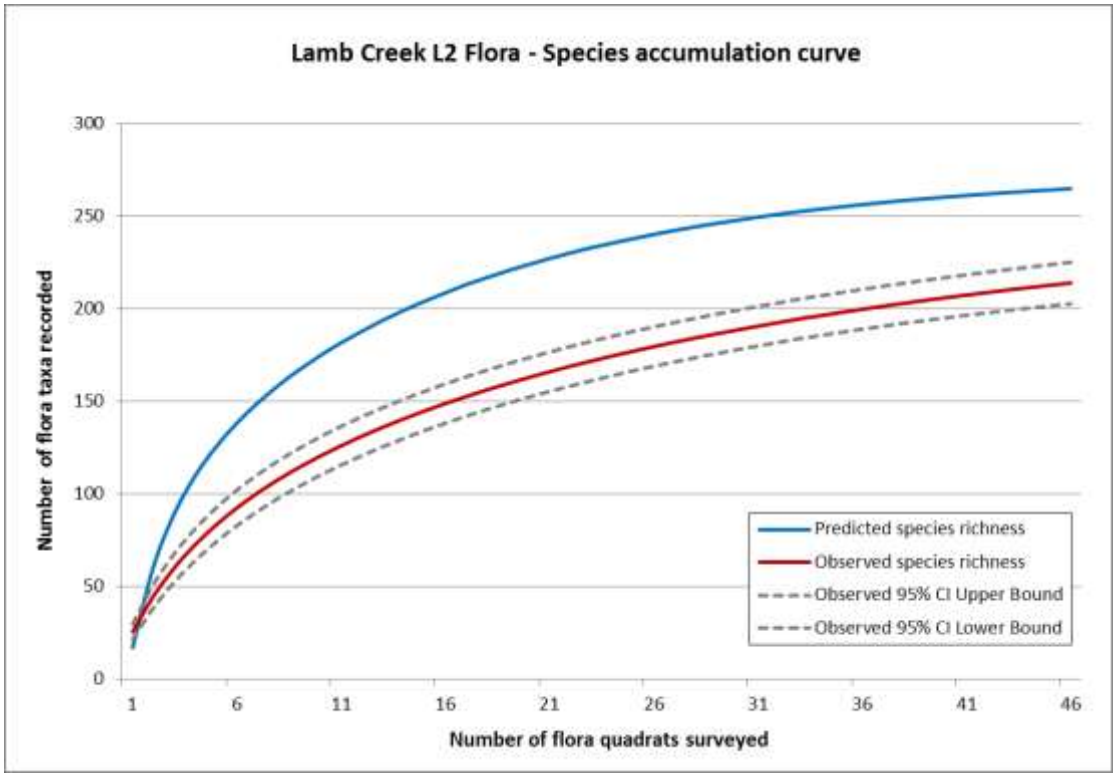

Figure 3 Species accumulation curve for the Lamb Creek L2 flora survey

4.2.2. CONSERVATION SIGNIFICANT TAXA

No species of Threatened Flora (Declared Rare Flora) pursuant to the Western Australian *Wildlife Conservation Act* 1950, and no species listed as Threatened pursuant to the Commonwealth *Environmental Protection and Biodiversity Conservation Act 1999* were recorded in the survey area.

Three species of Priority Flora listed by DEC were recorded during the survey, comprising one Priority 1 species (*Brachyscome* sp. Wanna Munna Flats (S. van Leeuwen 4662)) and two Priority 2 species (*Aristida calycina* var. *calycina* and *Aristida lazaridis*). The locations of conservation significant flora taxa recorded in the survey area are presented in Figure 4; the coordinates of all these records are listed in Appendix IV.

Brachyscome sp. Wanna Munna Flats (S. van Leeuwen 4662) - Priority 1

This species is a small herb in the Asteraceae (daisy) family, with pink flowers and sharply divided leaves.

Brachyscome sp. Wanna Munna Flats (S. van Leeuwen 4662) was collected at LCF33, LCF51, and LCF34. Single plants or small numbers present at all sites. This species was recorded as occurring in small but consistent numbers throughout the area between these sites, at the far-western extent of the proposed haul road.

The species is known from ten collections in the WA Herbarium from an approximately 330 km wide south east - north west band, with the current survey area situated roughly in the centre. The nearest record is from 2006 and was 20km to the west of the collection made within the survey area. *Brachyscome* sp. Wanna Munna Flats (S. van Leeuwen 4662) is represented by two records in the TPFL database, which are both probably derived from WAHERB specimen records as they share dates and coordinates with WAHERB records.

A specimen of this species will be submitted to the WA Herbarium collection.

Aristida calycina var. *calycina* - Priority 2

Aristida calycina var. *calycina* is described as a loosely tufted perennial grass, 0.3-1.3 m high, with smooth lemma groove. It occurs on red earths, sands, and alluvial soils (Western Australian Herbarium 2012). Widespread throughout NSW and is present in several other Australian states (The Royal Botanic Gardens and Domain Trust 2012).

This species was collected at site LCF31, where only a single plant was recorded. The specimen did not match the description of the species exactly, however was very close to collection S. van Leeuwen PBS0466, and will be assumed to be *A. calycina* var. *calycina* for the purposes of this report.

This taxon is known in Western Australia from a single specimen at the Western Australian Herbarium (Sheet 04867599), and is not recorded in DEC's TPFL database. The existing WA Herbarium record was collected in 1996 and has coordinates placing it approximately 65 km away from our collection.

The specimen collected will be submitted to the Western Australian Herbarium collection.

Aristida lazaridis - Priority 2

Aristida lazaridis is a tufted perennial grass, 0.4-1.5 m high, with green and purple flowers in April, occurring on sand or loam (Western Australian Herbarium 2012).

This species was record at site LCF31, where it was relatively abundant, with a density rated at 5-25%.

Aristida lazaridis is known from only two specimens at the WA Herbarium. One was collected in 2008, approximately 55 km to the east south east of our record, and the second was collected the same distance to the north west in 1996. The species is not recorded in DEC's TPFL database.

A specimen of *Aristida lazaridis* will be submitted to the WA Herbarium collection.

Conservation significant flora recorded in the survey area

4.2.3. WEEDS

Five species of introduced flora (weeds) were recorded in the survey area: *Bidens bipinnata* (Bipinnate Beggartick), *Cenchrus ciliaris* (Buffel Grass), *Chloris virgata* (Feathertop Rhodes Grass), *Malvastrum americanum* (Spiked Malvastrum), and *Portulaca oleracea* (Purslane).

None of these taxa were listed as Declared Plants by the WA Department of Agriculture and Food pursuant to section 37 of the *Agricultural and Related Resources Protection Act 1976* (Western Australia). None of these taxa were listed as Weeds of National Significance by the Commonwealth Department of Sustainability, Environment, Water, Population and Communities (SEWPaC 2012).

Five weed species were recorded at nine locations in the Lamb Creek survey area (Figure 5, Figure 6). Weed species were more abundant at locations where evidence of cattle was noted. The site that contained the most weed species was LCF31, where four weed species were found.

Bidens bipinnata (Bipinnate Beggartick)

Bidens bipinnata is an erect annual herb, from 0.1-0.9 m high, with yellow flowers from March to September. It occurs on alluvium, clay, loam over sandstone, and limestone, along rivers and creeks, in coastal areas, and on rocky hillsides. It is widespread throughout the Pilbara and also occurs in other north-western WA regions (Western Australian Herbarium 2012).

Bidens bipinnata was the most commonly recorded weed species, found at nine sites in the survey area: LCF12, LCF15, LCF18, LCF20, LCF23, LCF31, LCF34, LCF37, LCF46.

Cenchrus ciliaris (Buffel Grass)

Cenchrus ciliaris is a tufted perennial grass to 1.5m in height, with purple seed-heads from February to October (Western Australian Herbarium 2012). The seeds of this weed are spread by wind, water, stock and machinery (Thorp and Wilson 1998-2012). Buffel Grass has become a major environmental weed of northern Australia, displacing native species, and carrying fire into areas where fire was not normally part of the ecosystem (Thorp and Wilson 1998-2012, Hussey *et al* 2007).

This species was observed at a single site, LCF23, in the current project.

Chloris virgata (Feathertop Rhodes Grass)

Chloris virgata is an annua grass, usually from 0.23-0.45 m high, with green-purple flowers from April to May or in September. It usually occurs on sand dunes. It occurs in many areas of WA and is common in the Pilbara region (Western Australian Herbarium 2012).

Chloris virgata was observed at a single site, LCF31, in the current project.

Malvastrum americanum (Spiked Malvastrum)

Malvastrum americanum is an erect perennial herb or shrub, from 0.5-1.3 m high. It has yellow-orange flowers in April to July. It occurs on orange, red, or yellow sands, gritty alluvial sand, black or brown clay, alluvial cracking clays, limestone, and calcrete, on stony ridges and hillsides, floodplains, and along drainage lines. It is widespread and common within the Pilbara and other north-western regions of WA (Western Australian Herbarium 2012).

Malvastrum americanum was recorded at site LCF31 in the survey area.

Portulaca oleracea (Purslane)

Portulaca oleracea is a succulent, prostrate to decumbent annual herb to 0.2 m high. It has yellow flowers from April to May, and occurs on clay loam and sand, often in disturbed sites. It has been recorded extensively in the Pilbara, and also occurs in many other regions of WA (WA Herbarium 2012).

In the survey area, *Portulaca oleracea* was recorded at sites LCF31 and LCF34.

4.2.4. VEGETATION COMMUNITIES IN THE SURVEY AREA

Six vegetation communities were identified in the survey area. PATN analysis results were largely consistent with field mapping of vegetation communities, although they were partially manually adjusted to produce the final integrated results.

None of the vegetation communities in the survey area represented a TEC or PEC. The Coolibah-Lignum Flats vegetation complex PEC includes some species recorded in the survey, including 'mulga' (*Acacia aptaneura*, previously considered part of the *A. aneura* complex), however mulga was not found in association with *Eucalyptus victrix*, or with the species assemblage described in the PEC. *Eucalyptus victrix* was thought to be recorded at a single site, however due to lack of fruit was not able to be identified positively, and at that site it was not associated with any of the other species described in the Coolibah-Lignum Flats vegetation complex PEC.

PATN Dendrogram

Following analysis and evaluation, 110 species were selected for inclusion in the PATN analysis. This produced a dendrogram of seven vegetation types, with a stress value of 0.1686 (Figure 7). The quadrats assigned to one group, which consisted of two sites (LF12 and LCF32), were manually reassigned to other groups based on field observations, to produce six final groups.

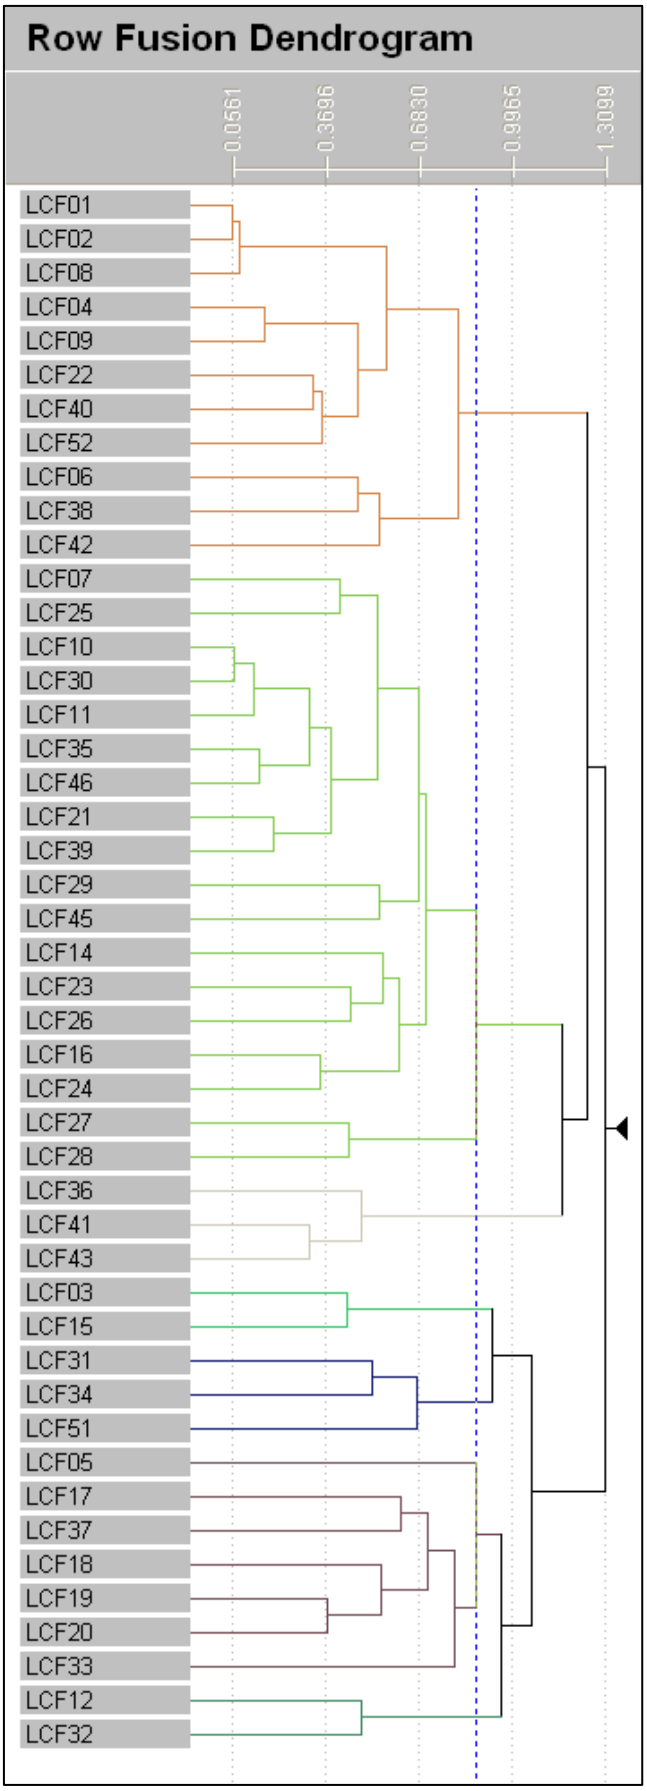

Figure 7 PATN dendrogram of analysis of survey quadrats

Vegetation Mapping

Based on field observations and PATN analysis, six main vegetation communities were recorded. The vegetation type occurring most widely across the survey area was *Eucalyptus gamophylla* woodland over hummock grassland (Table 1).

Table 1 Total and percentage area of each vegetation type recorded in the Lamb Creek survey area

Vegetation community	Total area (km^2) within survey area	Percentage of survey area
1. *Eucalyptus gamophylla* woodland over hummock grassland	9.57	46 %
2. *Eucalyptus leucophloia* subsp. *leucophloia* woodland over mixed shrubs over *Triodia wiseana* grassland	5.25	25 %
3. *Acacia* shrubland over hummock grassland	1.30	6 %
4. *Acacia tumida* var. *pilbarensis* scrub in creeklines	0.64	3 %
5. Wannamunna Mulga grove	0.66	3 %
6. *Acacia aptaneura* over hummock grassland	3.26	16 %
Totals	20.68	**100** %

The vegetation communities of the survey area are mapped in Figures 8, 9, 10, 11, 12 and 13 and described in detail in Table 13 below.

Table 13 Description of vegetation communities

Vegetation Community	Plate	Land System	Substrate	Description	Quadrats
1. *Eucalyptus gamophylla* woodland over hummock grassland	1	Boolgeeda, McKay, Newman, Platform	Clay loams with BIF and ironstone pebbles and gravel on open plains and gentle rises	*Eucalyptus gamophylla* low open woodland over *Acacia elachantha* or *Acacia hilliana*, *Senna glutinosa* subsp. *pruinosa* open shrubland over *Triodia brizoides*, *Triodia wiseana* hummock grassland.	LCF01, LCF02, LCF04, LCF06, LCF08, LCF09, LCF22, LCF38, LCF40, LCF42, LCF52
2. *Eucalyptus leucophloia* subsp. *leucophloia* woodland over mixed shrubs over *Triodia wiseana* grassland	2	Boolgeeda, Platform	Clays and clay loams with BIF and ironstone pebbles, cobbles, and sheetrock in gorges and rocky creeklines and on hillsides and breakaways	*Eucalyptus leucophloia* subsp. *leucophloia*, *Eucalyptus gamophylla* low open woodland over mixed species (typically *Gossypium robinsonii*, *Acacia hilliana*, *Grevillea wickhamii*, *Keraudrenia nephrosperma*) scattered shrubs over *Triodia wiseana* hummock grassland.	LCF07, LCF10, LCF11, LCF12, LCF14, LCF16, LCF21, LCF23, LCF24, LCF25, LCF26, LCF27, LCF28, LCF29, LCF30, LCF35, LCF39, LCF45

Vegetation Community	Plate	Land System	Substrate	Description	Quadrats
3. *Acacia* shrubland over hummock grassland	3	Boolgeeda, Newman	Sandy clay with ironstone gravel and pebbles on gentle slopes at bases of hills	*Acacia bivenosa* or *Acacia adsurgens* open shrubland over *Triodia* sp. Shovelanna Hill (S. van Leeuwen 3835) , *Triodia wiseana* hummock grassland.	LCF36, LCF41, LCF43
4. *Acacia tumida* var. *pilbarensis* scrub in creeklines	4	Boolgeeda, Platform	Clay loam and sandy clay with laterite pebbles in drainage lines	*Acacia tumida* var. *pilbarensis* tall open scrub over *Themeda triandra* tussock grassland and *Triodia wiseana* open hummock grassland.	LCF03, LCF15
5. Wannamunna Mulga grove	5	Boolgeeda, Wannamunna	Sandy clay and clay on flat plains	*Acacia aptaneura* low woodland over *Themeda triandra*, *Cymbopogon ambiguus*, *Chrysopogon fallax* open tussock grassland.	LCF31, LCF32, LCF34, LCF51
6. *Acacia aptaneura* over hummock grassland	6	Boolgeeda, Wannamunna	Broad open drainage system through stony plains with clay soils	*Acacia aptaneura* and/or *Corymbia deserticola* low woodland over *Acacia elechantha* and mixed *Eremophila* species over *Triodia wiseana* very open hummock grassland	LCF17, LCF18, LCF19, LCF20, LCF33, LCF37

Type 1: *Eucalyptus gamophylla* woodland over hummock grassland

A widespread vegetation type within the survey area, and especially within the main mining tenement and western haul road areas of the project, occurring on open plains and gentle rises.

This vegetation type had a mean Keighery health rating of 2.667 (excellent-very good) with the main disturbance causes being grazing (cattle), vehicle tracks, and erosion.

No weed species or Priority flora species were observed in this vegetation type.

Plate 1 ***Eucalyptus gamophylla*** **woodland over hummock grassland vegetation type (site LCF09)**

Type 2: *Eucalyptus leucophloia* subsp. *leucophloia* woodland over *Triodia wiseana* hummock grassland

The most widespread vegetation type within the survey area occurring on rocky ridges, hillsides, rocky minor drainage lines, and gorges.

This vegetation type had a mean Keighery health rating of 2 (excellent) with the main disturbance causes being grazing (cattle) and weeds.

The weed species *Bidens bipinnata* and *Cenchrus ciliaris* were observed at three sites in this vegetation type. No Priority flora species were observed in this vegetation type.

Plate 2 ***Eucalyptus leucophloia* subsp. *leucophloia* woodland vegetation type (site LCF24)**

Type 3: *Acacia* shrubland over hummock grassland

This is a minor vegetation type within the survey area. It occurs at three sites along the western haul road section of the survey area and on rocky gentle slopes at the base of hills.

This vegetation type had a mean Keighery health rating of 1.667 (pristine - excellent) with the main disturbance causes being grazing (cattle) and vehicle tracks.

No weed species or priority flora species were observed in this vegetation type.

Plate 3 ***Acacia*** **shrubland over hummock grassland vegetation type (site LCF36)**

Type 4: *Acacia* shrubland over hummock grassland

A minor vegetation type within the survey area, occurring at only two sites in medium-sized creek lines.

This vegetation type had a mean Keighery health rating of 3 (very good) with the main disturbance causes being grazing (cattle) and weeds.

The weed species *Bidens bipinnata* was found at one site in this vegetation type. No Priority flora species were observed in this vegetation type.

Plate 4 ***Acacia tumida* var. *pilbarensis* scrub in creeklines vegetation type (site LCF03)**

Type 5: Wannamunna Mulga grove vegetation

This vegetation type occurred primarily in the Wannamunna land system and was recorded at four sites.

This vegetation type had a mean Keighery health rating of 3 (very good) with the main disturbance causes being weeds and grazing (cattle).

The weed species *Bidens bipinnata*, *Chloris virgata*, *Malvastrum americanum*, and *Portulaca oleracea* were found in this vegetation type. Priority flora species including *Aristida calycina* var. *calycina* (Priority 2), *Aristida lazaridis* (Priority 2), and *Brachyscome* sp. Wanna Munna Flats (S. van Leeuwen 4662) (Priority 1) were observed in three sites of this vegetation type.

Plate 5 Wannamunna mulga grove vegetation type (site LCF31)

Type 6: *Acacia aptaneura* over hummock grassland

This vegetation type was recorded at seven sites, throughout the extent of the survey area but particularly in the open plains at the western end of the main mining tenement area.

This vegetation type was the most highly disturbed of all types in the current survey, and had a mean Keighery health rating of 3.57 (very good-good) with the main disturbance causes being grazing (cattle), active mining exploration, and vehicle tracks.

The weed species *Bidens bipinnata* was found at three sites in this vegetation type. The Priority flora species *Brachyscome* sp. Wanna Munna Flats (S. van Leeuwen 4662) (Priority 1) was observed at one site in this vegetation type (LCF33).

5. DISCUSSION AND RECOMMENDATIONS

5.1. SUMMARY OF RESULTS

A total of 230 species, from 110 genera and 42 families, were recorded during the survey of the Lamb Creek area, from 414 specimens collected. Of those, 209 were collected within survey quadrats; the rest were collected opportunistically.

Six main vegetation communities were recognised and mapped following field observations and statistical analysis of the field data.

5.1.1. CONSERVATION SIGNIFICANT SPECIES AND COMMUNITIES

No species of Threatened Flora (Declared Rare Flora) pursuant to the Western Australian *Wildlife Conservation Act* 1950, and no species listed as Threatened pursuant to the Commonwealth *Environmental Protection and Biodiversity Conservation Act 1999* were recorded in the project area.

Three species of Priority Flora listed by DEC were recorded during the survey, comprising one Priority 1 species (*Brachyscome* sp. Wanna Munna Flats (S. van Leeuwen 4662)) and two Priority 2 species (*Aristida calycina* var. *calycina* and *Aristida lazaridis*).

Brachyscome sp. Wanna Munna Flats (S. van Leeuwen 4662), although listed as a Priority 1 taxon, is actually the most well-known of the three Priority flora species that were recorded in the Lamb Creek survey, having ten collections in the WA Herbarium, spanning across a relatively wide area. The population recorded in the Lamb Creek project appears to be a previously unknown one, as there are no corresponding records in any of the DEC flora databases. Conservation impact on this species of the proposed Lamb Creek project should be able to be minimised by relocation of the proposed access road to intersect with the Great Northern Highway at a more northern location, however further survey should be conducted to determine the extent of this population before any disturbance is undertaken as the occurrence of the species may not be exactly defined by the extent of the land system. Because *B.* sp. Wanna Munna Flats (S. van Leeuwen 4662) was observed to occur in small numbers, evenly spread across a wide area, and due to its ephemeral life cycle, it may be difficult to avoid disturbing the species if the proposed infrastructure cannot be relocated to outside of its known habitat.

Although ranked as lower Priority than *B.* sp. Wanna Munna Flats (S. van Leeuwen 4662), *Aristida calycina* var. *calycina* and *A. lazaridis* (both Priority 2 species) are less well-known in Western Australia. *Aristida calycina* var. *calycina* is only known from a single location in WA, approximately 65 km away from our record, and *A. lazaridis* is only known from two locations. As both of these species were found at the same single site only at Lamb Creek, avoiding conservation impacts entirely should be quite possible if proposed infrastructure is planned appropriately. Further survey should be conducted in the area to determine the full extent of these populations, particularly for *A. lazaridis*, which formed a dominant species in its stratum where it was recorded, and was probably widespread and common throughout the area of similar vegetation surrounding.

No Threatened or Priority Ecological Communities listed by the DEC were recorded.

Kendrick (2002) lists a number of 'ecosystems at risk' in the Hamersley IBRA subregion including some that have brief descriptions similar to vegetation types found in the survey area (for example 'Grove/inter-grove mulga, eastern Hamersley Range' and 'Valley floor Mulga'); however given the sparseness of these descriptions it is not possible to determine if the vegetation complexes recorded in fact match the ones described by Kendrick. These vegetation complexes are not formally listed as TECs or PECs and there is little further information available about them (Jill Pryde, pers. comm.). However, in the time elapsed since publication of the Biodiversity Audit of Western Australia's 53 biogeographical subregions, significant environmental change driven primarily by mining development has occurred in

the Pilbara, and Kendrick's (2002) estimations may now be poor indications of current conservation status. For this reason significant impact on these vegetation types (particularly the *Acacia aptaneura* complexes: vegetation types 5 and 6 in this document) should be avoided where possible.

5.1.2. WEEDS

Five species of introduced flora were recorded in the project area: *Bidens bipinnata* (Bipinnate Beggartick), *Cenchrus ciliaris* (Buffel Grass), *Chloris virgata* (Feathertop Rhodes Grass), *Malvastrum americanum* (Spiked Malvastrum), and *Portulaca oleracea* (Purslane). These species were located in a total of nine sites.

None of these taxa were listed as Declared Plants by the WA Department of Agriculture and Food pursuant to section 37 of the *Agricultural and Related Resources Protection Act 1976* (Western Australia), or as Weeds of National Significance by the Commonwealth Department of Sustainability, Environment, Water, Population and Communities (SEWPaC 2012).

5.2. POTENTIAL PROJECT IMPACTS

As currently proposed, the project could impact on known habitat of the three Priority flora species observed in the Lamb Creek flora survey. The project also has the potential to impact on the 'at risk' ecological communities 'Grove/inter-grove mulga, eastern Hamersley Range' and 'Valley floor mulga' mentioned in Kendrick (2002). The project would also impact on the Wannamunna land system, a relatively uncommon land system with high conservation and pastoral value.

There is some risk of weed dispersal, particularly from the relatively weed-species rich south-west of the survey area to the relatively undisturbed main mining area.

5.3. RECOMMENDATIONS

1. Further targeted priority flora survey for *Brachyscome* sp. Wanna Munna Flats (S. van Leeuwen 4662), *Aristida calycina* var. *calycina*, and *Aristida lazaridis* should be conducted prior to disturbance to areas of the Wannamunna land system, and the associated nearby *Acacia aptaneura* groves where these taxa where recorded in the current survey.

2. Rapallo recommends avoiding impact on the Wannamunna land system vegetation where most of the Priority species where encountered.

3. If it remains necessary to impact the Wannamunna land system vegetation, consultation with the DEC is recommended before any works are undertaken.

4. A weed management program should be developed to reduce the spread of invasive plants before any further disturbance and/or clearing takes place. This should include washing down any vehicles travelling from weed-infested areas into non-infested areas.

5. Consultation with the DEC is recommended before any disturbance occurs in creek lines near watercourses in the areas of the proposed access roads in order to determine whether these areas are to be considered as wetland vegetation as specified under the *Environmental Protection Act 1986* (Section 51-O).

6. Access roads and other infrastructure should be planned to avoid disturbance to locations recorded to contain Priority Flora species including a minimum 50 m buffer around those locations is recommended. If disturbance cannot be avoided, consultation with the DEC is recommended before any clearing is undertaken

7. During project clearing, topsoil, branches and other vegetation debris should be stockpiled and returned directly to the disturbed areas for rehabilitation operations.

8. Windrows of topsoil, log debris and leaf litter formed during clearing should be retained.

9. Where possible ensure no ground engagements (the grader held blade up) when clearing or re-clearing the existing access tracks.

10. Ensure rapid rehabilitation of cleared areas such as laydown sites, access tracks and grid lines when they are no longer required.

Appendices

Appendix I: State and Federal Conservation Codes

Conservation Listings under the Environment Protection and Conservation Act 1999 (EPBC Act)

Threatened fauna and flora may be listed in any one of the following categories as defined in Section 179 of the EPBC Act. Section 179 Categories of threatened species

Extinct

(1) A native species is eligible to be included in the extinct category at a particular time if, at that time, there is no reasonable doubt that the last member of the species has died.

Extinct in the Wild

(2) A native species is eligible to be included in the extinct in the wild category at a particular time if, at that time:

(a) it is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; or

(b) it has not been recorded in its known and/or expected habitat, at appropriate seasons, anywhere in its past range, despite exhaustive surveys over a time frame appropriate to its life cycle and form.

Critically Endangered

(3) A native species is eligible to be included in the critically endangeredcategory at a particular time if, at that time, it is facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with the prescribed criteria.

Endangered

(4) A native species is eligible to be included in the endangered category at a particular time if, at that time:

(a) it is not critically endangered; and

(b) it is facing a very high risk of extinction in the wild in the near future, as determined in accordance with the prescribed criteria.

Vulnerable

(5) A native species is eligible to be included in the vulnerable category at a particular time if, at that time:

(a) it is not critically endangered or endangered; and

(b) it is facing a high risk of extinction in the wild in the medium term future, as determined in accordance with the prescribed criteria.

Conservation Dependent

(6) A native species is eligible to be included in the conservation dependent category at a particular time if, at that time:

(a) the species is the focus of a specific conservation program the cessation of which would result in the species becoming vulnerable, endangered or critically endangered; or

(b) the following subparagraphs are satisfied:

(i) the species is a species of fish;

(ii) the species is the focus of a plan of management that provides for management actions necessary to stop the decline of, and support the recovery of, the species so that its chances of long term survival in nature are maximised;

(iii) the plan of management is in force under a law of the Commonwealth or of a State or Territory;

(iv) cessation of the plan of management would adversely affect the conservation status of the species.

(7) In subsection (6): fish includes all species of bony fish, sharks, rays, crustaceans, molluscs and other marine organisms, but does not include marine mammals or marine reptiles.

Species listed as 'conservation dependent' and 'extinct' are not matters of national environmental significance and therefore do not trigger the EPBC Act.

Categories and definitions of Threatened Flora species under the *Wildlife Conservation Act (1950)* of Western Australia, taken directly from the DEC WA Herbarium website.

Under the *Wildlife Conservation Act(1950)* the Minister for the Environment may declare species of flora to be protected if they are considered to be in danger of extinction, rare or otherwise in need of special protection. Schedules 1 and 2 deal with those that are threatened and those that are presumed extinct, respectively.

T:Threatened Flora (Declared Rare Flora - Extant)

Taxa which have been adequately searched for and are deemed to be in the wild either rare, in danger of extinction, or otherwise in need of special protection, and have been gazetted as such (Schedule 1 under the *Wildlife Conservation Act 1950*).

Threatened Flora (Schedule 1) are further ranked by the Department according to their level of threat using IUCN Red List criteria:

- CR: Critically Endangered – considered to be facing an extremely high risk of extinction in the wild
- EN: Endangered – considered to be facing a very high risk of extinction in the wild
- VU: Vulnerable – considered to be facing a high risk of extinction in the wild.

X:Presumed Extinct Flora (Declared Rare Flora - Extinct)

Taxa which have been adequately searched for and there is no reasonable doubt that the last individual has died, and have been gazetted as such (Schedule 2 under the *Wildlife Conservation Act 1950*).

Species that have not yet been adequately surveyed to be listed under Schedule 1 or 2 are added to the Priority Flora List under Priorities 1, 2 or 3. These three categories are ranked in order of priority for survey and evaluation of conservation status so that consideration can be given to their declaration as threatened flora or fauna. Species that are adequately known, are rare but not threatened, or meet criteria for Near Threatened, or that have been recently removed from the threatened list for other than taxonomic reasons, are placed in Priority 4. These species require regular monitoring. Conservation Dependent species are placed in Priority 5.

Priority One - Poorly Known Taxa

Species that are known from one or a few collections or sight records (generally less than five), all on lands not managed for conservation, e.g. agricultural or pastoral lands, urban areas, Shire, Westrail and Main Roads WA road, gravel and soil reserves, and active mineral leases and under threat of habitat destruction or degradation. Species may be included if they are comparatively well known from one or more localities but do not meet adequacy of survey requirements and appear to be under immediate threat from known threatening processes.

Priority Two - Poorly Known Taxa

Species that are known from one or a few collections or sight records, some of which are on lands not under imminent threat of habitat destruction or degradation, e.g. national parks, conservation parks, nature reserves, State forest, vacant Crown land, water reserves, etc. Species may be included if they are comparatively well known from one or more localities but do not meet adequacy of survey requirements and appear to be under threat from known threatening processes.

Priority Three - Poorly Known Taxa

Species that are known from collections or sight records from several localities not under imminent threat, or from few but widespread localities with either large population size or significant remaining areas of apparently suitable habitat, much of it not under imminent threat. Species may be included if they are comparatively well known from several localities but do not meet adequacy of survey requirements and known threatening processes exist that could affect them.

Priority Four – Rare, Near Threatened and other species in need of monitoring

- Rare. Species that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection, but could be if present circumstances change. These species are usually represented on conservation lands.
- Near Threatened. Species that are considered to have been adequately surveyed and that do not qualify for Conservation Dependent, but that are close to qualifying for Vulnerable.
- Species that have been removed from the list of threatened species during the past five years for reasons other than taxonomy.

Priority Five – Conservation Dependent species

Species that are not threatened but are subject to a specific conservation program, the cessation of which would result in the species becoming threatened within five years.

Definitions and criteria for presumed totally destroyed, critically endangered, endangered and vulnerable ecological communities, taken from DEC (2010).

THREATENED ECOLOGICAL COMMUNITIES

A **threatened ecological community** (TEC) is one which is found to fit into one of the following categories; "presumed totally destroyed", "critically endangered", "endangered" or "vulnerable".

Presumed Totally Destroyed (PD)

An ecological community that has been adequately searched for but for which no representative occurrences have been located. The community has been found to be totally destroyed or so extensively modified throughout its range that no occurrence of it is likely to recover its species composition and/or structure in the foreseeable future.

Critically Endangered (CR)

An ecological community that has been adequately surveyed and found to have been subject to a major contraction in area and/or that was originally of limited distribution and is facing severe modification or destruction throughout its range in the immediate future, or is already severely degraded throughout its range but capable of being substantially restored or rehabilitated.

Endangered (EN)

An ecological community that has been adequately surveyed and found to have been subject to a major contraction in area and/or was originally of limited distribution and is in danger of significant modification throughout its range or severe modification or destruction over most of its range in the near future.

Vulnerable (VU)

An ecological community that has been adequately surveyed and is found to be declining and/or has declined in distribution and/or condition and whose ultimate security has not yet been assured and/or a community that is still widespread but is believed likely to move into a category of higher threat in the near future if threatening processes continue or begin operating throughout its range.

PRIORITY ECOLOGICAL COMMUNITIES

Possible threatened ecological communities that do not meet survey criteria or that are not adequately defined are added to the **Priority Ecological Community** List under priorities 1, 2 and 3. These three categories are ranked in order of priority for survey and/or definition of the community, and evaluation of conservation status, so that consideration can be given to their declaration as threatened ecological communities. Ecological communities that are adequately known, and are rare but not threatened or meet criteria for Near Threatened, or that have been recently removed from the threatened list, are placed in Priority 4. These ecological communities require regular monitoring. Conservation Dependent ecological communities are placed in Priority 5.

Priority One: Poorly-known ecological communities

Ecological communities that are known from very few occurrences with a very restricted distribution (generally ≤5 occurrences or a total area of ≤ 100ha). Occurrences are believed to be under threat either due to limited extent, or being on lands under immediate threat (e.g. within agricultural or pastoral lands, urban areas, active mineral leases) or for which current threats exist. May include communities with occurrences on protected lands. Communities may be included if they are comparatively well-known from one or more localities but do not meet adequacy of survey requirements, and/or are not well defined, and appear to be under immediate threat from known threatening processes across their range.

Priority Two: Poorly-known ecological communities

Communities that are known from few occurrences with a restricted distribution (generally ≤10 occurrences or a total area of ≤200ha). At least some occurrences are not believed to be under immediate threat of destruction or degradation. Communities may be included if they are comparatively well known from one or more localities but do not meet adequacy of survey requirements, and/or are not well defined, and appear to be under threat from known threatening processes.

Priority Three: Poorly known ecological communities

(i) Communities that are known from several to many occurrences, a significant number or area of which are not under threat of habitat destruction or degradation or:

(ii) communities known from a few widespread occurrences, which are either large or with significant remaining areas of habitat in which other occurrences may occur, much of it not under imminent threat, or;

(iii) communities made up of large, and/or widespread occurrences, that may or may not be represented in the reserve system, but are under threat of modification across much of their range from processes such as grazing by domestic and/or feral stock, and inappropriate fire regimes.

Communities may be included if they are comparatively well known from several localities but do not meet adequacy of survey requirements and/or are not well defined, and known threatening processes exist that could affect them.

Priority Four: Ecological communities that are adequately known, rare but not threatened or meet criteria for Near Threatened, or that have been recently removed from the threatened list. These communities require regular monitoring.

(i) Rare. Ecological communities known from few occurrences that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection, but could be if present circumstances change. These communities are usually represented on conservation lands.

(ii) Near Threatened. Ecological communities that are considered to have been adequately surveyed and that do not qualify for Conservation Dependent, but that are close to qualifying for Vulnerable.

(iii) Ecological communities that have been removed from the list of threatened communities during the past five years.

Priority Five: Conservation Dependent ecological communities

Ecological communities that are not threatened but are subject to a specific conservation program, the cessation of which would result in the community becoming threatened within five years.

Appendix II: Vegetation condition scale (Keighery 1994)

Vegetation condition scale (Keighery, 1994)

Vegetation Condition	Definition
Pristine (1)	Pristine or nearly so, no obvious signs of disturbance.
Excellent (2)	Vegetation structure intact, disturbance affecting individual species and weeds are non-aggressive species.
Very Good (3)	Vegetation structure altered, obvious signs of disturbance. For example, disturbance to vegetation structure caused by repeated fires, the presence of some more aggressive weeds, dieback, logging and grazing.
Good (4)	Vegetation structure significantly altered by very obvious signs of multiple disturbances. Retains basic vegetation structure or ability to regenerate it. For example, disturbance to vegetation structure caused by very frequent fires, the presence of some very aggressive weeds at high density, partial clearing, dieback and grazing.
Degraded (5)	Basic vegetation structure severely impacted by disturbance. Scope for regeneration but not to a state approaching good condition without intensive management. For example, disturbance to vegetation structure caused by very frequent fires, the presence of very aggressive weeds, partial clearing, dieback and grazing.
Completely Degraded (6)	The structure of the vegetation is no longer intact and the area is completely or almost completely without native species. These areas are often described as 'parkland cleared' with the flora comprising weed or crop species with isolated native trees or shrubs.

