## **PERMITS**

This flora survey was undertaken under the following licences issued by the Department of Environment and Conservation: SL008487 issued to Todd Edwards, SL008483 issued to Emma Carroll, SL008481 issued to Ciaran Sgherza and SL008491 issued to Kerryn McCann.

## **STATEMENT OF LIMITATIONS**

### **Scope of Services**

This environmental site assessment report (the report) has been prepared in accordance with the scope of services set out in the contract, or as otherwise agreed, between the Client and ENV.Australia Pty Ltd (ENV) (scope of services). In some circumstances the scope of services may have been limited by factors such as time, budget, access and/or site disturbance constraints.

### **Reliance on Data**

In preparing the report, ENV has relied on data, surveys, analyses, designs, plans and other information provided by the Client and other individuals and organisations, most of which are referred to in the report (the data). Except as otherwise stated in the report, ENV has not verified the accuracy or completeness of the data. To the extent that the statements, opinions, facts, information, conclusions and/or recommendations in the report (conclusions) are based in whole or in part on the data, those conclusions are contingent upon the accuracy and completeness of the data. ENV will not be liable in relation to incorrect conclusions should any data, information or condition be incorrect or have been concealed, withheld, unavailable, misrepresented or otherwise not fully disclosed to ENV.

### **Environmental Conclusions**

In accordance with the scope of services, ENV has relied on the data and has conducted environmental field monitoring and/or testing in the preparation of the report. The nature and extent of monitoring and/or testing conducted is described in the report.

Within the limitations imposed by the scope of services, the monitoring, testing, sampling and preparation of this report have been undertaken and performed in a professional manner, in accordance with generally accepted practices and using a degree of skill and care ordinarily exercised by reputable environmental consultants under similar circumstances. No other warranty, express or implied, is made.

### **Report for Benefit of Client**

The report has been prepared for the benefit of the Client and for no other party. ENV assumes no responsibility and will not be liable to any other person or organisation for or in relation to any matter dealt with or conclusions expressed in the report, or for any loss or damage suffered by any other person or organisation arising from matters dealt with or conclusions expressed in the report (including, without limitation, matters arising from any negligent act or omission of ENV or for any loss or damage suffered by any other party relying on the matters dealt with or conclusions expressed in the report). Other parties should not rely upon the report or the accuracy or completeness of any conclusions, and should make their own enquiries and obtain independent advice in relation to such matters.

### **Other Limitations**

ENV will not be liable to update or revise the report to take into account any events or circumstances occurring or facts becoming apparent after the date of the report.

The scope of services did not include any assessment of the title to or ownership of the properties, buildings and structures referred to in the report, nor the application or interpretation of laws in the jurisdiction in which those properties, buildings and structures are located.

## EXECUTIVE SUMMARY

ENV.Australia Pty Ltd was commissioned in March 2009 by WorleyParsons on behalf of BHP Billiton Iron Ore to undertake a Level Two, single season flora and vegetation assessment of the proposed Newman to Jimblebar Transmission Line and Newman Town Substation.

The field survey took place from the 23 to 28 April 2009. Twenty-four person days were invested in the survey, which included the compilation of a species inventory, a Declared Rare and Priority Flora search, assessment of vegetation condition, and mapping of vegetation communities and introduced species.

There were 365 taxa comprising 49 families and 147 genera recorded in the Newman to Jimblebar project area. The families most commonly represented by taxa richness, were Poaceae (62 taxa), Mimosaceae (38 taxa) and Malvaceae (33 taxa). The most common genera were *Acacia* (35 taxa), *Senna* (16 taxa) and *Eremophila* (16 taxa).

There were 44 taxa comprising 16 families and 66 genera recorded in Newman Town Substation. The families most commonly represented were Poaceae (25 taxa), Mimosaceae (14 taxa) and Malvaceae (13 taxa). The most common genera were *Acacia* (14 taxa), *Senna* (eight taxa) and *Eremophila* (eight taxa).

No species listed under the *Environment Protection and Biodiversity Conservation Act 1999* (Cth) or *Wildlife Conservation Act 1950* (WA) were recorded during the survey. Only one Priority Flora species listed by the Department of Environment and Conservation was recorded in the Newman to Jimblebar project area, *Goodenia nuda* (Priority 3).

There were 15 introduced flora species recorded within the Newman to Jimblebar project area. Two introduced species, *\*Aerva javanica* and *\*Cenchrus ciliaris*, were recorded within the Newman Town Substation project area. No taxa recorded in the project area are listed as Declared Plants under the *Agriculture and Related Resources Protection Act 1976* in the East Pilbara region.

There were twenty one vegetation associations characterised and categorised, and then mapped in the Newman to Jimblebar project area. Vegetation condition ranged from Pristine to Completely Degraded, with most sites being recorded as being in Excellent condition. Disturbances to vegetation within the project area included clearing for infrastructure and grading, and consequential introduced species invasion.