Appendix III: List of Flora Species Recorded during the Survey

Family	LSS	Taxonomic Name
Lauraceae	80	*Cassytha capillaris*
Cyperaceae	156	*Bulbostylis barbata*
		Cyperus cunninghamii subsp. *cunninghamii*
		Eragrostis cumingii
		Eragrostis eriopoda
		Eragrostis pergracilis
		Eragrostis tenellula
		Fimbristylis dichotoma
		Fimbristylis simulans
Poaceae	163	*Amphipogon caricinus* subsp. *caricinus*
		Amphipogon sericeus
		Aristida calycina var. *calycina* **(P2)**
		Aristida contorta
		Aristida holathera
		Aristida inaequiglumis
		Aristida lazaridis **(P2)**
		**Cenchrus ciliaris*
		Chloris pectinata
		**Chloris virgata*
		Chrysopogon fallax
		Cymbopogon ambiguus
		Cymbopogon obtectus
		Dactyloctenium radulans
		Digitaria ctenantha
		Enneapogon caerulescens
		Enneapogon polyphyllus
		Enteropogon ramosus
		Eriachne aristidea
		Eriachne helmsii
		Eriachne obtusa
		Eriachne pulchella subsp. *pulchella*

Family	LSS	Taxonomic Name
		Eulalia aurea
		Iseilema membranaceum
		Paraneurachne muelleri
		Paspalidium basicladum
		Paspalidium rarum
		Paspalidium tabulatum
		Perotis rara
		Schizachyrium fragile
		Sporobolus australasicus
		Themeda triandra
		Tragus australianus
		Triodia sp. Shovelanna Hill (S. van Leeuwen 3835)
		Triodia brizoides
		Triodia wiseana
		Triraphis mollis
		Urochloa holosericea subsp. *velutina*
		Urochloa piligera
Menispermaceae	169	*Tinospora smilacina*
Proteaceae	175	*Grevillea stenobotrya*
		Grevillea wickhamii
		Grevillea wickhamii subsp. *hispidula*
		Hakea lorea
Zygophyllaceae	199	*Tribulopis angustifolia*
		Tribulus astrocarpus
		Tribulus hirsutus
		Tribulus platypterus
Fabaceae	201	*Acacia adoxa* var. *adoxa*
		Acacia adsurgens
		Acacia ancistrocarpa
		Acacia aptaneura
		Acacia arida

Family	LSS	Taxonomic Name
		Acacia bivenosa
		Acacia dictyophleba
		Acacia elachantha
		Acacia hilliana
		Acacia inaequilatera
		Acacia maitlandii
		Acacia marramamba
		Acacia minyura
		Acacia monticola
		Acacia pachyacra
		Acacia pruinocarpa
		Acacia pyrifolia var. *morrisonii*
		Acacia steedmanii subsp. *borealis*
		Acacia synchronicia
		Acacia tenuissima
		Acacia tumida var. *pilbarensis*
		Acacia xiphophylla
		Crotalaria medicaginea
		Gompholobium sp. Pilbara (NF Norris 908)
		Indigofera georgei
		Indigofera monophylla
		Rhynchosia minima
		Senna artemisioides subsp. *filifolia*
		Senna artemisioides subsp. *helmsii*
		Senna artemisioides subsp. *oligophylla*
		Senna artemisioides subsp. *sturtii*
		Senna ferraria
		Senna glutinosa subsp. *glutinosa*
		Senna glutinosa subsp. *pruinosa*
		Senna notabilis
		Senna venusta

Family	LSS	Taxonomic Name
		Tephrosia densa
		Tephrosia supina
Surianaceae	202	*Stylobasium spathulatum*
Polygalaceae	203	*Polygala isingii*
Moraceae	211	*Ficus brachypoda*
Cucurbitaceae	224	*Cucumis maderaspatanus*
Celastraceae	229	*Stackhousia intermedia*
Euphorbiaceae	242	*Euphorbia australis*
		Euphorbia biconvexa
		Euphorbia boophthona
		Euphorbia latrobei subsp. *filiformis*
		Euphorbia tannensis subsp. *eremophila*
Phyllanthaceae	247	*Phyllanthus maderaspatensis*
Violaceae	261	*Hybanthus aurantiacus*
Myrtaceae	281	*Corymbia ?opaca*
		Corymbia deserticola
		Corymbia hamersleyana
		Eucalyptus ?victrix
		Eucalyptus ?xerothermica
		Eucalyptus gamophylla
		Eucalyptus kingsmillii subsp. *kingsmillii*
		Eucalyptus leucophloia subsp. *leucophloia*
Sapindaceae	299	*Dodonaea coriacea*
		Dodonaea viscosa subsp. *mucronata*
Malvaceae	309	*Abutilon dioicum*
		Abutilon indicum
		Abutilon otocarpum
		Corchorus incanus subsp. *lithophilus*
		Corchorus lasiocarpus subsp. *lasiocarpus*
		Gossypium australe
		Gossypium robinsonii

Family	LSS	Taxonomic Name
		Hibiscus burtonii
		Hibiscus coatesii
		Hibiscus sturtii var. *campylochlamys*
		Hibiscus sturtii var. *platychlamys*
		Keraudrenia nephrosperma
		**Malvastrum americanum*
		Rulingia luteiflora
		Sida ?echinocarpa
		Sida ?sp. Spiciform panicles (E. Leyland s.n. 14/8/90)
		Sida ?sp. Supplejack Station (T.S. Henshall 2345)
		Sida arenicola
		Sida fibulifera
		Sida platycalyx
		Sida sp. Golden calyces glabrous (H.N. Foote 32)
		Sida sp. Pilbara (A.A. Mitchell PRP 1543)
		Sida sp. Tiny fruits (AA Mitchell PRP1152)
		Triumfetta maconochieana
Gyrostemonaceae	328	*Codonocarpus cotinifolius*
Capparaceae	330	*Capparis lasiantha*
		Capparis spinosa var. *nummularia*
Brassicaceae	332	*Cleome oxalidea*
		Cleome viscosa
		Lepidium echinatum
		Stenopetalum anfractum
		Stenopetalum pedicellare
Santalaceae	338	*Santalum lanceolatum*
Loranthaceae	339	*Amyema sanguinea* var. *sanguinea*
		Lysiana murrayi
Caryophyllaceae	355	*Polycarpaea corymbosa* var. *corymbosa*
		Polycarpaea holtzei
		Polycarpaea longiflora

Family	LSS	Taxonomic Name
Amaranthaceae	357	*Alternanthera nana*
		Gomphrena canescens subsp. *canescens*
		Gomphrena cunninghamii
		Ptilotus astrolasius
		Ptilotus calostachyus
		Ptilotus clementii
		Ptilotus exaltatus var. *exaltatus*
		Ptilotus fusiformis
		Ptilotus gaudichaudii var. *gaudichaudii*
		Ptilotus helipteroides
		Ptilotus macrocephalus
		Ptilotus obovatus subsp. *obovatus*
		Ptilotus polystachyus
		Ptilotus rotundifolius
Chenopodiaceae	358	*Dysphania glomulifera* subsp. *eremaea*
		Dysphania kalpari
		Dysphania rhadinostachya
		Enchylaena tomentosa
		Maireana villosa
		Rhagodia eremaea
		Salsola australis
		Sclerolaena cornishiana
Aizoaceae	364	*Trianthema glossostigma*
Nyctaginaceae	367	*Boerhavia gardneri*
Portulacaceae	374	*Calandrinia ptychosperma*
		**Portulaca oleracea*
Rubiaceae	409	*Oldenlandia crouchiana*
		Psydrax latifolia
Rubiaceae	409	*Psydrax rigidula*
Apocynaceae	413	*Cynanchum floribundum*
		Rhyncharrhena linearis

Family	LSS	Taxonomic Name
Boraginaceae	415	*Heliotropium tenuifolium*
		Trichodesma zeylanicum var. *zeylanicum*
Convolvulaceae	416	*Bonamia rosea*
		Convolvulus angustissimus subsp. *angustissimus*
		Duperreya commixta
		Evolvulus alsinoides var. *villosicalyx*
		Ipomoea polymorpha
Solanaceae	417	*Nicotiana occidentalis* subsp. *obliqua*
		Solanum ferocissimum
		Solanum lasiophyllum
		Solanum phlomoides
Oleaceae	423	*Jasminum didymum* subsp. *lineare*
Plantaginaceae	427	*Stemodia grossa*
		Stemodia viscosa
Scrophulariaceae	428	*Eremophila forrestii* subsp. *forrestii*
		Eremophila fraseri subsp. *fraseri*
		Eremophila lachnocalyx
		Eremophila longifolia
Lamiaceae	432	*Clerodendrum ?tomentosum*
		Clerodendrum floribundum var. *angustifolium*
		Newcastelia sp. Hamersley Range (S. van Leeuwen 4264)
		Spartothamnella teucriiflora
Goodeniaceae	458	*Dampiera candicans*
		Goodenia forrestii
		Goodenia microptera
		Goodenia muelleriana
		Goodenia prostrata
		Goodenia stobbsiana
		Scaevola browniana subsp. *browniana*
		Scaevola parvifolia subsp. *pilbarae*
Asteraceae	460	**Bidens bipinnata*

Family	LSS	Taxonomic Name
		Brachyscome sp. Wanna Munna Flats (S. van Leeuwen 4662) **(P1)**
		Pterocaulon serrulatum
		Rhodanthe floribunda
Araliaceae	472	*Trachymene oleracea*

Appendix IV: Coordinates of Conservation Significant Taxa recorded in the Project Area

Taxon name	Conservation status	Quadrat	Latitude	Longitude
Brachyscome sp. Wanna Munna Flats (S. van Leeuwen 4662)	P1	LCF33	-22.878188	118.801596
		LCF34	-22.879474	118.801194
		LCF51	-22.878959	118.802863
Aristida calycina var. *calycina*	P2	LCF31	-22.865242	118.802478
Aristida lazaridis	P2			

Appendix V: Vegetation Structural Classes

Vegetation Structural Classes – Specht (1970) as modified by Aplin (1979)

Stratum	Canopy Cover (%)				
	70-100%	30-70%	10-30%	2-10%	<2%
Trees >30m	Tall closed forest	Tall open forest	Tall woodland	Tall open woodland	Scattered tall trees
Trees 10-30m	Closed forest	Open forest	Woodland	Open woodland	Scattered trees
Trees <10m	Low closed forest	Low open forest	Low woodland	Low open woodland	Scattered low trees
Shrubs >2m	Tall closed scrub	Tall open scrub	Tall shrubland	Tall open shrubland	Scattered tall shrubs
Shrubs 1-2 m	Closed heath	Open heath	Shrubland	Open shrubland	Scattered shrubs
Shrubs <1 m	Low closed heath	Low open heath	Low shrubland	Low open shrubland	Scattered low shrubs
Hummock grasses	Closed hummock grassland	Hummock grassland	Open hummock grassland	Very open hummock grassland	Scattered hummock grasses
Grasses Sedges, Herbs	Closed tussock grassland/bunch grassland /sedgeland /herbland	Tussock grassland/ bunch grassland/ sedgeland/ herbland	Open tussock grassland / bunch grassland/ sedgeland / herbland	Very open tussock grassland / bunch grassland / sedgeland / herbland	Scattered tussock grasses / bunch grasses / sedges / herbs

Appendix VI: Flora Quadrat Survey Site Descriptions

Lamb Creek Level 2 Flora and Vegetation Survey - Site LCF01							
Botanist	Chid	**Date**	3/27/2012	**Site area**	Quadrat 50 x 50 m		
Location	50K		695006 **mE**	7477811 **mN**	**Elevation** 733 m		
Topography and Geology	Landform: Low plateau / flat hilltop Soil: red brown clay loam. Geology: 95% cover of laterite, ironstone gravel, pebbles.						
Veg Condition	2	**Disturbances**	catte	**Land System**	Newman		
Site Photo							
Vegetation	*Eucalyptus leucophloia* subsp. *leucophloia* scattered low trees over *Acacia hilliana* scattered low shrubs over *Triodia wiseana, Triodia brizoides* hummock grassland.						
Species	*Acacia adoxa* var. *adoxa* *Acacia ancistrocarpa* *Acacia hilliana* *Bulbostylis barbata* *Cassytha capillaris* *Dysphania rhadinostachya* *Eriachne obtusa* *Eucalyptus leucophloia* subsp. *leucophloia* *Goodenia microptera* *Goodenia stobbsiana* *Hakea lorea*			*Keraudrenia nephrosperma* *Polycarpaea holtzei* *Ptilotus calostachyus* *Ptilotus rotundifolius* *Santalum lanceolatum* *Senna glutinosa* subsp. *glutinosa* *Senna glutinosa* subsp. *pruinosa* *Solanum lasiophyllum* *Triodia brizoides* *Triodia wiseana*			

Lamb Creek Level 2 Flora and Vegetation Survey - Site LCF02					
Botanist	Linda	**Date**	3/27/2012	**Site area**	Quadrat 50 x 50 m
Location	50K		694402 **mE**	7477855 **mN**	**Elevation** 731 m
Topography and Geology	Landform: Rolling hills Aspect and Slope: variable. Soil: orange brown clay. Geology: 100% cover of BIF, laterite pebbles.				
Veg Condition	2	**Disturbances**	none	**Land System**	Newman
Site Photo					
Vegetation	*Eucalyptus leucophloia* subsp. *leucophloia, Corymbia* deserticola scattered low trees over *Triodia wiseana, Triodia brizoides* hummock grassland.				
Species	*Acacia adoxa* var. *adoxa* *Bulbostylis barbata* *Capparis lasiantha* *Cassytha capillaris* *Corymbia deserticola* *Dysphania rhadinostachya* *Eriachne helmsii* *Eucalyptus leucophloia* subsp. *leucophloia* *Euphorbia australis* *Goodenia microptera* *Goodenia stobbsiana*			*Hakea lorea* *Keraudrenia nephrosperma* *Polycarpaea holtzei* *Ptilotus calostachyus* *Ptilotus rotundifolius* *Senna glutinosa* subsp. *glutinosa* *Senna glutinosa* subsp. *pruinosa* *Solanum lasiophyllum* *Triodia brizoides* *Triodia wiseana*	

Lamb Creek Level 2 Flora and Vegetation Survey - Site LCF03							
Botanist	Chid	**Date**	3/27/2012	**Site area**	Quadrat 50 x 50 m		
Location	50K		694242 **mE**	7477624 **mN**	**Elevation** 726 m		
Topography and Geology	Landform: Creekline Soil: orange clay loam. Geology: 5% cover of laterite pebbles.						
Veg Condition	3	**Disturbances**	cattle, weeds	**Land System**	Platform		
Site Photo							
Vegetation	*Acacia tumida* var. *pilbarensis* tall closed scrub with *Duperreya commixta* creepers over *Themeda triandra* tussock grassland and *Triodia wiseana* open hummock grassland.						
Species	*Acacia tumida* var. *pilbarensis* *Clerodendrum floribundum* var. *angustifolium* *Corymbia hamersleyana* *Dodonaea viscosa* subsp. *mucronata* *Duperreya commixta* *Eriachne helmsii*			*Eucalyptus leucophloia* subsp. *leucophloia* *Keraudrenia nephrosperma* *Rulingia luteiflora* *Senna glutinosa* subsp. *pruinosa* *Themeda triandra* *Triodia wiseana*			

Lamb Creek Level 2 Flora and Vegetation Survey - Site LCF04							
Botanist	Chid	**Date**	3/27/2012	**Site area**	Quadrat 50 x 50 m		
Location	50K		693654 **mE**	7477707 **mN**	**Elevation** 719 m		
Topography and Geology	Landform: Flat low plateau / plain Soil: red brown clay loam. Geology: 95% cover of laterite, ironstone gravel, pebbles.						
Veg Condition	3	**Disturbances**	cattle, tracks nearby, weeds	**Land System**	Platform		
Site Photo							
Vegetation	*Eucalyptus gamophylla* scattered low trees over *Triodia brizoides, Triodia wiseana* hummock grassland.						
Species	*Acacia ancistrocarpa* *Acacia hilliana* *Acacia pruinocarpa* *Acacia tenuissima* *Amphipogon caricinus* subsp. *caricinus* *Aristida contorta* *Aristida holathera* *Bulbostylis barbata* *Dysphania rhadinostachya* *Enneapogon polyphyllus* *Eriachne helmsii* *Eucalyptus gamophylla* *Goodenia microptera*				*Goodenia stobbsiana* *Hakea lorea* *Indigofera monophylla* *Jasminum didymum* subsp. *lineare* *Keraudrenia nephrosperma* *Polycarpaea holtzei* *Ptilotus calostachyus* *Ptilotus obovatus* var. *obovatus* *Schizachyrium fragile* *Senna artemisioides* subsp. *oligophylla* *Solanum lasiophyllum* *Triodia brizoides* *Triodia wiseana*		

Lamb Creek Level 2 Flora and Vegetation Survey - Site LCF05					
Botanist	Linda	**Date**	3/28/2012	**Site area**	Quadrat 50 x 50 m
Location	50K		692223 **mE**	7477666 **mN**	**Elevation** 699 m
Topography and Geology	Landform: Flat low plateau / plain Aspect and Slope: flat Soil: red clay. Geology: 90% cover of laterite (colluvial) gravels.				
Veg Condition	3	**Disturbances**	grazing, weeds, signs of old fires	**Land System**	McKay
Site Photo					
Vegetation	*Corymbia deserticola* scattered low trees over *Acacia elachantha* tall open shrubland over *Acacia hilliana, Acacia minyura, Senna artemisioides* subsp. *helmsii* low shrubland over *Eulalia aurea, Cymbopogon ambiguous* open tussock grassland and mixed scattered herbs.				

Species	
Abutilon otocarpum	*Euphorbia biconvexa*
Acacia aptaneura	*Evolvulus alsinoides* var. *villosicalyx*
Acacia elachantha	*Gomphrena canescens* subsp. *canescens*
Acacia elachantha	*Paspalidium rarum*
Acacia minyura	*Perotis rara*
Cassytha capillaris	*Ptilotus obovatus* subsp. *obovatus*
Corymbia deserticola	*Rhynchosia minima*
Cymbopogon ambiguus	*Senna artemisioides* subsp. *helmsii*
Dysphania rhadinostachya	*Senna notabilis*
Eremophila longifolia	*Sporobolus australasicus*
Eulalia aurea	*Triodia wiseana*

Lamb Creek Level 2 Flora and Vegetation Survey - Site LCF06					
Botanist	Linda	**Date**	3/28/2012	**Site area**	Quadrat 50 x 50 m
Location	50K		692877 **mE**	7477377 **mN**	**Elevation** 722 m
Topography and Geology	Landform: Flat plain Soil: red clay. Geology: 90% cover of BIF colluvial fragments mostly <1cm, some 2-5%.				
Veg Condition	4	**Disturbances**	fire 1-2 years previous, old clearing, scrap piles, tracks (>3 years ago).	**Land System**	McKay
Site Photo					
Vegetation	*Corymbia deserticola* scattered low trees over *Acacia elachantha* shrubland over *Keraudrenia nephrosperma, Bonamia rosea, Senna artemisioides* subsp. *oligophylla* low open shrubland over *Triodia brizoides* very open hummock grassland.				
Species	*Abutilon dioicum* *Acacia ancistrocarpa* *Acacia elachantha* *Aristida contorta* *Bonamia rosea* *Corymbia deserticola* *Cymbopogon ambiguus* *Eucalyptus leucophloia* subsp. *leucophloia* *Evolvulus alsinoides* var. *villosicalyx* *Goodenia microptera* *Goodenia stobbsiana*		*Indigofera monophylla* *Keraudrenia nephrosperma* *Ptilotus calostachyus* *Senna artemisioides* subsp. *oligophylla* *Senna glutinosa* subsp. *glutinosa* *Senna notabilis* *Sida arenicola* *Sida sp. Pilbara (A.A. Mitchell PRP 1543)* *Trianthema glossostigma* *Triodia brizoides*		

Lamb Creek Level 2 Flora and Vegetation Survey - Site LCF07					
Botanist	Linda	**Date**	3/28/2012	**Site area**	Quadrat 50 x 50 m
Location	50K		694241 **mE**	7477202 **mN**	**Elevation** 710 m
Topography and Geology	Landform: Small dissected creekline through gently undulating country Soil: red clay. Geology: 100% cover of BIF cobbles.				
Veg Condition	2	**Disturbances**	none	**Land System**	Platform
Site Photo					
Vegetation	*Eucalyptus gamophylla* low woodland over *Acacia elachantha* tall shrubland over *Triodia wiseana* hummock grassland and *Hybanthus aurantiacus, Crotalaria medicaginea* scattered herbs.				

Species	
Acacia adoxa var. *adoxa*	*Gossypium australe*
Acacia bivenosa	*Hakea lorea*
Acacia elachantha	*Hybanthus aurantiacus*
Bulbostylis barbata	*Indigofera monophylla*
Cassytha capillaris	*Paspalidium basicladum*
Corchorus lasiocarpus subsp. *lasiocarpus*	*Perotis rara*
Crotalaria medicaginea	*Rhynchosia minima*
Cymbopogon ambiguus	*Senna artemisioides* subsp. *oligophylla*
Enneapogon caerulescens	*Tephrosia densa*
Eucalyptus gamophylla	*Triodia wiseana*
Evolvulus alsinoides var. *villosicalyx*	

Lamb Creek Level 2 Flora and Vegetation Survey - Site LCF08						
Botanist	Linda	**Date**	3/28/2012	**Site area**	Quadrat 50 x 50 m	
Location	50K		693763 **mE**	7476932 **mN**	**Elevation** 730 m	
Topography and Geology	Landform: Gently undulating plains with dissected minor drainage lines Aspect and Slope: W (270°) gentle <5%. Soil: red clay. Geology:90% cover of BIF 2-10 cm.					
Veg Condition	3	**Disturbances**	old tracks, clearing	**Land System**	Platform	
Site Photo						
Vegetation	*Corymbia deserticola* scattered low trees over *Triodia wiseana, Triodia brizoides* hummock grassland.					
Species	*Acacia adoxa* var. *adoxa* *Acacia hilliana* *Acacia elachantha* *Bulbostylis barbata* *Corymbia deserticola* *Dysphania rhadinostachya* *Eremophila longifolia* *Fimbristylis dichotoma* *Fimbristylis simulans* *Goodenia microptera*			*Goodenia stobbsiana* *Hakea lorea* *Ptilotus calostachyus* *Senna artemisioides* subsp. *oligophylla* *Senna glutinosa* subsp. *glutinosa* *Senna glutinosa* subsp. *pruinosa* *Solanum lasiophyllum* *Triodia brizoides* *Triodia wiseana*

Species	
Acacia aptaneura	*Keraudrenia nephrosperma*
Acacia elachantha	*Paraneurachne muelleri*
Acacia tenuissima	*Polycarpaea holtzei*
Aristida contorta	*Ptilotus astrolasius*
Corymbia ?hamersleyana	*Ptilotus calostachyus*
Cymbopogon ambiguus	*Ptilotus exaltatus* var. *exaltatus*
Cymbopogon obtectus	*Ptilotus rotundifolius*
Dodonaea viscosa subsp. *mucronata*	*Rhynchosia minima*
Eucalyptus gamophylla	*Scaevola parvifolia* subsp. *pilbarae*
Fimbristylis simulans	*Schizachyrium fragile*
Gossypium robinsonii	*Senna artemisioides* subsp. *oligophylla*
Grevillea wickhamii	*Senna glutinosa* subsp. *pruinosa*
Hibiscus sturtii var. *campylochlamys*	*Sida arenicola*
Hybanthus aurantiacus	*Solanum lasiophyllum*
Indigofera monophylla	*Tephrosia densa*
Jasminum didymum subsp. *lineare*	*Triodia ?brizoides*
	Triodia wiseana

Executive summary

The Lamb Creek Iron Ore Project comprises a proposed mining area and an associated haul road, located approximately 130 kilometres north-west of Newman in the Pilbara region of Western Australia.

This report documents the findings of a desktop assessment and two field surveys (April 2020 and February 2021), that were conducted to identify the occurrence of vertebrate fauna species, and their supporting habitats, within the survey area.

Survey Area

The survey area was 1645 hectares (ha) in size. It comprised retention licence R47/19 the proposed haul road corridor within miscellaneous licence L47/736 and an alternative haul road section named 'intersection version B'.

An earlier survey of the Lamb Creek project was completed by Rapallo in 2012. That survey covered the same retention licence (R47/19), as well as two haul road options: a northern and a southern route. The 2012 northern route overlaps with 44% of the current haul road corridor. The 2012 southern route has been discounted as an option.

The Lamb Creek project area has been updated and expanded since the survey was completed. The current project area (as per December 2021) comprises retention licence R47/19 (pending conversion into mining lease M47/1592) and miscellaneous licences L47/736, L47/974, and L47/1008. Together these tenements cover an area of 2199 hectares. There is significant overlap between the tenements (Figure 1.1) hence this number is not cumulative. The fauna survey covered 1644 hectares (75%) of the current project area.

A proposed disturbance footprint (footprint V1) was provided by MRL prior to the survey in March 2020. This footprint formed the basis for site selection and survey planning. Footprint V1 has been superseded by footprint V3, which was provided by MRL in December 2021 after all fieldwork had been completed. Footprint V3 extends by 24 hectares (4% of footprint) outside of the survey area, most of which comprising the southern end of the proposed haul road.

Desktop

The region has had considerable survey effort over the last 20 years predominantly due to vertebrate fauna surveys completed within, or partly within, the boundary of the Mining Area C (MAC) Development Envelope. The MAC Development Envelope is approximately 10 kilometres south of the Lamb Creek retention licence (R4719). Mining Area C contains the same land systems as the Lamb Creek survey area and has similar habitats.

Lamb Creek was surveyed for vertebrate fauna in 2012, over a survey area that partially overlaps with the current project area. The detailed survey effort consisted of ten trap sites with a total trap effort of 2982 trap nights (pitfalls, Elliots and funnel traps). Cameras and cages were deployed for 182 camera nights and 300 cage trap nights respectively within gorges and the faces of rocky escapements. Other activities included spotlighting, habitat assessment, foraging , systematic bird survey and bat survey.

The desktop study identified 301 species of terrestrial vertebrate fauna recorded within 50 kilometres of the survey area. These included 157 birds, 46 mammals, 91 reptiles, and 7 amphibians. Not all species are likely to occur in the survey area due to the large search extent of the desktop assessment.

Additionally, many species tend to be patchily distributed even where appropriate habitats are present, and many species of birds can occur as regular migrants, occasional visitors or vagrants.

Discounting species listed as marine, the fauna desktop study identified 29 taxa of conservation significant fauna of which twelve were assessed as possible, likely, or confirmed to occur on the survey area. The remaining seventeen species identified by the desktop assessment were considered unlikely to highly unlikely occur in the survey area based on the absence of suitable habitat for the species and/or the survey area occurring well outside the known distribution of the species.

Field Survey

A detailed vertebrate fauna survey was completed by Rapallo over a period of 15 days from 16 to 28 April 2020, with supplementary field work occurring between 16 and 23 February 2021.

Survey work completed in 2020 included: ground truthing the 2012 broad fauna habitat mapping, systematic trapping, systematic bird surveys, foraging, opportunistic records, and deployment of SM4 recorders for night parrot and bats.

Survey effort consisted of 10 trap sites with a total trap effort of 3080 trap nights (pitfalls, Elliots and funnel traps). Cameras were deployed for 279 camera nights within the gorge, gully, breakaway habitat that occurs within the higher elevation areas of the retention licence and ranges adjacent to the proposed haul road corridor.

The survey area has experienced several fires over the past decade. Trap site locations were selected to cover the major (preliminary) habitats of the survey area and where possible trap sites were positioned in pockets of unburnt habitat within the burn mosaic.

Field survey activities for short range endemic invertebrates (SRE) included collection of invertebrate by-catch from pitfall traps, habitat assessment, foraging, and leaf litter sifting. SRE is reported in a standalone report (Rapallo 2022).

Supplementary survey work completed in 2021 included: fauna habitat assessment in order to update the 2012 habitat mapping, and a wet season deployment of SM4 recorders at caves in which ghost bat occurrence, or evidence of occurrence, was recorded in 2012 and 2020.

The field survey recorded 128 species of vertebrate fauna, including 63 bird species, 20 mammal species, 44 reptile species, and one frog. Combined with the 2012 fauna survey results, the total number of vertebrate fauna recorded from the Lamb Creek project area to date is 185 species.

Five species of vertebrate fauna listed as conservation significant under either the Western Australian *Biodiversity Conservation Act 2016* (BC Act) and/or the federal *Environment Protection and Biodiversity Conservation Act 1950* (EPBC Act) or ranked as a priority species by the Department of Biodiversity Conversation and Attractions (DBCA) have been recorded from or proximal to the Lamb Creek project area to date. These are listed below:

- Northern quoll (*Dasyurus hallucatus*) listed Endangered under both the EPBC Act and BC Act – Confirmed, recorded in 2012.
- Ghost bat (*Macroderma gigas*) listed Vulnerable under both the EPBC Act and the BC Act – Confirmed, recorded in 2012, 2020 and 2021.
- Western pebble-mound mouse (*Pseudomys chapmani*) DBCA Priority 4 – Confirmed, mounds recorded throughout the Lamb Creek survey area in 2012 and 2020.

- Fork-tailed Swift (*Apus pacificus*) listed migratory and marine under the EPBC Act – Confirmed, recorded in 2012.
- Pilbara olive python (*Liasis olivaceus barroni*) listed Vulnerable under both the EPBC Act and the BC Act – Confirmed, recorded in 2012.

A further three species of conservation significance were considered likely to occur within the survey area. These were peregrine falcon (*Falco peregrinus* – listed Other Specially Protected Fauna under the BC Act), Gane's blind snake (*Anilios ganei* –DBCA Priority 1), and Pilbara barking gecko (*Underwoodisaurus seorsus* – DBCA Priority 2).

Four species of conservation significance were regarded as possible to occur within the survey area. These were night parrot (*Pezoporus occidentalis* – listed Critically Endangered under the BC Act and Endangered under the EPBC Act), grey falcon (*Falco hypoleucos* – listed Vulnerable under both the EPBC Act and the BC Act), letter-winged kite (*Elanus scriptus* – DBCA Priority 1), and the short-tailed mouse (*Leggadina lakedownensis* – DBCA Priority 4).

Night parrot was not detected via acoustic recorder in 2020. Much of the spinifex across the survey area has been frequently burnt and habitats of the survey area do not include mosaics with samphire and chenopod shrublands, salt lake margin, or paleochannel.

The remaining seventeen species identified by the desktop assessment were considered unlikely to occur within the survey area.

Habitat

Habitat mapping was updated from the 2012 vertebrate fauna habitat assessments utilising aerial imagery, vegetation, topographical, land system and drainage mapping, and habitat data collected in February 2021. Seven broad fauna habitat types were identified within the survey area. These were, in decreasing order of extent; Stony plain, Hillcrest/hillslope, Mulga/corymbia plain, Minor drainage, Tussock grassland plain, Medium drainage and Gorge, gully and rocky breakaway. Additionally, a small portion of the survey area comprised cleared areas.

Within the survey area, the Gorge, gully, and rocky breakaway habitat was considered to be of high significance for vertebrate fauna as this habitat supports species of conservation significance (including nationally listed threatened species) or contains core habitats for such species. Five habitats were ranked as of moderate significance (Hillcrest/hillslope, Mulga/corymbia plain, Minor drainage, Tussock grassland plain, Medium drainage) and the remaining habitat (Stony plain) was ranked as low significance, as it is widespread in the surrounding region and species of conservation significance are exclusively dependent on this habitat.

Habitat Features

To date, no permanent or semi-permanent pools have been recorded from the Lamb Creek project area, despite extensive use of helicopters in 2012, 2020 and 2021 for baseline flora and fauna surveys.

There are five known caves on or proximal to the survey area in which ghost bat occurrence, or evidence of occurrence, has been recorded. These caves were surveyed as part of detailed fauna work, or sampled opportunistically during an SRE survey. To date, no targeted surveys or detailed cave/roost assessments have been completed at the Lamb Creek project.

Cave 1 is provisionally assigned as a Category 2 roost while Caves 2 and 3 are provisionally Category 3. Caves 4 and 5 are known Category 3 and 2 roosts, respectively, and occur nearby to a number of other

caves, shelters and overhangs identified in the desktop. Caves that are confirmed as Category 2 and groupings of caves that surround them are critical Ghost bat habitat.

Cave 1 and Cave 3 are located in the retention licence (R47/19) within respectively 325 meters and 600 meters from the proposed December 2021 disturbance footprint (footprint V3). Caves 4 and 5 are within approximately 200 meters of the disturbance footprint (haul road) in L47/713.

1 Introduction

1.1 Project overview

Mineral Resources Limited (MRL) is actively exploring the Pilbara region. The Lamb Creek project comprises a proposed mining and exploration area and an associated haul road alignment. The project is located approximately 130 kilometres north-west of Newman in the Pilbara region of Western Australia.

Rapallo Environmental (Rapallo) was commissioned by MRL to complete a single-phase detailed (Level 2) vertebrate fauna survey of the Lamb Creek project. The field survey was completed in April 2020, with supplementary data collected in February 2021. The size and extent of the survey area is outlined in section 1.3 below.

The project area as well as the proposed footprint have undergone several changes since the fauna survey was completed. The current Lamb Creek project area (as per December 2021) comprises retention licence R47/19 (pending conversion into mining lease M47/1592) and miscellaneous licences L47/736, L47/974, and L47/1008. Together these tenements cover an area of 2199 hectares. There is significant overlap between the tenements (Figure 1.1) hence this number is not cumulative.

1.2 Scope and objectives

The scope of the detailed vertebrate fauna survey was to:

- Complete a desktop study in order to understand the regional fauna assemblage and habitats, and to identify conservation significant vertebrate fauna which may occur in the survey area.
- Review previous 2012 survey results against the most recent desktop information, and verify current taxonomy and conservation status of relevant fauna and ecological communities.
- Complete a detailed (Level 2) fauna survey over the survey area to identify the fauna assemblage of the survey area.
- Refine previous 2012 fauna habitat mapping of the survey area and to extend fauna habitat mapping into the areas not covered by the 2012 fauna survey.

1.3 Survey area and project history

A detailed fauna survey was completed in April 2020, with supplementary data collected in April 2021. The survey area was 1645 hectares in size, comprising retention licence R47/19 (1200 hectares), miscellaneous licence L47/736 (388 hectares), and an alternative area for the haul road to intersect with the Great Northern Highway, referred to as intersection version B (58 hectares). The survey area is mapped in Figure 1.2.

An earlier detailed fauna survey was completed in March-April 2012 (Rapallo 2012a) over an area that partially overlaps with the current survey area. The 2012 survey area is also outlined in Figure 1.2. Two fires have burnt across the project area in 2015 and 2017 (NAFI 2021), which have altered vegetation composition and structure (Rapallo 2021a). One of the aims of the current fauna survey (section 1.2) was to ground-truth and refine the 2012 fauna habitat mapping.

The project area has changed since the survey was completed, with tenements L47/974, L47/1008 and M47/1592 added in December 2021, expanding the project area. Hence, the fauna survey covered 1220 hectares (75%) of the current project area, with 555 hectares (25%) unsurveyed (Figure 1.2).

A proposed disturbance footprint (footprint V1) was provided by MRL in March 2020, and this footprint formed the basis for survey planning and site selection. Two new footprints were provided since the surveys were completed. The current footprint V3 (657 hectares) extends outside the survey area by 24 hectares (4% of total footprint), with most of the unsurveyed area comprising the southern section of the proposed haul road (Figure 1.2).

1.4 Definitions

To aid interpretation of this report and associated mapping, Table 1.1 provides explanation of the various components of the Lamb Creek project and associated survey areas, as mapped in Figure 1.1.

Table 1.1 Project and survey area definitions

Component	Description
Project area	Project area as per December 2021, comprising tenements R47/19 (pending M47/1592), L47/736, L47/974, and L47/1008. The project area has a total size of 2199 hectares. There is significant overlap between the tenements, so this number is not cumulative.
Survey area	Area covered by the detailed fauna survey in 2020, comprising R47/19, L47/736 and intersection version B, with a combined area of 1645 hectares.
Resource area	General description of R47/19 (pending M47/1592) in which the proposed mine pit and associated infrastructure will be located, as well as the northernmost section of the proposed haul road.
Haul road corridor	General description of the area in L47/736 in which most of the proposed haul road will be located.
Great Northern Highway intersection (GNHI)	General name given to the area where the proposed haul road intersects the Great Northern Highway.
Footprint V1	Proposed disturbance footprint provided by MRL in March 2020 which formed the basis for survey planning and site selection.
Footprint V2	Revised disturbance footprint provided by MRL in July 2021, which has now been superseded by footprint V3.
Footprint V3	Revised disturbance footprint provided by MRL in December 2021 and used to describe localities of recorded target species and potential impacts.
Adjacent to footprint V3	Within 100 metres of the December 2021 disturbance footprint (footprint V3).
Targeted survey	The combined surveys of April 2020 and May 2021.
Intersection version B	An alternative haul road section of 58 hectares, located adjacent to the Great Northern Highway. It currently falls within L47/974 which was not yet defined at the time of the survey.
Lamb Creek 2012 survey area	Area covered by the 2012 detailed (Level 2) fauna survey completed over the Lamb Creek project area as it was defined then. It incorporated the current R47/19 and two potential haul road corridors: a northern and a southern route. The southern route has since been discounted as an option, and the northern route has been partially realigned and overlaps with parts of the current haul road corridor in L47/736.

Figure 1.2

Location of the Lamb Creek project and delineation of the survey area

2 Regional context

2.1 Climate and weather

The Lamb Creek project is situated in the Hamersley subregion (PIL03) of the Pilbara IBRA region, which is part of the Eremaean province (Beard 1990). The climate of the Hamersley IBRA subregion (PIL03) is described as semi-desert tropical. The average rainfall is 300 millimetres per year, usually in summer cyclonic or thunderstorm events. Winter rain is not uncommon (Kendrick 2001). Cyclones develop off the north-west coast and often cross the coastline between Karratha and Port Hedland and move inland over the Fortescue Valley system towards Newman (Beard 1990).

The closest Bureau of Meteorology (BOM) weather station to the survey area is at Newman Airport (station number 007176), located 130 kilometres south-east of the survey area. This weather station has been recording rainfall data since 1971 and temperature data since 1996.

Data recorded at Newman Airport (Figure 2.1) shows a mean annual rainfall of 324.3 millimetres (mm). Mean monthly rainfall is highest in February at 70.2 mm, and lowest in September at 3.7 mm. The hottest month is December with a mean maximum temperature of 39.3°C and a mean minimum temperature of 24.1°C. The annual wind records from 9am and 3pm show a dominant easterly throughout the day, with the strongest winds recorded in the morning of up to 30 kilometres /hour (BOM 2021).

Evaporation rates are not recorded at the Newman Airport Weather Station. However, evaporation in the Central Pilbara Region is estimated to be between 2000 millimetres and 3500 millimetres per annum, which is approximately ten times greater than annual rainfall (Gardiner 2003). This disparity maintains a typically arid landscape, except for areas located in proximity to river systems and shallow groundwater resources.

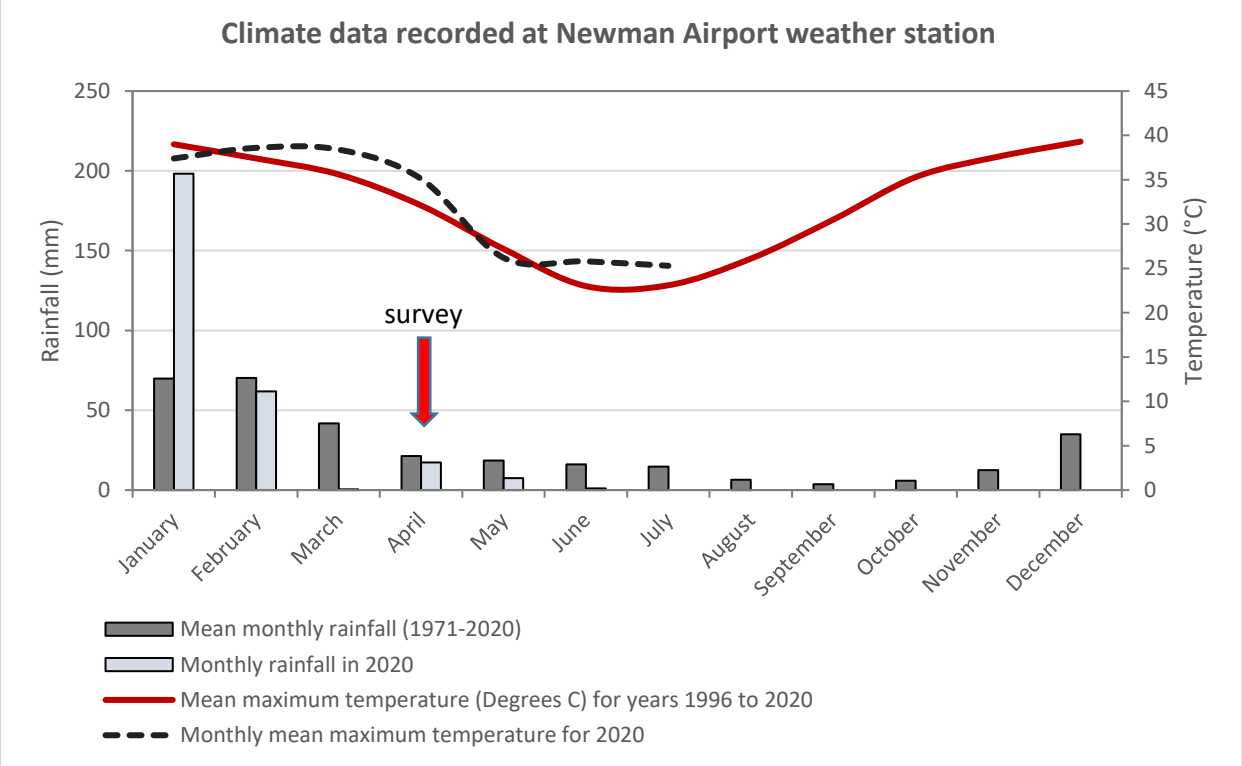

Figure 2.1 Long-term average monthly rainfall and maximum temperature, and 2019-2020 monthly rainfall and mean maximum temperature recorded at Newman Aero weather station (BOM 2020)

The fauna survey took place from 16 to 28 April 2020. Rainfall in the three months preceding the survey was higher than average for the region, with a total of 277.8 millimetres from January to March 2020 (BOM 2020). However, most of this rain fell in January, while rainfall for March was just below average and for February was well below average (see Figure 2.1).