One vegetation community was mapped in the Newman Town Substation project area. The area consisted of Degraded to Completely Degraded vegetation, with some of the area being denuded of native vegetation. There was a high level of disturbance within the expansion area from roads, adjacent infrastructure and introduced species.

No vegetation associations recorded in the project area are listed as Threatened Ecological Communities under the *Environment Protection and Biodiversity Conservation*

*Act 1999*, as Environmentally Sensitive Areas under the *Environmental Protection Act 1986*, or as Priority Ecological Communities by the Department of Environment and Conservation.

Beard (1975) mapped two vegetation types in the project area: Hummock grassland, low tree steppe, Snappy Gum (*Eucalyptus leucophloia* subsp. *leucophloia*) over *Triodia wiseana*; and Low woodland, Mulga (*Acacia aneura*). Neither of these vegetation types is considered to present constraints in terms of their regional representation.

Eight land systems were mapped by van Vreeswyk *et al.* (2004) for the project area; these were the Boolgeeda, Divide, Elimunna, Jamindie, Washplain, McKay, Newman and River land systems. All of these land systems are represented outside the project area and therefore disturbance is unlikely to impact upon their regional representation.

# 1 INTRODUCTION

## 1.1 THE PROJECT

ENV.Australia Pty Ltd (ENV) was commissioned by WorleyParsons on behalf of BHP Billiton Iron Ore ('BHPBIO') in March 2009 to undertake a Level Two, single season flora and vegetation assessment for a proposed Newman to Jimblebar transmission line.

### 1.1.1 Objectives

The objectives of the flora and vegetation assessment were to:

- document the presence of all plant species;
- document the presence of all plant species of conservation significance;
- record the occurrence of introduced plant species;
- assess and map vegetation condition;
- document, describe and map the vegetation associations present; and
- describe the conservation significance of these vegetation associations

### 1.1.2 Location

The project area is located in the vicinity of Newman and Jimblebar in the East Pilbara region of Western Australia (Figure 1). The project area consists of a 100 m wide by 50 km long corridor running from BHPBIO Mount Whaleback mine site (2.5 km north-west of the Newman town centre) to an area immediately west of the Jimblebar mine site (50 km north-east of the Newman town centre). The Newman Town Substation is located adjacent to the Great Northern Highway, adjacent to Kurra Village, and is approximately 1.6 kilometres north-north-east of the Newman townsite (Figure 1). The Newman Town Substation project area covers approximately 0.62 hectares.

### 1.1.3 Previous Biological Studies

Historically, the flora and fauna of the Pilbara has not generally been recorded systematically, with significant exceptions being flora studies by Burbidge (1959) and Beard (1975). More recently, the Department of Agriculture (van Vreeswyk *et al.* 2004) conducted an inventory and condition survey of the Pilbara. This report provides a regional inventory of flora species and a description of land resources. A comprehensive and systematic field review by the Department of Environment

and Conservation (DEC) of Pilbara regional flora is underway (DEC Pilbara Biological Survey 2002 to 2009), and is due for public release shortly.

In recent decades, a boom in large-scale regional resource development projects has resulted in a significant amount of site-specific biological survey work being carried out in the region, most of which is undertaken for formal environmental approvals. Various biological surveys have been conducted in the vicinity (i.e. within 50 km) of the project area in the last 5 years. Those most relevant to the current survey are:

- Orebody 24 (ENV 2006a);
- Orebody 18 (ENV 2008a);
- Jimblebar Wye Rail Junction (ENV 2007a);
- West Jimblebar (ENV 2007b);
- Jimblebar Access Road (ENV 2008b);
- Kurra Village (ENV 2006c) and
- Mount Whaleback (ENV 2006b).

In addition, a comprehensive bibliography of biological survey work undertaken in the Pilbara is available at <http://science.dec.wa.gov.au/projects/pilbaradb/>.