During the survey in April 2020, the survey area was found the be very dry and there was no discernible moisture in the leaf litter, with the exception of the southernmost part of the survey area in the Wannamunna land system. Day-time temperatures in April 2020 were warm to hot, ranging from 33.9 °C to 39.7 °C, while night-time temperatures were mild, ranging from 22.9 °C to 26.6 °C (BOM 2021).

Additional data was collected during the wet season, between 16 and 25 February 2021, comprising supplementary habitat assessment work and deployment of bat recorders.

Table 2.1 Daily rainfall and temperatures recorded during the field survey (Newman Airport weather station)

Survey date	Rainfall (mm)	Maximum Temperature (°C)	Minimum Temperature (°C)

24 February 2021	0	37.4	24.6

Survey date	Rainfall (mm)	Maximum Temperature (°C)	Minimum Temperature (°C)
25 February 2021	0	37.2	20.7

2.2 Biogeography

2.2.1 IBRA bioregions

The bioregions of Australia are described in the Interim Biogeographic Regionalisation for Australia (IBRA) (Thackway & Cresswell 1995). Bioregions are large, geographically distinct areas of land with common characteristics such as geology, landform patterns, climate, ecological features and plant and animal communities. The latest version, IBRA7, classifies Australia's landscapes into 89 large geographically distinct bioregions and 419 subregions (DoE 2012).

The Lamb Creek project is located in the Hamersley (PIL3) subregion of the Pilbara bioregion. The Hamersley subregion comprises the southern section of the Pilbara Craton. It is a mountainous area of Proterozoic sedimentary ranges and plateaux, dissected by gorges (basalt, shale and dolerite). Geographically it is synonymous with the Hamersley vegetation system as described by Beard (1990). The dominant vegetation is mulga low woodland over bunch grasses on fine textured soils in valley floors, and Eucalyptus leucophloia (snappy gum) over *Triodia brizoides* on skeletal soils of the ranges. Regional vegetation is further described in section 2.3 Drainage runs into either the Fortescue River to the north, the Ashburton river to the south, or the Robe river to the west (Kendrick 2001).

2.2.2 Land systems

The Lamb Creek survey area traverses five land systems, as mapped by the Western Australian Land Information Authority (2018) and described by Van Vreeswyk *et al*. (2004). These are listed and summarised in Table 2.2.

The majority of the survey area occurs within the Boolgeeda land system, comprising stony slopes, plains, hills, and drainage floors with spinifex. This land system underlies the majority of the retention licence and the proposed haul road corridor.

The Newman land system, comprising rugged mountains, ridges, and plateaux, was the second dominant, intersecting the haul road in two places and covering the south-west and south-eastern corners of the retention licence.

The McKay and Platform Land Systems occurred in the north-eastern part of the retention licence only, while the Wannamunna land system only appeared in the southernmost part of the haul road corridor where it intersects the highway. Intersection version B fell entirely within the Boolgeeda land system.

The vegetation in all but the Wannamunna land system is typified by spinifex grasslands. Wannamunna is characterised by hardpan plains and internal drainage tracts supporting mulga shrublands and woodlands (and occasionally eucalypt woodlands). Floristically, the survey area fell within the Hamersley 18 and Hamersley 82 vegetation system-associations as defined by Beard (2018) as described further in section 2.3.2. Vegetation system mapping and land system mapping overlapped quite well for the Lamb Creek survey area, with Hammersley 82 roughly following the Newman land system, while Hamersley 18 roughly followed the other four land systems including Wannamunna.

Table 2.2 Land systems of the Lamb Creek detailed fauna survey area

Name	Land type	Description	Extent in survey area
Boolgeeda Land System	Stony plains with spinifex grasslands	Stony lower slopes, stony plains below hills, and narrow sub-parallel drainage floors. Supports hard and soft spinifex grasslands or mulga shrublands. Often occurs below hill systems such as Newman and Rocklea	1036 ha
McKay Land System	Hills and ranges with spinifex grasslands	Hills, ridges, plateaux remnants and breakaways of meta sedimentary and sedimentary rocks supporting hard spinifex grasslands. Relief up to 100 m	44 ha
Newman Land System	Hills and ranges with spinifex grasslands	Rugged high mountains, ridges and plateaux with near vertical escarpments of jaspilite, chert and shale, supporting hard spinifex grasslands. Relief up to 400 m.	340 ha
Platform Land System	Stony plains with spinifex grasslands	Stony upper plains, dissected slopes and drainage floors, supporting hard spinifex grasslands. Erosional surfaces formed by partial dissection of the old tertiary surface. The gently inclined upper plains have extensive marginal dissection zones with gently inclined to steep slopes. Floors incised up to 30 m with steep stable marginal slopes becoming wider downslope.	198 ha
Wannamunna Land System	Wash plains on hardpan with mulga shrublands	Hardpan plains and internal drainage tracts supporting mulga shrubland and woodlands, and occasionally eucalypt woodlands. Depositional surfaces, level hardpan wash plains subject to overland sheet flow. Broad internal drainage flats receiving run-on from adjacent hardpan surfaces; rare, channelled tracts but mostly not organised through drainage. Relief up to 5 m.	27 ha

2.2.3 Geology

The survey area is located in the south-west corner of the Roy Hill 1:250,000 Geological Survey Sheet (SF50-12: Thorne & Tyler 1997). The geology of the survey area is generally defined by the assemblage of prehnite, pumpellyite, epidote, actinolite. Basement rocks comprise the early Proterozoic Brockman Iron Formation and Weeli Wolli Formation. The Brockman Iron Formation consists of banded iron formation (BIF) and shale, while the Weeli Wolli formation consists of BIF separated by shale and siltstone bands, with younger dolerite sills that intersect the sedimentary sequence.

Regionally, the fresh basement rocks are typically overlain by weathered basement rocks which occur as lateritic and basal gravel and/or conglomerate deposits. These weathered deposits underlie early Tertiary Channel Iron Deposits (CID), which are the dominant economic-grade iron deposits in the region. The CID is typically overlain by younger alluvial and colluvial gravels and sediments (Thorne & Tyler 1997). The survey area overlies the following geological units (Thorne & Tyler 1997).

- Brockman Iron Formation (PLHB): banded iron-formation, chert, and pelite;
- Quaternary Alluvium (Qa): unconsolidated silt, sand, and gravel; in drainage channels and on adjacent floodplains;
- Quaternary Alluvium and Colluvium (Qw): red-brown sandy and clayey soil; on low slopes and sheetwash areas; and
- Cainozoic Colluvium (Czc): partly consolidated quartz and rock fragments in silt and sand matrix; old valley-fill deposits.

2.2.4 Soils

The survey area is located within the Fortescue botanical district of the Pilbara region (Beard 1990). This region is mountainous, with soils ranging from shallow, stony sandy loams along slopes, to cracking clays, stripped hardpans and calcareous loams along active waterways (Beard 1990).

The landforms of the survey area are typical of the eastern Pilbara with rocky hills, small gorges, mostly seasonal watercourses, and gravelly loam valleys. The soils are typified by hard red alkaline soils on plains, pediments and alluvial areas, while shallow, skeletal soils are common on ranges that rise to 1,250 m (Beard 1990). The southern part of eastern Pilbara region is characterised by earthy loams underlain by red-brown hardpan (Beard 1975, 1990).

The survey area has two distinct soil and landform assemblages. The majority of the haul road corridor (L47/736) and the edges of the mine tenement (R47/19) are characterised as soil unit Fa13. The central part of the mine tenement and small portion of the potential haul road alignment is characterised as soil unit Fb3. These are defined as follows (CSIRO Australia 2018):

- Fa13 – Ranges of banded jaspilite and chert along with shales, dolomites, and iron ore formations with some areas of ferruginous duricrust as well as occasional narrow winding valley plains and steeply dissected pediments. This unit is largely associated with the Hamersley and Ophthalmia Ranges. The soils are frequently stony and shallow and there are extensive areas without soil cover: chief soils are shallow stony earthy loams (Um5.51) along with some (Uc5.11) soils on the steeper slopes. Associated are (Dr2.33, Dr2.32) soils on the limited areas of dissected pediments, while (Um5.52) and (Uf6.71) soils occur on the valley plains; and
- Fb3 – High-level valley plains set in extensive areas of unit Fa13. There are extensive areas of pisolitic limonite deposits: principal soils are deep earthy loams (Um5.52) along with small areas of (Gn2.12) soils.

Figure 2.2

Land System Mapping and Regional localities

2.3 Regional vegetation

2.3.1 Botanical district

The survey area is located in the Fortescue botanical district of the Pilbara region (Beard 1990), which forms part of the Eremaean Botanical Province. The Pilbara region receives a slightly higher than average rainfall than most of the Eremaean Province, due to the prevalence of cyclones off the coast, but this is not enough to modify the essentially desert appearance of the plant cover (Beard 1990).

The Fortescue botanical district consists predominantly of tree and shrub steppe communities with *Eucalyptus* trees, Acacia shrubs and spinifex grasses including *Triodia pungens* and *T. wiseana* (Beard 1975). Mulga (species of the *Acacia aneura* complex) occurs in valleys, and short-grass plains may be present on alluvial soils (Beard 1990).

2.3.2 Vegetation system-associations

Digital maps (shapefiles) of pre-European vegetation communities, based on state-wide mapping by J.S. Beard at 1:250,000 scale, are published by the Department of Primary Industries and Regional Development (Beard 2018).

Vegetation of the Hamersley (PIL3) IBRA subregion is generally low Mulga woodland over bunch grasses on fine textured soils in the valleys with snappy gums (*Eucalyptus leucophloia*) over *Triodia brizoides* on skeletal soils of the ranges (Kendrick 2001). The mountain tops and gorges of the Hamersley subregion provide refugia for humidophile and/or fire intolerant flora, and support a diversity of range-restricted species (Kendrick 2001).

The survey area falls within two Beard (2018) vegetation system-associations: Hamersley 18: Low woodland of *Acacia aneura*, and Hamersley 82: Hummock-grass (*Triodia wiseana*) steppe with irregularly scattered *Eucalyptus brevifolia* trees (Table 2.3). Cameras were deployed within the gorge, gully, breakaway habitat adjacent to the proposed haul road corridor located primarily within Hamersley 82.

Table 2.3 Beard vegetation system-associations within the survey area

Beard Vegetation System and Association	Extent in survey area	Extent in Western Australia (ha) [1)]	Pre-European extent remaining (%) [1)]
Hamersley 18	982 ha	575 852 ha	99.2%
Hamersley 82	663 ha	2 157 841 ha	99.4%

Footnotes:
1) Numbers from 2018 Statewide Vegetation Statistics (DBCA 2019)

Vegetation that is not a Threatened or Priority Ecological Community may still be considered significant if it has a restricted distribution, or has experienced a degree of historical impact from threatening processes (EPA 2016a). Vegetation types retaining less than 30% of their pre-European extent generally experience accelerated species loss at an ecosystem level (EPA 2000) and are regarded as being 'vulnerable', while vegetation types retaining less than 10% of their original extent are regarded as being 'endangered' (EPA 2000, Shepherd *et al.* 2002, DER 2014, 2016a).

As described above, the Hamersley 18 and Hamersley 82 vegetation system-associations intersected by the survey area still have close to 100% of their original extent remaining, and would be considered 'least concern' (DER 2014).

2.4 Reserves and Environmentally Sensitive Areas

2.4.1 Environmentally Sensitive Areas

Environmentally sensitive areas (ESAs) are protected under the *Environmental Protection (Clearing of Native Vegetation) Regulations 2004* and are selected for their environmental values at state or national levels. The survey area does not occur within an ESA, nor are there any ESAs within five kilometres of the survey area, as shown by the Department of Water and Environment Regulation (DWER) Clearing Permit System and Map Viewer (DWER 2020).

Karijini National Park is located to the west of the survey area, approximately 18 kilometres west of the intersection of the proposed haul road and the Great Northern Highway. Mungaroona Range Nature Reserve is approximately 100 kilometres northwest of the survey area. The nearest Nationally Important Wetland is the Fortescue Marsh located 52 km north of the survey area (AWE 2021).

2.4.2 Threatened and Priority Ecological Communities

The survey area is not located within a known Threatened or Priority Ecological Community (TEC-PEC) (Rapallo 2012b, 2021b). The nearest known PEC is subtype 2 of the Coolibah-Lignum Flats vegetation community, with the edge of the buffer zone located less than five kilometres south of the survey area (DBCA 2021b) as shown in Figure 1.2.

The Coolibah-Lignum Flats vegetation complex is described as: Woodland or forest of *Eucalyptus victrix* (coolibah) over thicket of *Duma florulenta* (lignum) on red clays in run-on zones. Associated species include *Eriachne benthamii*, *Themeda triandra*, *Aristida latifolia*, *Eulalia aurea* and *Acacia aneura* (DBCA 2021d). The Coolibah-Lignum Flats PEC is unlikely to occur within the fauna survey area, as discussed in Rapallo (2012b) and Rapallo (2021b). It must be noted that the flora surveys did not cover the entirety of the current project area.

2.5 Fire history

Fire mapping for Australia is available from the Northern Australia and Rangelands Fire Information (NAFI 2021) website, with fire scar data available from 2000 to present. The NAFI service displays maps of fire activity based on information from satellites, such as hotspots (locations of recently burning fires) and fire scars (maps of recently burnt country).

The majority of the Lamb Creek project area has been burnt since the 2012 fauna survey (Rapallo 2012a), with three partially overlapping fire scars resulting in a mosaic of different fire ages. Fire mapping over the project area between 2012 and 2021 (NAFI 2021) is shown in Figure 2.3.

It must be noted that NAFI data is very broad-scale and does not show the fine-scale mosaic within the project area, nor does the mapping indicate fire intensity. For example, trap site LCS03 (see section 3.3.1) was positioned in one of the few unburnt areas, but the NAFI data does not provide enough detail to show this (Figure 2.3).

3 Methods

3.1 Desktop

The fauna desktop study comprised a search of paid and free databases as listed in Table 3.1, and a review of available literature relevant to the survey area as listed in Table 3.2. The fauna desktop served to place the fauna assemblage of the survey area in a regional context and to compile a list of vertebrate fauna species with the potential to occur within the survey area. This list was then filtered for conservation significant fauna species and likelihood to occur within the survey area was assessed using the fauna decision matrix located in Appendix I.

Table 3.1 Database search parameters

Source of information	Zone	Easting (mE)	Northing (mS)	Search area type
DBCA (2020a)Threatened and Priority Fauna Database (TPFA)	50K	688039	7473704	50 km radius circle centred on point
DBCA (2021a) Threatened and Priority Ecological Communities (TEC-PEC) database	50K	688039	7473704	50 km radius circle centred on point
DBCA (2020b) NatureMap online database	50K	688039	7473704	40 km radius circle centred on point
AWE (2020) Protected Matters search tool	50K	688039	7473704	50 km radius circle centred on point
Birdlife Australia (2020) Birdata online database	50K	688039	7473704	100 x 100 km box centred on point

The surveys used as part of the literature review are listed in Table 3.2 and generally occurred within 50 kilometres of the Lamb Creek project area.

Table 3.2 Fauna surveys completed within 50 km of Lamb Creek

3.1.1 Conservation status and naming

Names for bird species follow Birdlife Australia (2019), names for mammals, reptiles and amphibians follow the Western Australian Museum (2019) with common names supplemented from Wilson and Swan (2017). Further information was gained from Johnstone and Storr (1998, 2004) for birds, Van Dyck and Strahan (2008) for mammals, and Cogger (Cogger 2018) and Tyler and Doughty (2009) for reptiles and amphibians, as well as the Frog Watch website (WAM 2018).

Distribution maps and recent records of vertebrate fauna species were verified using the Atlas of Living Australia (ALA 2021), and Birdata online databases, the Species Profile and Threats Database (SPRAT) (AWE 2021), NatureMap (DBCA 2020b), as well as maps published in Van Dyck and Strahan (2008), Johnstone and Storr (1998, 2004), Wilson and Swan (2017), Cogger (2018), and other relevant publications as cited within this report.

Conservation codes cited in this report are as per Appendix II.

3.2 Personnel and licensing

The personnel involved in the field survey, data entry and analysis, and the preparation of this report are listed in Table 3.3. The field survey was conducted under Fauna Taking (Biological Assessment) Licence BA27000239 issued under Regulation 17 of the *Biodiversity Conservation Regulations 2018*. As part of the license conditions, a list of fauna species recorded in the survey will be forwarded to the DBCA.

Table 3.3 Personnel involved in the project

Name	Position	Field survey	Reporting
Kate George	Principal Environmental Scientist	X	X
Marieke Weerheim	Senior Environmental Scientist	X	X
Jon-Paul Emery	Ecologist	X	X
Jari Cornelis	Ecologist	X	
Heidi Nore	Ecologist	X	
Kady Grosser	Ecologist	X	
Molly George	Ecologist	X	

3.3 Field survey

The detailed vertebrate fauna survey was completed over the period of 16 to 28 April 2020 with supplementary habitat assessment and bat recording occurring during the wet season between the 17 and 25 February 2021.

3.3.1 Systematic trapping

Ten systematic trap sites were established across the survey area, as mapped in Figure 3.1. Trap site locations were selected to cover the major habitats of the survey area and where possible trap sites were positioned in pockets of unburnt habitat within the burn mosaic. Coordinates of trap sites are presented in Appendix III and habitat assessment data presented in Appendix IX.

Trap sites were established in a staggered manner over a four-day period, with sites kept open from the day they were established for a period of seven nights. Trap site closure also occurred in a staggered manner over a four-day period.

Trap site design aligned with recommendations in EPA (2016b). Each systematic trap site comprised six 20-litre buckets, six pipes, and twelve funnel traps, which were distributed equally along two 50-metre drift fences running parallel, approximately 50 metres apart. The two trap lines were surrounded by a grid of 20 aluminium box traps. One camera was positioned at each trap site for a period of 7 days.

Trap effort is summarised in Table 3.4.

All traps were cleared between first light and 10 am. The majority of vertebrate fauna captured in traps were identified in the field and released. Reptiles and mammals that could not immediately be identified at the trap site were taken back to a central location within the project area with shelter (referred to as the 'day camp') for identification using the appropriate keys in Cogger (2018), Wilson and Swan (2017), Van Dyck *et al.* (2013), and Menkhorst and Knight (2010).

Terrestrial invertebrate fauna from orders known to support short range endemic invertebrates (SRE) were collected, stored and labelled according to Western Australian Museum guidelines (WAM 2012). Potential SRE specimens were taken back to Perth and submitted to taxonomic experts for identification. Invertebrate fauna captured during the 2020 vertebrate fauna survey are included in Rapallo (2022).

3.3.2 Bird surveys

Bird surveys were completed at the ten trap sites, with each site surveyed at least once. All systematic bird surveys were completed in the morning before 10 am when bird activity was high and cryptic species were most detectable. The survey method involved 50-minute surveys surrounding each individual trap site. The survey area for each survey was unbounded, but restricted to one single habitat which was representative for each trap site.

3.3.3 SM4 recorders for bats and night parrot

The bat assemblage of the survey area was assessed using two ultrasonic echolocation recorders that were moved to systematically sample all the potential fauna habitats across the survey area. The model of recorder used was a Wildlife Acoustics SM4BAT-FS ultrasonic recorder, hereafter referred to as simply SM4 bat recorders.

Bat survey consisted of completing a total of thirty-three overnight ultrasonic bat sound recordings, beginning at twilight, at sixteen locations within and proximal to the survey area.

SM4 bat recorders were deployed for a minimum of one night at each trap site, as well as at caves 1 and 3 located on the retention licence where ghost bat had been recorded in 2012 (Rapallo 2012a). Additional caves (caves 2, 4 and 5) outside the defined survey area, but proximal to the project area, were sampled opportunistically. Cave 2 was sampled in April 2020, and was located approximately two kilometres to the south of the retention licence. Caves 4 and 5 were sampled in February 2021, and were located in the hills proximal to the Great Northern Highway intersection. Cave 2 was sampled two nights in April 2020, while caves 4 and 5 were sampled for 2 nights in February 2021 (Appendix III).

The survey area was sampled for potential night parrot calls using one Wildlife Acoustics Song Meter SM4 Acoustic Recorder, hereafter referred to as the SM4 night parrot recorder. Acoustic recorders were deployed at areas within the survey area that contained patches of mature spinifex as potential habitat, and a location on the 2020 disturbance footprint. The night parrot recorder was deployed at each site for a minimum of two consecutive nights, with a total of eight acoustic survey nights (Appendix III).

Recordings were "continuous" made using ultrasonic SM4BAT-FS and acoustic SM4A SongMeter (both by Wildlife Acoustics Inc., USA) detectors. The audio settings used followed the manufacturer's recommendations contained in the user manuals (Bat Call WA 2021).

Recordings were sent to Bat Call WA for analysis and identification. For the ultrasonic (bat) recordings, call analysis details are provided in Bat Call WA (2021) (Appendix VIII) as recommended by the Australasian Bat Society (Australasian Bat Society 2006). Reference data for the species identified are available in (Bullen & McKenzie 2002, McKenzie & Bullen 2003, 2009). For the acoustic recordings (night parrot), Bat Call reviewed recordings both manually and using an automatic scan technique for Night parrot calls. Candidate calls were compared to Bat Call's confirmed reference calls.

See Figure 3.1 and Appendix III for SM4 deployment locations and duration.

3.3.4 Foraging and leaf litter Searching

Foraging (active searching) targeting both vertebrate and invertebrate fauna was conducted at all trap sites, for a minimum of 1.5 person hours per site. Foraging methods included turning rocks, logs, peeling bark, raking leaf litter, litter sieving and searching under vegetation. Northern quoll camera sites (see section 3.3.6) were searched for a minimum of 0.5 person hours, plus time spent traversing between camera locations.

3.3.5 Opportunistic observations

Opportunistic records of mammals, birds, reptiles, amphibians and potential SRE invertebrates were collected throughout the survey area. Opportunistic records included direct sightings and calls, as well as secondary signs of presence such as tracks, scats, diggings, burrows, mounds, feathers, bones, and sloughed reptile skins. All records were accompanied by a GPS waypoint and/or fauna habitat notes, to link species records to fauna habitats.

Figure 3.1

Survey Effort

3.3.6 Camera transects

Forty Swift Enduro motion-detecting camera traps were deployed along four transects in the gorge, gully, breakaway landscapes that occur within the higher elevation areas of the retention licence and ranges adjacent to the proposed haul road corridor. The four transect sites were selected based on aerial photography with consideration of safety and logistics.

Camera transects were placed in four selected areas of gorge / gully habitat, with two transects deployed within the defined survey aera, and two in the elevated areas to the south of the project area. Cameras were positioned between 15 and 50 meters apart, depending on the length of the gorge / gully. This method broadly aligned with an initial reconnaissance survey under (DotEE 2016).

Cameras were deployed for a minimum of 5 consecutive nights (some longer due to the logistics of retrieval) and baited with cat food that contained a high sardine content. Bait was enclosed in non-reward food tubes, to allow for longer deployment time.

Each camera on the transects was programmed to record video for 30 seconds upon being triggered, with detection sensitivity set to medium. See Table 3.4, Figure 3.1 and Appendix III for trap effort and location of camera transects.

A single ScoutGuard 550V camera was deployed at each of the 10 trap sites for a minimum of five days. Cameras were positioned about 30 centimetres off the ground and angled towards the ground. Cameras at trap sites were baited daily for a period of five nights with a mix of dried oats, peanut butter, and olive oil. Bait was not replenished after the fifth night to minimise impacts on normal animal behaviour.

3.3.7 Species richness estimators

Species accumulation curves for birds and trappable ground-dwelling fauna were generated via EstimateS software Version 9.1.0 (Copyright R. K. Colwell). Predicted species richness was calculated by taking the average of the estimators ACE, Chao 1, Jackknife 1 and Bootstrap (Colwell 2013).

Since models can only be generated from data collected through systematic methods, the species accumulation curve and predicted species richness were calculated from systematic trapping data, and from systematic bird surveys. Separate analyses were conducted for these two methods.

Predicted species richness of trappable ground-dwelling vertebrate fauna was calculated using the combined trapping data for mammals and reptiles from all ten trap sites for the single-season fauna survey, with statistics calculated over abundance data (total number of captures per species at that site).

Predicted species richness of birds was calculated using data from systematic birds surveys only, with data entered as total abundance for each species per site. Analyses for both trappable ground-dwelling fauna and birds were run using the default settings with the following exceptions:

- Accumulations (runs) were randomised 10,000 times without replacement.
- Upper abundance limit for rare or infrequent species was set to 3.

3.3.8 Habitat mapping

Broad fauna habitat mapping was completed in 2012 over an area that partially overlaps with the current 2020 survey area. The broad fauna habitat mapping from 2012 was selectively ground-truthed during the 2020 survey and further refined with habitat assessment data collected during a short-range endemic

fauna survey completed in February 2021 (Rapallo 2022). Habitat data included notes on land form, soil, rock cover, and broad description of vegetation.

Fauna habitats were assessed for the likelihood that they may support fauna of conservation significance. All major fauna habitats present within the survey area were scored for significance (High, Moderate or Low) according to the criteria in Appendix IV.

Table 3.4 Summary of survey effort

Name	Effort
Pit fall trap nights	840
Funnel trap nights	840
Box (Elliot) trap nights	1400
Ultrasonic (bat) detector nights	33
Acoustic (night parrot) detector nights	8
Camera nights (transects)	279
Camera nights (trap sites)	73
Systematic bird census (minutes)	500
Trap Site Foraging (minutes)	900
Camera transect site foraging (minutes)	1410

4 Results and Discussion

4.1 Desktop results vertebrate fauna

A portion of the current Lamb Creek project area was surveyed for vertebrate fauna in 2012 by means of a single-season detailed (Level 2) fauna survey. The 2012 survey area overlapped in part with the 2020 survey area, as outlined in section 1 (Figure 1.2). Survey effort consisted of ten trap sites open for five consecutive nights: a trap effort of 852 pitfall traps, 1420 Elliot traps and 710 funnel traps. Bat recorders were deployed for 13 nights. Cameras and cages were deployed for 182 camera nights and 300 cage trap nights within gorges and the faces of rocky escapements. Other activities included spotlighting, habitat assessment, foraging and systematic bird survey (Rapallo 2012).

4.1.1 Regional survey effort

The region has had considerable survey effort over the last 20 years predominantly due to vertebrate fauna surveys completed within, or partly within, the boundary of the Mining Area C (MAC) Development Envelope. The MAC Development Envelope is approximately 10 kilometres south of R47/19 as showed in Figure 1.1.

Twenty-one vertebrate fauna surveys have been conducted wholly or partially in the MAC Envelope between 1997 and 2016; these comprised seven Level 2 surveys (one or two seasons), five Level 1 surveys and nine targeted surveys (for conservation significant fauna) (Biologic 2017).

Mining Area C contains the same land systems as the Lamb Creek survey area and has similar habitats.

4.1.2 Regional fauna assemblage

The fauna desktop study identified 301 species of terrestrial vertebrate fauna recorded within 50 kilometres of the survey area. These included 157 birds, 46 mammals, 91 reptiles, and 7 amphibians. Not all species are likely to occur in the survey area due to the large search extent of the desktop assessment. Additionally, many species tend to be patchily distributed even where appropriate habitats are present, and many species of birds can occur as regular migrants, occasional visitors or vagrants. The desktop results are presented in Appendix V.

4.1.3 Introduced fauna (Pests)

The desktop study identified ten introduced taxa (Pests) recorded within 50 kilometres of the survey area, as presented in Table 4.1. Three of these introduced fauna species are currently listed on the Western Australian Organism List (WAOL) as Permitted - s11 (Department of Agriculture and Food, Western Australia 2021), while the other seven were listed as Declared Pest – s22(2).

Based on distribution maps, database records, and habitat preferences, seven species were considered possible to likely to occur in the survey area. These were cattle (*Bos taurus*), camel (*Camelus dromedarius*), domestic dog (*Canis lupus*), cat (*Felix catus*), house mouse (*Mus musculus*), rabbit (*Oryctolagus cuniculus),* and the red fox (*Vulpes vulpes*). The cat and house mouse were recorded during the survey, while either dingo or dog was also recorded.

Table 4.1 Desktop results: Introduced (feral) fauna recorded within 50 kilometres of the survey area

Scientific name	Common name	Pest Status (WAOL)	Likelihood
Columba livia	Rock Dove	Permitted - s11	Unlikely
Bos taurus	European Cattle	Declared pest - s22(2)	Confirmed
Camelus dromedarius	Dromedary, Camel	Declared pest - s22(2)	Likely
Canis familiaris familiaris	Dog	Declared pest - s22(2)	Likely
Vulpes vulpes	Red Fox	Declared pest - s22(2)	Likely
Equus asinus	Donkey	Declared pest - s22(2)	Unlikely
Equus caballus	Horse	Declared pest - s22(2)	Unlikely
Felis catus	Cat	Permitted - s11	Possible
Oryctolagus cuniculus	Rabbit	Declared pest- s22(2)	Likely
Mus musculus	House Mouse	Permitted - s11	Possible

4.1.4 Conservation significant fauna

The fauna desktop study identified 50 taxa of conservation significant fauna recorded previously within 50 kilometres of the survey area. These are listed in Appendix VI.

Twenty-one of these species were conservation significant only because they are listed Marine under the EPBC Act. These all comprised common and widespread species, including cuckoos, raptors, egrets, rainbow bee-eater, magpie-lark and welcome swallow. Marine species are listed in Appendix VI but are not discussed further in this document.

For the remaining 29 species, likelihood to occur in the survey area was assessed using location and date of previous records, and currently known range and habitat requirements relative to the fauna habitats recorded in the survey area (section 4.5). The risk matrix used to assess likelihood is presented in Appendix I, and likelihood scores are shown in Appendix VI.

Based on the likelihood assessment outlined above, seventeen conservation significant species were considered unlikely to highly unlikely to occur in the survey area due to absence of suitable habitat (such as sand dunes for bilbies and mulgaras, and rivers, dams, wetlands for wader species). Species were also considered unlikely if they were rare vagrants, or where recent distribution maps showed that the survey area was located well outside their known range (these database records may have been incorrect).

The Pilbara Leaf-nosed bat (*Rhinonicteris aurantia* – Pilbara population) was considered unlikely to occur in the survey area, based on extensive survey efforts completed in the adjacent Mining Area C. Despite many years of surveying including cave assessments and acoustic surveys, the species was only detected twice as a foraging visitor (Biologic 2017). Bob Bullen (*pers. comm*. 2020) confirmed that, based on the survey results for Mining Area C, it is highly unlikely that roost caves for the Pilbara Leaf-nosed Bat occur in the survey area.

The remaining twelve species of conservation significant fauna were assessed as possible, likely or confirmed to occur in the survey area. These are listed in Table 4.2 below.

Table 4.2 Desktop results: Fauna species confirmed to possible to occur in the survey area

Name	Status[1)]		Likelihood	Details
	BCA	EPBC		
Fork-tailed swift (*Apus pacificus)*		MI, MA	Confirmed	Recorded at Lamb Creek in 2012, from all habitats surveyed (Rapallo 2012a) and there are also multiple records from Mining Area C (Biologic 2017).
Peregrine falcon (*Falco peregrinus)*	OS		Likely	Recorded from Mining Area C (Biologic 2017). Prefers areas with cliffs and rocky escarpments for nesting. The survey area contains some potentially suitable breeding habitat within the gorge, gully , breakaway habitat that occurs within the higher elevation areas of the retention licence, with more extensive suitable habitat in the ranges adjacent to the proposed haul road corridor. Water ecotones and tree covered areas provide productive habitat for Peregrine falcon prey species. However, Peregrine Falcons are an open country hunter (Ratcliffe 1993, Jenkins 2000) and some level of open country is essential for them to access prey (Jenkins & Hockey 2001). Peregrine falcon is likely to forage broadly across all habitats within the survey area especially on drainage ecotones during wetter seasons, but lack of permanent and semi-permanent water in the region will limit prey availability.
Night parrot (*Pezoporus occidentalis*)	CR	EN	Possible	Based on accepted records, Night parrot habitat comprises long-unburnt mature Triodia grasslands forming mosaics with samphire and chenopod shrublands (Jackett et al. 2017, McDougall et al. 2009, Murphy et al. 2017) including genera such as Atriplex, Bassia and Maireana, on floodplains and claypans, and on the margins of salt lakes, creeks or other sources of water (McGilp 1931, Wilson 1937). Contemporary Western Australian Pilbara/Murchison records include records north east of Wiluna (Hamilton et al. 2017, Jackett et al. 2017), Lake Disappointment (Great Sandy Desert) (Harewood 2018), Great Sandy Desert (Caccetta 2018) , south of Newman (Ison 2017), salt lake systems on Martu County (Michelmore & Birch 2020) and near the Fortescue Marsh (Davis & Metcalf 2008). The current interim guidelines for preliminary surveys of Night parrot in Western Australia suggest the species requires large, dense Triodia hummocks primarily old-growth (often more than 50 years unburnt) for roosting and nesting (DPaW 2017), although little is known about foraging sites hence the precautionary score of possible. Foraging habitat is typically located nearby to roosting habitat (Jackett et al. 2017), though individuals have been recorded 9.4 km from roosting sites in a single night and recorded to have travelled over 40 km in a single night (Murphy et al. 2017). Local records of the Night parrot are scarce, with the nearest contemporary record of the species observed at Minga Well, a station bore and livestock watering point with large pools of water near Fortescue Marsh (Davis & Metcalf 2008) and a record from near Newman (Ison 2017) . At Lamb Creek, mature triodia at site LCS03 (which has not been affected by recent fires) could be utilised by Night parrot; however, most of the survey area has been recently burnt in 2013, 2015 and 2017 (NAFI 2021). There is unburnt Triodia on the surrounding hill slopes, but the majority were small clumps that would not provide extensive cover, with larger clumps occurring on outwash slopes. Small patches of mature triodia occurred in creek lines and low points of stony plain but were often small patches. Night parrot was not detected via acoustic recorder and habitats of the survey area do not include mosaics with samphire and chenopod shrublands, salt lake margin, or paleochannel.

Name	Status[1)]		Likelihood	Details
	BCA	EPBC		
Grey falcon (*Falco hypoleucos)*	VU	VU	Possible	Grey falcon commonly nests in timbered areas, particularly tall trees along watercourses, and forages in open or more sparsely vegetated habitats (Garnett et al. 2011). Medium Drainage habitats are likely to provide suitable nesting habitat for the species. Grey falcon is likely to forage broadly across all habitats within the survey area particularly Stony Plain. Highly nomadic with multiple records within 20 km of the survey area, including from Mining Area C where none of the records were breeding records (Biologic 2017).
Letter-winged Kite (*Elanus scriptus*)	P4		Possible	The Letter-winged Kite is a bird of open country and grasslands in arid and semi-arid Australia, where there are tree-lined streams or water courses. When food is plentiful, the species irrupts and birds may disperse to higher rainfall coastal regions (Birdlife 2020b). This kite roosts by day in the high canopy of leafy trees and is the only member of its family that hunts at night. Highly nomadic several records within 10 km of the survey area (DBCA 2020b). Probable infrequent visitor during irruptive events.
Ghost bat (*Macroderma gigas*)	VU	VU	Confirmed	Recorded by Rapallo in 2012, 2020 and 2021 in the retention licence (cave 1 and 3) and adjacent (cave 2). A regional review completed in November 2016 mapped all known ghost bat caves in the vicinity of Mining Area C (Biologic 2016b). A cluster of roost caves are located just east of the Lamb Creek haul road alignment. Bat Call WA confirmed that these caves comprise a category 2 roost cave surrounded by category 3 caves in an "apartment block" configuration (Bob Bullen pers. comm. 2020). These caves (cave 4 and 5 in Figure 3.1) are located 200-250 m east of the haul road corridor.
Short-tailed mouse (*Leggadina lakedownensis*)	P4		Possible	This species has a broad distribution across much of northern Australia, but is irregularly distributed with scattered populations (Van Dyck & Strahan 2008). In habits areas of open tussock and hummock grassland, Acacia scrubland, and savanna woodland, on alluvial clay or sandy soils (Lee 1995) and also cracking clay in the Pilbara (Gibson & McKenzie 2009) The DBCA threatened fauna database has two records from the same locality approximately 9 km SW of the survey area (GNHI), recorded in 1997 from the Boolgeeda land system DBCA 2020b). There are no records from Mining Area C despite extensive survey effort (Biologic 2017). The Short-tailed mouse could occur within the tussock grassland habitat of the survey area.
Northern quoll (*Dasyurus hallucatus*)	EN	EN	Confirmed	Recorded at Lamb Creek during the 2012 surveys (flora and fauna) from scats and camera (Rapallo 2012a). No records from Mining Area C despite extensive survey effort . Scats recorded approximately 5 km northwest of Mining Area C and a male quoll observed 5 km east of Mining Area C (Biologic 2017). Regionally there is a concentration of records 40 km to the north east from 2018 (DBCA 2020b). At Lamb Creek, potential habitat occurs within the gorge, gully , breakaway landscapes that occur within the higher elevation areas of the retention licence and ranges adjacent to the proposed haul road corridor. Northern quoll may forage/disperse through surrounding habitats such as hill crest/hillslope and drainage habitats.

Name	Status[1)]		Likelihood	Details
	BCA	EPBC		
Western pebble-mound mouse (*Pseudomys chapmani*)	P4	LC	Confirmed	The Western pebble-mound mouse occurs on the gentler slopes of rocky ranges where the ground is covered with a stony mantle and vegetated by hard spinifex, often with a sparse overstorey of eucalypts and scattered shrubs (Anstee & Armstrong 2001). Recorded in the survey area during the 2012 and 2020 survey from stony plain and hillcrest/hilltop habitat. Multiple records from Mining Area C (Biologic 2017) and other localities (DBCA 2020b).
Pilbara olive python (*Liasis olivaceus barroni*)	VU	VU	Confirmed	Within inland Pilbara the species is most often encountered near permanent waterholes in rocky ranges or among riverine vegetation (Pearson 1993). Recorded at Lamb Creek during the 2012 survey crossing stony plain between the Hamersley massive (hillcrest /hilltop habitat) and the Lamb Creek (medium drainage) within the now discounted southern haul road option (Rapallo 2012a). Five records from Mining Area C (Biologic 2017). At Lamb Creek, potential habitat occurs within the gorge, gully , breakaway landscapes that occur within the higher elevation areas of the retention licence and ranges adjacent to the proposed haul road corridor. The species may forage/disperse through drainage habitats.
Pilbara barking gecko (*Underwoodisaurus seorsus*)	P2		Likely	Pilbara barking gecko is a rock inhabiting, restricted-range species encountered at mid elevations in the Hamersley Ranges, widely separated from the closest populations of the related barking gecko *Underwoodisaurus milii* in the northern Goldfields and Shark Bay in Western Australia (Doughty & Oliver 2011) . The species has been recorded from several locations at Mining Area C and surrounds from gorge gully habitats (Biologic 2017). The species is known to be distributed over a wider area, having been recorded 120 km to the north-west and approximately 40 km to the south-west (DBCA 2020b). It is unknown whether its distribution is continuous between these areas, or if it occurs as a series of isolated populations. At Lamb Creek, potential habitat occurs within the gorge, gully , breakaway landscapes that occur within the higher elevation areas of the retention licence and ranges adjacent to the proposed haul road corridor.
Gane's blind snake (*Anilios ganei*)	P1		Likely	Endemic to the Pilbara, Gane's blind snake was originally listed because it was known from just a few scattered records, this species has now been more recently recorded from nine records in the region (DBCA 2020b). Gane's blind snake has been recorded from five locations within the Mining Area C Development Envelope, including an open drainage line (ENV Australia 2007) , rocky slope below the vertical wall of a gully, and mulga woodland habitat (Biologic 2011). Gane's blind snake was not recorded in this survey or the 2012 Lamb creek fauna survey but potential habitat occurs within the gorge, gully, breakaway, medium drainage, tussock grassland and mulga/corymbia plain habitats.

Footnotes:
1) Status: BCA = Western Australian Biodiversity Conversation Act 2016. EPBC = Commonwealth Environment Protection and Biodiversity Conservation Act 1999. See Appendix II for conservation codes.

4.2 Vertebrate fauna assemblage

During the 2020 detailed fauna survey of Lamb Creek, 128 species of vertebrate fauna were recorded, including 63 bird species, 20 mammal species, 44 reptile species, and one frog.

Combined with the 2012 fauna survey results, the total number of vertebrate fauna recorded from the Lamb Creek project area to date is 185 species. Results are presented in Appendix VII, summarised in Table 4.3 below and discussed in the text below.

Table 4.3 Summary of the total number of vertebrate fauna species recorded from Lamb Creek to date

Species group	2012 fauna survey	2020 fauna survey	Total recorded from Lamb Creek to date
Birds	76	63	87
Mammals	22	20	28
Reptiles	58	44	68
Amphibians	2	1	2
Totals	**158**	**128**	**185**

4.2.1 Birds

Birds were the most frequently observed fauna group, with 947 records representing 63 bird species. Of these species, 51 (81%) were recorded during systematic bird surveys, eleven species were recorded opportunistically, and one species, the little button-quail, was captured in a fauna trap.