## 1.2 PHYSICAL ENVIRONMENT

### 1.2.1 Climate

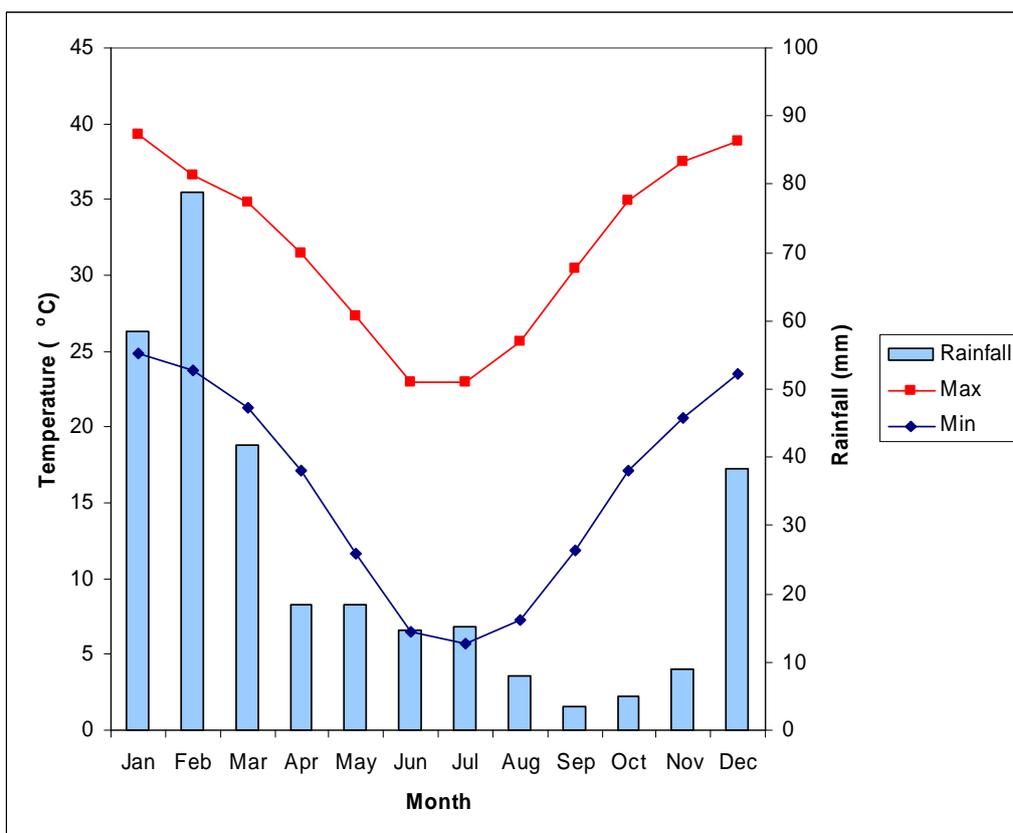

The project area is in the Pilbara region of Western Australia. The nearest accessible climate data to the project area is available from the Bureau of Meteorology (BoM) Newman Aero weather station located approximately 9.4 km from the Newman Township .

The Pilbara has an arid-tropical climate with two distinct seasons, a hot summer from October to April and a mild winter from May to September. The area experiences a wide range of temperatures, with an average annual temperature of 31.4°C (1965-1998). In summer, maximum temperatures may reach 46.0°C, whilst in winter, minimum temperatures may reach -2.0°C (BoM 2009). The average maximum temperature over this three month period was 26.1°C.

Rainfall in the Pilbara is often sporadic, and can occur in summer and winter. The Newman area has average annual rainfall of 310 mm (1971-2009) (Figure 3). Summer rainfall is typically associated with tropical storms in the north, or tropical

cyclones that cross the coast and move inland. Winter rainfall is generally less significant, and is commonly the result of cold fronts moving north-easterly across the State.

The Newman area received a relatively low amount of rainfall in the 2008/2009 summer season, with the area having received 122.8 mm (December - February). On average the area usually receives 175.8 mm over the December to February period (BoM 2009). However, for the three months preceding the survey the area received 204 mm (January - March 2009), compared with 179.1 mm for the long-term (1971–2009) average for the same period (BoM 2009).

**Figure 3:** Average Monthly Rainfall from 1971–2009 and Maximum and Minimum Temperatures at Newman from 1965–2009 (BoM 2009)

### 1.2.2 Geology

Tyler, Hunter & Williams (1991) mapped the geology of the Newman region, which includes the project area. Seven units occur within the project area, as listed below:

- Qa: Alluvium: clay, silt, sand, gravel: in drainage channels and adjacent flood plains;

- Qc: Colluvium and minor alluvium: quartz pebble and rock fragments in silt, sand; adjacent to bedrock; scree, talus slope deposits;
- Czc: Colluvium: partly consolidated and consolidated ferruginized silt, sand, gravel; valley-fill deposits dissected by present drainage;
- Czk: Calcrete: sheet carbonate usually formed in major drainage lines;
- Hj: Weeli Wolli Formation: interlayered banded iron-formation and metadoleritic sills, minor shale. Often overlies the Brockman Iron Formation (Hb); and
- Hm: Marra mamba iron formation: chert, ferruginous chert and banded iron-formation with minor shale.

### 1.2.3 Land Systems

Land system mapping is based on regional patterns in topography, soils and vegetation. The most recent land system mapping of the Pilbara bioregion, in which the current project area lies, was completed by van Vreeswyk *et al.* (2004). The mapping classifies the Pilbara region into 102 land systems.

The project area comprises of eight land systems, as listed below:

- New: Newman: Rugged jaspilite plateaux, ridges and mountains; supporting hard Spinifex grasslands; forms 8.0% of the Pilbara bioregion;
- Bgd: Boolgeeda: Stony lower slopes and plains below hill slopes; supporting hard and soft Spinifex grasslands and Mulga scrublands; forms 4.3% of the Pilbara bioregion;
- Div: Divide: Sand plains and occasional dunes supporting shrubby hard spinifex grasslands; forms 2.9% of the Pilbara bioregion;
- Mck: McKay: Hills, ridges, plateaux remnants and breakaways of meta sedimentary and sedimentary rocks supporting hard spinifex grasslands; forms 2.3% of the Pilbara bioregion;
- Riv: River: Active flood plains and major rivers supporting grassy eucalypt woodlands and soft spinifex grasslands; forms 2.3% of the Pilbara bioregion;
- Jam: Jamindie: Stony hardpan plains and rises supporting groved mulga shrublands, occasionally with spinifex understorey; forms 1.1% of the Pilbara bioregion;

Wsp: Washplain: Hardpan plains supporting groved mulga shrublands; forms 0.5% of the Pilbara bioregion; and

Eli: Elimunna: Stony plains on basalt supporting sparse *Acacia* and *Cassia* shrublands and patchy tussock grasslands; forms 0.3% of the Pilbara bioregion.