Bird diversity was lower than predicted from the desktop study, which listed 159 bird species recorded from the region (section 4.1.2). However, the survey area did not contain suitable habitat for every one of these regional species. For example, there was no habitat for waders or waterbirds, while some species on the desktop list are migratory or respond to rainfall.

The habitat with the highest bird diversity recorded was medium drainage lines, dominated by *Corymbia*, *Acacia* and *Gossypium* over spinifex) with 34 bird species recorded, whereas the habitat with the lowest number of birds recorded was the hill crests and hill slopes habitat with only nine species recorded. The low diversity in this habitat likely reflects the low botanical diversity and structurally simplistic habitat.

The most frequently recorded bird species during the systematic surveys were the white-breasted woodswallow (n=103), Singing honeyeater (n=84), and budgerigars (n=76).

One conservation significant bird species has been recorded in the Lamb Creek project to date. This is the fork-tailed swift (*Apus pacificus*) which is listed EPBC Migratory and Marine. The fork-tailed swift is an extremely aerial species that is highly unlikely to land in the survey area and would not be affected by developments on the ground.

A comparison with data from the 2012 survey (Rapallo 2012a) indicated that the bird diversity in 2020 was lower than in that earlier survey, when 76 bird species were recorded (Table 4.3). The 2012 survey, however, covered a larger area as a southern haul road option was included, and in 2012 the survey area had not experienced recent fires. Over both survey years combined (see Appendix V) a total of 87 bird species have been recorded from the Lamb Creek project to date. Of these species, 52 were recorded in both survey years, 24 were only recorded in 2012, and four were only recorded in 2020. This difference

reflects the variability in bird assemblages between seasons and between years, and underlines that no single season survey would capture the complete avifauna of an area.

No conservation significant bird species were recorded in 2020. However, in 2012 the Fork-tailed swift (listed EPBC Migratory and Marine) was recorded from several locations (section 4.1.4).

4.2.2 Mammals

Twenty species of mammal were recorded during the 2020 survey. Bats were the most abundant group, with seven species recorded including the conservation significant ghost bat (listed Vulnerable). The majority of mammal species were recorded from systematic trap sites.

Mammal diversity was lower than predicted from the desktop study, which lists 46 mammal species recorded previously within 50 kilometres of the survey area (Appendix V), of which 43 species recorded from the adjacent Mining Area C. However, the Lamb Creek survey area did not contain suitable habitat for some of these regional species (for example no sand plains for Bilbies), and the survey comprised a single season only. In comparison, 21 surveys have been completed over the adjacent Mining Area C with data spanning many years and seasons, and over a much larger area containing habitats that do not occur in the Lamb Creek survey area (Biologic 2017).

To date, 28 mammal species have been recorded from Lamb Creek over both 2012 and 2020 surveys combined (Table 4.3). The number of mammal species recorded in 2020 was 19 compared to 22 recorded in 2012. The majority of species were recorded in both surveys. The northern quoll, listed Endangered, was only recorded in 2012, as discussed further below.

Systematic captures of small mammals were dominated by small dasyurids and rodents. The most abundant species were the Ooldea dunnart (*Sminthopsis ooldea*), Pilbara ningaui (*Ningaui timealeyi*) and the sandy inland mouse (*Pseudomys hermannsburgensis*) each with five captures. One additional species, the common rock rat (*Zyzomys argurus*) was recorded from a camera trap. The only conservation significant trappable mammal species recorded in 2020 was the western pebble-mound mouse (*Pseudomys chapmani*) which was recorded in the form of numerous mounds across the survey area. Nearly all pebble-mounds were recorded in the habitats of hill crest and hill slopes (section 4.5.2) and stony plain (section 4.5.1).

The 2020 survey recorded two conservation significant mammal species: the ghost bat (Vulnerable) and the western pebble-mound mouse (Priority 4). These same species were also recorded in 2012, as well as the northern quoll and the Pilbara olive python. These are discussed further in section 4.3.

Four introduced (feral) mammal species were recorded in 2020. These were the dromedary camel (*Camelus dromedarius*) and dog/dingo (*Canis lupus* sp.) which are listed declared pests s22(2), and the feral cat (*Felis catus*) and house mouse (*Mus musculus*) which are listed permitted s11 on the Western Australian Organism List (DAFWA 2021). One additional species of introduced fauna, the cow (*Bos taurus*) was recorded in 2012 (Rapallo 2012a).

4.2.3 Reptiles

During the 2020 survey 44 species of reptile and one species of amphibian were recorded from the Lamb Creek survey area. The desktop study indicated a total of 91 reptile species and seven amphibian species have been recorded within 50 kilometres of the survey area. However, the survey area does not contain suitable habitat for every one of these species.

To date, 68 reptile species and two frog species have been recorded from the 2012 and 2020 Lamb Creek survey areas (Table 4.3). In 2012 58 reptile species and two frog species were recorded, which is clearly higher than the number of species recorded in 2020. The lower numbers in 2020 were most likely because spotlighting was not permitted in 2020 due to logistics and client safety restrictions, and also because the survey area was recovering after several fires which burnt the majority of the survey area.

Overall, reptile records were still quite high during the 2020 survey. The reptile assemblage comprised sixteen skink species, five varanid species, five pygopod species, six agamid species and eight gecko species and four species of elapid for a total of 44 reptile species. The most commonly recorded reptile species were the rock ctenotus (*Ctenotus saxatilis*) with 86 records followed by the leopard ctenotus (*Ctenotus pantherinus*) with 61 records. The two most common geckos were the Pilbara ground gecko (*Lucasium wombeyi*) and western beaked gecko (*Rhynchoedura ornata*) with 37 and 36 records, respectively. The majority of reptile records came from systematic trapping.

Reptile species richness was generally consistent across all sites. The highest species richness was recorded at sites S06 and S09 with 15 species recorded at each.

No reptile species of conservation significance were recorded in 2020. However, in 2012 the Pilbara olive python (*Liasis olivaceus barroni*), listed Vulnerable under both the *Biodiversity Conservation Act 2016* and the EPBC Act, was recorded from a single location (section 4.3).

4.2.4 Amphibians

Amphibian diversity was low across the survey area, with only one species, *Cyclorana maini,* recorded. This is not a conservation listed taxon. One individual was detected opportunistically at trap site S02 within the Tussock grassland plain habitat. The lack of diversity and abundance of amphibian records likely reflects the low rainfall in the month prior to the survey.

4.2.5 Species richness estimators

To provide an indication of survey completeness, the software program EstimateS (Version 9.1.0) (Colwell 2013) was used to generate species accumulation curves and to calculate predicted species richness. Species accumulation curves represent a theoretical model of the relationship between survey effort and species accumulation: as the number of individuals recorded during the survey increases, the accumulation of fauna species decreases until the curve reaches an asymptote (Gotelli & Colwell 2011).

Since models can only be generated from data collected through systematic methods, the species accumulation curve and predicted species richness were calculated from systematic trapping data, and from systematic bird surveys. Separate analyses were conducted for these two methods.

4.2.5.1 Species accumulation curve for trapping data

The species accumulation curve for trapping data is presented in Figure 4.1, plotting the number of fauna species recorded (y-axis) against the number of individual animals captured in traps (x-axis). Observed species richness is presented as a sample-based rarefaction curve, computing the mean number of fauna species (S(est)) over all possible combinations of 1, 2, and up to 402 individuals captured (Colwell *et al.* 2012).

Systematic trapping recorded 43 species. The predicted species richness for trappable ground-dwelling fauna was 71 species, which indicates that 61% of the (estimated) trappable fauna had been captured

during the survey. This is reflected in the species accumulation curve, which after 402 individuals captured has not started to approach an asymptote (Figure 4.1).

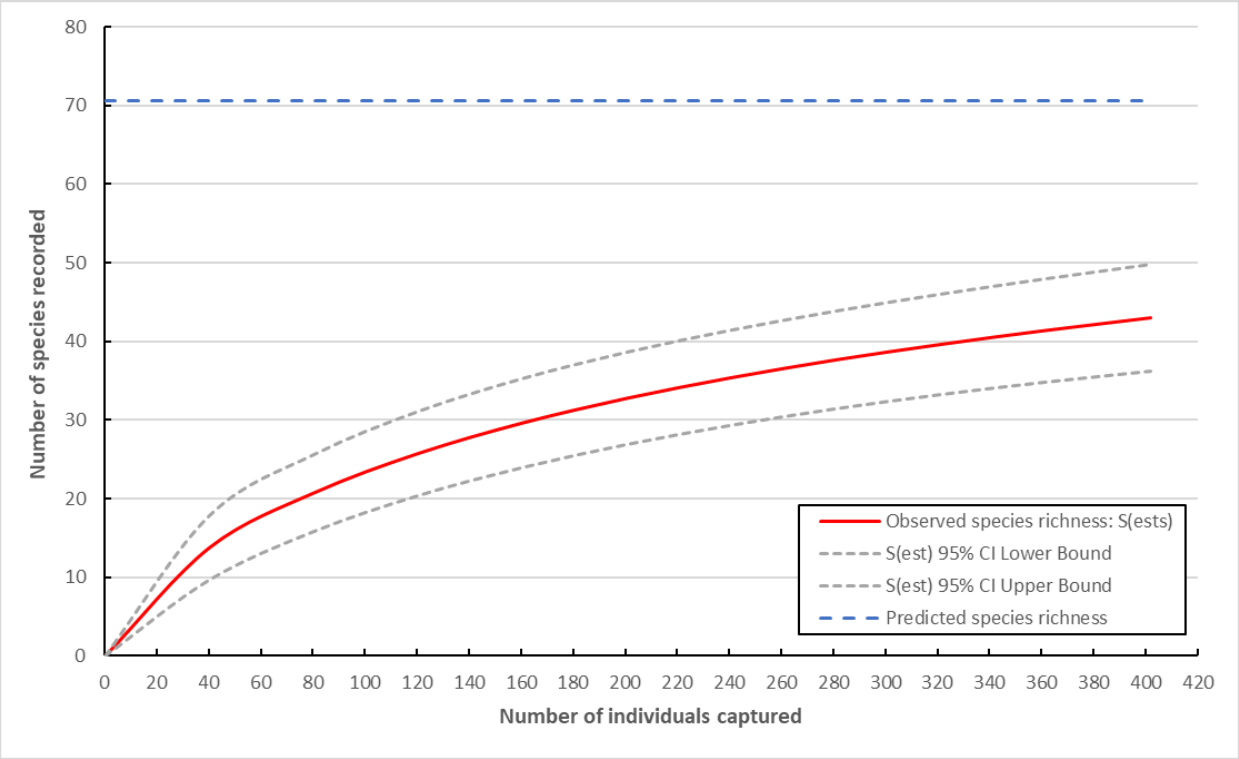

Figure 4.1 Species accumulation curve for trappable vertebrate fauna

The primary reason for the large difference between predicted and recorded species richness was the Chao 1 estimator which is very sensitive to the presence of species represented only by singletons (rare species) relative to species captured more than once. The theory behind the Chao 1 estimator is that if rare species (singletons) are still being discovered by the end of the survey, there are likely to still be more species present in the survey area that have not yet been recorded (Vavrek 2011). During the 2020 survey of Lamb Creek, sixteen species out of a total of 43 were trapped only once, hence 37% of the species were represented by singletons. This suggests that more species are likely present in the survey area than recorded during the current survey.

Opportunistic and spotlighting records of trappable fauna (excluding microbats and species too large to be captured in the traps deployed) yielded an additional nine species of small to medium-sized ground dwelling vertebrate fauna that could have been captured in traps. Hence, the actual number of trappable fauna recorded during the survey was 52, which represents 73% of the predicted total.

A comparison with data from the 2012 survey (Rapallo 2012a) yielded a total of 26 mammals (of which 19 trappable), 68 reptiles, and two frogs recorded from the Lamb Creek project area over both surveys combined (see Appendix V). Out of the combined total of 96 species of mammals, reptiles, and frogs recorded from Lamb Creek to date, 49 were recorded in both surveys, 33 were recorded only in 2012, and fourteen were recorded only in 2020.

The desktop study identified 46 mammals, 91 reptiles, and seven frog species within 50 kilometres of the survey area (section 4.1.2). Of these, 24 mammals were not considered trappable as they were either too big for the traps deployed, or were bats. Hence, the total number of potential trappable fauna identified in the desktop is 113 species. This number exceeds the predicted species richness, which is not unexpected, as not all species occur everywhere within their range, and not all habitats that appear

potentially suitable may meet the exact specifications that a particular species needs. The Pilbara region is well surveyed, and this indicates that the desktop list provides a good representation of all potential species within 50 kilometres of the survey area. Further trapping efforts in the survey area are likely to yield additional species for the Lamb Creek project.

Based on current desktop results, differences between the two survey years, as well as the shape of the species accumulation curve, it is expected that additional surveys would improve the known species richness of the Lamb Creek survey area. However, without considerable trapping effort, further surveys are unlikely to yield additional trappable conservation significant vertebrate fauna. The habitat suitable for those species not yet recorded in the survey area (see desktop section 4.1.4) are primarily within the areas to the south of the haul road, which is outside of the survey area.

4.2.5.2 Species accumulation curve for systematic bird survey data

The species accumulation curve for systematic bird survey data is presented in Figure 4.2, plotting the number of bird species recorded (y-axis) against the total number of detections for all species combined (x-axis). Observed species richness is presented as a sample-based rarefaction curve, computing the mean number bird species (S(est)) over all possible combinations of 1, 2, and up to 335 detections (Colwell *et al.* 2012). Predicted species richness was calculated by taking the average of the estimators ACE, Chao 1, Jackknife 1, and Bootstrap, as appropriate for abundance data (Colwell 2013).

Systematic bird surveys recorded 51 bird species. The predicted bird species richness was 67 species, which indicates that 76% of the (estimated) bird species present in the survey area had been detected through systematic surveys. This is reflected in the species accumulation curve, which after 335 detections is not yet approaching an asymptote (Figure 4.2).

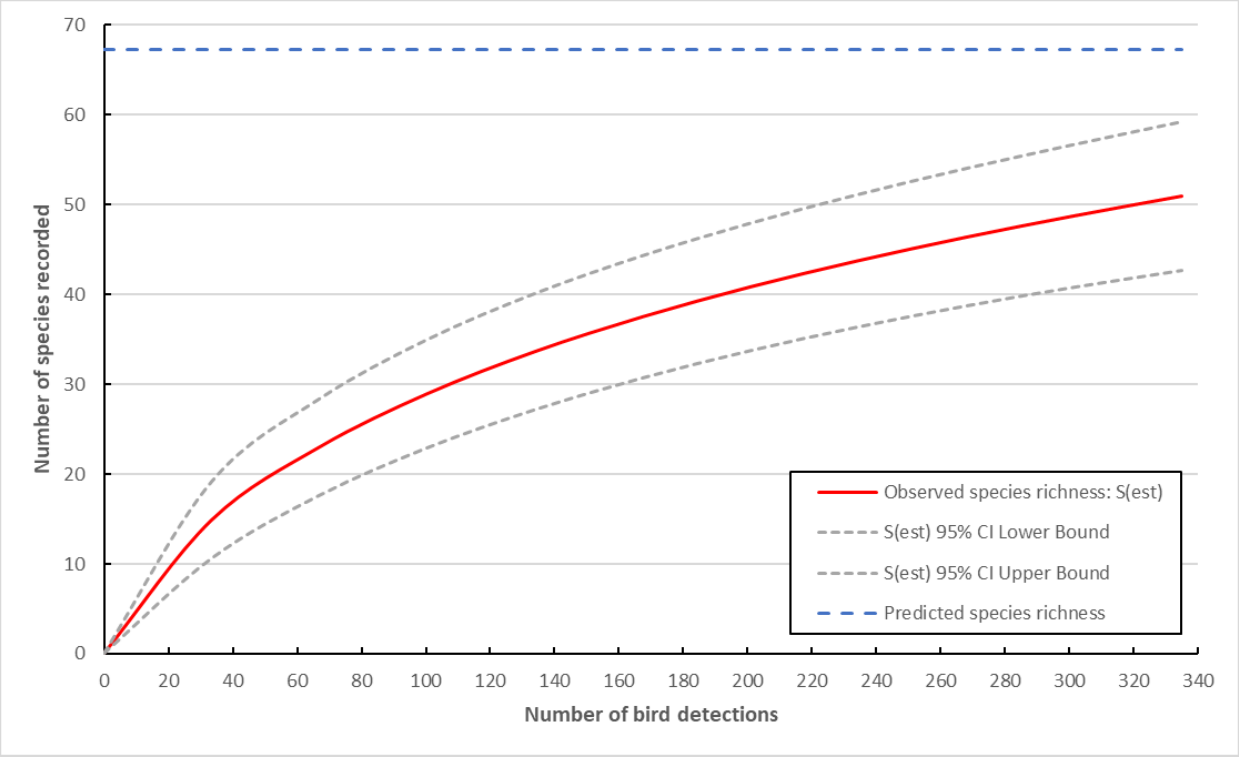

Figure 4.2 Species accumulation curve for systematic bird surveys

Similar to the trapping data, the Chao 1 estimator for the systematic bird data was very high compared to the other estimators, which is reflected by the fact that out of the total 51 species, 15 were

represented by singletons (29%). A high Chao 1 is a strong indication that further rare species occur in the survey area that have not yet been detected during the survey.

Opportunistic bird records collected during the survey (plus three Little button-quails captured in traps) yielded an additional twelve species. Hence the actual number of bird species recorded during the survey was 63, which represent 94% of the predicted total.

Bird assemblages of a given area often show variability between seasons and between years. A comparison with data from the 2012 survey (Rapallo 2012a) yielded a total of 86 bird species recorded from the Lamb Creek project area over both surveys combined (see Appendix V). Of these species, 47 were recorded in both survey years, 29 were only recorded in 2012, and 10 were only recorded in 2020. The total number of 86 bird species exceeds the predicted species richness of 67 bird species. However, since predicted species richness was calculated on data from the 2020 survey, it can only estimate total bird species richness at the time of the survey, and not across seasons or years.

The desktop study identified 157 bird species recorded within 50 kilometres of the survey area. The survey area contains potentially suitable habitat for 131 of these species (excluding ducks, waders, and other waterbirds).

Based on the desktop results, seasonal variability in bird assemblages, and the shape of the species accumulation curve, it is expected that additional surveys would further improve the known bird species richness of the Lamb Creek survey area. However, further surveys are unlikely to yield additional conservation significant bird species for the survey area.

4.4 Conservation significant vertebrate fauna

Five species of vertebrate fauna listed as conservation significant under either the Western Australian *Biodiversity Conservation Act 2016* (BC Act) or the federal *Environment Protection and Biodiversity Conservation Act 1950* (EPBC Act)[1] or listed as priority species by the department of Biodiversity Conversation and Attractions (DBCA) have been recorded from or proximal to the current Lamb Creek survey area to date, as listed below.

- Northern quoll (*Dasyurus hallucatus*) listed Endangered under both the EPBC Act and BC Act – Confirmed, recorded in 2012.
- Ghost bat (*Macroderma gigas*) listed Vulnerable under both the EPBC Act and the Biodiversity Conservation Act 2016 (BD Act) listed Confirmed, recorded in 2012 and 2020.
- Western pebble-mound mouse (*Pseudomys chapmani*) listed DBCA Priority 4 – Confirmed, recorded throughout the project area in 2012 and 2020.
- Fork-tailed Swift (*Apus pacificus*) listed Migratory and Marine under the EPBC Act – Confirmed, recorded in 2012.
- Pilbara olive python (*Liasis olivaceus barroni*) listed Vulnerable under both the EPBC Act and the BC Act – Confirmed, recorded in 2012.

4.4.1 Northern quoll

The Northern quoll is listed as Endangered under the EPBC act and the BC Act. The species, once widely distributed across northern Australia, is now restricted to three isolated populations; the Pilbara, the Kimberley and Northern Territory, and Queensland, in addition to a number of islands along the north coast (DoE 2016). Such declines are primarily due to the western expansion of the cane toad which is highly toxic to predators when consumed (Woinarski *et al.* 2008). Other threats include predation from feral predators such as foxes and cats, inappropriate fire regimes, disease, habitat degradation through grazing as well as habitat destruction through mining and agriculture (Woinarski *et al.* 2011).

The Northern quoll is both arboreal and terrestrial, inhabiting ironstone and sandstone ridges, scree slopes, granite boulders and outcrops, drainage lines and riverine habitats (Braithwaite & Griffiths 1994, Oakwood 2002). Rocky habitats tend to support higher densities, as they offer protection from predators and are generally more productive in terms of availability of resources (Braithwaite & Griffiths 1994, Oakwood 2002). Other microhabitat features important to the species include: rock cover; proximity to permanent water and time-since last fire (Woinarski *et al.* 2008). Dens occur in a wide range of situations including: rock overhangs, tree hollows, hollow logs, termite mounds, goanna burrows and human dwellings/infrastructure, where individuals usually den alone (Oakwood 2002, Woinarski *et al.* 2008). Northern quoll populations go through boom-bust cycles with population crashes recorded in years of drought (Hernandez-Santin, et al. 2019, Moore et al. 2021).

The Northern quoll is moderately common through part of the Pilbara (within 150 kilometres of the coast) and therefore usually present where suitable rocky habitat is present. Northern quoll occur in the hard rocky habitats of the Pilbara that provide denning habitat and safety from predators and fire (Hill & Ward 2010, Turpin & Bamford 2014).

Habitat critical to the survival of the northern quoll is defined as rocky habitats such as ranges, escarpments, mesas, gorges, breakaways, boulder fields, major drainage lines, or treed creek lines (DotEE

[1] Note that all species listed under the EPBC Act as Threatened (see Appendix II) are considered Matters of National Environmental Significance (MNES).

2016). The gorge, gully, breakaway habitat within the higher elevation areas of the retention licence and ranges adjacent to the proposed haul road corridor fit the definition of critical northern quoll habitat, defined by large areas of condensed, complex rocky habitat, with intact vegetation occurring within and in the areas surrounding habitat (DotEE 2016, Moore et al. 2021). Habitat complexity within-patch scale (Moore *et al.* 2021) is present for denning via the deep cracks and crevices of the extensive outcropping. Suitable denning habitat for this species occurs within the gorge, gully, breakaway habitat within the higher elevation areas of the retention licence and the ranges adjacent to the proposed haul road corridor. Northern quoll may forage/disperse through surrounding habitats such as hill crest/hillslope and drainage habitats.

No evidence of Northern quoll was detected during the 2020 survey, despite significant effort including searching on foot for scats, footprints and other signs, and placement of 40 camera traps (279 camera nights) (Figure 3.1). The 2012 trap effort of 182 camera nights and 300 cage trap nights yielded one individual recorded via camera and a scat from gorge, gully, breakaway habitat located in the ranges adjacent to the current haul road corridor (Rapallo 2012a). In addition, a scat was recorded during April 2012 flora surveying from a rock overhang in the gorge, gully, rocky breakaways habitat of the eastern part of the retention licence (M. Weerheim *pers. comm*.) (Figure 4.3). The 2012 survey coincided with the recruitment season for northern quoll (Hernandez-Santin, et al. 2019).

Northern quoll was recorded very infrequently from the adjacent Mining Area C, despite significant survey effort over many years, and all records were scats only (Biologic 2017).

Based on desktop evidence and records from 2012 and 2020, it appears that northern quoll are locally present at low density. It is unlikely that an extensive population of northern quoll inhabits the survey area, or habitats adjacent to it, bearing in mind that the current 2020 survey was completed at reconnaissance level, and survey work to date (2012 and 2020) and did not cover all areas of potential gorge / gully habitat within the project area.

4.4.2 Ghost bat

The Ghost bat (*Macroderma gigas*) is listed It is listed as Vulnerable under both the Western Australian *Biodiversity Conservation Act 2016* and under the Commonwealth EPBC Act. The species has declined significantly over the last 200 years and currently has a patchy and widespread distribution across northern Australia (Van Dyck & Strahan 2008). The availability of suitable roost caves is critical for the species' persistence and survival (Armstrong & Anstee 2000).

Rapallo recorded ghost bat at Lamb Creek during a detailed fauna survey in 2012. At that time, the ghost bat was Priority 4 and not considered an MNES species. Hence, (DEWHA 2010) did not apply to the ghost bat at the time. Furthermore, ultrasonic recordings in 2012 failed to detect ghost bat calls as, at the time, the consensus was that their echolocation and social calls were difficult to distinguish from other signals based on their structure (Armstrong 2010). All ghost bat records from Rapallo (2012) were through direct sightings on the few select caves that could be visited by the team on foot as access via helicopter was not provided.

Bat survey work completed in 2020-2021 was a component of the detailed survey in order to assess general bat populations of the survey area. Caves 1, 2 and 3, where ghost bats had been detected visually in 2012 were re-visited in April 2020. Caves 4 and 5 were identified after the 2020 field survey when additional regional information became available. Because they were very close to the survey area (approximately 200 meters) caves 4 and 5 were visited opportunistically in February 2021 during SRE field

work, with some additional recordings also made at caves 1 and 2. The purpose of this was to make use of the opportunity to accumulate more survey data, as a helicopter was available.

Calls at times consistent with foraging visits were detected at Caves 2 and 3 in April 2020 and at Caves 3 and 4 in February 2021. At least four diurnally roosting ghost bats were confirmed at Cave 1 in 2020. This was confirmed by the temporal pattern of their recorded calls on three nights. Both social and ultrasonic calls were recorded before dawn followed by similar numbers of calls soon after dusk that day.

In 2021 calls consistent with diurnally roosting ghost bats were detected at Cave 5. These records are consistent with the Ghost bat being present in the region (Bat Call WA 2021) including the adjacent Mining Area C (Biologic 2017, 2016b).

Cave 1 is provisionally assigned as a Category 2 roost while Caves 2, and 3 are provisionally Category 3. Caves 4 and 5 are known Category 3 and 2 respectively (Bat Call unpublished data) and occur nearby to a number of other caves, shelters and overhangs identified in Biologic (2016b).

Caves that are confirmed as Category 2 and groupings of caves that surround them are critical Ghost bat habitat (Bat Call WA 2021). Based on this, caves 4 and 5 are confirmed critical habitat, and cave 1 is potential critical habitat pending confirmation. Caves are initially given a provisional categorisation based on the first visit. In order for this status to become confirmed, permanent monitoring is required to confirm pattern of usage over a two-year period (B. Bullen *pers. comm*. January 2022).The roost categories are detailed in (Appendix VIII).

Ghost bat will often forage more broadly across habitats, often utilising drainage lines and other habitats where prey species are likely to be most abundant (Richards *et al.* 2008, Tidemann *et al.* 1985). Therefore, until habitat requirements for Ghost bat in the Pilbara are refined it is assumed that suitable foraging habitat exists across all habitats of the survey area.

Cave 1 and cave 3 are located in the retention licence (R47/19), within respectively 325 metres and 600 meters from footprint V3, while cave 4 and 5 are located adjacent to the project area within 200 meters of the haul road footprint in L47/713 (Figure 4.3).

In summary, ghost bat was confirmed in the areas surveyed at Lamb Creek in 2012, 2020 and 2021. To date no targeted work on ghost bats as per DEWHA (2010) or detailed cave/roost assessments have been completed in the Lamb Creek project area, and some areas have never been visited as they were added after the surveys were completed. The work completed on ghost bats in 2012, 2020 and 2021 was either a component of a detailed survey or opportunistic records.

4.4.3 Pilbara olive python

The Pilbara olive python (*Liasis olivaceus barroni*) is listed Vulnerable under both the *Biodiversity Conservation Act 2016* and the EPBC Act. This species was not recorded in 2020, but in 2012 it was recorded crossing stony plain habitat between the Hamersley massive (hillcrest/hilltop habitat) and the Lamb Creek (medium drainage) within the now discounted southern haul road option (Rapallo 2012a), (Figure 4.3). The species has been recorded from the adjacent Mining Area C (Biologic 2017) and from four DBCA records in the vicinity (Appendix VI).The Pilbara olive python favours areas with permanent water holes in rocky rangers or along rivers (Pearson 1993).

This species is likely to be found within the gorges and gullies of the ranges adjacent to the proposed haul road corridor and may forage/disperse through surrounding habitats such as stony plain and drainage habitats.

4.4.4 Western pebble-mound mouse

The Western pebble-mound mouse (*Pseudomys chapmani*) is listed by the DBCA as Priority 4 which is defined as taxa in need of monitoring. The species has experienced a significant decline in their range from the Gascoyne and Murchison (Van Dyck & Strahan 2008). Pebble mounds were recorded in both 2012 and 2020 from the hill crest/hill slopes and stony plain habitats (Figure 4.3). The Western pebble-mound mouse was also recorded throughout similar habitat in the adjacent Mining Area C project area (Biologic 2017) and appears to be locally common.

4.4.5 Fork-tailed swift

The Fork-tailed swift (*Apus pacificus*) is listed Migratory and Marine under the EPBC Act. It was not recorded in 2020, but in 2012 it was recorded from all habitats of the survey area (Rapallo 2012a) . This species is migratory, and would forage above the Lamb Creek project area during summer (Johnstone & Storr 1998). The species is entirely aerial and would not land in the survey area. Hence, project activities on the ground are unlikely to impact this species.

Table 4.5 Fauna habitat descriptions

Habitat	Representative Photo
Stony plain Plains and lower slopes of spinifex hummock grasslands (or in small patches, tussock grass) on red sandy clay loam to loam soil. Typically, with a mantle of gravel (less so on the valley floor adjacent to drainage, where soils are loamier). Little to no overstory aside from scattered trees or patches of mixed shrubs often regenerating from fire. Generally, *Eucalyptus leucophloia* occurs on the slopes, *Eucalyptus gamophylla* on lower slopes and *Corymbia hamersleyana* is typically associated with drainage). Potential conservation significant species: ▪ Night parrot (possible foraging/ dispersal in small area of unburnt mature Triodia near LCS03) ▪ Ghost bat (foraging/ dispersal) ▪ Grey falcon (foraging/ dispersal ▪ Western pebble-mound mouse (breeding/ shelter, foraging/ dispersal) ▪ Pilbara olive python (foraging/dispersal) Sites: LC16, LC22, LC24B, LC24A, LC27B, LC28, LC29A, LC30, LC37A, LC40, LCS08, LCS03 LCS04 Area: 518 hectares Significance: Low	

Habitat	Representative Photo
Hillcrest/hill slopes Slopes and hill crests of the higher elevation areas. Spinifex hummock grassland dominated with scattered Eucalyptus leucophloia trees and mallee, and acacia and grevillea shrubs on rocky, red skeletal soils (loams to clay/loam). Potential conservation significant species: ▪ Ghost bat (foraging/ dispersal) ▪ Western pebble-mound mouse (breeding/ shelter, foraging/ dispersal) ▪ Northern quoll (foraging/ dispersal) Area : 319 hectares Sites: LC11, LC19, LC17, LC38, LC26, LCS10 Significance: Moderate	
Mulga/corymbia plain Open mulga shrubland patches over spinifex or tussock grassland on loams to sandy clay loam occurring in areas of sheet flow drainage. The mulga patches are surrounded by run-off zones of stonier plain of open spinifex/tussock grassland under very open mulga/ *Corymbia deserticola (*shrubland). Potential conservation significant species: ▪ Ghost bat (foraging/ dispersal) ▪ Grey falcon (foraging/ dispersal ▪ Gane's blind snake Area: 291 hectares Sites: LC04, LC05, LC06, LC07, LC08, LC09, LC10, LC15, LCS05 and LCS06 Significance: Moderate	

Habitat	Representative Photo
Minor drainage The smaller narrow drainage channels and shallow gullies that bisect the stony plain habitat and hill slopes, forming flow zones on the valley floor. Mixed open shrubland to shrubland often over tussock grass and herbs with occasional fringing trees (scattered *Eucalyptus leucophloia, Corymbia or Eucalyptus gamophylla)* Potential conservation significance species: ▪ Ghost bat (foraging/ dispersal) ▪ Grey falcon (foraging/ dispersal) ▪ Peregrine falcon (foraging/ dispersal) ▪ Pilbara olive python (foraging/ dispersal) ▪ Northern quoll (foraging/ dispersal) Area : 210.6 hectares Sites: LC18, LC23, LC25, LC27A, LC36, LC37, LC42A, LC44, LC43, LC45, LC29B Significance: Moderate	
Tussock grassland plain Tussock grass (Aristida i*naequiglumis*, *A. contorta*, *Themeda triandr*a) dominated largely undefined drainage plain. Contains occasional open mulga woodland stands or scattered mulga individuals on brown sandy clay loam to loams. Contains patches of spinifex. Potential conservation significant species: ▪ Ghost bat (foraging/ dispersal) ▪ Grey falcon (foraging/ dispersal ▪ Peregrine falcon (foraging/ dispersal) ▪ Gane's blind snake ▪ Short-tailed mouse Area : 137 hectares Sites: LC31, LC32, LC33, LC34, LC35, LC41, LC42, LCS01, LCS02 Significance: Moderate	

Habitat	Representative Photo
Medium drainage Wide loamy drainage channels to undefined drainage (gravelly) containing occasional emergent *Corymbia hamersleyana* over patches of low mixed shrubs over buffel grass and tussock grass dominated understory on low relief. Contains very occasional mulga stands in loamier soils. Potential conservation significant species: ▪ Ghost bat (foraging/ dispersal) ▪ Grey falcon (breeding/ nesting, foraging, dispersal) ▪ Pilbara olive python (foraging/dispersal) ▪ Northern quoll (foraging/ dispersal) ▪ Peregrine falcon (foraging/ dispersal) ▪ Gane's blind snake Area : 113 hectares Sites: LC01, LC02, LC03, LC39, LC39A, LCS07, LCS09 Significance: Moderate	
Gorge, gully and rocky breakaway The wide rocky gullies and gorges that bisect the hillcrest/hillslopes of the higher elevation areas containing caves, deep cracks, and crevices. Breakaways occur as the rugged edges of hillslopes. Spinifex hummock grassland with mixed shrubland patches or occasional ficus occurring in shaded locations or occasional *Eucalyptus leucophloia.* otential conservation significant species: ▪ Pilbara olive python (breeding/ shelter, foraging/ dispersal) ▪ Northern quoll (breeding/ shelter, foraging/ dispersal) ▪ Ghost bat (roosting/foraging/ dispersal) ▪ Peregrine falcon (breeding/foraging/ dispersal) ▪ Pilbara barking gecko ▪ Gane's blind snake Area : 54.7 hectares Sites: LC13, LC21, LC12, LC14, LC20, LC12, LC14, LC20 Significance: High	
4.5.1 Stony plain

A habitat of the lower slopes, undulating and level plains, the stony plain habitat often occurs in shallow valleys below hill systems. This habitat typically has a low habitat complexity due to low diversity of microhabitat and minimum shading from vegetation and landform dependent on surrounding topography and outcropping.

The stony plain habitat is the most extensive habitat on the survey area (518 hectares), covering most of the retention licence and haul road corridor on the lower valley sides to valley floor. At Lamb Creek this habitat is characterised by little to no overstory aside from scattered trees or patches of mixed shrubs often regenerating from fire. *Eucalyptus leucophloia* often occurs on the slopes, *Eucalyptus gamophylla* on the valley floor and lower slopes and *Corymbia hamersleyana* grades into drainage. Within the survey area the stony plain typically has low habitat complexity with microhabitats restricted to infrequent rocky outcrops and limited shade provided by vegetation.

Stony plain habitat is a common habitat in the Pilbara, particularly in the Boolgeeda Land System. Aerial photography and helicopter visuals confirm that this broad habitat occurs outside of the survey area. There are some species of conservation significance that may utilise this habitat, primarily as foraging or dispersal. However, they are not restricted to this habitat type. The stony plain habitat is ranked as low significance (Table 4.5, Appendix IV).

4.5.2 Hill crests/hill slopes

Hillcrests and hillslopes are the rocky crest and slopes of the large hills and ranges. This habitat typically has a low habitat complexity due to low diversity of microhabitat and minimum shading from vegetation and landform dependent on surrounding topography and outcropping.

At Lamb Creek this habitat is confined to the higher elevation areas (centre and south-east corner of the retention licence) and falls within the Newman Land and Boolgeeda Land System. There are no high elevation south facing slopes and outcropping with cracks and crevices predominately occurs in the adjacent gorge, gully and rocky breakaway habitat. This broad habitat can contain areas of outcropping, outwash (minor drainage) and breakaway that were too small to map in detail.

Hill crests and hill slopes formed the second most extensive habitat within the survey area, covering 319 hectares. Vegetation is characterised by a *Triodia hummock* grassland with scattered *Eucalyptus leucophloia* trees and mallee, and acacia and grevillea shrubs.

Aerial photography, helicopter visuals, and ground-truthing for camera trapping confirmed that this habitat extends outside of the retention licence, to the south of the haul road corridor. In a regional context, rocky spinifex dominated hillcrests and hillslopes habitats of the Pilbara are common.

Conservation significant species are likely to disperse and forage within these habitats due to the proximity of the gorge, gully and rocky breakaway habitat, therefore, this habitat is ranked as moderate significance (Table 4.5, Appendix IV).

4.5.3 Gorge, gully and rocky breakaway

Gorges are deeply incised, with vertical cliff faces, while gullies are more open and shallower. Breakaways refer to rugged slopes with vertical fall on the edge of a hill or range. This habitat can support caves and

semi-permanent rock pools and has a moderate to high habitat complexity largely dependent on landform and aspect.

At Lamb Creek this habitat is confined to the higher elevation areas within the retention licence and falls within the Newman Land System. This habitat bisects the hillcrest/hillslopes of the higher elevation areas and contains caves, deep cracks/crevices, and shaded microhabitats from both vegetation and landform shadow. The more open, shallow gullies contain have lower habitat complexity with microhabitats occurring within the rocky substrate and partial shade provided by vegetation and landform. The deepest gorge on the retention licence has northern-facing slope and there are no south facing gorges or deep gullies.

This habitat occurs as two deep gorges and two smaller gorges in the centre and south-east corner of the retention licence and is typically vegetated with spinifex hummock grassland with mixed shrubland patches or ficus occurring in shaded locations and occasional *Eucalyptus leucophloia*. The gorge, gully and rocky breakaway habitat does not occur on the haul road corridor.

The gorge, gully and rocky breakaway habitat is one of the smallest habitats in the survey area (54.7 hectares) due to its narrow features. Aerial photography and helicopter visuals and ground-truthing for camera trapping confirmed that this habitat extends outside of the retention licence, bisecting the higher elevation areas adjacent to the proposed haul road corridor. In a regional context, the gorges, gully and rocky breakaway habitats of the Pilbara are restricted to the Chichester and Hamersley IBRA subregions but are well represented. Locally, this habitat occurs at Mining Area C (Biologic 2017) and within Karijini National Park.

The gorge, gully and rocky breakaway habitat are considered important for conservation significant fauna, including Matters of National Environmental Significance species. The gorge, gully and rocky breakaway habitat is ranked as high significance (Table 4.5, Appendix IV).

4.5.4 Medium drainage

Medium drainage is defined as the narrow gravelly drainage channels that become wider on the lower plains of the valley. This drainage is made up of minor tributaries that feed into the major creek lines of the catchment. Medium drainage is often fringed by *Corymbia hamersleyana*. Medium drainage habitat typically exhibits a moderate habitat diversity with some tree hollows and woody debris (logs and leaf litter) and typically does not contain semi-permanent/ permanent pools or the large fringing river gums.

At Lamb Creek this habitat occurs on the valley floor of the retention licence as wide loamy drainage channels to undefined drainage (gravelly) containing occasional emergent *Corymbia hamersleyana* over patches of low mixed shrubs over buffel grass and tussock grass dominated understory on low relief. Contains very occasional mulga stands in loamy soils as the habitat transitions into mulga/corymbia plain habitat.

The medium drainage habitat provides higher protection than the surrounding stony plain habitat due to partial shading from vegetation and some leaf litter and woody debris, however it was noted in 2020 and 2021 that detritus and litter within this habitat was sparse or in piles without accumulated soil - indicating recent fast flow and little opportunity for soil and fine detritus to accumulate. This habitat typically has deeper loamier soils than the surrounding stony plain, therefore greater potential to retain moisture.

The medium drainage habitat although small in area (113 hectares) due to narrow features is relatively common throughout the Pilbara. Aerial photography and helicopter visuals confirm that this habitat occurs outside of the survey area aligning with the Lamb Creek that feeds into Marillana creek.

The medium drainage habitat provides foraging and dispersal opportunities for conservation significant fauna including Matters of National Environmental Significance species. The medium drainage habitat is ranked as moderate significance (Table 4.5, Appendix IV).

4.5.5 Minor drainage

Minor drainage represents the small drainage channels that originate from the hillcrest/ hillslope habitats and bisect the stony plain habitat. Minor drainage typically exhibits a low-moderate habitat complexity, with some shading from vegetation but low soil moisture levels, low accumulated litter, and generally gravelly soils.

At Lamb Creek this habitat occurs throughout the survey area and represents the smaller drainage channels and shallow gullies. Typically, vegetation can be denser than the surrounding habitat of stony plain or hill slopes and hill crests, consisting of mixed open shrubland to shrubland often over tussock grass and herbs with occasional fringing trees (scattered *Eucalyptus leucophloia, Corymbia hamersleyana or Eucalyptus gamophylla*. The substrate can be sandy in places but generally consists of a skeletal loam gravel or stone. This broad habitat although small in area (211 hectares) is relatively common throughout the Pilbara. Aerial photography and helicopter visuals confirm that this habitat occurs outside of the survey area.

There are some species of conservation significance that may utilise this habitat, primarily as foraging or dispersal, however, they are not restricted to this habitat type. The minor drainage line habitat is ranked as moderate significance (Table 4.5, Appendix IV).

4.5.6 Tussock grassland plain

The tussock grassland plain habitat is defined as tussock grassland dominated drainage plain (hardpan) containing open mulga woodland stands or scattered mulga individuals on brown sandy clay loam to loams with surface mantles of very few to few pebbles of ironstone.

This habitat occurs at the southern end of the haul road corridor within the Wannamunna and Boolgeeda land systems. This habitat receives run-on from adjacent hills and surrounding stony plain and much of the drainage is undefined. The tussock grassland broad habitat is not widespread throughout the Pilbara, compared with the adjacent spinifex stony plain and hillcrest/hillslope habitats and aligns broadly with the groves landform unit of the Boolgeeda land system, the hardpan plains landform unit of the Wannamunna land system and 'valley floor mulga' as described by Kendrick (2001).

Aerial photography suggests that this habitat continues south east from the survey area parallel to the Great Northern Highway, aligning with the mulga habitat found at Area C (Biologic 2017), approximately three kilometres to the south-south west of the survey area.

Mulga (species in the *Acacia aneura* complex) is widespread across arid and semi-arid regions of Western Australia, covering approximately 37 percent of the surface area of Western Australia (Fox 1980). Grove-intergrove Mulga communities of the eastern Hamersley range were considered as "ecosystems at risk" by (Kendrick 2001) because it is thought that sensitivity to disturbance is greatest at the northern limit of

mulga's distribution (Fox 1980), related to the dominant summer rainfall pattern of the Pilbara (Fox 1980, Kendrick 2001, Maslin & Reid 2012).

Kendrick (2001) lists a number of 'ecosystems at risk' including grove/inter-grove mulga of the eastern Hamersley range, and 'valley floor mulga' within the Hamersley IBRA subregion. Given the lack of detail provided by Kendrick, it is not possible to determine if the habitats containing mulga vegetation at Lamb Creek match the mulga ecosystems at risk. However, vegetation types B, C, D and E (Rapallo 2021b) do contain *Acacia aptaneura* within the upper storey on stony or clay plains and floodplains, which broadly aligns with the broad description of 'valley floor mulga'.

Regionally, (Biota 2014) consider "valley floor mulga" to extend over a range of approximately 350 kilometres through the southern half of the Pilbara (Biota, unpublished data, cited in Biota 2014) and Onshore (2017) conclude that mulga vegetation of *Acacia catenulata* subsp. *occidentalis* and *Acacia aptaneura* that aligns with valley floor mulga' on the MAC Development Envelope is common on plains between Newman and Roy Hill (approximate range 150 kilometres).

Onshore (2017) concluded that seven other vegetation associations within BHP Billiton Iron Ore's consolidated vegetation mapping database support *Acacia catenulata* subsp. o*ccidentalis* and *Acacia aptaneura* as dominant upper storey components, and are considered to be closely affiliated with the mulga communities recorded on the lower stony plains of the MAC development area. As such Onshore (2017) does not considered the mulga communities within the MAC Development Area to be locally endemic or unique.

Neither the vegetation association nor related ecosystem of "valley floor mulga" has been nominated as a PEC by DBCA since identified as an ecosystem at risk by Kendrick (2001b) suggesting a low level of perceived conservation significance.

The tussock grassland plain habitat provides foraging and dispersal opportunities for conservation significant fauna including Matters of National Environmental Significance species. The tussock grassland plain habitat is ranked as moderate significance (Table 4.5, Appendix IV).

4.5.7 Mulga/corymbia plain

The mulga/corymbia plain habitat is defined as level plain subject to sheet flow containing mulga woodland patches adjacent to run-on zones of stonier plain.

At Lamb Creek this habitat occurs on the valley floor adjacent to medium drainage primarily in the retention licence and also in the northern section of the haul road corridor. Vegetation is broadly open mulga shrubland patches over spinifex or tussock grassland surrounded by run - on zones of stonier plain of open spinifex/tussock grassland under very open mulga/ *Corymbia deserticola* shrubland. Soils are loams to sandy clay loam.

The mulga/corymbia plain habitat exhibits a moderate habitat complexity. Mulga stands provide shade; however, the stands are not extensive or thick, therefore the shade is patchy as is the accumulated litter and associated patches of moister soil. Within the mulga patches this habitat provides loamier soil for burrowing species, however the substrate in adjacent run-on areas is predominantly hard and stony.

This habitat aligns broadly with the stony lower plains and narrow drainage floors, channels land landform unit of the Boolgeeda land system (van Vreeswyk et al. 2004) and 'valley floor mulga' as described by Kendrick (2001).

Boolgeeda is a common system in shallow valleys below hill systems such as the Newman and Rocklea land system (van Vreeswyk et al. 2004). Aerial photography and helicopter visuals suggest that this habitat occurs outside of the survey area however, ground truthing has not verified the extent of individual mulga patches beyond 50 metres south of the survey area. Valley floor mulga is discussed in detail in section 4.5.6.

Disruption to sheet flow could impact this habitat. The mulga/corymbia plain habitat provides foraging and dispersal opportunities for conservation significant fauna including Matters of National Environmental Significance species . The mulga/corymbia plain habitat is ranked as moderate significance (Table 4.5, Appendix IV).

4.5.8 Disturbance

Some habitats have been disturbed via selective clearing for tracks, drill pads and laydown associated with exploration activities, particularly within the stony plain habitat of the retention licence. The majority of the survey area has been burnt over recent years, with some parts burnt several times (NAFI 2021) resulting in a mosaic of different post fire ages. See section 2.5.

4.6 Habitat Features

Water sources are a limiting factor for many ecosystems ((James *et al.* 1995), particularly within arid-zone ecosystems such as the Pilbara ((Burbidge *et al*. 2010, Doughty *et al.* 2011) and often represent areas of comparatively high ecological productivity (Murray *et al.* 2003). Continuous sources of food and moisture, and water for amphibians provides opportunities to forage and breed (James *et al.* 1995). To date there have not been permanent or semi-permanent pools recorded from the Lamb Creek project area, despite extensive use of helicopter in 2012, 2020 and 2021 for baseline surveys.

Caves can be important features within a landscape, particularly in arid zone systems, often providing stable microclimates, shelter and protection (Medellin et al. 2017). Ghost bat occurrence, or evidence of occurrence, has been recorded at five known caves on or proximal to the survey area (section 4.4.2). Cave photographs are located in Appendix VIII.

Habitats of the survey area

4.7 Survey adequacy and limitations

The following sections address level of assessment, survey completeness and survey limitations. The field survey was completed in April 2020 and aligned with the following Environmental Protection Authority (EPA) guidance statements:

- *Technical Guidance – Terrestrial Fauna Surveys* (EPA 2016c)
- *Technical Guidance – Sampling methods for terrestrial vertebrate fauna* (EPA 2016b).

These guidance statements have been superseded by the current technical guidance (EPA 2020), which was published post field work (June 2020).

4.7.1 Level of assessment and survey timing

A single-phase detailed vertebrate fauna survey was conducted over 13 days, from 16 to 28 April 2020. Supplementary habitat assessment and bat call recordings occurred during the wet season between 16 and 25 February 2021. The survey level and timing were as per client request aligning with the end of the EPA (2016b, 2020) recommended survey period for reptiles in the Eremaean botanical province. The recommended survey period for birds and amphibians in the Eremaean province is after rain (EPA 2016b, 2020). As described in section 2.1, rainfall in January 2020 was above average, but below average for February and March 2020 (BOM 2020), and there was no rainfall during the survey. At the time of the survey, the area appeared to be very dry.

The primary focus of the detailed terrestrial vertebrata fauna survey was to identify the faunal assemblages present in the survey area. For this reason, conducting the survey post summer rainfall, when faunal activity is typically high was appropriate. The field survey occurred post-mating season for Northern quoll (Hernandez-Santin, *et al.* 2019), however, the cameras deployed as part of this survey were additional survey effort to the detailed survey rather than constituting a targeted survey as per the Commonwealth guidelines for Northern quoll (DoE 2016). A targeted conservation significant fauna survey (including northern quoll and ghost bat) was beyond the scope.

4.7.2 Survey completeness

Species accumulation curves for trappable fauna and birds are presented in section 4.2.5. Species richness estimators indicate that the survey recorded 61% of the estimated trappable fauna, and 76% of the estimated birds. This is reflected in the shape of the species accumulation curves, which by the end of the survey had not started to approach an asymptote. Additional trapping surveys would likely improve the known species richness of the survey area; however, further short-term trapping surveys are unlikely to yield additional conservation significant species.

4.7.3 Survey limitations

In accordance with EPA (2016c, 2020) technical guidance, an assessment of the limitations of the survey is presented in Table 4.6.

Table 4.6 Limitations of the fauna survey of the Lamb creek survey project area

Aspect	Limitation	Discussion
Scope and intensity	No	Scope and intensity of the survey were suitable to achieve the aims of a level 2 fauna survey as outlined in EPA (2016a).

Aspect	Limitation	Discussion
Availability of contextual information at a regional and local scale	No	Extensive surveying has been undertaken in the Pilbara region including an extensive body of work over BHP Mining Area C which is located directly adjacent and south of the survey area over similar land systems.
Competency/experience of the team carrying out the survey, including experience in bioregion surveyed	No	All members of the survey team have experience in conducting fauna surveys in arid Western Australia.
Proportion of fauna recorded and/or collected, any identification issues	Partial	Approximately 43% of vertebrate fauna identified in the desktop assessment were recorded during the field survey. Although the desktop assessment is likely to overestimate the number of species occurring within the survey area, appropriate sampling was conducted to adequately sample all fauna groups. Apart from SRE specimens, all observed fauna was identified at the point of observation during the field surveys. All recorded bat calls were analysed, and species identified by an external expert. The survey recorded 128 species of vertebrate fauna, including 63 bird species, 20 mammal species, 44 reptile species, and one frog species. However, in comparison with the 2012 survey, the 2020 fauna assemblage was subdued, which was likely related to low rainfall and recent fires. In addition, the 2012 survey included nocturnal spotlighting which often produces additional fauna that are not captured in traps or diurnal surveys, while in 2020 nocturnal surveys were not possible due to client safety requirements. The species accumulation curves for trappable fauna and birds indicated that additional trapping effort is likely to detect further species within the Lamb Creek survey area. The survey comprised a single-season detailed fauna survey, and was not a targeted survey for conservation significant fauna including ghost bat, northern quoll, and Pilbara olive python. The latter two species were not detected in 2020 but known to be present at Lamb Creek in 2012. These species are cryptic and take sufficient effort to detect. Targeted surveys in accordance with national guidelines (DEWHA 2010, 2011) may detect these species within the project area but this was outside the scope. The method used to sample northern quoll broadly aligned with an initial reconnaissance survey under DotEE (2016), but this was not the purpose of the survey which was designed as a detailed fauna survey. Not all critical habitat as per (DotEE 2016) was ground truthed. The camera transects deployed aimed to collect supplementary data to feed into a targeted survey. SM4 deployment completed in 2020 and 2021 did not comprise a targeted survey for ghost bat as per DEWHA (2010). This is not a limitation of this survey as it was a detailed vertebrate fauna survey and a targeted ghost bat survey was outside the scope.
Was the appropriate area fully surveyed (effort and extent)	Partial (survey area) Yes (project area)	The entire survey area (but not the project area) was covered through the use of helicopters which enabled access to all areas. Approximately 555 hectares (25%) of the current project area has not been covered by fauna surveys. Spotlighting was not conducted due to client safety restrictions. Often nocturnal surveys detect additional species including owls

Aspect	Limitation	Discussion
		and nightjars, reptile or mammal species that are not typically captured in traps, and species like frogs which most frequently call at night. The survey was completed as a single-phase detailed vertebrate fauna survey, and not a targeted conservation significant fauna survey.
Access restrictions within the survey area	No	All survey areas were accessible by helicopter.
Survey timing, rainfall, season of survey	Partial	The survey was completed in late April, which falls within the EPA (EPA 2016b) recommended timing to survey reptiles in the Eremaean botanical province. The recommended survey time for birds and frogs is immediately after rainfall events. Rainfall in the two-month preceding the survey was low compared to the annual average and conditions over most of the project area were dry. This is a factor of the survey being single-season only. A single-season survey is unlikely to sample all fauna species present, either because they are infrequently encountered, or because they are not present year-round.
Disturbances that may have affected the results of the survey (e.g. fire, flooding, clearing)	No	The survey area experienced fires in recent years, and the vegetation over most of the survey area was regenerating and relatively sparse compared to unburnt conditions. This is likely to have influenced the overall diversity and abundance of species, however where possible trap sites were positioned in pockets of unburnt habitat within the burn mosaic.

5 Conclusion

Five species of vertebrate fauna listed as conservation significant under either the Western Australian *Biodiversity Conservation Act 2016* (BC Act) or the federal *Environment Protection and Biodiversity Conservation Act 1950* (EPBC Act) or ranked as a priority species by the Department of Biodiversity Conversation and Attractions (DBCA) have been recorded from or proximal to the Lamb Creek project area to date.

- Northern quoll (*Dasyurus hallucatus*) listed Endangered under both the EPBC Act and BC Act – Confirmed, recorded in 2012.
- Ghost bat (*Macroderma gigas*) listed Vulnerable under both the EPBC Act and the BC Act - Confirmed, recorded in 2012 and 2020.
- Western pebble-mound mouse (*Pseudomys chapmani*) DBCA Priority 4 – Confirmed, mounds recorded throughout the survey area in 2012 and 2020.
- Fork-tailed Swift (*Apus pacificus*) listed migratory and marine under the EPBC Act – Confirmed, recorded in 2012.
- Pilbara olive python (*Liasis olivaceus barroni*) listed Vulnerable under both the EPBC Act and the BC Act – Confirmed, recorded in 2012.

The desktop review identified 29 species of conservation significance (excluding species listed solely as EPBC Marine) for which records, or potential habitat exist within 50 kilometres of the project area.

Five species identified in the desktop were recorded during the 2012 and 2020-2021 surveys, as discussed above. Three species were considered likely to occur within the survey area. These were Peregrine falcon (*Falco peregrinus* – listed Other Specially Protected Fauna under the BC Act), Gane's blind snake (*Anilios ganei* –DBCA Priority 1) and Pilbara barking gecko (*Underwoodisaurus seorsus* - DBCA Priority 2).

Four species of conservation significance were regarded as possibly occurring within the survey area these were Night parrot (*Pezoporus occidentalis* – listed Critically Endangered under the BC Act and Endangered under the EPBC Act), Grey falcon (*Falco hypoleucos* – listed Vulnerable under both the EPBC Act and the BC Act), Letter-winged Kite (*Elanus scriptus* – DBCA Priority 1), and the Short-tailed mouse (*Leggadina lakedownensis* – DBCA Priority 4).

Night parrot was not detected via acoustic recorder in 2020. Much of the spinifex across the survey area has been frequently burnt and habitats of the survey area do not include mosaics with samphire and chenopod shrublands, salt lake margin, or paleochannel.

The remaining seventeen species identified by the desktop assessment were considered unlikely to occur within the survey area.

Within the survey area, the gorge, gully, and rocky breakaway habitat was considered to be of high significance for vertebrate fauna as this habitat support species of conservation significance (including nationally listed threatened species) or contains core habitats for such species. Five habitats were ranked as of moderate significance (Hillcrest/hillslope, Mulga/Corymbia plain, Minor drainage, Tussock grassland plain, Medium drainage) and the remaining habitat (Stony plain) was ranked as low significance, as it is widespread in the surrounding region and species of conservation significance are exclusively dependent on this habitat.

To date there have not been permanent or semi-permanent pools recorded from the Lamb Creek project area, despite extensive use of helicopter in 2012, 2020 and 2021 for baseline surveys.

There are five known caves on or proximal to the survey area in which Ghost bat occurrence, or evidence of occurrence, has been recorded. Cave 1 is provisionally assigned as a Category 2 roost while caves 2, and 3 are provisionally Category 3. Caves 4 and 5 are known Category 3 and 2 respectively and occur nearby to a number of other caves, shelters and overhangs. Caves that are confirmed as Category 2 and groupings of caves that surround them are critical Ghost bat habitat.

Cave 1 and 3 are located in the R47/19, within respectively 325 meters and 600 meters from footprint V3 (mining pit, stock piles, infrastructure). Caves 4 and 5 were located adjacent to L47/736 within 200 meters of footprint V3 (haul road).

7 Appendices

No	Title
Appendix I	Likelihood of occurrence matrix: Vertebrate fauna
Appendix II	Conservation codes
Appendix III	Site coordinates, camera trap and SM4 deployment details
Appendix IV	Significance assessment criteria: Habitat
Appendix V	Fauna desktop results: All fauna
Appendix VI	Fauna desktop results: Conservation significant vertebrate fauna
Appendix VII	Field Records
Appendix VIII	SM4 Analysis
Appendix IX	Fauna habitat sites

Appendix I Likelihood of occurrence matrix: Vertebrate fauna

Species records relative to survey area	Habitat suitability			
	High (breeding and foraging)	Medium (foraging habitat)	Low (dispersal habitat)	Unsuitable [6]
Records within 10 km [1]	Highly Likely	Likely	Likely	Possible
Records within 50 km [2]	Likely	Possible	Possible	Unlikely
Records within 100 km [3]	Possible	Possible	Possible	Unlikely
Records within 200 km [4]	Possible	Unlikely	Unlikely	Unlikely
No records within 200 km [5]	Unlikely	Unlikely	Unlikely	Highly unlikely

Footnotes for highly cryptic or poorly known species for which there are few records, and for under-surveyed areas:
1 – Survey area occurs within currently known range and species has high dispersal capability.
2 – Survey area occurs within currently known range and species has low dispersal capability.
3 – Survey area occurs on margin of currently known range and species has high dispersal capability.
4 – Survey area occurs outside of currently known range and species has high dispersal capability.
5 – Survey area occurs outside of currently known range and species has low dispersal capability.
Footnotes with habitat suitability:
6 – Depending on a species' ecology, 'unsuitable' can either mean 'not preferred' or 'not containing resources', or it can be 'prohibitive' (i.e. absence of water for aquatic species). This distinction affects the final likelihood score in this column.

Appendix II Conservation codes

Threatened species under the Commonwealth EPBC Act

Threatened fauna and flora may be listed under Section 178 of the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) in any one of the following categories:

EX Extinct

EW Extinct in the wild

CR Critically endangered

EN Endangered

VU Vulnerable

CD Conservation dependent

Migratory and Marine species under the Commonwealth EPBC Act

Migratory and Marine species are not listed as Threatened but are protected for other reason. Only Migratory species are considered Matters of National Environmental Significance (MNES) while Marine species are not.

MI Migratory

MA Marine

Migratory species listed under international agreements to which Australia is a party are protected under section 209 of the EPBC Act and are considered MNES. Listed migratory species are those listed in the:

- Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention)
- China-Australia Migratory Bird Agreement (CAMBA)
- Japan-Australia Migratory Bird Agreement (JAMBA)
- Republic of Korea-Australia Migratory Bird Agreement (ROKAMBA)

Marine species are those listed under s248 of the EPBC Act. Marine species are not considered MNES.

Conservation codes for Western Australian flora and fauna under the Western Australian *Biodiversity Conservation Act 2016*

Threatened, Extinct and Specially Protected fauna or flora are species which have been adequately searched for and are deemed to be, in the wild, threatened, extinct or in need of special protection, and have been gazetted as such.

The *Wildlife Conservation (Specially Protected Fauna) Notice 2018* and the *Wildlife Conservation (Rare Flora) Notice 2018* have been transitioned under regulations 170, 171 and 172 of the *Biodiversity Conservation Regulations 2018* to be the lists of Threatened, Extinct and Specially Protected species under Part 2 of the *Biodiversity Conservation Act 2016*.

Categories of Threatened, Extinct and Specially Protected fauna and flora are:

Threatened species

Listed by order of the Minister as Threatened in the category of critically endangered, endangered or vulnerable under section 19(1), or is a rediscovered species to be regarded as threatened species under section 26(2) of the *Biodiversity Conservation Act 2016* (BC Act).

Threatened fauna is that subset of 'Specially Protected Fauna' listed under schedules 1 to 3 of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018* for Threatened Fauna.

Threatened flora is that subset of 'Rare Flora' listed under schedules 1 to 3 of the *Wildlife Conservation (Rare Flora) Notice 2018* for Threatened Flora.

The assessment of the conservation status of these species is based on their national extent and ranked according to their level of threat using IUCN Red List categories and criteria as detailed below.

CR Critically endangered species

Threatened species considered to be "facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with criteria set out in the ministerial guidelines". Listed as critically endangered under section 19(1)(a) of the BC Act in accordance with the criteria set out in section 20 and the ministerial guidelines.

Published under **schedule 1** of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018* for critically endangered fauna or the *Wildlife Conservation (Rare Flora) Notice 201*8 for critically endangered flora.

EN Endangered species

Threatened species considered to be "facing a very high risk of extinction in the wild in the near future, as determined in accordance with criteria set out in the ministerial guidelines". Listed as endangered under section 19(1)(b) of the BC Act in accordance with the criteria set out in section 21 and the ministerial guidelines. Published under **schedule 2** of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018* for endangered fauna or the *Wildlife Conservation (Rare Flora) Notice 2018 for endangered flora*.

VU Vulnerable species

Threatened species considered to be "facing a high risk of extinction in the wild in the medium-term future, as determined in accordance with criteria set out in the ministerial guidelines". Listed as vulnerable under section 19(1)(c) of the BC Act in accordance with the criteria set out in section 22 and the ministerial guidelines.

Published under **schedule 3** of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018* for vulnerable fauna or the *Wildlife Conservation (Rare Flora) Notice 2018* for vulnerable flora.

Extinct species

Listed by order of the Minister as extinct under section 23(1) of the BC Act as extinct or extinct in the wild.

EX Extinct species

Species where "there is no reasonable doubt that the last member of the species has died", and listing is otherwise in accordance with the ministerial guidelines (section 24 of the BC Act).

Published as presumed extinct under **schedule 4** of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018* for extinct fauna or the *Wildlife Conservation (Rare Flora) Notice 2018 for extinct flora*.

EW Extinct in the wild species

Species that "is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; and it has not been recorded in its known habitat or expected habitat, at appropriate seasons, anywhere in its past range, despite surveys over a time frame appropriate to its life cycle and form", and listing is otherwise in accordance with the ministerial guidelines (section 25 of the BC Act).

Currently there are no threatened fauna or threatened flora species listed as extinct in the wild. If listing of a species as extinct in the wild occurs, then a schedule will be added to the applicable notice.

Specially protected species

MI Migratory species

Fauna that periodically or occasionally visit Australia or an external Territory or the exclusive economic zone; or the species is subject of an international agreement that relates to the protection of migratory species and that binds the Commonwealth; and listing is otherwise in accordance with the ministerial guidelines (section 15 of the BC Act).

Includes birds that are subject to an agreement between the government of Australia and the governments of Japan (JAMBA), China (CAMBA) and The Republic of Korea (ROKAMBA), and fauna subject to the Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention), an environmental treaty under the United Nations Environment Program.

Migratory species listed under the BC Act are a subset of the migratory animals, that are known to visit Western Australia, protected under the international agreements or treaties, excluding species that are listed as Threatened species. Published as migratory birds protected under an international agreement under **schedule 5** of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018*.

CD **Species of conservation interest (conservation dependent fauna)**

Fauna of special conservation need being species dependent on ongoing conservation intervention to prevent it becoming eligible for listing as threatened, and listing is otherwise in accordance with the ministerial guidelines (section 14 of the BC Act). Published as conservation dependent fauna under **schedule 6** of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018.*

OS **Other specially protected species**

Fauna otherwise in need of special protection to ensure their conservation, and listing is otherwise in accordance with the ministerial guidelines (section 18 of the BC Act). Published as other specially protected fauna under **schedule 7** of the *Wildlife Conservation (Specially Protected Fauna) Notice 2018*.

Priority species

Priority species are possibly threatened species that do not meet survey criteria, or are otherwise data deficient, are added to the Priority Fauna or Priority Flora Lists under Priorities 1, 2 or 3. These three categories are ranked in order of priority for survey and evaluation of conservation status so that consideration can be given to their declaration as threatened fauna or flora.

Species that are adequately known, are rare but not threatened, or meet criteria for near threatened, or that have been recently removed from the threatened species or other specially protected fauna lists for other than taxonomic reasons, are placed in Priority 4. These species require regular monitoring.

Assessment of Priority codes is based on the Western Australian distribution of the species, unless the distribution in WA is part of a contiguous population extending into adjacent States, as defined by the known spread of locations. In this report, priority species are given the codes P1, P2, P3 and P4.

P1 **Priority 1: Poorly-known species**

Species that are known from one or a few locations (generally five or less) which are potentially at risk. All occurrences are either: very small; or on lands not managed for conservation, e.g. agricultural or pastoral lands, urban areas, road and rail reserves, gravel reserves and active mineral leases; or otherwise under threat of habitat destruction or degradation. Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements and appear to be under immediate threat from known threatening processes. Such species are in urgent need of further survey.

P2 **Priority 2: Poorly-known species**

Species that are known from one or a few locations (generally five or less), some of which are on lands managed primarily for nature conservation, e.g. national parks, conservation parks, nature reserves and other lands with secure tenure being managed for conservation. Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements and appear to be under threat from known threatening processes. Such species are in urgent need of further survey.

P3 **Priority 3: Poorly-known species**

Species that are known from several locations, and the species does not appear to be under imminent threat, or from few but widespread locations with either large population size or significant remaining areas of apparently suitable habitat, much of it not under imminent threat. Species may be included if they are comparatively well known from several locations but do not meet adequacy of survey requirements and known threatening processes exist that could affect them. Such species are in need of further survey.

P4 **Priority 4: Rare, Near Threatened and other species in need of monitoring**

(a) **Rare**. Species that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection but could be if present circumstances change. These species are usually represented on conservation lands.

(b) **Near Threatened**. Species that are considered to have been adequately surveyed and that are close to qualifying for vulnerable but are not listed as Conservation Dependent.

(c) Species that have been removed from the list of threatened species during the past five years for reasons other than taxonomy.

Appendix IV Significance assessment criteria: Habitat

Rank	Criteria
High	Fauna listed as threatened under the EPBC Act and/ or BC Act and fauna listed as Species of Special Conservation Interest or Other Specially Protected Species have been recorded breeding from this habitat type within the survey area
	Fauna listed as threatened under the EPBC Act and/ or BC Act and fauna listed as species of Special Conservation Interest or Other Specially Protected Species have been recorded foraging or sheltering from this habitat type within the survey area where the species is solely reliant on this habitat type for foraging or sheltering
	Habitat known to be suitable core habitat (breeding), for EPBC Act and/ or BC Act listed threatened fauna and/or fauna listed as species of Special Conservation Interest or Other Specially Protected Species, and there are records of this species within 40km^2
	Habitat known to be suitable core habitat (foraging or sheltering), for EPBC Act and/ or BC Act listed threatened fauna and or fauna listed as species of Special Conservation Interest or Other Specially Protected Species, and there are records of this species within 40km^2 and the species is solely reliant on this habitat type for foraging or sheltering.
	Habitat is regionally uncommon or limited in extent and known to support species listed as: ▪ Threatened fauna under the EPBC Act and/or BC Act, but it is not their core habitat (e.g. may be used periodically/ seasonally or for dispersal). ▪ DBCA listed Priority fauna which are known to be solely reliant on this habitat.
	Habitat known to support EPBC Act and/or BC Act listed Migratory fauna such as breeding grounds, or important feeding grounds such as Eighty Mile Beach (including ephemeral habitats) defined via international agreement e.g. RAMSA and also Important Bird Areas (Dutson *et al.* 2009) https://www.birdlife.org.au/documents/OTHPUB-IBA-supp.pdf
Moderate	Habitat known to regularly support EPBC Act and/or BC Act listed Migratory fauna – (not breeding grounds or important feeding grounds)
	Habitat that is regionally uncommon (e.g. occurs in small and isolated areas) and supports a particularly diverse and uncommon faunal assemblage.
	Habitat is common and widespread and known to support species listed as: Threatened fauna under the EPBC Act and/or BC Act but it is not their core habitat (e.g. may be used periodically/ seasonally or for dispersal, or foraging habitats that where the species is not solely reliant on that habitat for resources, is an occasional visitor or foraging habitat is marginal. Species of Special Conservation Interest or Other Specially Protected Species under the BC Act but it is not their core habitat (e.g. may be used periodically/ seasonally or for dispersal) or foraging habitats that where the species is not solely reliant on that habitat for resources, is an occasional visitor or foraging habitat is marginal. DBCA listed Priority fauna which are known to be solely reliant on this habitat
Low	▪ Habitat is widespread/common and does not solely support any DBCA listed Priority fauna ▪ Habitat has minimal records of EPBC Act and/or BC Act listed Migratory fauna – (not breeding grounds or important feeding grounds). Especially so if these records are > 10 years old.

Appendix V Desktop results: All vertebrate fauna species recorded within 50 km of Lamb Creek

Footnotes:
1) Scientific name:
Asterisk (*) preceding name indicates fauna species in introduced (not native) to Western Australia.
2) Status:
EPBC = Conservation listing under the federal EPBC Act: CR = Critically Endangered, EN = Endangered, VU = Vulnerable, MI = Migratory, MA = Marine
BCA = Conservation listing under the Western Australian Biodiversity Conservation Act and Priority listing by the DBCA: CR = Critically Endangered, EN = Endangered, VU = Vulnerable, MI = Migratory, OS = Other specially protected fauna, P1 to P4 = DBCA Priority 1 to 4
3) Databases:
TPFa = DBCA Threatened and Priority Fauna Database (50 km radius)
NM = DBCA NatureMap online database (40 km radius)
PM = Protected Matters database (50 km radius). Only returns species and communities listed under the EPBC Act.
BD50 = Birdlife Australia Birdata database (50 km radius)
4) Fauna survey reports:
BL11 = Biologic (2011) Area C and surrounds fauna survey
BL12 = Biologic (2012) Southern Flank vertebrate fauna survey
BL13 = Biologic (2013) Mudlark vertebrate fauna survey
BL16 = Biologic (2016) South Flank targeted fauna survey
EC04a = Ecologia (2004a) Packsaddle Range biological survey
EC04b = Ecologia (2004b) Area C: Deposits D, E, F biological survey
EC05 = Ecologia (2005) Pilbara Leaf-nosed Bat and Ghost Bat monitoring survey at Nimingarra and Cattle Gorge.
EC98 = Ecologia (1998) Mining area C biological survey
EV07 = ENV (2007) Area C: R deposit fauna assessment
EV08 = ENV (2008) Area C southern flank deposit fauna assessment
MA99 = Halpern Glick Maunsell (1999) Mining Area C western access corridor biological assessment
OE08 = Outback Ecology (2008) Area C Mining Operation Environmental Management Plan
SZ08 = Specialised Zoological (2008) Area C bat survey

Appendix VI Desktop results: Conservation significant fauna recorded within 50 km of Lamb Creek

Family	Scientific name	Common name	Status[1)]		Total records	Likelihood in Survey area
			EPBC	BCA		
Birds						
Cuculidae	*Chalcites basalis*	Horsfield's Bronze-Cuckoo	MA		10	Confirmed
Cuculidae	*Chalcites osculans*	Black-eared Cuckoo	MA		5	Likely
Cuculidae	*Heteroscenes pallidus*	Pallid Cuckoo	MA		11	Confirmed
Eurostopodidae	*Eurostopodus argus*	Spotted Nightjar	MA		10	Confirmed
Apodidae	*Apus pacificus*	Fork-tailed Swift	MI, MA	MI	11	Confirmed
Scolopacidae	*Tringa nebularia*	Common Greenshank	MI, MA	IA	3	Unlikely
Ardeidae	*Bubulcus ibis*	Cattle Egret	MA		2	Possible
Threskiornithidae	Threskiornis spinicollis	Straw-necked Ibis	MA		1	Possible
Accipitridae	*Elanus scriptus*	Letter-winged Kite		P4	2	Possible
Accipitridae	*Accipiter fasciatus*	Brown Goshawk	MA		7	Confirmed
Accipitridae	*Haliastur sphenurus*	Whistling Kite	MA		11	Confirmed
Strigidae	Ninox boobook	Southern Boobook	MA		7	Likely
Strigidae	Ninox connivens subps. connivens	Barking Owl (southwest)		P3	1	Highly unlikely
Meropidae	*Merops ornatus*	Rainbow Bee-eater	MA		13	Confirmed
Alcedinidae	Todiramphus sanctus	Sacred Kingfisher	MA		3	Possible
Falconidae	*Falco cenchroides*	Nankeen Kestrel	MA		11	Confirmed
Falconidae	*Falco hypoleucos*	Grey Falcon	VU	VU	7	Possible
Falconidae	*Falco peregrinus*	Peregrine Falcon		OS	16	Likely
Psittaculidae	*Pezoporus occidentalis*	Night Parrot	EN	CR	2	Possible
Campephagidae	*Coracina novaehollandiae*	Black-faced Cuckoo-shrike	MA		13	Confirmed
Maluridae	Malurus leucopterus subsp. leucopterus	White-winged Fairy-wren (Dirk Hartog Island)	VU	VU	1	Highly unlikely
Monarchidae	*Grallina cyanoleuca*	Magpie-lark	MA		12	Confirmed

Family	Scientific name	Common name	Status[1)]		Total records	Likelihood in Survey area
			EPBC	BCA		
Motacillidae	Anthus novaeseelandiae	Australasian Pipit	MA		6	Possible
Hirundinidae	*Hirundo neoxena*	Welcome Swallow	MA		3	Possible
Mammals						
Dasyuridae	*Dasycercus blythi*	Brush-tailed Mulgara, Ampurta		P4	2	Unlikely
Dasyuridae	*Dasyurus hallucatus*	Northern Quoll	EN	EN	16	Confirmed
Dasyuridae	*Dasyurus geoffroii*	Western quoll, Chuditch	VU	VU	1	Highly unlikely
Thylacomyidae	*Macrotis lagotis*	Bilby, Dalgyte	VU	VU	5	Unlikely – no sandplains
Muridae	*Leggadina lakedownensis*	Short-tailed Mouse		P4	3	Likely
Muridae	*Pseudomys chapmani*	Western Pebble-mound Mouse		P4	205	Confirmed
Muridae	*Zyzomys pedunculatus*	Central rock rat	CR	CR	1	Highly unlikely
Rhinonycteridae	*Rhinonicteris aurantia (Pilbara)*	Pilbara Leaf-nosed Bat	VU	VU	13	Unlikely
Megadermatidae	*Macroderma gigas*	Ghost Bat	VU	VU	142	Confirmed
Reptiles						
Carphodactylidae	*Underwoodisaurus seorsus*	Pilbara Barking Gecko		P2	22	Likely
Typhlopidae	*Anilios ganei*	Gane's Blind Snake		P1	6	Likely
Pythonidae	*Liasis olivaceus barroni*	Pilbara Olive Python	VU	VU	10	Confirmed

Summary
Bat and Night Parrot (*Pezoporus occidentalis*) presence is reported for seventeen sites at Lamb Creek, in the Pilbara, WA. Rapallo carried out an echolocation-based survey in April 2020 and February 2021. Sixteen sites were surveyed for all bats present including Ghost bat social and ultrasonic calls. Three were surveyed using acoustic detectors set to record Night Parrot and Ghost bat social calls. Bat Call WA has reviewed the recordings made and provided species lists for the bats present.

Seven species of echolocating bats were confirmed present including the Ghost bat (*Macroderma gigas*) (PGb) that is listed as vulnerable under both state and commonwealth legislation. PGb presence was detected at five caves. Multiple calls consistent with at least four diurnally roosting PGb were detected on three nights at Cave 1 in April 2020 and for 2 nights at Cave 5 in February 2021. Calls consistent with a single diurnally roosting PGb were detected on one night at Cave 4 in February 2021. Calls at times consistent with foraging visits were detected at Caves 2 and 3 in April 2020 and at Cave 3 in February 2021. This result is consistent with the known population and dispersal of PGb in the district.

No Pilbara leaf-nosed bats (*Rhinonicteris aurantia*) (PLNb) or Night Parrot calls were detected.

Habitats
The sites for the survey were chosen by Rapallo. Details of the sites are presented in table 1 and caves are described in detail in Appendix A. The bat sites included each type of habitat present in the study area including cave entrances, an incised gully, drainage lines and spinifex plains. All the Night Parrot sites are on spinifex plains with thin shrubland. The locations are shown in relation to local features in figure 1.

Timing, Moon Phase and Weather
The dry season echolocation survey was conducted between 16th to 28th April 2020. The sampling evenings were hot and dry with minimum overnight temperatures between 25 and 30^{O}C. Occasional showers fell during the survey. The moon was between third quarter and new.

The wet season echolocation survey was conducted between 20th to 24th February 2021. The sampling evenings were hot and dry with minimum overnight temperatures between 20 and 25^{O}C. No rain fell during the survey. The moon was between first quarter and full.

Survey Team
Sites were chosen and detectors placed by Rapallo ecologists. Bob Bullen of Bat Call WA completed analysis of audio and echolocation recordings.

Sampling
The bat survey consisted of completing a total of thirty-three overnight ultrasonic bat sound recordings, beginning at twilight, at sixteen locations within the survey area. A total of eight acoustic survey nights were completed at three sites for Night Parrot. The recordings were "continuous" (Hyder *et al.* 2010) made using ultrasonic SM4BAT-FS and acoustic SM4A SongMeter (both by Wildlife Acoustics Inc., USA) detectors. The audio settings used followed the manufacturer's recommendations contained in the user manuals.

For the ultrasonic recordings, once reformatted as .wav files, COOL EDIT 2000 (now available as AUDITION from Adobe Systems Inc.) was used to display each sequence for identification. Calls were identified manually. Only good quality call sequences were used. Details of calls analysed are provided in Table 2 as recommended by Australasian Bat Society (ABS 2006). Reference data for

the species identified are available in Bullen and McKenzie 2002, McKenzie and Bullen 2003 and McKenzie and Bullen 2009.

For the acoustic recordings, each was reviewed both manually and using an automatic scan technique for Night Parrot calls. Candidate calls were compared with the author's confirmed reference calls from two Western Australian arid zone locations.

Survey Limitations
The sites surveyed were accessible on foot and the detectors, using omnidirectional microphones, were set on the ground with the microphone horizontal. Species are unlikely to be under-represented as a result.

Bat species density away from cave or adit entrances is impossible to estimate from echolocation records. Bat activity is therefore substituted as an approximate guide to the relative numbers of each species using the study area.

Results of bat fauna survey
An assemblage of seven echolocating bat species was confirmed as present at the study sites including the PGb, table 4. Species activity levels were low to high, which is expected for the study area habitat and the times of year.

PLNb detections
No PLNb were detected during the survey

PGb detections
Ghost bats were detected ultrasonically at all five cave sites, table 4, figure 1. At least four diurnally roosting PGb were confirmed at Cave 1 in April 20 by the temporal pattern of their recorded calls on three nights. Both social and ultrasonic calls were recorded before dawn followed by similar numbers of calls soon after dusk that day. This was not repeated in February 2021. Calls consistent with diurnally roosting PGb were detected at Caves 4 and 5 in February. Calls consistent with foraging PGb were detected at Caves 2 and 3 on one night each in February and for two nights at cave 3 in February. These records are consistent with the PGb being present in the study area ridges. This result is consistent with the known presence of the PGb across the central Pilbara in general and on the major ridges in the district.

The five caves have been provisionally classified as roost caves of either Category 2, 3 or 4 based on the detected call pattern and the descriptions of their internal complexity, table 4 and Appendix A. Cave 1 is provisionally a Cat 2 while Caves 2, and 3 are provisionally Cat 3. Caves 4 and 5 are known Cat 3 and 2 respectively (authors unpublished data). Caves that are confirmed as Category 2 and groupings of caves that surround them are critical PGb habitat. The categories are described in detail in Appendix B.

Common bat species detections
Four common species, *Chaerephon jobensis*, *Chalinolobus gouldii*, *Taphozous hilli* and *Vespadelus finlaysoni* dominated bat presence in the area.

Taxonomy presented herein is after Reardon *et al.* (2014) and Jackson and Groves (2015).

Results of Night Parrot survey.
No Night Parrot calls were detected.

Appendix B: Ghost bat Cave Habitat Classifications

Each Ghost bat roost cave identified can be categorised according to the following definitions based on usage. These definitions are based on contemporary observations and unpublished data and have been developed from the earlier cave definitions contained in TSSC 2016 and other publications.