## 1.3 BIOLOGICAL ENVIRONMENT

### 1.3.1 IBRA and Beard Vegetation Mapping

The IBRA divides Australia into 85 bioregions based on major biological and geographical/geological attributes (Thackway and Cresswell 1995). These bioregions are subdivided into 404 subregions, as part of a refinement of the IBRA framework (Department of Environment, Water, Heritage and the Arts [DEWHA] 2007).

The project area is located within the Hamersley subregion (PIL3) of the Pilbara region and the Augustus subregion (GAS3) of the Gascoyne region (Thackway and Cresswell 1995).

The Hamersley subregion is characterised by mountain ranges and plateaux of Proterozoic sedimentary rock, dissected by gorges (Kendrick 2001). The vegetation is characterised by mulga low woodland over bunch grasses on fine textured soils in valley floors, and Snappy Gum (*Eucalyptus leucophloia*) over *Triodia brizoides* on skeletal soils of the ranges (Kendrick 2001).

The Augustus subregion is characterised by rugged low Proterozoic sedimentary and granite ranges divided by broad flat valleys (Desmond *et al.* 2001). The vegetation is characterised by Mulga woodland with *Triodia* on shallow stony loams on rises and shallow earthy loams over hardpan on the plains are covered by Mulga parkland (Desmond *et al.* 2001).

Vegetation mapping of the Pilbara region was completed on a broad scale (1:1,000,000) by Beard (1975). The project area is situated in the Hamersley Plateau, which forms part of the Fortescue Botanical District in the Eremaean Botanical Province of Western Australia as per Beard (1975), who mapped the project area as two vegetation associations:

a<sub>1</sub>Li: Low woodland; Mulga (*Acacia aneura*); and

e<sub>16</sub>Lr.t<sub>3</sub>Hi: Hummock grasslands, low tree steppe; Snappy Gum (*Eucalyptus leucophloia* subsp. *leucophloia*) over *Triodia wiseana*.

## 2 METHODOLOGY

### 2.1 BACKGROUND TO SURVEY METHODOLOGY

#### 2.1.1 Protection of Flora and Vegetation

Flora species are protected formally and informally by various legislative and non-legislative measures, which are as follows:-

##### **Legislative Protection**

- *Environment Protection and Biodiversity Conservation Act 1999* (Cth): a federal Act;
- *Wildlife Conservation Act 1950* (WA): a State Act; and
- *Environmental Protection Act 1986* (WA): a State Act.

##### **Non-Legislative Protection**

- Western Australian Department of Environment and Conservation (DEC) Priority lists for flora and vegetation; and
- informal recognition of locally significant populations.

A short description of these Acts is given below, and definitions of the species conservation codes and ecological community categories they use, and those used by the DEC, are provided in Appendix A and B.

##### **Environment Protection and Biodiversity Conservation Act 1999 (Cth)**

The *Environment Protection and Biodiversity Conservation Act 1999* (Cth) (the *EPBC Act*) aims to protect matters of national environmental significance, which are detailed in Appendix A.

Under the *EPBC Act*, the DEWHA lists threatened species and Threatened Ecological Communities (TECs) in certain categories determined by criteria set out in the Act ([www.environment.gov.au/epbc/index.html](http://www.environment.gov.au/epbc/index.html)).

##### **Wildlife Conservation Act 1950 (WA)**

The Western Australian DEC lists flora taxa under the provisions of the *Wildlife Conservation Act 1950* (WC Act) as protected according to their need for protection (see Appendix A).

Flora species are given Declared Rare Flora (DRF) status when their populations are geographically restricted or are threatened by local processes. In addition,

under the *WC Act*, by Notice in the Western Australian Government Gazette of 9 October 1987, all native flora (spermatophytes, pteridophytes, bryophytes and thallophytes) is protected throughout the State.

The *WC Act* makes it an offence to ‘take’ threatened species without an appropriate licence.

### **Environmental Protection Act 1986 (WA)**

DRF and TECs are given special consideration in environmental impact assessments, and areas covered by TECs have special status as Environmentally Sensitive Areas (ESAs) under the *Environmental Protection Act* and the Environmental Protection (Clearing of Native Vegetation) Regulations 2004.

The protection of ESAs is a 'clearing principle' for assessing applications for permits to clear native vegetation, where exemptions for a clearing permit do not apply.