Category 1 diurnal roost caves with permanent Ghost bat occupancy.

There are a number of documented permanent roost caves and underground mines in northern Australia, e.g. Tunnel Creek in the Kimberley and Kohinoor adit in the NT. These tend to have large but variable populations, e.g. Kohinoor's colony has grown from 300+ in 1981 to ~1,500 in 1990 and then reduced to 550 in 2013 (Woinarski *et al*. 2014). In the Pilbara, other than a number of historical underground mines e.g. Comet, Klondyke Queen, Lalla Rookh and Bamboo Creek which do have large populations of over 100 Ghost bats, very few such roosts in natural caves are documented. Those natural caves that may be permanently occupied have been observed with variable populations present. One example is a significant cave with a complex surrounding gully in the Robe Valley south-west of Pannawonica that has had Ghost bats present on most, if not all, survey visits. The colony size at this cave has varied from a few to over 70 recorded in April 2017 (Bat Call 2017). Where permanent presence at category 1 sites is proven, they must all be assumed to be maternity caves. These are considered as critical habitat essential for the persistence of the Ghost bat in the Pilbara.

Category 2 diurnal roost caves with regular occupancy.

There are a number of Pilbara caves and adits where Ghost bats have regular, but not continuous, presence over long periods. These tend to be deep caves with ceiling heights in rear chambers of at least 1.5 m allowing multiple roosting opportunities for Ghost bats out of reach of predators. The longest continuous monitoring programs have been at Rio Tinto's West Angelas project and at BHPs Mining Area C and South Flank projects. At all three locations there are a number of caves with roosting Ghost bats records but none of these have had either permanent presence or consistently high numbers present. Numbers have varied between zero and five with very occasional counts of 20 or more (author's unpublished data). Based on recent monitoring of caves using ultrasonic call detectors, these caves have Ghost bats present for 25 to 75% of nights for mid to long periods but then may be abandoned for periods. There is insufficient data at present to see if there are any seasonal trends in these occupancy rates. These caves typically have a

number of other caves, shelters and overhangs within a few hundred meters. Together they make up an "apartment block" grouping (TSSC 2016, Bat Call 2017) that supports the ongoing presence of the bats.

Recent analysis at West Angelas based on genetic sampling at five monitored caves in 2015 and 2017 (Ottwell *et al*. 2018) suggests that some Ghost bats tend to use particular caves regularly over a season or year, but others move between caves in the same period. Their analysis identifies 34 unique individuals at caves over those two years and indicated that the "genetic effective population size" was twelve. Two of the five caves have been shown by the long-term observations to have regular occupancy (Biologic 2016). In all surveys undertaken, Ghost bats have been either roosting in low numbers or there was evidence of recent roosting at the former and, with the exception of one survey, at the latter. The genetic analysis also supports this conclusion with presence of multiple bats over the two years of that study at these caves. Similar occupancy patterns have been recorded at several caves at the BHP projects. There are an increasing number of observations becoming available of pregnant Ghost bats or Ghost bats carrying pups at some of these caves, plus others (e.g. Silvergrass East cave SG-1, Hamersley Iron 1999) although again there is insufficient data to identify any trends other than to say that any cave that has regular occupancy must be assumed to be capable of supporting one or more reproducing females and their offspring. These caves are considered as critical habitat essential for the persistence of the Ghost bat in the Pilbara.

Category 3 roost caves with occasional occupancy.

There are a large number of caves and adits where Ghost bats roost occasionally or rarely in small numbers of one to a few. Many are located nearby higher category roosts, but many are also in isolated locations. Surveys in recent years have identified numerous caves that have Ghost bats scats or small food middens present but either no evidence of roosting bats or with rarely repeated presence observations, e.g. five of the seven monitored caves at West Angelas (Biologic 2016) show such a pattern with occasional Ghost bats present and/or intermittent evidence of recent occupancy. Reproducing females have been reported from at least two caves at West Angelas that ongoing observations indicate fall into this category, but no firm evidence exists that such caves are necessary for successful reproduction. Individually, these are not considered as critical habitat but when they are located nearby one or more category 1 or 2 caves, and are part of an "apartment block" of disturbance refuges or nocturnal feeding sites, they are important for the persistence of the Ghost bat in the local area and the cave grouping becomes critical. Due

to the number of caves across the Hamersley Ranges and the Eastern Pilbara, isolated category 3 caves may only be considered important for the long-range dispersal of the species.

Category 4 nocturnal roost caves, opportunistic usage.

Numerous observations suggest that the majority of caves and adits in the Pilbara are used in at least an opportunistic manner by itinerant Ghost bats. This may be anything from a single foraging visit to a longer visit with a resting period or possibly a feeding session. Evidence of such visits is the widespread presence of small numbers of scats found or occasional echolocation calls recorded during surveys. These visits may or may not be repeated depending whether the bat is passing through a district or is a more permanent resident nearby. These are not considered as critical habitat but when they are located close to higher category caves and are part of an apartment block of refuges, the cave grouping is important for the persistence of the Ghost bat in the local area. Due to the number of caves across the Hamersley Ranges and the Eastern Pilbara, isolated category 4 caves are not considered important for the species.

Report No. J020969

Baseline Short-range Endemic Invertebrate Survey of the Lamb Creek Iron Ore Project

Prepared for: Mineral Resources Limited
Date: 1 February 2022

Rapallo Environmental is a Western Australian consultancy with a strong reputation for technical excellence, client-focus and innovation. We build long-term alliances through outstanding delivery on a range of services to the resource sector, government and associated industries.

Executive Summary

The Lamb Creek Iron Ore Project comprises a proposed mining area and an associated haul road, located approximately 130 kilometres (km) north-west of Newman in the Pilbara region of Western Australia.

A desktop assessment, comprising searches of the Western Australian Museum Invertebrate databases yielded a total of 8894 records of SRE category taxa (i.e. taxa belonging to taxonomic groups prone to shortrange endemism). Of these records, six taxa were assessed to be SRE and 376 were assessed as potential SRE. The remainder were assessed as widespread.

Seventy-eight records of potential SRE taxa were collected from within ten kilometres of the survey area (central point). Thirteen records of potential SRE taxa were collected from the survey area from the pseudoscorpion and scorpion groups. No confirmed SRE taxa records occurred from the survey area.

During the February 2021 survey, 51 sites from the following habitats were surveyed via foraging and litter sampling.

- stony plain
- mulga shrubland patches
- spinifex grassland dominated hillcrest/hillslopes
- deep gullies
- shallow open gullies
- minor drainage
- medium drainage
- tussock grassland plain

The 2021 field survey yielded a total of 119 SRE invertebrate category specimens, representing 25 different taxa, collected from 23 sites. When combined with the SRE category taxa collected from the 2020 vertebrate fauna survey, a total of 159 invertebrate specimens from SRE target groups, representing 30 different taxa have been collected over a two-year period. The data set is made up of three mygalomorph spider taxa, seven pseudoscorpions, five scorpions, seven soil centipedes, two millipedes, one snail and five isopod taxa.

Of these taxa, 24 are classified as potential SRE with 23 regarded as data deficient due to known distribution and one assessed as data deficient due to limited taxonomic resolution. The remaining six taxa collected from the survey area are regarded as widespread.

There are fourteen potential SRE taxa collected from the survey area that have not been recorded regionally. Of these taxa, six were recorded from the proposed 2021 disturbance footprint only

- Austrostrophus 'Clade M'
- Cryptops 'LCr02'
- Indolpium 'LCr03'
- Indolpium 'LCr05'
- Mecistocephalus 'LCr01'
- Orphnaeus 'LCr01'

Three taxa were collected from adjacent to the proposed disturbance footprint only (within 100 metres). Of these taxa, two had not been recorded regionally.

- Austrochthonius 'LCr01'
- Mecistocephalus 'LCr02'

Potential SRE taxa were collected from all habitats. The mulga shrubland patches within the mulga/corymbia plain habitat yielded the highest abundance and species richness followed by stony plain, although survey effort was not uniform across habitats.

On a macro scale there is connectivity of all habitats to the surrounding landscape, accordingly, it is unlikely that the Potential SRE taxa collected would be restricted to survey area habitats especially where the survey area is narrow (haul road portion). As with all SRE invertebrate surveys, there are limitations to using broad habitat to predict whether a species is restricted and only more surveying, sequencing and greater public access to sequencing data will confirm whether a species is restricted.

Disruption to sheet flow could impact the mulga patches within the mulga/corymbia plain habitat outside of the survey disturbance footprint and if so, it is recommended that planning incorporate drainage design to minimise alterations to sheet flow.

1 Introduction

1.1 Project overview

Mineral Resources Limited (MRL) commissioned Rapallo Environmental (Rapallo) to conduct a single-phase, baseline short-range endemic (SRE) invertebrate survey of the Lamb Creek Iron Ore Project (Lamb Creek). The field survey was completed in February 2021, with supplementary data collected during a detailed vertebrate fauna survey in April 2020.

The project comprises a proposed mining area and an associated haul road, located approximately 130 kilometres (km) north-west of Newman in the Pilbara region of Western Australia.

The Lamb Creek project area as well as the proposed footprint have undergone several changes since the SRE survey was completed. The current project area (Figure 1.1) as per December 2021 comprises retention licence R47/19 (pending conversion into mining lease M47/1592) and miscellaneous licences L47/736, L47/974, and L47/1008. Together these tenements cover an area of 2199 hectares. There is significant overlap between the tenements hence this number is not cumulative.

The SRE survey area comprised retention licence R47/19, miscellaneous licence L47/736 and an additional alternative haul road section adjacent to the Great Northern Highway (intersection version B) as shown in Figure 1.2. The total size of the survey area was 1645 hectares (75% of the project area).

1.2 Scope and objectives

The scope of the SRE survey was to:

- conduct a desktop assessment of SRE invertebrate fauna likely to occur within and within the vicinity of the survey area;
- conduct a SRE invertebrate fauna survey to determine the occurrence of SRE invertebrates within the survey area and document associated habitat.

The objective of the survey was to provide SRE invertebrate fauna data to inform environmental planning and environmental impact assessment of the project, to support approval applications. An indicative disturbance footprint was provided by MRL prior to the survey, in early 2020. Note as the disturbance footprint is subject to change, this report focuses predominately on survey area as defined in section 1.3.

1.3 Survey area

The survey area was 1645 hectares in size and comprised R47/19, L47/736, and intersection version B. A proposed disturbance footprint (footprint V1) was provided by MRL in March 2020, and this footprint formed the basis for survey planning and site selection. Footprint V1 comprised a mine pit, stock piles, infrastructure, and a camp within R47/19, and a haul road alignment within L47/736.

Two new footprints have been provided since the surveys were completed. The current footprint V3 was provided in December 2021. Footprint V3 is 657 hectares in size, and extends outside the survey area by 24 hectares (4% of total footprint), with most of the unsurveyed area comprising the southern section of the proposed haul road (Figure 1.2).

1.4 Definitions

To aid interpretation of this report and associated mapping, Table 1.1 provides explanation of the various components of the Lamb Creek project and associated survey areas, as mapped in Figure 1.1.

Table 1.1 Project and survey area definitions

Component	Description
Project area	Project area as per December 2021, comprising tenements R47/19 (pending M47/1592), L47/736, L47/974, and L47/1008. The project area has a total size of 2199 hectares. There is significant overlap between the tenements, so this number is not cumulative.
Survey area	The survey area as per February 2021, which includes R47/19 (resource area), L47/736 (haul road corridor) and intersection version B. Total size of the survey area is 1645 hectares.
Resource area	General description of R47/19 (pending M47/1592) in which the proposed mine pit and associated infrastructure will be located, as well as the northernmost section of the proposed haul road.
Haul road corridor	General description of the area in L47/736 in which most of the proposed haul road will be located.
Great Northern Highway intersection (GNHI)	General name given to the area where the proposed haul road intersects the Great Northern Highway.
Intersection version B	Alternative intersection of the haul road and the Great Northern Highway, investigated during flora and fauna assessments, but to date not used for any of the footprints.
Footprint V1	Proposed disturbance footprint provided by MRL in March 2020 and used to develop the initial survey area as defined in section 1.3.
Footprint V2	Revised disturbance footprint provided by MRL in July 2021, which has now been superseded by footprint V3.
Footprint V3	Revised disturbance footprint provided by MRL in December 2021 and used to describe localities of recorded target species and potential impacts.
Adjacent to footprint V3	Within 100 metres of the December 2021 disturbance footprint (footprint V3).

2 Regional context

2.1 Climate and weather

The Pilbara bioregion has a semi-desert to tropical climate, with rainfall occurring sporadically throughout the year, mostly during summer (Thackway & Cresswell 1995). Summer rainfall is usually the result of tropical storms in the north or tropical cyclones that impact upon the coast and move inland. Winter rainfall is generally lighter and is the result of cold fronts moving north easterly across the state (Leighton 2004). The average annual rainfall ranges from 200-350 mm, although there are significant fluctuations between years (Bureau of Meteorology 2021), with up to 1,200 mm falling in some locations in some years (McKenzie et al. 2009).

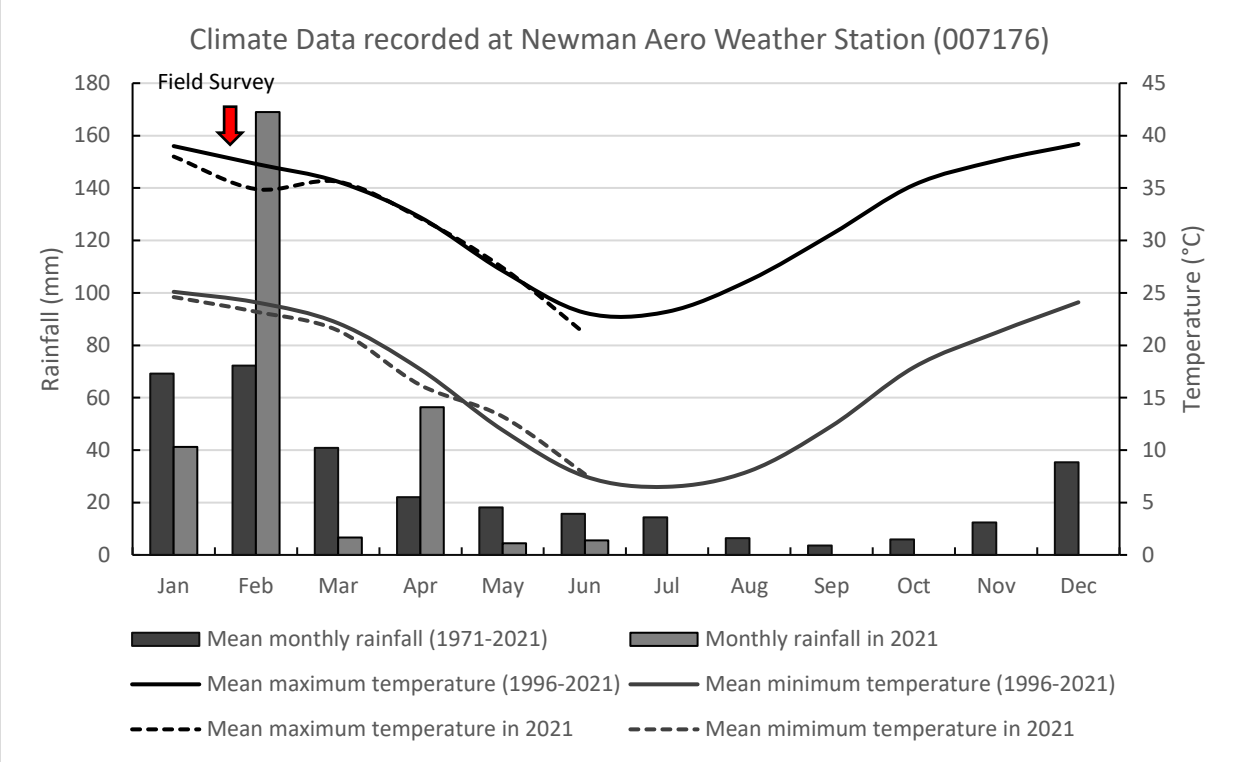

Figure 2.1 Weather graph (source BOM 2021)

Table 2.1 Rainfall and temperature over the survey period (Source BoM 2021)

Survey date	Rainfall (mm)	Maximum Temperature (°C)	Minimum Temperature (°C)
16 February 2021	0	33.5	24.3
17 February 2021	0	37.7	26.5
18 February 2021	0	37.9	26.7
19 February 2021	34.6	32.8	22.3
20 February 2021	0.2	36.7	24.2
21 February 2021	0	38.1	26.3
22 February 2021	0	37.7	25.2
23 February 2021	0	37.6	25.5
24 February 2021	0	37.4	24.6
25 February 2021	0	37.2	20.7

Rainfall over the three months preceding the survey was low, with February (the month of the survey) experiencing the largest amount of rainfall within 12 months.

Daily maximum temperatures during the survey ranged from 33.5°C to 38.1°C. Daily minimum temperatures ranged from 20.7°C to 26.7°C.

2.2 Biogeography

2.2.1 IBRA bioregions

The bioregions of Australia are described in the Interim Biogeographic Regionalisation for Australia (IBRA) (Thackway & Cresswell 1995). Bioregions are large, geographically distinct areas of land with common characteristics such as geology, landform patterns, climate, ecological features and plant and animal communities. The latest version, IBRA7, classifies Australia's landscapes into 89 large geographically distinct bioregions and 419 subregions (DoE 2012).

The survey area is located within the Pilbara Bioregion, characterised by vast coastal plains and inland mountain ranges with cliffs and deep gorges (Thackway & Cresswell 1995). Vegetation is predominantly mulga low woodlands or snappy gum over bunch and hummock grasses (Bastin 2008).

The survey area is located in the Hamersley (PIL3) subregion of the Pilbara bioregion. The Hamersley subregion comprises the southern section of the Pilbara Craton. It is a mountainous area of Proterozoic sedimentary ranges and plateaux, dissected by gorges (basalt, shale and dolerite). Geographically it is synonymous with the Hamersley vegetation system as described by Beard (1990). The dominant vegetation is mulga low woodland over bunch grasses on fine textured soils in valley floors, and *Eucalyptus leucophloia* (snappy gum) over *Triodia brizoides* on skeletal soils of the ranges. Regional vegetation is further described in section 2.3.

2.2.2 Land System

The land systems of the Pilbara region are classified according to similarities in landform, soil, vegetation, geology and geomorphology, following van Vreeswyk et al. (2004). Five land systems occur on the survey area, as listed in Table 2.2 below and displayed in Figure 2.2. The dominant land system within the survey area is the Boolgeeda land system, characterised by stony plains and lower slopes supporting spinifex grasslands or mulga shrublands.

Table 2.2 Land Systems of the survey area

Name	Land type	Description	Extent in survey area	Total Area
Boolgeeda Land System	Stony plains with spinifex grasslands	Stony lower slopes, stony plains below hills, and narrow sub-parallel drainage floors. Supports hard and soft spinifex grasslands or mulga shrublands. Often occurs below hill systems such as Newman and Rocklea	1036 ha	511442 ha
McKay Land System	Hills and ranges with spinifex grasslands	Hills, ridges, plateaux remnants and breakaways of meta sedimentary and sedimentary rocks supporting hard spinifex grasslands. Relief up to 100 m	44 ha	153286 ha

Name	Land type	Description	Extent in survey area	Total Area
Newman Land System	Hills and ranges with spinifex grasslands	Rugged high mountains, ridges and plateaux with near vertical escarpments of jaspilite, chert and shale, supporting hard spinifex grasslands. Relief up to 400 m.	340 ha	1141628 ha
Platform Land System	Stony plains with spinifex grasslands	Stony upper plains, dissected slopes and drainage floors, supporting hard spinifex grasslands. Erosional surfaces formed by partial dissection of the old tertiary surface. The gently inclined upper plains have extensive marginal dissection zones with gently inclined to steep slopes. Floors incised up to 30 m with steep stable marginal slopes becoming wider downslope.	198 ha	188829 ha
Wannamunna Land System	Wash plains on hardpan with mulga shrublands	Hardpan plains and internal drainage tracts supporting mulga shrubland and woodlands, and occasionally eucalypt woodlands. Depositional surfaces, level hardpan wash plains subject to overland sheet flow. Broad internal drainage flats receiving run-on from adjacent hardpan surfaces; rare, channelled tracts but mostly not organised through drainage. Relief up to 5 m.	27 ha	62648 ha

2.2.3 Hydrology

Within the Hamersley (PIL3) subregion drainage runs into either the Fortescue River to the north, the Ashburton river to the south, or the Robe river to the west (Kendrick 2001). The majority of the survey area falls within the Fortescue River Upper Catchment with a smaller portion occurring within the Ashburton River Catchment. Nine intermittent creek lines bisect the survey area, draining into the larger Marillana Creek, and ultimately into Weeli Wooli Creek within the Fortescue River basin.

2.2.4 Topography

The survey area occurs within the central Hamersley Ranges which dominate the sub-region (Thorne & Tyler 1997). The topography of the region is highly mountainous comprising three smaller ranges: Packsaddle Range in the centre, Jirrpalpur Range in the south and the Hancock Range to the north. The uplands of the survey area fall within the western edge of the Hancock Range.

The haul road portion of the survey area skirts the western edge of the Hancock Range, with the survey area predominantly characterised by plain and valley floor. The south-eastern corner of the survey area contains significant rocky landforms associated with the Hancock Range.

2.2.5 Geology

The survey area is located in the south-west corner of the Roy Hill 1:250,000 Geological Survey Sheet (SF50-12: Thorne & Tyler 1997). The geology of the survey area is generally defined by the assemblage

of prehnite, pumpellyite, epidote, actinolite. Basement rocks comprise the early Proterozoic Brockman Iron Formation and Weeli Wolli Formation. The Brockman Iron Formation consists of banded iron formation (BIF) and shale, while the Weeli Wolli formation consists of BIF separated by shale and siltstone bands, with younger dolerite sills that intersect the sedimentary sequence.

Regionally, the fresh basement rocks are typically overlain by weathered basement rocks which occur as lateritic and basal gravel and/or conglomerate deposits. These weathered deposits underlie early Tertiary Channel Iron Deposits (CID), which are the dominant economic-grade iron deposits in the region. The CID is typically overlain by younger alluvial and colluvial gravels and sediments (Thorne & Tyler 1997). The survey area overlies the following geological units (Thorne & Tyler 1997).

- Brockman Iron Formation (PLHB): banded iron-formation, chert, and pelite;
- Quaternary Alluvium (Qa): unconsolidated silt, sand, and gravel; in drainage channels and on adjacent floodplains;
- Quaternary Alluvium and Colluvium (Qw): red-brown sandy and clayey soil; on low slopes and sheetwash areas; and
- Cainozoic Colluvium (Czc): partly consolidated quartz and rock fragments in silt and sand matrix; old valley-fill deposits.

2.2.6 Soils

The survey area is located within the Fortescue botanical district of the Pilbara region (Beard 1990). This region is mountainous, with soils ranging from shallow, stony sandy loams along slopes, to cracking clays, stripped hardpans and calcareous loams along active waterways (Beard 1990).

The landforms of the survey area are typical of the eastern Pilbara with rocky hills, small gorges, mostly seasonal watercourses, and gravelly loam valleys. The soils are typified by hard red alkaline soils on plains, pediments and alluvial areas, while shallow, skeletal soils are common on ranges that rise to 1,250 m (Beard 1990). The southern part of eastern Pilbara region is characterised by earthy loams underlain by red-brown hardpan (Beard 1975, 1990).

The survey area has two distinct soil and landform assemblages. The majority of the haul road corridor and the edges of the mine tenement are characterised as soil unit Fa13. The central part of the mine tenement and small portion of the potential haul road alignment is characterised as soil unit Fb3. These are defined as follows (CSIRO Australia 2018):

- Fa13 – Ranges of banded jaspilite and chert along with shales, dolomites, and iron ore formations with some areas of ferruginous duricrust as well as occasional narrow winding valley plains and steeply dissected pediments. This unit is largely associated with the Hamersley and Ophthalmia Ranges. The soils are frequently stony and shallow and there are extensive areas without soil cover: chief soils are shallow stony earthy loams (Um5.51) along with some (Uc5.11) soils on the steeper slopes. Associated are (Dr2.33, Dr2.32) soils on the limited areas of dissected pediments, while (Um5.52) and (Uf6.71) soils occur on the valley plains; and
- Fb3 – High-level valley plains set in extensive areas of unit Fa13. There are extensive areas of pisolitic limonite deposits: principal soils are deep earthy loams (Um5.52) along with small areas of (Gn2.12) soils.

Figure 2.2

Land System Mapping and Regional localities

2.3 Regional vegetation

2.3.1 Botanical district

The survey area is located in the Fortescue botanical district of the Pilbara region (Beard 1990), which forms part of the Eremaean Botanical Province. The Pilbara region receives a slightly higher than average rainfall than most of the Eremaean Province, due to the prevalence of cyclones off the coast, but this is not enough to modify the essentially desert appearance of the plant cover (Beard 1990).

The Fortescue botanical district consists predominantly of tree and shrub steppe communities with *Eucalyptus* trees, Acacia shrubs and spinifex grasses including *Triodia pungens* and *T. wiseana* (Beard 1975). Mulga (species of the *Acacia aneura* complex) occurs in valleys, and short-grass plains may be present on alluvial soils (Beard 1990).

2.3.2 Vegetation system association

Digital maps (spatial data) of pre-European vegetation communities, based on state-wide mapping by J.S. Beard at 1:250,000 scale, are published by the Department of Primary Industries and Regional Development (DPIRD) (Beard 2018).

Vegetation of the Hamersley (PIL3) IBRA subregion is generally low Mulga woodland over bunch grasses on fine textured soils in the valleys with snappy gums (*Eucalyptus leucophloia*) over *Triodia brizoides* on skeletal soils of the ranges (Kendrick 2001). The mountain tops and gorges of the Hamersley subregion provide refugia for humidophile and/or fire intolerant flora, and support a diversity of range-restricted species (Kendrick 2001).

The survey area falls within two Beard (2018) vegetation system-associations: Hamersley 18: Low woodland of *Acacia aneura*, and Hamersley 82: Hummock-grass (*Triodia wiseana*) steppe with irregularly scattered *Eucalyptus brevifolia* trees.

Table 2.3 Pre-European vegetation within the survey area

Beard Vegetation System and Association	Extent in survey area	Current extent in Australia (ha) [1)]	Pre-European extent remaining (%) [1)]
Hamersley 18	982.5 ha	575 852 ha	99.2%
Hamersley 82	662.7 ha	2 157 841 ha	99.4%

Footnotes: 1) Numbers from 2018 Statewide Vegetation Statistics (DBCA 2019)

2.4 Habitat

Seven broad fauna habitats were identified in the Lamb Creek survey area (as defined Table 1.1) during a detailed vertebrate fauna survey, as reported in Rapallo (2022), and listed in Table 2.4.

Table 2.4 Broad Fauna Habitats

Broad fauna habitat	Area (hectares)
Gorges, gullies and rocky breakaways	54.7
Hill crests and hill slopes	319
Stony plain	518
Medium drainage lines	113
Minor drainage lines	211
Mulga/Corymbia plain	292
Tussock grassland plain	137
Road – Bitumen (not a habitat)	0.83
	1645

2.4.1 Stony plain

A habitat of the lower slopes, undulating and level plains, the stony plain habitat often occurs in shallow valleys below hill systems. This habitat typically has a low habitat complexity due to low diversity of microhabitat and minimum shading from vegetation and landform dependent on surrounding topography and outcropping.

At Lamb Creek the stony plain habitat is the most extensive habitat on the survey area (518 hectares), covering most of the retention licence and haul road corridor on the lower valley sides to valley floor. At Lamb Creek this habitat is characterised by little to no overstorey aside from scattered trees or patches of mixed shrubs often regenerating from fire. *Eucalyptus leucophloia* often occurs on the slopes, *Eucalyptus gamophylla* on the valley floor and lower slopes and Corymbia grades into drainage. Within the survey area the stony plain typically has low habitat complexity with microhabitats restricted to infrequent rocky outcrops and limited shade provided by vegetation.

Stony plain habitat is a common habitat in the Pilbara particularly in the Boolgeeda Land System. Aerial photography and visual assessment from a helicopter confirm that this broad habitat occurs outside of the survey area (Rapallo 2022).

2.4.2 Hillcrests and hillslopes

Hillcrests and hillslopes are the rocky crest and slopes of the large hills and ranges. This habitat typically has a low habitat complexity due to low diversity of microhabitat and minimum shading from vegetation and landform dependent on surrounding topography and outcropping (Rapallo 2022).

At Lamb Creek this habitat is confined to the higher elevation areas (centre and south-east corner of the retention licence) and falls within the Newman Land and Boolgeeda Land System. There are no high elevation south-facing slopes and outcropping with cracks and crevices predominately occurs in the adjacent gorge, gully and rocky breakaway habitat. Hill crests and hill slopes formed the second most extensive habitat within the survey area, covering 319 hectares. Vegetation is characterised by a *Triodia*

hummock grassland with scattered *Eucalyptus leucophloia* trees and mallee, and acacia and grevillea shrubs. Aerial photography, helicopter visuals and ground-truthing as part of vertebrate fauna surveying (Rapallo 2022) confirmed that this habitat extends outside of the retention licence, to the south of the haul road corridor. In a regional context, rocky spinifex dominated hillcrests and hillslopes habitats of the Pilbara are common.

2.4.3 Gorges, gullies and rocky breakaways

Gorges are deeply incised, with vertical cliff faces, while gullies are more open and shallower. Breakaways refer to rugged slopes with vertical fall on the edge of a hill or range. This habitat can support caves and semi-permanent rock pools and has a moderate to high habitat complexity largely dependent on landform and aspect (Rapallo 2022).

At Lamb Creek this habitat is confined to the higher elevation areas and falls within the Newman Land System. This habitat bisects the hillcrest/hillslopes of the high elevation areas and contains caves, deep cracks/crevices, and shaded microhabitats from both vegetation and landform shadow. The more open, shallow gullies have lower habitat complexity with microhabitats occurring within the rocky substrate and partial shade provided by vegetation and landform. The deepest gorge on the retention licence has northern-facing slope and there are no south facing gorges or deep gullies. Despite extensive use of helicopter in 2012, 2020 and 2021 for baseline surveys, to date there have not been permanent or semi-permanent pools recorded in this habitat (Rapallo 2022).

This habitat occurs as two deep gorges and two smaller gorges in the centre and south-east corner of the retention licence and is typically vegetated with spinifex hummock grassland with mixed shrubland patches with occasional figs (*Ficus* sp.) occurring in shaded locations and occasional *Eucalyptus leucophloia*. The gorge, gully and rocky breakaway habitat does not occur on the haul road corridor.

The gorge, gully and rocky breakaway habitat is the smallest habitat in the survey area due to its narrow features (54.7 hectares). Aerial photography, helicopter visuals, and ground-truthing for vertebrate fauna survey (Rapallo 2022) confirmed that this habitat extends outside of the retention licence, bisecting the high elevation areas to the south of the haul road corridor. In a regional context, the gorges, gully and rocky breakaway habitats of the Pilbara are restricted to the Chichester and Hamersley IBRA subregions but are well represented. Locally this habitat occurs at Mining Area C (Biologic 2017) and within Karijini National Park.

2.4.4 Medium drainage lines

Medium drainage is defined as the narrow gravelly drainage channels that become wider on the lower plains of the valley. This drainage is made up of minor tributaries that feed into the major creek lines of the catchment. Medium drainage is often fringed by *Corymbia hamersleyana*. Medium drainage habitat typically exhibits a moderate habitat diversity with some tree hollows and woody debris (logs and leaf litter) and typically does not contain semi-permanent/ permanent pools or the large fringing river gums (Rapallo 2022).

At Lamb Creek this habitat occurs on the valley floor of the retention licence as wide loamy drainage channels to undefined drainage (gravelly) containing occasional emergent *Corymbia hamersleyana* over patches of low mixed shrubs over buffel grass and tussock grass dominated understory on low relief. Contains very occasional mulga stands in loamy soils as the habitat transitions into Mulga/Corymbia plain habitat (Rapallo 2022).

This habitat provides higher protection than the surrounding stony plain habitat due to partial shading from vegetation and some leaf litter and woody debris, however it was noted in 2020 and 2021 that detritus and litter within this habitat was sparse or in piles without accumulated soil - indicating recent fast flow and little opportunity for soil and fine detritus to accumulate. This habitat typically has deeper loamier soils than the surrounding stony plain, therefore greater potential to retain moisture.

The medium drainage habitat although small in area (113 hectares) due to narrow features is relatively common throughout the Pilbara. Aerial photography and helicopter visuals confirm that this habitat occurs outside of the survey area aligning with the Lamb Creek that feeds into Marillana Creek (Rapallo 2022).

2.4.5 Minor drainage lines

Minor drainage represents the small drainage channels that originate from the hillcrest/ hillslope habitats and bisect the stony plain habitat. Minor drainage typically exhibits a low-moderate habitat complexity, with some shading from vegetation but low soil moisture levels, low accumulated litter, and generally gravelly soils (Rapallo 2022).

At Lamb Creek this habitat occurs throughout the survey area and represents the smaller drainage channels and shallow gullies. Typically, vegetation can be denser than the surrounding habitat of stony plain or hill slopes and hill crests, consisting of mixed open shrubland to shrubland often over tussock grass and herbs with occasional fringing trees (scattered *Eucalyptus leucophloia, Corymbia hamersleyana or Eucalyptus gamophylla*). The substrate can be sandy in places but generally consists of a skeletal loam gravel or stone. This broad habitat although small in area (210 hectares) is relatively common throughout the Pilbara. Aerial photography and helicopter visuals confirm that this habitat occurs outside of the survey area (Rapallo 2022).

2.4.6 Tussock grassland plain

The tussock grassland plain habitat (137 hectares) is defined as tussock grassland dominated drainage plain (hardpan) containing open mulga woodland stands or scattered mulga individuals on brown sandy clay loam to loams with surface mantles of very few to few pebbles of ironstone (Rapallo 2022).

This habitat occurs at the southern end of the haul road corridor within the Wannamunna and Boolgeeda land systems. This habitat receives run-on from adjacent hills and surrounding stony plain and much of the drainage is undefined. The tussock grassland broad habitat is not widespread throughout the Pilbara, compared with the adjacent spinifex stony plain and hillcrest/hillslope habitats and aligns broadly with the groves landform unit of the Boolgeeda Land System, the hardpan plains landform unit of the Wannamunna Land System and 'valley floor mulga' as described by Kendrick (2001). Grove-intergrove mulga and valley floor mulga are threatened by water shadow from linear infrastructure (Kendrick 2001). Disruption to sheet flow could impact this habitat.

Aerial photography suggests that this habitat continues south east from the survey area parallel to the Great Northern Highway, aligning with the mulga habitat found at Area C (Biologic 2017), approximately three kilometres to the south-south west of the survey area.

2.4.7 Mulga/Corymbia plain

The mulga/corymbia plain habitat is defined as level plain subject to sheet flow containing mulga woodland patches adjacent to run-on zones of stonier plain (Rapallo 2022).

At Lamb Creek this habitat occurs on the valley floor adjacent to medium drainage primarily in the retention licence and also in the northern section of the haul road corridor covering 292 hectares. Vegetation is broadly open mulga shrubland patches over spinifex or tussock grassland surrounded by run - on zones of stonier plain of open spinifex/tussock grassland under very open mulga/ *Corymbia deserticola* shrubland. Soils are loams to sandy clay loam (Rapallo 2022).

The mulga/corymbia plain habitat exhibits a moderate habitat complexity. Mulga stands provide shade; however, the stands are not extensive or thick, therefore the shade is patchy as is the accumulated litter and associated patches of moister soil. Within the mulga patches this habitat provides loamier soil for burrowing species, however the substrate in adjacent run-on areas is predominantly hard and stony (Rapallo 2022).

This habitat aligns broadly with the stony lower plains and narrow drainage floors, channels land landform unit of the Boolgeeda Land System (van Vreeswyk et al. 2004) and 'valley floor mulga' as described by Kendrick (2001).

Boolgeeda is a common system in shallow valleys below hill systems such as the Newman and Rocklea Land system ((Van Vreeswyk *et al.* 2004). Aerial photography and helicopter visuals suggest that this habitat occurs outside of the survey area however ground truthing has not verified the extent of individual mulga patches beyond 50 metres south of the survey area. Grove-intergrove mulga and valley floor mulga are threatened by water shadow from linear infrastructure (Kendrick 2001). Disruption to sheet flow could impact this habitat.

2.4.8 Disturbance

Some habitats have been disturbed via selective clearing for tracks, drill pads and laydown associated with exploration activities, particularly within the stony plain habitat of the retention licence. A large portion of the survey area has been burnt multiple times over recent years resulting in a mosaic of post fire ages (NAFI 2021, Rapallo 2022).

3 Methods

3.1 Desktop study

3.1.1 Database Searches

Searches from within the Western Australian Museum's (WAM) invertebrate databases were conducted with interpretation by Dr Erich Volschenk. At the time of report preparation there is limited taxonomic support or screening for SRE invertebrate fauna. Database search results for arachnids (pseudoscorpions, scorpions, and spiders) and myriapods (centipedes and millipedes) consisted of ALL records from within the database search area, as WAM do not provide SRE filtered results that reflect the rapidly evolving taxonomy of this group. Database search results were edited and filtered prior to assessment to align the different WAM departmental databases and remove non-target data such as subterranean fauna. Search parameters, filter methodology and SRE status justification are located with the WAM database results in Appendix I.

3.1.2 Historical Data

The desktop study focused on records of specimens lodged within the WAM. Unpublished reports for projects carried out within the search area are required to have all voucher specimens lodged with the WAM (Environmental Protection Authority 2009); therefore, WAM records provide the best consolidated and up to date source of information regarding SRE candidates previously recorded from within a search area. Records from previous reports also represent static taxonomic interpretations, therefore the names of taxa in these reports may no longer be current if they are revised in the intervening period. WAM records are largely maintained and incorporate contemporary taxonomy. Records of SREs from other sources cannot be verified and are therefore of limited or questionable value if the original specimen is not available.

3.2 Field Survey

3.2.1 Timing and Site Selection

The SRE field survey was completed between 16 and 25 February 2021. The survey area was accessed by a combination of four-wheel drive vehicle using existing tracks, and by helicopter, and was surveyed on foot.

Survey locations were selected prior to the field survey, in consultation with Dr Volschenk from aerial imagery. Areas of vegetation along drainage lines, deep gullies, shaded topography and patches of dense vegetation were targeted. At Lamb Creek, and regionally some SRE groups have been sampled from habitats typically thought to be unsuitable for SREs (trapdoor spiders, scorpions, pseudoscorpions and isopods). For this reason, survey effort included landscapes previously regarded as unconducive for SREs such as stony spinifex plain and slopes. Foraging sites were also selected in accordance with the preliminary disturbance footprint outline (dated March 2020) that was available in February 2021.

The disturbance footprint has changed with advanced mine and haul road planning, with the current disturbance footprint V3 provided in December 2021, after all fieldwork had been completed. At the time of report preparation, footprint V3, there were 27 SRE foraging sites located within the proposed disturbance footprint V3 and 24 located outside of the proposed disturbance footprint. Of the out of

impact sites, 13 foraging sites are within 100 metres of proposed footprint V3 proposed disturbance footprint (eight sites proximal to the proposed haul road and five sites proximal to the mining area). Survey sites relative to broad fauna habitats and disturbance footprint V3 are mapped in Figure 3.1.

3.2.2 Habitats

Table 2.2 shows examples of representative habitats sampled with habitat data located in Appendix II. Note habitats sampled for SRE generally align with broad vertebrate habitats as described in section 2.4 and mapped Figure 3.1, however there are differences in scale for SRE invertebrate habitat versus broad habitat.