### **DEC Priority Lists**

The DEC lists Priority flora species that have not been assigned statutory protection under the *WC Act*, but which are under consideration for declaration as DRF. Species assessed as Priorities 1 to 3 (see Appendix A) are in urgent need of further survey, whilst Priority 4 species require monitoring every 5 to 10 years.

In addition, the DEC maintains a list of Priority Ecological Communities (PEC) which identifies those communities that need further investigation before possible nomination for TEC status (see below).

Although DEC Priority species and communities have no formal legal protection, they are under consideration as ‘Scheduled’ flora under the *WC Act*.

The DEC identifies and lists vegetation communities believed to be threatened. Once listed, a community is a PEC, but only when endorsed by the Minister for the Environment, does it become a TEC, and therefore protected as an environmentally sensitive area under vegetation clearing regulations.

### **Informal Recognition of Threatened Flora and Vegetation**

Certain populations or communities may be of local significance or interest because of their patterns of distribution and abundance. For example, flora may be locally significant because they are range extensions to the previously-known distribution or are newly-discovered taxa (and therefore have the potential to be of more than local significance). In addition, many species are in decline as a

result of threatening processes (primarily land clearing), and relict populations of such species assume local importance.

### 2.1.2 Environmental Protection Authority Guidance Statement No. 51

A baseline flora survey for environmental impact assessment should at the very least provide a comprehensive list of species in a given area. There are two levels of flora survey as delineated by the EPA:

- **Level One:** a 'desktop' study to collate historical knowledge conducted in conjunction with a reconnaissance survey (site inspection); and
- **Level Two:** an intensive survey that incorporates a detailed and comprehensive survey to characterise the flora present, combined with a Level One survey.

Where the scale and nature of the proposed impact is moderate to high, a Level Two survey will be required in most areas of the State, and is typically required for resource development projects. The expectations of the EPA are set out in *Guidance Statement No. 51* (EPA 2004). Specifically, it details the extent, design and intensity of field surveys for environmental assessments in Western Australia.

The methodology of the current survey, a Level Two survey, has been developed to be compliant with the requirements of *Guidance Statement No. 51*.

### 2.1.3 Introduced Species

The Environmental Weed Strategy for Western Australia (Conservation and Land Management 1999) contains criteria for the assessment and ranking of weeds in terms of their environmental impact on biodiversity. The Strategy defines environmental weeds as 'plants that establish themselves in natural ecosystems and proceed to modify natural processes, usually adversely, resulting in the decline of the communities they invade.'

Plants may also be 'Declared' by the Agriculture Protection Board under the *Agriculture and Related Resources Protection Act 1979* (WA) (ARRP Act). Declared Plants are gazetted under five categories (P1 to P5), which define the action required. Details of the definitions of these categories are provided in Appendix C. A declaration may apply to the whole State, to districts, individual properties or even to single paddocks. If a plant is Declared, landholders are obliged to control that plant on their properties (Department of Agriculture and Food Western Australia [DAFWA] 2007).

## 2.2 SURVEY METHODOLOGY

The survey was carried out in a manner designed to be compliant with EPA requirements for the environmental surveying and reporting for flora and vegetation in Western Australia, as set out in the following documents:

- *Environmental Protection of Native Vegetation in Western Australia: Clearing of Native Vegetation with Particular Reference to Agricultural Areas. Position Statement No.2* (EPA 2000);
- *Terrestrial Biological Surveys as an Element of Biodiversity Protection. Position Statement No. 3* (EPA 2002); and
- *EPA Guidance for the Assessment of Environmental Factors: Terrestrial Flora and Vegetation Surveys for Environmental Impact Assessment in Western Australia No. 51* (EPA 2004).

The methodology for the current work involved the following key steps:

### 2.2.1 Desktop Survey

The purpose of a desktop survey was to gather background information on the project area and the flora species and vegetation it may support. This involved a search of literature, data, aerial photographs and maps for information relating to landforms likely to be found in the area.

A request for a database search was submitted to the DEC [23°20'10"S, 119° 42' 02"E and 23°21'11"S, 119° 43' 19"E] to ascertain whether any DRF or Priority species or any TECs or PECs had been recorded in the project area or surrounding areas. In addition, a literature review of previous biological reports conducted in the vicinity of the project area was completed. These sources were used to compile a list of expected DRF and Priority species, and TECs or PECs that may occur on the landforms in the project area.

### 2.2.2 Field Survey

The field survey was conducted from 23 to 28 April 2009 with 24 person-days invested in the field survey.

Field staff collected flora information using 50 m x 50 m vegetation survey plots, as preferred by DEC (pers. comm. S. van Leeuwen, DEC), relevés and opportunistic collections. For areas in which a 50 m x 50 m quadrat was not achievable, suitable quadrat dimensions were used, whilst maintaining the same total search area. Forty-eight quadrats and nineteen relevés were executed (Figure 3A-H). The quadrats and relevés were selected as being representative of the flora and vegetation of the project area (flora survey quadrat and relevé

locations are presented in Appendix D and project area photographs are presented in Appendix E).

Data was recorded using standardised field sheets designed in accordance with BHPBIO guidelines (BHPBIO May 2009). The information noted at each site included landscape features, soils, bare ground and disturbance levels (the vegetation condition scale used is presented in Appendix F). Each species of plant at each site was recorded, including information on height and percentage cover (Data Sheets are presented in Appendix G). This enabled more accurate vegetation mapping to be undertaken, and provided greater detail of the species present. The opportunistic collections and relevés focussed mainly on the location of new flora taxa not recorded in the quadrats, and in particular, DRF and Priority Flora, and flora not well known or not currently described.

### **2.2.3 Taxonomic Identification**

Where field identification of plant taxa was not possible, specimens were collected systematically for later identification by taxonomists utilising the resources of the Western Australian Herbarium (WAH), through comparison with the reference collection and use of identification keys.

The project species list was checked against FloraBase (WAH 2009) and Atkins (2008) DRF and Priority Flora list to determine whether any of the species are listed as DRF or Priority species. Species were also checked against the EPBC Act listing of Threatened species to determine whether any are federally listed (DEWHA 2007).

All difficult to identify, new taxa, range extensions, DRF and Priority flora specimens were validated by the WAH.

### **2.2.4 Vegetation Analysis**

Vegetation was described based on structure and species composition in accordance with BHPBIO guidelines (BHPBIO May 2009). Vegetation was categorised in three levels; Broad Floristic Formations, Vegetation Associations, and Sub-Associations.

Multivariate analysis was computed on quadrat data. Quadrat data was transformed (square root) to improve normality, and a similarity matrix based on Bray-Curtis similarities was computed. A dendrogram was then computed, using hierarchical agglomerative cluster analysis using *Primer-E* version 6.1.5 (2006). Non-metric Multivariate Dimensional Scaling (NMDS) analysis of quadrat data was then used to complement hierarchical agglomerative cluster analysis to help define vegetation communities.

Once the vegetation associations were determined, they were checked against the listings of State and Federal TECs and PECs.

### **2.2.5 Vegetation Mapping**

Field mapping was carried out using GPS (Magellan) and GIS (OziExplorer and Microstation V7.0) hardware and software. The details of each site were interpreted and vegetation associations were then described. The boundaries of the vegetation associations were drawn over an aerial photograph with the aid of GPS coordinates taken throughout the field survey. The vegetation associations were then digitised and produced as manipulable electronic mapping data using Microstation V7.0. ESRI shape files were created with ARCGIS 3.

### 3 RESULTS

#### 3.1 VARIABLES INFLUENCING THE FLORA AND VEGETATION SURVEY

It is important to note the variables associated with individual surveys, which are often difficult to predict, as is the extent to which they influence survey outcomes. Survey variables of the proposed Newman to Jimblebar transmission line and Newman Town Substation flora and vegetation survey are detailed in Table 1.

**Table 1:** Variables Associated with the Proposed Newman to Jimblebar Transmission Line Flora and Vegetation Survey

Variable	Impact on Survey Outcomes
Access Problems	All areas were accessible and adequately surveyed.
Experience levels	<p>The scientists who executed this survey were practitioners suitably qualified in their respective fields.</p> <ul style="list-style-type: none"> <li>• Coordinating Botanist: Todd Edwards (Senior Environmental Scientist/Botanist);</li> <li>• Field Staff: Emma Carroll (Environmental Biologist), Ciaran Sgherza (Environmental Biologist) and Kerryn McCann (Environmental Biologist);</li> <li>• Taxonomy: Malcolm Trudgen (Taxonomist) and Chris Hancock (Taxonomist / Botanist);</li> <li>• Taxonomy Verifications: Steven Dillon; and</li> <li>• Data Interpretation and Analysis: Todd Edwards and Elaine Chua (Environmental Biologist).</li> </ul>
Timing <sup>1</sup> , weather, season.	<p>The survey was undertaken following the wet season from 23 to 28 April 2009. The area had received 212.2 mm of rain in the year to date (January to April 2009) (BoM 2009). March received a high amount of rainfall (122.8 mm) as a remnant result from a tropical cyclone. Overall conditions were ideal for flora and vegetation surveys as the area received above average rainfall during the wet season.</p> <p>Flora composition changes over time, with flora species having specific growing periods, especially annuals and ephemerals (some plants lasting</p>

<sup>1</sup> EPA Guidance Statement 51 (2004) stipulates that flora and vegetation surveys should be undertaken following the season that contributes the greatest rainfall in the region. In the Eremaean Province, this is after summer. Short-term variations in normal weather patterns (e.g. drought) may necessitate supplementary survey work at other times of year or in later years to take into account temporal changes in diversity.