Table 3.1 Examples of Habitats Surveyed

Habitat	Representative Photo
Stony Plain Plains and lower slopes of spinifex hummock grasslands (or in small patches, tussock grass) on red sandy clay loam to loam soil. Typically, with a mantle of gravel (less so on the valley floor adjacent to drainage, where soils are loamier). Little to no overstory aside from scattered trees or patches of mixed shrubs often regenerating from fire. Generally, *Eucalyptus leucophloia* occurs on the slopes, *Eucalyptus gamophylla* on the valley floor and lower slopes and *Corymbia* is typically associated with drainage). Sites[1]: LC16, LC22, LC24B, LC24A, LC27B, LC28, LC29A, LC30, LC37A, LC40, LCS08*, LCS03* LCS04*	

[1] Asterisk denotes site was a vertebrate fauna trapping site surveyed in April 2020

Habitat	Representative Photo
Mulga shrubland patches Open mulga shrubland patches over spinifex or tussock grassland on loams to sandy clay loam occurring in areas of sheet flow drainage. The mulga patches are surrounded by run-off zones of stonier plain of open spinifex/tussock grassland under very open mulga/ *Corymbia deserticola (*shrubland). Sites: LC04, LC05, LC06, LC07, LC08, LC09, LC10, LC15, LC17, LCS06*	
Spinifex grassland dominated hillcrest/hillslopes Slopes and hill crests of the higher elevation areas. Spinifex hummock grassland dominated with scattered *Eucalyptus leucophloia* trees and mallee, and acacia and grevillea shrubs on rocky, red skeletal soils (loams to clay/loam). Sites: LC11, LC17, LC19, LC38, LC26, LCS10*	

Habitat	Representative Photo
Deep Gullies The deep rocky gullies that bisect the hillcrest/hillslopes of the high elevation areas containing caves, deep cracks, and crevices. Spinifex hummock grassland with mixed shrubland patches or ficus occurring in shaded locations or occasional *Eucalyptus leucophloia.* Sites: LC13, LC21	
Shallow Open Gullies The shallow rocky gullies that bisect the hillcrest/hillslopes of the high elevation areas. Spinifex hummock grassland with scattered *Eucalyptus leucophloia.* Occasional fig trees (*Ficus* sp.) Sites: LC12, LC14, LC20	

Habitat	Representative Photo
Minor Drainage The smaller narrow drainage channels and shallow gullies that bisect the stony plain habitat and hill slopes, forming flow zones on the valley floor. Mixed open shrubland to shrubland often over tussock grass and herbs with occasional fringing trees (scattered *Eucalyptus leucophloia, Corymbia or Eucalyptus gamophylla)* Sites: LC18, LC23, LC25, LC27A, LC36, LC37, LC42A, LC44, LC43, LC45, LC29B	

Habitat	Representative Photo
Medium Drainage Wide loamy drainage channels to undefined drainage (gravelly) containing occasional *Corymbia* over patches of low mixed shrubs over buffel grass and tussock grass dominated understory on low relief. Contains very occasional mulga stands in loamier soils. Sites: LC01, LC02, LC03, LC39, LC39A, LCS07*, LCS09 *	

Habitat	Representative Photo
Tussock grassland plain Tussock grass (*Aristida inaequiglumis*, *A. contorta*, *Themeda triandr*a) dominated largely undefined drainage plain. Contains occasional open mulga woodland stands or scattered mulga individuals on brown sandy clay loam to loams. Contains patches of spinifex. Sites: LC31, LC32, LC33, LC34, LC35, LC41, LC42, LCS01*, LCS02*	
* 2020 Vertebrate Fauna trapping sites	

3.2.3 Survey Methods

Habitat assessment, spider/scorpion burrow searching, and foraging occurred at all sites. Foraging methods included turning rocks, logs, peeling bark, raking leaf litter, and searching under vegetation. If no leaf litter was present, then litter sifting could not be conducted as was the case at sites LC11, LC17, LC18, LC26, LC37, LC38 AND LC40). Black lighting (nocturnal searches) did not occur due to logistics as per client safety protocol.

Litter sifting utilised a series of sieves (32 cm diameter), each sieve being progressively finer (top-bottom: 17 mm, 11 mm, and 3 mm mesh) through which leaf litter (and surface soil below the leaf litter) was sieved. The finest particles passing through the sieves into a receiving pan. Where possible, leaf litter was collected from the southern sides of a shady tree or shrub and from close to its trunk.

At each site, where litter was present, a minimum of six sifts were carried out, each one targeting a different tree or patch of litter. During each sift, approximately 5 litres of leaf litter and surface soil were sieved. The retained litter from each sieve and the receiving pan were examined separately and targeted invertebrates were picked using forceps or an aspirator.

A handheld blower was used to aid spider burrow searching. Opportunistic collection and observations were also made during the field survey.

A minimum of 1.5 person-hours occurred at each site (independent of time spent litter sifting).

In addition to the February 2021 collections, potential SRE specimens were also collected as bycatch to vertebrate fauna surveying (April 2020). These specimens were also sequenced and are discussed in this report. Seven of the ten vertebrate trap sites are considered to be within footprint V3.

3.2.4 Sample curation and lodgement

All specimens were initially preserved in >95% ethanol. After fixing, tissues (usually a leg) were removed from appropriate specimens and stored separately under refrigeration. The remainder of the specimens were transferred to 75% ethanol to better facilitate morphological identification since samples preserved in 100% ethanol are often very brittle and fragile. At the completion of the project, morphological samples will be deposited to the WAM for inclusion in the state's biological collection, in accordance with requirements of EPA Technical Guidance for sampling SREs (EPA 2016).

3.2.5 Personnel and licensing

The personnel involved in the field survey, data entry and analysis, and the preparation of this report are listed in Table 3.2. The field survey was conducted under Fauna Taking (Biological Assessment) Licence BA27000239 issued under Regulation 17 of the *Biodiversity Conservation Regulations 2018.* As part of the license conditions, a list of species recorded in the survey will be forwarded to the DBCA.

3.2.6 Morphological identifications, taxonomic nomenclature and statistics

Morphological identifications and SRE assessment of scorpions, pseudoscorpions, trapdoor spiders, centipedes, millipedes and snails were carried out by Dr Erich Volschenk of Alacran Environmental Science (Alacran). Dr Simon Judd contributed information and identification of isopods. References used for species determination and taxonomic nomenclature of invertebrates are detailed in Table 3.3.

Morphospecies designations follow the parataxonomy of the scientist(s) working on the group; these informal names are written between single quotation marks rather than being italicised as they are not valid under the International Code of Zoological Nomenclature (International Commission on Zoological Nomenclature 1999). Morphospecies is defined as per the "Phylogenetic Species Concept" (Cracraft 1983): "A species is the smallest diagnosable cluster of individual organisms within which there is a parental pattern of ancestry and descent."

Table 3.3 General references and collections used to assist with morphospecies designations

Order	Taxonomic Reference	Morphospecies and reference collection

	Judd *et al.* 2013; Javidkar et al. 2015 ;Javidkar et al. 2016; Javidkar et al. 2017; Javidkar *et al*. 2017)	Judd. Reference collection at the W.A. Museum and with Dr Simon Judd.
Eupulmonata	Solem 1985, Solem 1988, Solem 1997; Whisson & Köhler 2012; Whisson & Kirkendale 2014; Stanasic et al. 2017	W.A. Museum reference collection.

Fifty-eight specimens (Appendix III) representing unidentifiable and or ambiguously identified taxa were sequenced for the gene Cytochrome C Oxidase subunit I (COI) for the purpose of species delimitation (DNA barcoding). A total of fifty-six yielded sequences. Sequence fragments of the COI gene were amplified from muscle tissues obtained from specimens fixed and preserved in >95% ethanol or from samples fixed in propylene glycol and later preserved in >95% ethanol. Sequence generation from tissues was undertaken by Genotyping Australia Pty Ltd and AGRF Perth (Alacran 2021a).

Phylogenetic analyses, species delimitation and SRE status was determined by Alacran (2021a) utilising Alacran and GenBank reference sequences for the majority of sequences. Figures 5.1 to 5.15 of Appendix III show Bayesian phylogeny of each SRE category taxon. Query taxa (Lamb Creek specimens) are highlighted in coloured text and conspecific species 'groups' are denoted in bold text.

First pass species delimitation was based on an 8% sequence divergence threshold for most taxa (Hebert *et al*. 2003; Hebert, Ratnasingham, *et al*. 2003; Barret & Hebert 2005; Robinson *et al.* 2009). For trapdoor spiders, the delimiting threshold of 9.5 % was used (Castalanelli *et al.* 2014); (Huey e*t al*. 2019) and 5% was used for scorpions (Volschenk unpublished data). For *Austrostrophus* millipedes the WAM Museum clade identification system was used to identify specific clades; however, the divergence between these clades is often very low suggesting strong sexual selection may be present.

Where there was no match with Alacran or GenBank sequences, or where there was outstanding ambiguity, the Lamb Creek sequences were assessed against various datasets derived from WAM research projects via the Western Australian Museum Molecular Systematics Unit (WAM MSU). The sequences for 14 specimens that did not have matches with GenBank or Alacran reference sequences were BLASTED against WAM MSU data sets (Appendix V). Extraneous primers sequences were removed prior to analysis. The top 10 blast hits for each major taxon were gathered, duplicates removed, and analysed with a Maximum Likelihood phylogenetic analysis using a GTR+G model of evolution and 100 bootstraps (RAxML). Distances were calculated via tree-based estimates of identical bases in Geneious Prime 2020.2.5.

To avoid confusion, where the WAM MSU assigned a WAM code for a morphospecies (Appendix V) this replaces the designation given by (Alacran 2021a) which is referred to in the text of this report as the Alacran Preliminary ID. Where there is no code system for this group, then the Alacran designation remains.

For further detail on Genomic Identification (DNA Barcoding) refer to Appendix III and Appendix V.

The species accumulation curve was generated using EstimateS software version 9.1.0 (copyright R.K. Colwell) (Colwell 2016). The analysis was conducted using presence-absence data of the 25 taxa of SRE category specimens (i.e. both potential SRE and widespread) recorded through foraging, from the 23

sites that yielded SRE category specimens. Predicted species richness was calculated using the Chao2 estimator (Gotelli and Colwell 2011).

3.2.7 Assessment Of Short-Range Endemism

There are no published systems for assessing the SRE potential for a species. The WAM previously employed the following system to assess SRE-status of invertebrates:

- **Confirmed SRE**: This category applies when the identity of the taxon is unambiguous and its distribution is less than 10 000 km^2 based on publicly available vouchered records. Supporting data can be either genomic (from DNA sequences) or morphological, ideally both.
- **Potential SRE**: This category applies to situations where there are knowledge gaps for the taxon. The following sub-categories further elucidate this status:
    - **Data Deficiency (DD)**: This category covers taxa for which there is insufficient data available to determine SRE status. Factors that fall under this category include:
    - insufficient geographic information, and/or
    - inappropriate life stages prevent identification to species level.
    - **Habitat Indicators (H)**: This category employs habitat characteristics to evaluate SRE status when habitats are known to support SRE taxa. For example, many species sampled from subterranean habitats are known to be range restricted; a new species discovered from such habitat therefore has greater potential to be range restricted (i.e. a SRE) than widespread.
    - **Morphological Evidence (M)**: This category uses one or more morphological characters that are characteristic of SRE taxa inhabiting restricted environments, e.g. the specialised morphological features of animals adapted to subterranean habitats, including body markings that are absent or significantly paler than surface dwelling relatives, eyes that are absent or significantly reduced, and/or longer appendages (legs and antennae) than surface relatives.

- **Unpublished Research & Expertise (U):** This category relies on unpublished research or expertise to develop SRE status.
- **Widespread (not an SRE)**: This category applies when vouchered evidence demonstrates a distribution greater than 10,000 km^2.

SRE assessment and classification of field specimens and WAM database records was conducted by Dr Erich Volschenk.

4 Results

4.1 Desktop

The search area yielded a total of 8894 records of SRE category taxa (i.e., taxa belonging to taxonomic groups prone to shortrange endemism). Of these records, six taxa were assessed to be SRE and 376 were assessed as potential SRE (Table 4.1 and Table 4.2). The remainder were assessed as widespread (Appendix I). .

Seventy-eight records of potential SRE taxa were collected from within ten kilometres of the survey area (central point) (Table 4.3). Thirteen records of potential SRE taxa were collected from the survey area from the pseudoscorpion and scorpion groups (Table 4.3). No confirmed SRE taxa records occurred from the survey area.

4.2 Field survey results

4.2.1 Summary

Fifty-one sites were sampled during the February 2021 survey (Figure 3.1). Field data is presented in Appendix II.

The 2021 field survey yielded a total of 119 invertebrate specimens from SRE target groups, representing 25 different taxa. When combined with the SRE category taxa collected in 2020 from dry pitfall traps and litter sampling (Rapallo 2022), a total of 159 invertebrate specimens from SRE target groups, representing 30 different taxa have been collected over a two-year period from the Lamb Creek survey area.

Of this combined dataset of SRE category taxa, 24 taxa are classified as potential SRE with 23 regarded as data deficient due to known distribution (DDG) and one assessed as potential SRE owing to limited taxonomic resolution (DDT). The remaining six taxa were assessed as widespread (Alacran 2021a).

Eight potential SRE taxa were linked with existing sequenced, undescribed species (Bothriembryon BOT065, Buddelundiinae (Armadillidae) 'ISOP009', Kwonkan MYG324, Olpiidae 'LCr02', Lychas 'bituberculatus complex', Lychas 'multipunctatus complex' , Lychas 'hairy tail complex') and Buddelundia '10ma'.

Lychas 'harveyi complex' was identified by Alacran on the basis of morphology. This taxon is considered a potential SRE because it is a species complex containing potential SRE. The Lychas 'harveyi complex' specimens were not sequenced as the taxa was previously believed to be widespread, however information from WAM in October 2021 indicated a change of status to potential SRE (Volschenk unpublished data provided by Alacran).

One potential SRE taxon (Buddelundia '13') was identified via morphology and not linked with reference sequences because at the time of report writing no reference sequences were available through either GenBank, Alacran, or WAM MSU.

Ten potential SRE taxa were identified as a new undescribed or previously unsequenced species (Austrochthonius 'LCr01', Austrostrophus 'Clade M' , Cryptops 'LCr01', Cryptops 'LCr02', Euryolpium 'LCr01', Indolpium 'LCr03', Indolpium 'LCr04', Indolpium 'LCr05', Mecistocephalus 'LCr01' and Mecistocephalus 'LCr02')

Two potential SRE taxa sequences (Sepedonophilus 'LCr01' (AES210156 and AES210143)) and Orphnaeus 'LCr01 (AES210206) were not run against the WAM MSU database because there were no reference sequences available.

No confirmed SRE invertebrate taxa were collected from the survey area.

Figure 4.1 gives abundance records, for SRE category taxa (potential SRE and widespread) and Figure 4.2 presents the number of sites SRE category taxa were recorded from. Table 4.5 and Table 4.6 summarises the abundance, species richness and number of sites sampled per habitat type.

Table 4.4 Summary of the field survey results; bold text identifies species identifications confirmed using DNA sequences. Refer to Barcoding report (Appendix III) for detail and sequence divergence. Note Buddelundia species were sequenced for reference and identified via morphology.

Class	Order	Family	SRE category taxa	Matched with reference sequence?	SRE status (Alacran 2021a)	Reason for status/Comments
Arachnida	Araneae	Anamidae	Aname mellosa	Yes (GenBank reference sequences)	Widespread	Harvey et al 2012, WAM database
Arachnida	Araneae	Anamidae	Kwonkan 'MYG324'	Yes, (WAM MSU reference sequences)	Potential SRE: DDG	WAM database
Arachnida	Araneae	Barychelidae	Synothele 'MYG311'	Yes (GenBank and Alacran reference sequences)	Widespread	WAM database
Arachnida	Pseudoscorpiones	Atemnidae	Oratemnus 'WA1'	Yes (GenBank and Alacran reference sequences)	Widespread	T149473 (AES190320) a sequence match to the Lamb Creek specimen was collected ca 30 km to the south-southeast of Lamb Creek (unrelated project/client) and identified by WAM MSU as Oratemnus 'WA1' (Volchenck pers com). T149473 (AES190320) is recorded within the WAM database.
Arachnida	Pseudoscorpiones	Chthoniidae	Austrochthonius 'LCr01'	No	Potential SRE: DDT	A new undescribed or previously unsequenced species (Wilson & Harvey 2021).

Gastropoda		Bothriembryontidae	Bothriembryon 'BOT065'	Yes, WAM MSU sequence database match	Potential SRE: DDG	There are 44 records of Bothriembryon 'BOT065' held by WAM MSU extending 170 kilometres from Prairie Downs west of Newman to near Tom Price (WAM unpublished data supplied by Alacran).

4.2.2 Abundance

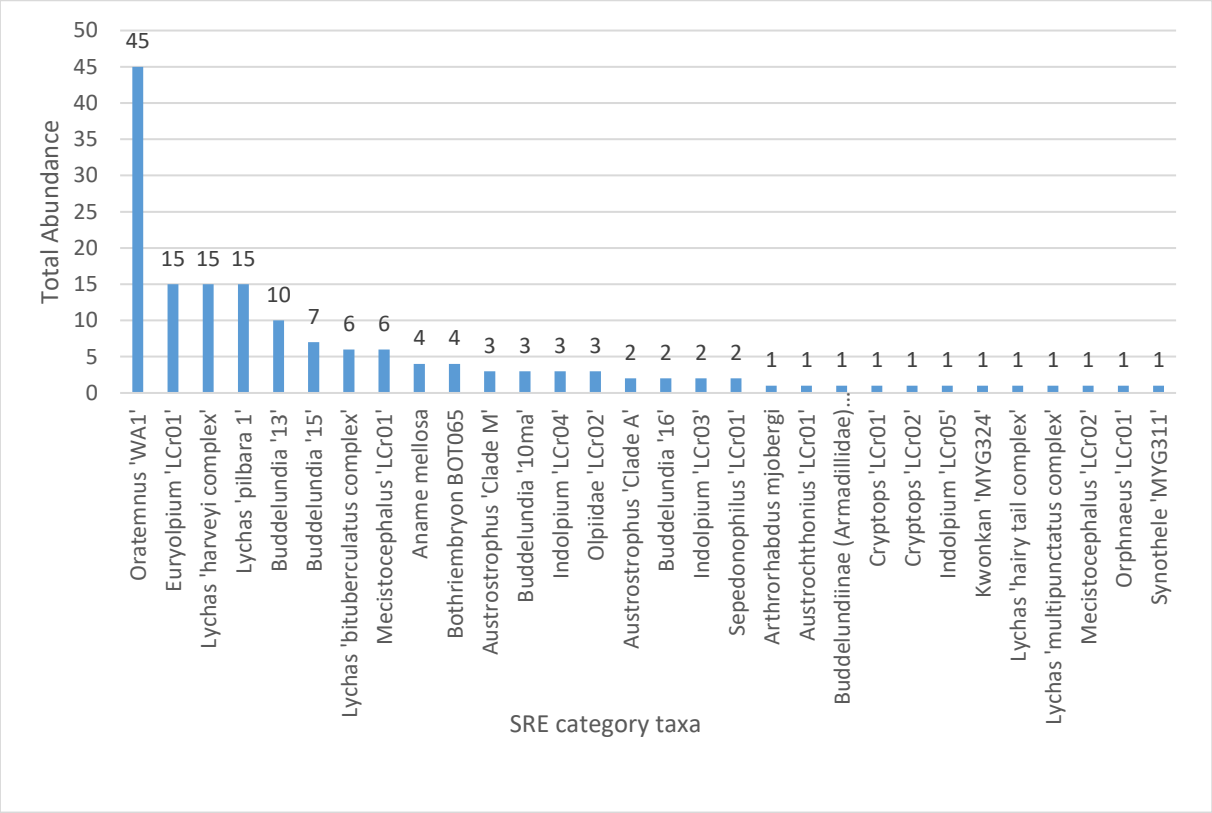

Figure 4.1 Abundance of SRE category taxa collected from Lamb Creek (2020 and 2021).

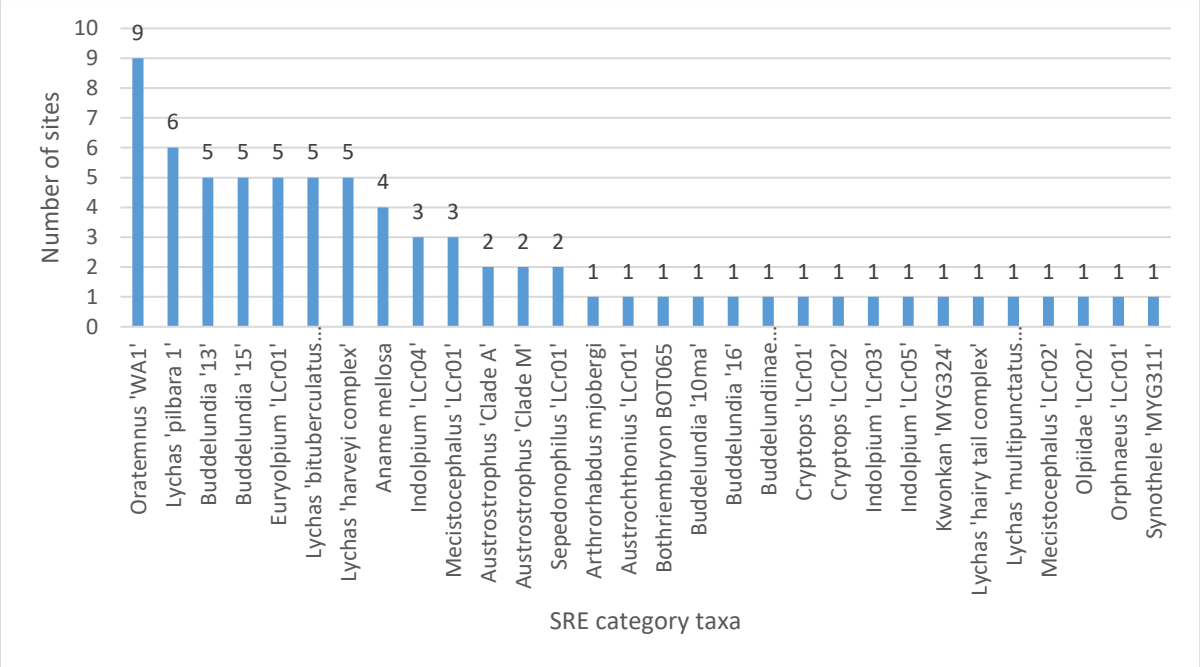

Figure 4.2 Number of sites within the survey area that SRE category taxa were collected from (2020 and 2021).

4.2.3 Species richness estimates

To provide an indication of survey completeness the software program EstimateS (Version 9.1.0) (Colwell 2013) was used to generate species accumulation curves and to calculate predicted species richness. Species accumulation curves represent a theoretical model of the relationship between survey effort and species accumulation: as the number of specimen captures or sites foraged increases, the accumulation of invertebrate taxa decreases until the curve reaches an asymptote (Gotelli & Colwell 2011).

Since models can only be generated from data collected through (the same) systematic methods, the species accumulation curve and predicted species richness was calculated using the 2021 foraging data. Analyses were conducted on presence-absence data of the 25 taxa of SRE category specimens (i.e. both potential SRE and widespread taxa) recorded through foraging in 2021, from the 23 sites that yielded SRE category specimens. The analysis was run using the default settings, with the following exceptions:

- Accumulations (runs) were randomised 10,000 times without replacement.
- Upper abundance limit for rare or infrequent species was set to 5.

The species accumulation curve is presented in Figure 4.3 plotting number of SRE category taxa (y-axis) against the number of foraging sites sampled. Observed species richness is presented as a sample-based rarefaction curve, computing the mean expected number of SRE category taxa (S(est)) over all possible combinations of 1, 2, and up to 23 sites sampled (Colwell et al. 2012). The Chao2 estimator (which is a robust estimator of minimum species richness for incidence-based data) was used to calculate predicted species richness (Gotelli and Colwell 2011).

The Chao 2 estimator gave a predicted species richness of 48.41 taxa, which indicates that the survey recorded 52% of the (estimated) total SRE category species richness in the survey area that could have been recorded through foraging. This relatively low percentage is reflected in the species accumulation curve which by the end of the survey had not commenced towards an asymptote (Figure 4.3).

The total number SRE category taxa recorded in the Lamb Creek survey area to date (including the 2020 dry pitfall trapping by-catch) was 30 taxa. Hence, even when taking into account additional taxa collected as by-catch during the vertebrate fauna survey, only 62.5% of the (estimated) total species richness of the survey area has been collected to date. Additional survey work completed under favourable climatic conditions is highly likely to capture additional taxa.

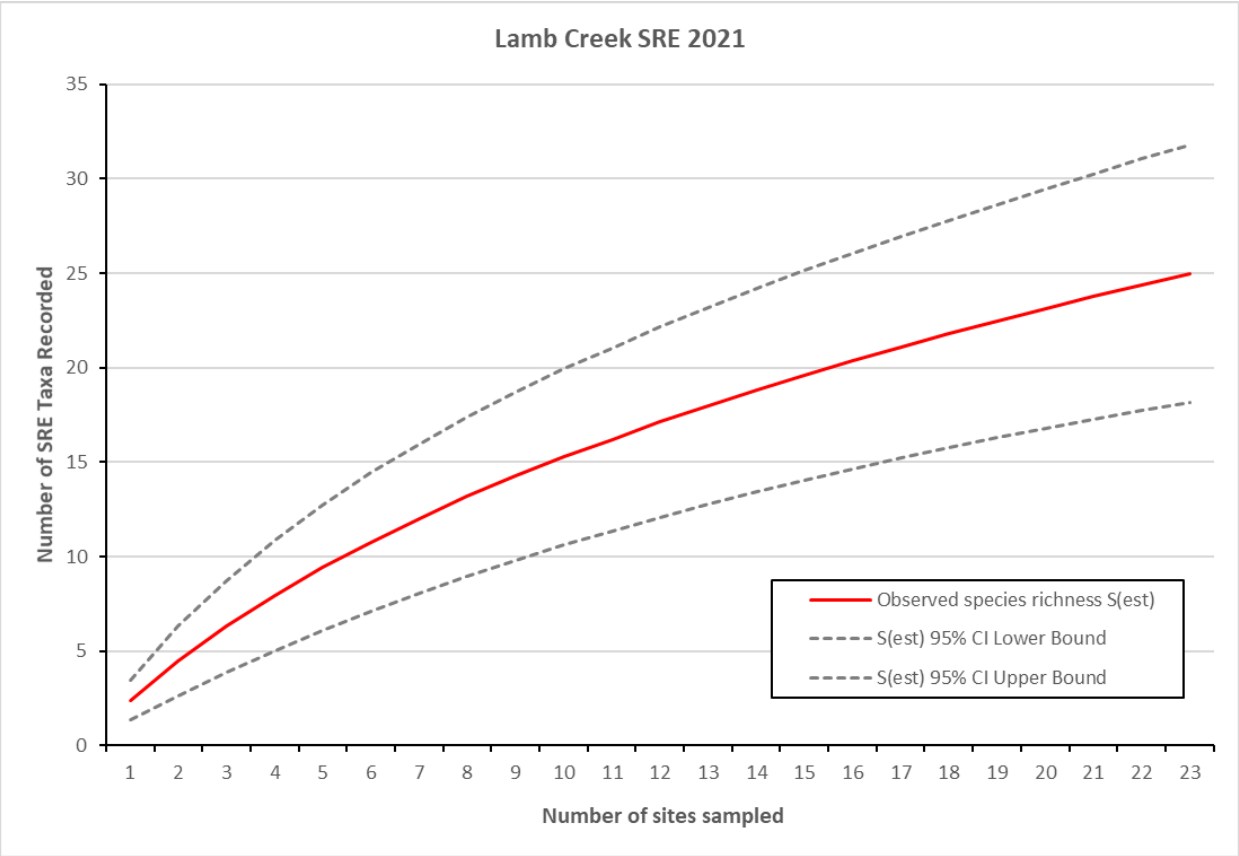

Figure 4.3 Species accumulation curve

4.2.4 SRE category taxa per habitat type

All eight habitat types surveyed yielded invertebrates belonging to SRE category taxa (Table 4.5). Of those eight habitats mulga shrubland patches supported the greatest species richness of taxa from SRE groups. Interestingly minor drainage, with a high foraging effort comparable to stony plain, and mulga shrubland patches yielded only one taxon from SRE groups.

Table 4.5 Summary of short-range endemic category taxa, abundance, species richness and number of sites sampled per habitat type

Table 4.6 presents each SRE category taxa per broad habitat type as described in Table 2.4. Nine SRE category taxa were sampled from 2 or more different habitats. Eighteen taxa belonging to SRE groups were found in only one habitat type, of which, sixteen SRE category taxa were also sampled from single sites.

Table 4.6 Short-range endemic category taxa per broad habitat type and sample sites.

Short-range endemic category taxa	No of foraging sites taxa sampled from (2021)	No of broad habitat types taxa sampled from (2021)	No of sites taxa sampled from (2020)	No of broad habitat types taxa sampled from (2020)	Broad Habitats

5 Discussion

5.1 Summary of SRE status and collections relative to the disturbance footprint

Table 5.1 summarises the potential SRE taxa collected from the survey area with regards to occurrence relative to footprint V3 and regional records. The taxa that were sampled from the disturbance footprint V3, that were not found elsewhere on the survey area or known to have regional records are highlighted. Section 5.2 discusses each potential SRE taxa individually and habitats are discussed in section 5.3.

There are fourteen potential SRE taxa collected from the survey area that have not been recorded regionally. Of these taxa, six were recorded from within footprint V3 only (highlighted blue in Table 5.1).

- Austrostrophus 'Clade M'
- Cryptops 'LCr02'
- Indolpium 'LCr03'
- Indolpium 'LCr05'
- Mecistocephalus 'LCr01'
- Orphnaeus 'LCr01'

Three taxa were collected from adjacent to the proposed disturbance footprint V3 only (within 100 metres). Of these taxa, two taxa had not been recorded regionally (highlighted in orange in Table 5.1).

- Austrochthonius 'LCr01'
- Mecistocephalus 'LCr02'

Figure 5.1 to Figure 5.3 show the collection locations of potential SRE taxa across the survey area. Note that SRE category taxa assessed to be widespread have not been mapped.

Table 5.1 Location of sampled potential short-range endemic taxa relative to disturbance footprint V3 and regional records.

Taxon name	SRE status	Survey area collections relative to footprint V3 [2]			Regional records?
		In footprint V3	Within 100 m of footprint V3	More than 100 m outside V3	
Austrochthonius 'LCr01'	Potential SRE: DDT		1		No
Austrostrophus 'Clade A'	Potential SRE: DDG	1		1	Yes , undisclosed sampling location accessed via GenBank
Austrostrophus 'Clade M'	Potential SRE: DDG	2			No
Bothriembryon BOT065	Potential SRE: DDG	1			Yes, unpublished WAM MSU data (Section 5.2.7).
Buddelundia '10ma'	Potential SRE: DDG	1			Yes from 53 km NE of Lamb Creek (Alacran 2021c)
Buddelundia '13'	Potential SRE: DDG	2	1	2	No. There are WAM database records of Buddelundia '13' however no sequenced specimen data publicly available or available via WAM MSU.
Buddelundia '16'	Potential SRE: DDG			1	There are WAM database records of Buddelundia '16' however no sequenced specimen data
Buddelundiinae (Armadillidae) 'ISOP009'	Potential SRE: DDG	1			Yes, 124 km NW (Wilson & Harvey 2021) and NE of Lamb Creek (Alacran 2021c)
Cryptops 'LCr01'	Potential SRE: DDG			1	No
Cryptops 'LCr02'	Potential SRE: DDG	1			No
Euryolpium 'LCr01'	Potential SRE: DDG			7	No
Indolpium 'LCr03'	Potential SRE: DDG	1			No
Indolpium 'LCr04'	Potential SRE: DDG			3	No
Indolpium 'LCr05'	Potential SRE: DDG	1			No

[2] Numbers in this column represent the number of unique collection locations (sites) and not the number of individual specimens collected.

Taxon name	SRE status	Survey area collections relative to footprint V3 [2]			Regional records?
		In footprint V3	Within 100 m of footprint V3	More than 100 m outside V3	
Kwonkan 'MYG324'	Potential SRE: DDG	1			Yes, records from Karijini and Juna Downs (Wilson & Harvey 2021)
Lychas 'bituberculatus complex'	Potential SRE: DDG	4	1		Yes, record from approx. 30km , south south-east of Lamb Creek (Alacran reference sequence)
Lychas 'hairy tail complex'	Potential SRE: DDG			1	Yes, undisclosed sampling locations accessed via GenBank
Lychas 'harveyi complex'	Potential SRE: DDG	3	1	1	No matches with sequenced specimen as Lychas 'harveyi complex' was not sequenced (previously believed to be widespread). as Lychas 'harveyi complex' was collected during the 2012 fauna survey of Lamb Creek.from Nearest regional specimen of Lychas 'harveyi complex' is from Area C ca. 14 km to SE.
Lychas 'multipunctatus complex'	Potential SRE: DDG			1	Yes record from approx. 30km, south of Lamb Creek (Alacran reference sequence)
Mecistocephalus 'LCr01'	Potential SRE: DDG	3			No
Mecistocephalus 'LCr02'	Potential SRE: DDG		1		No
Olpiidae 'LCr02'	Potential SRE: DDG	1			Yes, two WAM lodged specimens collected approximately 7 kilometres north of the Lamb Creek specimen (Wilson & Harvey 2021)
Orphnaeus 'LCr01'	Potential SRE: DDG	1			No
Sepedonophilus 'LCr01'	Potential SRE: DDG			2	No

5.2 SRE invertebrate category fauna assemblage

This section discusses the SRE category taxa collected from the survey area, SRE status classification, distribution (where known), and site information. Habitats are discussed in section 5.3.

5.2.1 Arachnida (spiders)

Australia's spiders are broadly divided into two groups, the Araneomorphae (modern spiders) and the Mygalomorphae (trapdoor spiders). Typically, most modern spiders have large distributions and achieve this through 'ballooning'; a process where a spiderling creates and releases a long strand of silk into the wind. The silk strand eventually becomes able to 'catch the wind' and lift the spiderling into the wind to be deposited elsewhere, potentially many kilometres from its original site.

In Western Australia, the modern spiders currently considered to contain SRE's are members of the family Selenopidae (wall crab spiders) (Crews & Harvey 2011, Crews 2013); and some members of the family Archiidae (assassin spiders Rix & Harvey 2011, Rix & Harvey 2012). Additionally, salt lake specialist Lycosidae (wolf spiders) have the potential to be range restricted cryptic species (Hudson & Adams 1996; Framenau & Hudson 2017).

Most of Western Australia's SRE spiders are trapdoor spiders. In Western Australia, 10 trapdoor spider species are listed in the Wildlife Conservation (Specially Protected Fauna) Notice 2017 (Western Australian Government 2018).

Anamidae (Open-hole trapdoor spiders)

Anamidae is a diverse family of trapdoor spiders that are broadly characterised by building burrows without trapdoors. Most of this family was previously referred to as Nemesiidae prior to the global revision by Opatova *et al.* (2019). The higher level systematics of the Australasian representatives (as Nemesiidae) was revised by Harvey *et al*. (2018). Anamidae includes the genera Aname, Chenistonia, Hesperonatalius, Kwonkan, Merredinia, Namea, Pseudoteyl, Swolnpes, Teyl, Teyloides and Yilgarnia and all except for Namea are represented in Western Australia.

This survey sampled five specimens of Anamidae belonging to the genera Aname and Kwonkan.

Three taxa from the family Anamidae: Aname sp., Kwonkan sp. and c.f. Aname mellosa. Aname sp. (two samples) and Kwonkan sp. (one sample) were represented by adult female specimens and could not be identified to species using morphology. For species level taxonomic resolution, these specimens required assessment using DNA sequences.

Aname mellosa

Three samples that were loosely assigned to one morphospecies of Aname on the basis of morphology were matched to each other using DNA sequences. These sequences were grouped with seven GenBank reference sequences of undisclosed locations. (Figure 5.1 of Appendix III). A fourth male specimen had been previously identified on the basis of morphology as *Aname mellosa*.

Aname mellosa represents a species complex with two representatives in the Pilbara and several from the Midwest and Murchison regions. While the Pilbara forms appear to be widespread (Harvey et al. 2012), those collected from outside of the Pilbara appear to be potential SRE (WAM unpublished data provided by Alacran). The WAM database search returned 339 records of *Aname mellosa* (WAM 2020).

Four specimens of *Aname mellosa* were collected from the survey area, comprising three adult females and one male) from mulga shrubland and stony plain habitats.

Kwonkan 'MYG324', (Alacran Preliminary ID: Kwonkan 'LCr01')

Sequencing: one sample that was identified as Kwonkan sp. on the basis of morphology was not grouped with GenBank or Alacran reference sequences (Figure 5.2 of Appendix III). The specimen did match with WAM MSU sequences and was placed in a clade known as MYG324 which is a known but undescribed species (Wilson & Harvey 2021).

Kwonkan 'MYG324' is regarded as Potential SRE owing to geographical data deficiencies (Alacran 2021a).

The specimen of Kwonkan 'MYG324' collected from the survey area (one adult female) was from mulga shrubland habitat (LC09, Table 3.1 and Appendix II). Kwonkan 'MYG324' was collected within the disturbance footprint V3 (Table 5.1). Sequenced specimens from the WAM MSU database are known from Karijini as well as the Juna Downs area (Wilson & Harvey 2021, Appendix V).

Barychelidae (Brush-Footed Spiders)

The family Barychellidae is diverse in Western Australia where it is represented by the genera Aurecocrypta, Synothele and Idiommata. They are characterised by distinctive foot pads. There are many undescribed species from Western Australia with a high proportion being potential SRE and only known from limited numbers of specimens.

***Synothele* 'MYG311'**

Sequencing: one sample that was loosely assigned to the genus of *Synothele* on the basis of morphology was grouped with six GenBank and one Alacran reference sequences of *Synothele* 'MYG311' (Figure 5.3 of Appendix III). With collections of *Synothele* 'MYG311' from Jinayri, Mudlark, Hope Downs, Koodaideri and Area C (WAM 2020), the taxon is regarded as widespread (Alacran 2021a).

The specimen of *Synothele* 'MYG311' collected from the survey area was from tussock grassland habitat (LC33 Table 3.1 and Appendix II).

5.2.2 Pseudoscorpiones (pseudoscorpions)

In Western Australia pseudoscorpions are represented by 19 families (Harvey 2013). They occur in most undisturbed terrestrial habitats but are easily unobserved due to their small size and cryptic behaviour. The Western Australian pseudoscorpion fauna is poorly known with only a few groups receiving taxonomic attention since the turn of the century and these are primarily focussed on subterranean species (Harvey & Edward 2007; Harvey & Volschenk 2007; Edward & Harvey 2008; Harvey & Leng 2008). The epigean (surface dwelling) fauna flagged as SREs or Potential SREs are largely undescribed.

FAMILY ATEMNIDAE

Most representatives of this family collected from Western Australia represent species in the genus Oratemnus. The taxonomy of Oratemnus is not well known and numerous undescribed species have been identified on the basis of their DNA sequences. In many baseline studies, Oratemnus sp. was regarded as being widespread; however, unpublished molecular data (WAM unpublished cited in Alacran 2021b) indicate that this genus is more complex and has greater diversity than is currently recognised.

***Oratemnus* 'WA1'**

Sequencing: six samples of Oratemnus sp. were matched to each other using DNA sequences and grouped with five GenBank reference sequences and one Alacran reference sequence (AES190320; T149473) (Figure 5.4 of Appendix III).

T149473 (AES190320) was collected ca 30 km to the south-southeast of Lamb Creek (unrelated project/client) and identified by WAM MSU as Oratemnus 'WA1' (E. Volschenk *pers. comm.*). Oratemnus 'WA1' is not considered SRE (E. Volschenk *pers. comm.*).

Forty-five specimens of Oratemnus 'WA1' were collected from the survey area (18 adult males, 13, adult females and 14 juveniles) from stony plain, tussock grassland drainage, mulga shrubland and medium drainage habitats (LC28, LC42, LC05, LC15, LC06, LC32, LC01, LC02, LC35, LC28) (Table 3.1 and Appendix II).

FAMILY CHTHONIIDAE

Chthoniidae represents a family of fairly primitive pseudoscorpions and in the Pilbara they are mostly represented by troglobitic species in the genera Tyrannochthonius and Lagynochthonius. Epigean (surface) chthoniids are known from the Pilbara and are representatives of the genera Tyrannochthonius and Austrochthonius. Only one epigean species is described, *Tyrannochthonius aridus*; however, that species is known to represent a species complex (E Volschenk pers comm).

Austrochthonius 'LCr01'

Sequencing: this morphospecies could not be matched to a GenBank or Alacran reference sequence at species level and was found to be cogeneric with Austrochthonius 'Australia'- EU559513 and Austrochthonius sp.- EU559512 (Figure 5.5 of Appendix III). WAM MSU concluded the specimen represented a new undescribed or previously un-sequenced species (Wilson & Harvey 2021, Appendix V).

The taxon is regarded as a potential SRE owing to limited taxonomic resolution (Alacran 2021a).

Austrochthonius 'LCr01'was represented by a single collection from the survey area (one male), sampled from mulga shrubland habitat (LC06). The site was within 100 meters of footprint V3 in R47/19 (Table 5.1, Figure 5.1, Appendix II).

FAMILY OLPIIDAE

Olpiidae is diverse in Western Australia; however, most of that diversity is undescribed and represented by genetically determined cryptic species (E Volschenk pers comm).

Sequencing determined the identity of 12 samples that were loosely assigned to five morphospecies of the genera Indolpium (three morphospecies), Euryolpium (one morphospecies) and one morphospecies from an unknown genus.

Euryolpium 'LCr01'

Six samples of Euryolpium were grouped together according to DNA sequences. This taxon could not be matched to a known species or morphospecies from GenBank, Alacran or WAM MSU sequence databases (Appendix III, Appendix V).