Variable	Impact on Survey Outcomes
	for a markedly brief time, some only a day or two). Therefore the results of future botanical surveys in this location may differ from the results of this survey.
Scope: Life forms	The high level of rainfall preceding the survey meant that flowers and fruit were available for most perennial and annual species in the project area, therefore allowing for detailed taxonomic identification.
Sources of information	At the bioregion level, the Pilbara has been relatively well studied in recent years. Numerous flora and vegetation assessment surveys have been undertaken in the area as part of environmental impact assessment processes.
Completeness	<p><u>Newman to Jimblebar</u></p> <p>The field survey recorded 365 taxa, including species, subspecies, affiliates and variants. The species richness recorded in the project area was 36.8 taxa per quadrat. This level of species richness is comparable to that recorded in other surveys conducted in the region using similar methodologies, for example: 44 taxa per quadrat were recorded at West Jimblebar (1380 ha: ENV 2007b); 38 taxa per quadrat at Mount Whaleback (1700 ha: ENV 2006b); and 37 taxa per quadrat Orebody 24 (ENV 2006a). Other surveys have recorded much lower species richness than in the project area, for example at Orebody 18 (1500 ha) 27 taxa per quadrat were recorded (ENV 2008a), and for the Jimblebar Access Road survey (130.1 ha) only 14 taxa per quadrat were recorded (ENV 2008b). This suggests the survey effort was comprehensive and adequate.</p> <p><u>Newman Town Substation</u></p> <p>The field survey recorded 44 taxa from a single quadrat and site walkover. A previous survey of Kurra Village (ENV 2006c) recorded 38 taxa in a quadrat located within the immediate vicinity of that in the current survey. Six of the taxa recorded in the current survey were coloniser species while two were introduced species.</p>

### 3.1.1 Potentially Occurring Flora Species and Vegetation Communities of Conservation Significance

From previous surveys conducted in the area and database searches EPBC listed DRF and 19 Priority species were identified as potentially occurring in the area.

The DRF species that potentially occurs within the project area is *Lepidium catapycnon* (Hamersley Lepidium). It is a woody perennial herb or shrub that

grows to 0.3 m high, and is typically recorded on skeletal soils on hill slopes (WAH 2009).

Details of the 19 Priority flora species that potentially occur in the project area are provided in Appendix A.

The DEC database search found that one known TEC, the Ethel Gorge Aquifer Stygobiont community, is located about 1 km north of the project area. This TEC is not relevant to the current study; because it is a stygofauna (groundwater fauna) based community.

From previous surveys conducted in the area, twenty-one introduced plant species were identified as potentially occurring in the project area, and these species are listed in Appendix C.

## 3.2 FIELD SURVEY

### 3.2.1 Flora

#### *Newman to Jimblebar*

Forty-nine families, 147 genera and 365 taxa were recorded in the project area (347 native flora taxa and 15 introduced). The flora inventory is provided in Appendix H.

Seven taxa could not be confirmed to species level, and three taxa could not be confirmed to subspecies level. A further sixteen taxa are considered to be affiliates, and were not given discrete species names.

The plant families most frequently recorded from the survey were as follows:

- Poaceae 62 taxa;
- Mimosaceae 38 taxa; and
- Malvaceae 33 taxa.

The plant genera most frequently recorded from the survey were as follows:

- *Acacia* 35 taxa;
- *Senna* 16 taxa; and
- *Eremophila* 16 taxa.

Average plant species richness was 36.8 taxa per quadrat (excludes relevés: Appendix I).

The species most commonly recorded flora species was *Solanum lasiophyllum* (recorded in 37 quadrats and five relevés), *Acacia bivenosa* (recorded in 34 quadrats and nine relevés) and *Cymbopogon obtectus* (recorded in 31 quadrats and four relevés).

### **Newman Town Substation**

Sixteen families, 25 genera and 44 taxa were recorded in the survey area (42 native flora taxa and 2 introduced): refer to Appendix H for the flora species list).

The plant genera most frequently recorded from the survey were as follows:

- *Acacia*                seven taxa;
- *Ptilotus*              five taxa; and
- *Senna*                five taxa.

The plant families most frequently recorded from the survey were Amaranthaceae, Mimosaceae and Poaceae, all of which were all represented by seven taxa.

### **3.2.2 Flora of Conservation Significance**

No Threatened species pursuant to the *EPBC Act* were identified during the survey.

No plant taxa gazetted as DRF pursuant to the *WC Act* were located in the survey area.

One Priority Flora species was located in the survey area, *Goodenia nuda*, which is currently Priority 3. One individual was recorded at one location, GDA94 Zone 51K 793 683mE 741 7742mN. The location of the Priority flora is shown in Figure 4.

### **3.2.3 Flora of Interest**

One taxa recorded in the project area, *Muelleranthus trifoliolatus*, is considered to be taxa of interest because it represents a possible range extension. *Muelleranthus trifoliolatus* is a prostrate to semi-prostrate annual or perennial herb, growing 0.02 to 0.3 m high and 0.3 to 2m wide (WAH 2009). It favours river banks, claypans and rocky outcrops and typically occurs in the Gascoyne and Murchison regions. This herb was recorded once in the project area (quadrat NJ16) located in a drainage / floodplain area (Table 2). Its location in the project area represents an approximately 80 km range extension for this species (DEC 2009). The species has not previously been recorded in the Pilbara region (WAH 2009).