Fifteen specimens of Euryolpium 'LCr01' were collected from the survey area (three adult males, six adult females and six juveniles) from deep gully and shallow open gully habitats, corresponding to areas of high elevation (LC21, LC20, LC14, LC12, LC13) all outside of footprint V3 (Table 5.1 and Appendix II).

Beyond Lamb Creek, this taxon is not currently known to occur elsewhere, representing a new undescribed or previously unsequenced species (Wilson & Harvey 2021). Euryolpium 'LCr01' is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

Indolpium 'LCr04'

Three samples of Indolpium 'LCr04' were grouped together according to DNA sequences. The taxon could not be matched to a known species or morphospecies from GenBank, Alacran or WAM MSU sequence databases (Figure 5.7 of Appendix III, Appendix V).

WAM MSU do not have a good grasp of typical species level divergences in this group, so it is unclear if the queried taxa is conspecific with others or not (Wilson & Harvey 2021). This species is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

Three specimens of Indolpium 'LCr04' were collected from the survey area (one adult male, one adult female and one juvenile) from deep gully and shallow open gully habitats, corresponding to areas of high elevation (LC21, LC20, LC14, LC12, LC13) all outside of footprint V3 (Table 5.1, Figure 5.1, Figure 5.2, Figure 5.2, Appendix II).

Indolpium 'LCr05'

This taxon could not be matched to a known species or morphospecies from GenBank, Alacran or WAM MSU sequence databases (Figure 5.7 of Appendix III, Appendix V).

The Lamb Creek specimen is 12.82% divergent from its nearest relative in the tree (WAM T114698). WAM MSU do not have a good grasp of typical species level divergences in this group, so it is unclear if the queried taxa is conspecific with others or not (Wilson & Harvey 2021). This species is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

One specimen of Indolpium 'LCr05' was collected from the survey area (one adult female) from a minor drainage habitat (LC23) within footprint V3 (Table 5.1, Figure 5.2, Appendix II).

Indolpium 'LCr03'

Three samples of Indolpium 'LCr03' were grouped together according to DNA sequences. This taxon could not be matched to a known species or morphospecies from GenBank, Alacran or WAM MSU reference sequences (Figure 5.7 of Appendix III, Appendix V).

The Lamb Creek specimen is 10.38% divergent from its nearest relative in the tree (WAMT149362). WAM MSU do not have a good grasp of typical species level divergences in this group, so it is unclear if the queried taxa is conspecific with others or not (Wilson & Harvey 2021). This species is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

Two specimens of Indolpium 'LCr03' were collected from the survey area during the 2020 vertebrate pitfall trapping (one adult female and one adult male) from hillcrest/hillslope habitat (LCS10) within footprint V3 (Table 5.1, Figure 5.1 of Appendix II). Indolpium 'LCr03 was not recollected during the 2021 foraging survey.

Olpiidae 'LCr02'

Three samples of Indolpium 'LCr02' were grouped together according to DNA sequences. This taxon could not be matched to a known species or morphospecies from GenBank or Alacran sequences (Figure 5.6 in Appendix III) but was matched with specimens WAMT122180 and T122190 that were collected approximately seven kilometres north of the Lamb Creeks specimen (Wilson & Harvey 2021, Appendix V). Olpiidae 'LCr02' represents a known but undescribed species (Wilson & Harvey 2021) and is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

Three specimens of Olpiidae 'LCr02' were collected from the survey area (one adult female and one juvenile) from hillcrest/hillslope habitat during the 2020 vertebrate fauna survey within footprint V3 (LCS10) (Table 5.1, Figure 5.1, Appendix II). Olpiidae 'LCr02' was not re-collected during the 2021 foraging survey.

5.2.3 Scorpiones (scorpions)

Scorpions are represented by four families from Western Australia. Short-range endemic species are known from the families Buthidae, Urodacidae and Hormuridae. Australian scorpion fauna is poorly understood with as much as 85% suspected of being undescribed (Volschenk et al. 2000; (Volschenk & Prendini 2008; Volschenk et al. 2010; (Volschenk et al. 2012; (Harvey 2014).

In Western Australia, the family Buthidae is represented by three genera, Lychas, Isometroides and Isometrus. Representatives of Lychas are frequently collected in surveys within Western Australia and current investigations on the genus Lychas by the WAM indicates the presence of several species' complexes, some of which appear to contain SREs (Alacran 2021b).

The family Urodacidae is represented by two genera, Urodacus and Aops, the latter *Aops oncodactylus* is only known from a single specimen from Barrow Island (Volschenk & Prendini 2008). Most species of Urodacus appear to be relatively widespread, but are often patchily distributed, such as their distribution does not equate to their area of occupation (Volschenk et al. 2010). Several Urodacus species are also known to be SREs including the described species *Urodacus planimanus* and *Urodacus koolanensis* as well as several undescribed species from the Pilbara.

Thirty-three specimens were collected during the vertebrate fauna survey (2020), and three specimens were collected during the 2021 survey period, all from the *Lychas* genera (Buthidae).

Lychas 'bituberculatus complex'

The *Lychas* 'bituberculatus complex' is a known species complex that supports multiple cryptic species (E. Volschenk unpublished data provided by Alacran). Five samples that were assigned to the morphospecies of '*Lychas* 'bituberculatus complex' on the basis of morphology, were matched according to DNA sequences. The Lamb Creek collections were grouped with seven reference sequences (GenBank and Alacran) (Figure 5.8 of Appendix III).

This species is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

Specimens of '*Lychas* 'bituberculatus complex')13 adult males, 1 adult female and 2 juveniles) were collected from five sites within the survey area, from mulga shrubland and stony plain habitat. The taxon has been collected from five sites, with the majority (LC16, LC28, LCS05, LCS06) within footprint

V3 and one site (LCS04) adjacent to footprint V3 (Table 5.1, Figure 5.1, Figure 5.2, Figure 5.3, and Appendix II).

Specimen AES190065 (WAM 149489) from the Alacran sequence library that matched with the Lamb creek specimen (Appendix III) was collected approximately 30 km to the south south-east of Lamb Creek.

Lychas 'multipunctatus complex'

The Lychas 'multipunctatus complex' is a known species complex that support multiple cryptic species (Volschenk unpublished data provided by Alacran). One sample that was assigned to the morphospecies of Lychas 'multipunctatus' was grouped with three reference sequences (Figure 5.8, Appendix III) with two reference sequences closely matching the Lamb Creek specimen (Lychas SCO046 (multpunctatus cmpx)-MW078434 and Lychas SCO046 (multpunctatus cmpx) – AES190080).

This taxon is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

One adult male was sampled from the survey area during the 2020 vertebrate fauna survey from tussock grassland habitat outside of footprint V3 (LCS01) (Table 5.1, Figure 5.3, Appendix II). Lychas 'multipunctatus' was not recollected during the 2021 foraging survey.

Specimen AES190080 (WAM 149497): from the Alacran sequence library that matched with the Lamb creek sequence (Appendix III) was collected from approximately 30 km to the south of Lamb Creek.

Lychas 'hairy tail complex'

The *Lychas* 'hairy tail complex' is a known species complex that supports multiple cryptic species (E. Volschenk unpublished data). One specimen that was assigned to the morphospecies of Lychas 'hairy tail complex' was grouped with five GenBank reference sequences with undisclosed locations (Figure 5.8 of Appendix III).

This taxon is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a). One juvenile was sampled from deep gully habitat (LC21) outside of footprint V3 (Table 5.1, Figure 5.1, Appendix II).

Lychas 'pilbara 1'

Fifteen specimens of *Lychas* 'pilbara 1' were collected from the vertebrate fauna survey (2020) from mulga shrubland, medium drainage, stony plain and hillcrest/hillslope habitats (LCS06, LCS09, LCS05, LCS04, LCS10, LCS08).

Lychas 'pilbara 1' was identified by Alacran on the basis of morphology and is considered a widespread species (E. Volschenk unpublished data provided by Alacran).

Lychas 'harveyi complex'

Fifteen specimens of *Lychas* 'harveyi complex' were collected during the vertebrate fauna survey (2020) from medium drainage, stony plain, tussock grassland and mulga shrubland habitats (LCS07, LCS05, LCS01, LCS06 and LCS08) (Figure 5.1, Figure 5.2, Figure 5.3) Lychas 'harveyi complex' was collected during the 2012 Lamb Creek fauna survey from a variety of habitats.

Lychas 'harveyi complex' was identified by Alacran on the basis of morphology. This taxon is considered a potential SRE because it is a species complex containing potential SRE (Volschenk unpublished data provided by Alacran).

The *Lychas* 'harveyi complex' specimens were not sequenced with the other specimens, as they were believed to be widespread at the time. The change in status only came into effect in October 2021 (E. Volschenk pers. comm. 22 October 2021). The nearest WAM database record of Lychas 'harveyi complex' is from Area C ca. 14 kilometres to the south east. Only sequencing will confirm if all the individuals collected from Lamb Creek are the same species as each other and the same species as those collected from Area C or those collected in 2012. Regardless, given the taxon was collected from four habitats in 2021, it does appear (based on morphology) that *Lychas* 'harveyi complex' occurs across multiple habitats in the survey area.

5.2.4 Chilopoda (centipedes)

Two orders of centipedes from Western Australia are known to contain SREs: Geophilomorpha (Soil Centipedes) and members of the family Cryptopidae from the order Scolopendromorpha. Geophilomorphs and cryptopids are blind and strongly associated with habitats characterised by numerous rocks or boulders, and habitats with deep leaf litter, usually encountered when turning over rocks or larger pieces of fallen wood/logs. Members of both groups are also frequently collected in subterranean fauna surveys where their presence as troglofauna or soil fauna is debated. Regardless of their specific ecophysiological requirements, unpublished genetic studies on Pilbara cryptopids and geophilomorphs, both terrestrial and subterranean, indicates highly localised genetic species. For this reason, species occurring in arid or semi-arid environments may be considered SRE (E. Volschenk *pers. comm.*).

5.2.4.1 Geophilomorpha (Soil Centipedes)

Geophilomorpha represents the largest (most speciose) of centipede orders but it is also the most taxonomically challenging owing to their highly reduced mouth parts, features heavily relied on for diagnosing species in other centipede orders. The recent application of DNA sequencing to this group of centipedes has exposed numerous species and most appear to be SRE (E Volschenk pers comm).

The survey collected representatives of three taxa belonging to three families: Sepedonophilus sp. (Chilenophilidae); Mecistocephalus sp. (Mecistocephalidae) and Oryidae sp. (Oryidae). For species level taxonomic resolution, all specimens required assessment using DNA sequences (Appendix III) and publicly available sequences are lacking.

FAMILY CHILENOPHILIDAE

Sepedonophilus 'LCr01'

Two samples of this taxon were matched to each other using DNA sequences. This taxon could not be grouped with GenBank or Alacran reference sequences (Figure 5.9 of Appendix III). Sepedonophilus 'LCr01' is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a). The sequences were not run against the WAM MSU sequence databases because WAM advised at the time of the request that there was no applicable sequence data available (E. Volschenk *pers. comm.*).

Two specimens of Sepedonophilus 'LCr01' were collected from the survey area from shallow open gully habitats outside of the footprint V3 (LC14 and LC12) (Table 5.1, Figure 5.1, Appendix II).

FAMILY MECISTOCEPHALIDAE

Mecistocephalus 'LCr01'

Six samples of this taxon were matched to each other using DNA sequences. This taxon could not be grouped with GenBank, Alacran or WAM MSU reference sequences (Figure 5.10 of Appendix III, Appendix V).

Six specimens of Mecistocephalus 'LCr01' were sampled from the survey area from mulga shrubland and stony plain habitats within disturbance footprint V3 (LC05, LC04, LC16) (Table 5.1, Figure 5.1, Appendix II).

Beyond Lamb Creek, this taxon is not currently known to occur elsewhere, representing a new undescribed or previously unsequenced species (Wilson & Harvey 2021). Mecistocephalus 'LCr01' is regarded as a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

Mecistocephalus 'LCr02'

One sample was delineated as separate and given the morphospecies name of Mecistocephalus 'LCr02'. This taxon could not be matched to a known species or morphospecies from GenBank , Alacran or WAM MSU sequence databases (Figure 5.10 of Appendix III, Appendix V).

One specimen of Mecistocephalus 'LCr02' was sampled from the survey area from a tussock grassland habitat (LC34) adjacent to disturbance footprint V3 (Table 5.1, Figure 5.3, Appendix II).

Beyond Lamb Creek, this taxon is not currently known to occur elsewhere, representing a new undescribed or previously unsequenced species (Wilson & Harvey 2021). Mecistocephalus 'LCr02' is regarded as a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

FAMILY ORVIDAE

Orphnaeus 'LCr01'

This taxon could not be matched to a known species or morphospecies from GenBank or Alacran sequences (Figure 5.11 of Appendix III) and is regarded as a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a). The sequence was not run against the WAM MSU sequence databases because WAM advised at the time of the request that there was no applicable sequence data available (E. Volschenk *pers. comm.*).

One specimen was collected from the survey area from a medium drainage habitat within disturbance footprint V3 (LC01) (Table 5.1, Figure 5.1, Appendix II). This taxon is not currently known to occur elsewhere.

Scolopendromorpha

Scolopendromorph centipedes represent the largest centipedes and are the ones most commonly encountered native centipedes. The order is represented by two families, Scolopendridae and Cryptopidae, both present in Western Australia. Scolopendridae is relatively well known taxonomically in Western Australia where most epigean (surface) species in this family appear to be widespread. Accordingly, several non-target species were collected from the survey area but were assessed to be widespread or not from groups known to be SRE (*Arthrorhabdus mjobergi, Cormocephalus aurantiipes, Cormocephalus westangelasensis, Scolopendra laeta, Scolopendra morsitans*).

Collections were also made from the order Scutigeromorpha that were also deemed to be non-target, widespread species.

FAMILY CRYPTOPIDAE

Cryptopidae is poorly known and in Western Australia and in the Pilbara they are known mostly from subterranean SRE (troglobitic) species, none of which are described (Volschenk pers comm). Epigean cryptopids are rare in the Pilbara and molecular species delimitation indicates that they are also SREs Volschenk unpublished data provided by Alacran).

Cryptops 'LCr01'

This taxon could not be grouped with reference library sequences from GenBank, Alacran or WAM MSU (Figure 5.12 of Appendix III, Appendix V) and is regarded as a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

One specimen was sampled from the survey area from a shallow open gully habitat (LC14) located outside of disturbance footprint V3 (Table 5.1, Figure 5.1, Appendix II). This taxon is not currently known to occur elsewhere and represents a new undescribed or previously unsequenced species (Wilson & Harvey 2021).

Cryptops 'LCr02'

This taxon could not be grouped with GenBank, Alacran or WAM MSU reference sequences (Figure 5.12 of Appendix III, Appendix V) and is regarded as a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

One specimen was sampled from the survey area from a stony plain habitat (LC16) located within disturbance footprint V3 (Table 5.1, Figure 5.1, Appendix II).

This taxon is not currently known to occur elsewhere and represents a new undescribed or previously unsequenced species (Wilson & Harvey 2021).

5.2.5 Diplopoda (millipedes)

In Western Australia, millipedes are diverse and are often short-range endemic fauna. Five orders are known to contain epigean (surface dwelling) SREs: Polydesmida (Car & Harvey 2013; (Car, Short, et al. 2013; (Car, Wojcieszek, et al. 2013; Car & Harvey 2014), Polyzoniida (Harvey 2002; Moir & Harvey 2008; Harvey et al. 2011), Spirobolida (Harvey 2002; Harvey et al. 2011) Spirostreptida (Edward & Harvey 2010) and Sphaerotheriida (Harvey 2002; Moir & Harvey 2008; (Harvey et al. 2011).

In the Pilbara, Paradoxosomatidae are represented by two described genera Antichiropus and Boreohesperus, both of which contain SRE representatives and Spirobolis likely harbour significant undescribed species diversity (Harvey pers comm cited in Alacran (2018); (WAM 2021)).

The orders Polyzoniida (sucking millipedes) and Spirostreptida are poorly known from the Pilbara; however, based on investigations of the fauna of south western Australia (Harvey 2002; Moir et al. 2009; Edward & Harvey 2010; Harvey et al. 2011), it is likely that most Pilbara representatives are SRE.

5.2.5.1 Spirobolida (Roundback millipedes)

Until recently, the Pilbara spirobolida was thought to be represented by a single widespread species *Austrostrophus stictopygus* (Hoffman 2003) and the troglobitic genus Speleostrophus (Hoffman 1994). Molecular investigations into this group by the WAM indicate significant variation between some Pilbara populations of *Austrostrophus stictopygus* which are consistent with species level divergences (Harvey pers comm cited in Alacran (2018); (WAM 2021)). *Austrostrophus stictopygus* therefore appears to represent a complex of species, some of which may be SREs.

Four spirobolids (Trigoniulidae) were collected from the survey area and for species level taxonomic resolution, all specimens required assessment using DNA sequences.

Austrostrophus 'Clade A'

Two samples were matched using DNA sequences and grouped with 12 reference sequences from GenBank of undisclosed sampling location (Figure 5.13 of Appendix III). This taxon is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

Two specimens of Austrostrophus 'Clade A' were sampled from the survey area from mulga shrubland and the shallow open gully habitat (LC15, LC20) both within and outside of disturbance footprint V3 (Table 5.1, Figure 5.1, Appendix II).

Austrostrophus 'Clade M', (Alacran Preliminary ID: Austrostrophus 'Clade Lc01')

Two Lamb Creek samples were matched to each other using DNA sequencing. This taxon could not be grouped with reference library sequences (Figure 5.13 of Appendix III, Appendix V) and is recognised that there are few publicly available reference sequences of Austrochthonius available to enable confident species delimitation (Alacran 2021a).

Wilson & Harvey (2021) found the Lamb Creek specimen was at least 6.08% divergent from its nearest relative in the tree (WAMT100193). Based on the topology of the tree, which places this specimen on a branch that falls between known clades (Wilson & Harvey 2021). Wilson and Harvey (2021) allocated this taxon a new clade name (M) where clade names approximate species level clades i.e.. Austrostrophus 'clade M', represents a new undescribed or previously unsequenced species. This taxon is a potential SRE owing to taxonomic data deficiency (Alacran 2021a).

Two specimens of Austrostrophus 'Clade M' were sampled from stony plain and mulga shrubland habitats (LC28, LC04) (Table 5.1, Figure 5.1, Appendix II). Both collection sites were within disturbance footprint V3.

5.2.5.2 Polyxenida (pincushion millipedes)

The order Polyxenida (pincushion millipedes) contains mostly widespread epigean (surface dwelling) species (Short & Huynh 2011, 2013).

Polyxenidae sp.

Three pincushion millipede specimens were collected from the survey area (LC12, LC01 and LC04) but were assessed to be widespread and not from groups known to be SRE.

5.2.6 Isopoda (slaters)

The Western Australian terrestrial isopod fauna is largely undescribed and is diverse (Judd & Horwitz 2003; Judd & Perina 2013). Isopods have poor dispersal capabilities and often have specific habitat preferences, making them target SRE taxa.

Four samples of the genus Buddelundia and one Buddelundiinae of the family Armadillidae were sequenced to determine species level taxonomic resolution. Additional representatives of Buddelundia (identified on morphology) were also sequenced as additional reference taxa for comparison with the unidentified taxa.

Buddelundia '13'

Buddelundia '13' is a relatively small morphospecies belonging to a complex found in the Pilbara region likely to contain numerous species (S Judd unpublished data provided by Alacran). Two Lamb Creek samples identified as Buddelundia '13' via morphology were matched using DNA sequences (Figure 5.14 of Appendix III) but were not grouped with reference sequences as reference sequences were not available for the species. Buddelundia '13' is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

Ten specimens of Buddelundia '13' (four adult males, two adult females and four juveniles) were collected from the survey area from deep gullies, medium drainage and mulga shrubland habitats (LC21, LC01, LC13, LC39A, LC04) from within and outside of disturbance footprint V3 (Table 5.1, Figure 5.1, Figure 5.2, Figure 5.3, Appendix II).

The WAM database search yielded twenty-two regional collections of Buddelundia '13' from locations such as Cloudbreak, Wonmunna, Christmas Creek and Turee Syncline (Reg No: 62079, 62078, 62077, 62076, 62081, 62082, 62083, 62729, 62963, 63269, 62965, 62964, 62080, 48222, 48228, 48227, 48225, 48224, 48223, 48221, 48226, 51859) (WAM 2020). The closest regional collections to the survey area are from Wonmunna, ca. 40 kilometres to the south-east.

At the time of report preparation there were no publicly available reference sequences or WAM MSU reference sequences available for comparison with the Lamb Creek specimens and the WAM database does not indicate if the specimens lodged in the WAM have been sequenced.

There were specimens initially identified on morphology as Buddelundia '13' collected from a different MRL site to the north-west. Sequencing found that the Lamb Creek specimens (AES210142, AES210215) did not match with these specimens (AES210628, AES210616, AES210571) (Alacran Environmental Science 2021b), confirming there is more than one clade in this complex and there is limited value to compare WAM database search results to the Lamb Creek results.

Buddelundia '10ma'

Two Lamb Creek samples were matched together using DNA sequences verifying the morphological identification as Buddelundia '10ma'. Samples were not grouped with reference sequences as reference sequences were not available for the taxon (Figure 5.14 of Appendix III). Buddelundia '10ma' has a limited distribution and is considered a potential SRE (S Judd unpublished data provided by Alacran).

Three specimens of Buddelundia '10ma' (one adult male and two adult females) were collected from the survey area from stony plain habitat (LC22). This site falls within disturbance footprint V3 (Table 5.1, Figure 5.2, Appendix II).

Regionally, Buddelundia '10ma' has been collected from another MRL site approximately 53 kilometres to the north-east of Lamb Creek, and sequencing found that specimens AES210603A, AES210576, AES210608, AES210602, AES210644, AES210622 matched with the sequenced Lamb Creek specimen (AES210193) (Alacran 2021c).

Buddelundia '15'

Buddelundia '15' is a relatively widespread Hamersley Range species and not considered SRE (S Judd unpublished data provided by Alacran).

Four Buddelundia '15' samples were sequenced to provide a reference for other isopod taxa and all Buddelundia '15' samples were grouped together using DNA sequences verifying the morphological identification. Samples were not grouped with reference sequences as reference sequences were not available for the taxon (Figure 5.14 of Appendix III)., however at a later date, one specimen of Buddelundia '15'(AES210562) collected from a separate MRL site, approximately 53 kilometres to the north-east of Lamb Creek was matched via sequencing ((Alacran Environmental Science 2021b), confirming the widespread status.

Seven specimens of Buddelundia '15' (three adult males, one adult female and three juveniles) were collected from the survey area from mulga shrubland, medium drainage and tussock grassland habitats (LC06, LC15, LC05, LC06, LC39A, LC42) (Figure 5.1, Figure 5.2, Figure 5.3, Appendix II).

***Buddelundia* '16'**

This morphospecies has been collected extensively in numerous other projects in the area and was regarded as widespread (S Judd unpublished data provided by Alacran), however the WAM assessment is potential SRE. There are WAM database records of Buddelundia '16' however no sequenced specimen data to prove that all specimens currently lodged under that name represent the same species. Because it was considered widespread, this taxon was not sequenced.

Two specimens of Buddelundia '16' 1 adult male, 1 adult female) were collected from the survey area from deep gully habitats located off the V3 disturbance footprint (LC13) (Appendix II).

Buddelundiinae (Armadillidae) 'ISOP009'

The specimen collected from the survey area belongs to an undescribed genus closely related to *Buddelundia* which is mostly found in the Pilbara region. This type of isopod lacks the morphological characters used to determine *Buddelundia* and it is, therefore, difficult to determine morphospecies (S Judd pers comm provided by Alacran).

One sample of this taxon was matched with one of the reference isopod taxon on GenBank (MT902625) (Figure 5.14 of Appendix III).

Morphologically the Lamb Creek specimen was unusual and differed from other specimens of this genus in a couple of obvious morphological characters, the taxa are much less common than *Buddelundia* and all are potential SRE species (S Judd unpublished data provided by Alacran). Consequently, Buddelundiinae (Armadillidae) 'ISOP009' is a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

One specimen was collected from the survey area from medium drainage habitat (LC01) within disturbance footprint V3 (Table 5.1, Figure 5.1, Appendix II).

The Lamb Creek specimen falls within a clade that represents a known but undescribed species of Armadillidae with a code from GenBank ISOP009 (2.13% divergent). That specimen was collected 124 kilometres north-west of this target specimen (Wilson & Harvey 2021, Appendix V). A second collection of Buddelundiinae (Armadillidae) 'ISOP009' was made from a different MRL site to the northwest and matched via sequencing (AES210609, AES210594). (Alacran Environmental Science 2021b).

5.2.7 Gastropoda (Snails)

FAMILY BOTHRIEMBRYONITIDAE

Bothriembryontidae is represented by the genus Bothriembryon, which is endemic to Australia. The genus is represented by 31 described species in Western Australia, many of which are SREs.

Bothriembryon 'BOT065', (Alacran Preliminary ID: Bothriembryon 'Pilbara')

Three live samples of Bothriembryon were collected from the survey area, all from a single site (LC07) within the mulga/Corymbia plain broad fauna habitat. The specimens were collected under spinifex clumps during a period of significant rainfall (34.6 mm was recorded on 19th March at Newman Aerodrome). The sampling location was within disturbance footprint V3 (Table 5.1, Figure 5.1, Appendix II).

Based on traditional morphological analysis this morphospecies was thought to be widespread in the eastern and central Pilbara (Alacran 2021a), distributed across most of the Hamersley Range, from Gregory Gorge at the north-western end, intermittently through to Roy Hill at the south-eastern end of the Hamersley Range. There is considerable variation in the shell characters of specimens from the Hamersley Range, and it is not known whether one or more species exists (Durrant 2011).

DNA barcoding assessment by WAM MSU assigned the Lamb Creek specimen to a clade known as BOT065, representing a known but undescribed species of Bothriembryon. (Wilson & Harvey 2021, Appendix V). There are 44 records of Bothriembryon 'BOT065' held by WAM MSU extending 170 kilometres from Prairie Downs west of Newman to near Tom Price (WAM unpublished data supplied by Alacran).

Bothriembryon 'BOT065' is regarded as a potential SRE owing to data deficiency concerning its distribution limits (Alacran 2021a).

FAMILY SUBULINIDAE

Eremopeas interioris

This species is native to the warmer areas of Australia, being recorded in Western Australia from the North West Cape area to the Kimberley, and through the Northern Territory to western Queensland. In the Pilbara Region it has been found in the areas of Roy Hill, Port Hedland, and across much of the Hamersley Range (Durrant 2011).

Eremopeas interioris is regarded as widespread and non-target . One specimen was collected from the survey area (LC13) from deep gully habitat (Whisson & Kirkendale 2014).

5.3 Habitat

On a macro scale there is connectivity of all habitats to the surrounding landscape, accordingly, it is unlikely that the Potential SRE taxa collected would be restricted to survey area habitats especially where the survey area is narrow (haul road portion). As with all SRE invertebrate surveys, there are limitations to using broad habitat to predict whether a species is restricted and only more surveying, sequencing and greater public access to sequencing data will confirm whether a species is restricted.

Potential SRE taxa collected from each of the seven broad fauna habitats are summarised in Table 5.2

Table 5.2 Potential SRE taxa collected across broad fauna habitats in the survey area

Potential SRE Taxon	Broad vertebrate fauna habitats *						
	STPL	HCHS	GGRB	MEDR	MIDR	MCPL	TGPL
Austrochthonius 'LCr01'						x	
Austrostrophus 'Clade A'			x			x

*Footnotes: * Habitats: STPL = Stony plain; HCHS = Hill crests and hill slopes; GGRB = Gullies, gorges and rocky breakaways; MEDR = Medium drainage lines; MIDR = Minor drainage lines, MCPL = Mulga/Corymbia plain; TGPL = Tussock grassland plain.*

5.3.1 Stony plain

The stony plain habitat generally has skeletal soils with loamier patches adjacent to drainage and sparse to patchy vegetation (mainly Triodia hummock grassland) with various overstory that provides minimal to some shading and patchy litter. On the survey area within this habitat there are no areas of continuous shade occurring due to topography. Within the survey area this habitat type is continuous not isolated. Suitability for SRE is medium to low suitability based on low - medium protection and low isolation. This broad habitat type is not restricted to the survey area.

Six potential SRE category taxa were collected from this habitat over 2020 and 2021 combined. In 2021 five potential SRE category taxa were collected from this habitat type: Austrostrophus 'Clade M', Buddelundia '10ma', Cryptops 'LCr02', Lychas 'bituberculatus complex' and Mecistocephalus 'LCr01'. In 2020 Lychas 'bituberculatus complex' was collected from dry pitfall traps within the stony plain habitat.

Cryptops 'LCr02, and Buddelundia '10ma' have been collected from this habitat type only.

5.3.2 Hill crests and hill slopes

The hillcrest/hill slope habitat generally has skeletal soils and sparse vegetation (mainly Triodia hummock grassland) that provides little if any protection from exposure and no leaf litter or woody debris accumulation (Appendix II). Steep, south-facing hill slopes can provide a degree of protection; however, within the survey area there are no areas of high elevation that are steep, south facing and constantly shaded. Within the survey area this habitat type is continuous (not isolated). Suitability for SRE is low based on low protection and low isolation and this broad habitat type is not restricted to the survey area.

In 2021 no potential SRE category taxa were collected from this habitat type. Indolpium 'LCr03' and Olpiidae 'LCr02' were collected from litter sifts that occurred during the 2020 vertebrate fauna survey and have not been collected from other habitat types.

5.3.3 Gorges, gullies and rocky breakaways

Within this habitat protection is medium to high dependent on orientation and gully depth where the majority of the gullies on the survey area are shallow and offer low protection. In the deepest gullies on the survey area leaf litter accumulation was common and areas of partial to full shade (deep cracks) were recorded as were Ficus (Appendix II). No areas of permanent or semi permanent water or seeps have been found on the survey area to date. In the deep gullies after rain small rockpools form but dry out due to evaporation.

The deepest gullies on the project area occur on the south eastern corner of the survey area within a north-west and northern-facing slope. Within the survey area this habitat type is not isolated with no gorges terminal gorges or gullies. Suitability for SRE is rated as medium to high. This broad habitat type is not restricted to the survey area.

Shallow open gully and deep gully habitats fall within this broad habitat. Eight potential SRE category taxa were collected from this habitat over the 2020 and 2021 field surveys combined. In 2021 eight potential SRE category taxa were collected from this habitat type: Austrostrophus 'Clade A', Buddelundia ‘13’, Buddelundia ‘16’, Cryptops 'LCr01', Euryolpium 'LCr01', Indolpium 'LCr04', Lychas ‘hairy tail complex’, and Sepedonophilus 'LCr01'.

Lychas 'hairy tail complex', Cryptops 'LCr01' and Sepedonophilus 'LCr01' were collected from this habitat type only.

5.3.4 Medium drainage lines

Connectivity of the medium drainage habitat is high, as this habitat is part of an interconnected network prone to disturbance from flooding. This habitat provides higher protection than the surrounding stony plain habitat due to partial shading from vegetation and some leaf litter and woody debris. This habitat typically has deeper loamier soils than the surrounding stony plain, therefore greater potential to retain moisture. In the survey area, detritus and litter within this habitat was sparse or in piles without accumulated soil - indicating recent fast flow and little opportunity for soil and fine detritus to accumulate. Suitability for SRE is medium to low based on medium to low protection and low isolation. This broad habitat type is not restricted to the survey area.

Four potential SRE category taxa have been collected from this habitat type. These were Lychas ‘harveyi complex’ collected in 2020 from dry pitfall trapping, and Buddelundia '13', Buddelundiinae (Armadillidae) 'ISOP009' and Orphnaeus 'LCr01' collected in 2021.

Buddelundiinae (Armadillidae) 'ISOP009' and Orphnaeus 'LCr01' were collected from this habitat type only.

5.3.5 Minor drainage lines

Despite some patchy shading from vegetation the minor drainage lines assessed had low soil moisture levels, low accumulated litter, and generally gravelly soils. Connectivity of minor drainage is high as the drainage lines flow fast after significant rainfall into a network of drainage. Suitability for SRE is low based on low protection and low isolation. This broad habitat type is not restricted to the survey area.

In 2021 one potential SRE category taxa was collected from this habitat type; Indolpium 'LCr05'.

5.3.6 Tussock grassland plain

The tussock grassland plain habitat is connected via vegetation and undefined flow occurs after significant rainfall. The mulga stands provide shade; however, the stands are not extensive or thick, therefore the shade is patchy as is the accumulated litter. The soils are loamier than the surrounding habitats, so there are areas of higher soil moisture under the bigger mulga stands. Suitability for SRE is medium based on low isolation and medium protection. This broad habitat type is unlikely to be restricted to the survey area.

Three potential SRE taxa have been collected from this habitat type. In 2020 Lychas ‘multipunctatus complex’ and Lychas ‘harveyi complex’ were collected from a dry pitfall trap (LCS01) during the 2020 vertebrate fauna survey. In 2021 Mecistocephalus ‘LCR02’ was collected from a litter sift at site LC34.

Both Lychas ‘multipunctatus complex’ and Mecistocephalus ‘LCR02’ were not collected from other habitat types.

5.3.7 Mulga/Corymbia plain

The mulga/corymbia plain habitat has high connectivity due to drainage, however it is sheet flow rather than fast flowing channel drainage. Mulga stands provide shade; however, the stands are not extensive

or thick, therefore the shade is patchy as is the accumulated litter and associated patches of moister soil. Within the mulga patches this habitat provides loamier soil for burrowing species, however the substrate in adjacent run-on areas is predominantly hard and stony. Suitability for SRE is medium based on low isolation and medium protection. This broad habitat type is unlikely to be restricted to the survey area. However, mulga is sensitive to disruptions to sheet flow, and any disturbances that disrupt sheet flow could impact this habitat both within and outside the project area. Hence, in situations where the footprint V3 would impact sheet flow, it is not important whether sites are inside or outside of the footprint area as impacts would extend well beyond.

Nine taxa of potential SRE invertebrates were collected from this habitat over the 2020 and 2021 field surveys, through the combined methods of dry pitfall trapping, litter sifting, and burrow excavations. These taxa were: Austrochthonius 'LCr01', Austrostrophus 'Clade A', Austrostrophus 'clade M', Bothriembryon 'BOT065', Buddelundia '13', Kwonkan 'MYG324', Lychas 'bituberculatus complex', Lychas 'harveyi complex', and Mecistocephalus 'LCr01'.

Austrochthonius 'LCr01', Bothriembryon BOT065, and Kwonkan 'MYG324' were only recorded from the mulga/corymbia plain habitat.

6 Survey adequacy and limitations

An assessment of survey adequacy , limitations and discussion and variance against EPA Technical Guidance for sampling SRE (Environmental Protection Authority 2016) is presented in Table 6.1.

Table 6.1 Limitations of the survey

Aspect	Limitation	Discussion
Scope and intensity	No	This survey was designed with the intention of sampling multiple habitats throughout the survey area, including habitats not typically thought to harbour SRE invertebrate groups. The survey targeted all invertebrate groups likely to represent SREs rather than just focussing on a small subset of these such as spiders or snails. All likely terrestrial SRE groups were sampled including some groups rarely sampled in terrestrial SRE surveys and more commonly detected in subterranean fauna surveys. There are difficulties that apply to all SRE surveys such as cryptic habitats and taxa occurring in low numbers leading to taxa being difficult to detect.
Availability of contextual information at a regional and local scale	No	Contextual information is strongly dependent on data from the WAM invertebrate databases. The Hamersley subregion has been subject to numerous SRE surveys, most associated with EIA for mining developments. Lodgement requirements of EPA (2009) make WAM database searches the most reliable source of contextual knowledge with which to assess the findings of this survey. Additional data sources include publicly available DNA sequences on GenBank from significant recent revisions of Australian and Western Australian Trapdoor Spiders (Rix, Wilson, et al. 2018); (Castalanelli et al. 2014); (Rix, Huey, et al. 2017); (Harvey et al. 2018); Rix, Huey, et al. 2018; Rix, Wilson, et al. 2018). The data required to classify SRE category taxa, and the interpretation of species' distributions is dependent on the current state of taxonomic and ecological knowledge of the target groups at time of survey and the public availability of this information. Contextual information is available for many groups but often not in published form. Numerous morphospecies could not be matched with WAM records on the basis of morphology. Molecular identifications relied heavily on DNA sequences available to the invertebrate taxonomist and publicly accessible via GenBank. The WAM internal collection of DNA sequences was also queried for additional morphospecies matches. Despite this there remains some SRE target groups that have few reference sequences available to query.
Competency/experience of the team carrying out the survey, including experience in bioregion surveyed	No	The field personnel have experience conducting SRE invertebrate surveys in Western Australia and surveying and collecting SRE target groups. The field team were advised by the invertebrate taxonomist (Dr Erich Volschenk) prior to the survey on locations and habitats to target prior to conducting the field work. The invertebrate taxonomist is well versed in the taxonomy of terrestrial arthropods using both morphological and molecular data and is experienced classifying SRE category taxa. This is especially important as currently WAM invertebrate database searches, although geographically filtered, do not come with taxonomic support/interpretation with regards to SRE category taxa and SRE status and there is a lag updating taxonomic knowledge. This is especially important as genetic analysis is finding

Aspect	Limitation	Discussion
		that many morpho-species once thought to be widespread are actually species complexes that may contain SRE species, and status is rapidly changing.
Proportion of fauna recorded and/or collected, any identification issues	No	Morphological identifications were made by the invertebrate taxonomist (Dr Erich Volschenk) using expert knowledge (scorpions and pseudoscorpions), or morphological comparisons against voucher specimens at the WAM. Where available, relevant taxonomic experts were consulted in order to identify unfamiliar species: Dr Simon Judd (independent taxonomist: terrestrial Isopoda). Where species boundaries were questionable and when suitable tissue samples were available, DNA barcoding was undertaken to help verify species identity. Where reference sequences were not available to help verify species identity, this is not seen as a limitation because taxa are still able to be given the status of Potential SRE based on morphology.
Was the appropriate area fully surveyed (effort and extent)	No	51 sites were sampled across the survey area. Use of helicopter meant that foraging sites were selected based on vegetation/litter cover and habitat complexity rather than a reliance of sites near tracks. All broad habitats of the survey area were sampled. This survey also targeted all invertebrate groups likely to represent SREs rather than just focussing on a small subset of these such as spiders or snails. Night spotting with UV lights was not conducted due to client safety requirements. Scorpions were sampled in 2020 through dry pitfall trapping, and via litter sifting in 2021. Therefore, there is representation of this group in the collection despite not being able to survey at night. Wet pits were not deployed as per client request. Wet pitfall traps, owing to their longer sampling period relative to foraging, would have increased diversity and abundance of SRE category taxa collected. This is not variance against guidance as SRE ((EPA 2016)) does not direct the use of wet pits over other sampling methods such as foraging. The species accumulation curve (section 4.2.3) depicted a curve that had not plateaued, indicating that more sampling would have yielded more species. This is not unusual for a single phased SRE survey or even multi phased SRE survey because of the cryptic nature of many of the target groups and the general lack of ecological knowledge of invertebrates in comparison to vertebrate fauna. Despite this, this survey is not at variance with the EPA Technical Guidance for sampling SREs because EPA 2016) offers no guidance on minimum survey effort for SRE surveys.
Access restrictions within the survey area	No	The survey area was accessible with minimal restrictions once land access was granted across the full survey area. Land access issues meant that the haul road portion of the survey area could not be visited until the latter half of the February sampling period.
Survey timing, rainfall, season of survey	No	The timing of the survey followed EPA (2016) and the survey intercepted a significant rainfall period.
Disturbances that may have affected the results of the survey (e.g. fire, flooding, clearing)	No	No disturbances beyond clearing for tracks and exploration office/ laydown

7 Conclusion

There are fourteen potential SRE taxa collected from the survey area that have not been recorded regionally. Of these taxa, six were recorded from the proposed footprint V3 only.

- Austrostrophus 'Clade M'
- Cryptops 'LCr02'
- Indolpium 'LCr03'
- Indolpium 'LCr05'
- Mecistocephalus 'LCr01'
- Orphnaeus 'LCr01'

Three taxa were collected from adjacent to the proposed disturbance footprint V3 only (within 100 metres). Of these taxa, two had not been recorded regionally.

- Austrochthonius 'LCr01'
- Mecistocephalus 'LCr02'

Potential SRE taxa were collected from all habitats. The mulga shrubland patches within the mulga/corymbia plain broad habitat yielded the highest abundance and species richness followed by stony plain, although survey effort was not uniform across habitats. The mulga/Corymbia plain habitat is sensitive to interruption of sheet flow, and impacts to sheet flow may affect the entire habitat, not just within the immediate footprint.

On a macro scale there is connectivity of all habitats to the surrounding landscape, accordingly, it is unlikely that the Potential SRE taxa collected would be restricted to survey area habitats especially where the survey area is narrow (haul road portion).