One further species of interest *Goodenia* sp. Sandy Creek (R.D. Royce 1653) was recorded in the project area. It was recorded opportunistically at one location on a hill slope on *Triodia* hummock grassland (Table 2). *Goodenia* sp. Sandy Creek (R.D. Royce 1653) is a species which is superficially similar to the priority species *Goodenia hartiana*. It is doubtful that both these species occur within the local region and therefore previous records of the priority *G. hartiana* within the project area and its vicinity are likely to be misidentifications (pers. comm. Trudgen).

**Table 2:** Locations of Species of Interest

Taxon	Site Number	# Easting	# Northing
<i>Muelleranthus trifoliolatus</i>	NJ16	794080	7417709
<i>Goodenia</i> sp. Sandy Creek (R.D. Royce 1653)	NJOP44T	798414	7417931

# Australian Geocentric 1994 (GDA94), Zone 50K

### 3.2.4 Introduced Flora

There were 15 introduced flora species recorded in the project area. The introduced flora ratings and criteria according to the Environmental Weed Strategy for Western Australia (refer to Appendix B for the criteria used for ranking) are displayed in the table below.

**Table 3:** Introduced Species Identified

Taxon	Common Name	Criteria			
		Rating	Invasiveness	Distribution	Impacts
* <i>Datura leichhardtii</i>	Native Thornapple	P1; Moderate	Yes	Yes	-
* <i>Acetosa vesicaria</i>	Ruby Dock	High	Yes	Yes	Yes
* <i>Aerva javanica</i>	Kapok Bush	High	Yes	Yes	Yes
* <i>Cenchrus ciliaris</i>	Buffel Grass	High	Yes	Yes	Yes
* <i>Cenchrus setiger</i>	Birdwood Grass	High	Yes	Yes	Yes
* <i>Vachellia farnesiana</i>	Mimosa Bush	High	Yes	Yes	Yes
* <i>Cynodon dactylon</i>	Couch	Moderate	Yes	Yes	-
* <i>Malvastrum americanum</i>	Spiked Malvastrum	Moderate	Yes	Yes	-

Taxon	Common Name	Criteria			
		Rating	Invasiveness	Distribution	Impacts
* <i>Sonchus oleraceus</i>	Common Sowthistle	Moderate	Yes	Yes	-
* <i>Echinochloa colona</i>	Awnless Barnyard Grass	Mild	Yes	-	-
* <i>Setaria verticillata</i>	Whorled Pigeon Grass	Low	-	-	-
* <i>Bidens bipinnata</i>	Bipinnate Beggartick	N/A	-	-	-
* <i>Cucumis melo subsp. agrestis</i>	Ulcardo Melon	N/A	-	-	-
* <i>Portulaca oleracea</i>	Purslane	N/A	-	-	-
* <i>Tribulus terrestris</i>	Caltrop	N/A	-	-	-

No Declared Plants listed under the *Agriculture and Related Resources Protection Act 1976* were recorded in the project area. Note: *Datura leichhardtii* is listed as a Declared Plant, but not in the East Pilbara region.

Locations of introduced species are presented in Appendix J, and mapped in Figure 5A-H.

### 3.2.5 Vegetation Associations

#### *Newman to Jimblebar*

Twenty one vegetation associations were described at the project area (Table 4). The results of cluster analysis are provided in Appendix K and the vegetation associations are mapped in Figures 6A-H.

**Table 4a:** Classification of Quadrats into Vegetation Associations for Newman to Jimblebar

Broad Floristic Formation	Vegetation Association	Sites and Relevés
<i>Acacia</i> High Shrubland (AHS1)	High Shrubland of <i>Acacia citrinoviridis</i> , <i>A. bivenosa</i> and <i>Petalostylis labicheoides</i> over Hummock Grassland of <i>Triodia pungens</i> with Scattered Low Trees of <i>Eucalyptus xerothermica</i> on Red-Brown Alluvial Loam on Drainage Lines and Floodplains.	NJ50, NJ54 and NJR32

Broad Floristic Formation	Vegetation Association	Sites and Relevés
Acacia High Shrubland (AHS2)	High Shrubland of <i>Acacia ligulata</i> , <i>A. pruinocarpa</i> and <i>Petalostylis labicheoides</i> over Closed Hummock Grassland of <i>Triodia pungens</i> with Low Open Woodland of <i>Eucalyptus leucophloia</i> subsp. <i>leucophloia</i> on Red-Brown Loam on Hill Slopes and Drainage Lines.	NJR30
Acacia Open Scrub (AOS1)	Open Scrub of <i>Acacia monticola</i> , <i>A. citrinoviridis</i> and <i>Petalostylis labicheoides</i> over Open Hummock Grassland of <i>Triodia pungens</i> and <i>T. basedowii</i> over Scattered Low Trees <i>Eucalyptus leucophloia</i> subsp. <i>leucophloia</i> or <i>E. gamophylla</i> (Mallee) on Red-Brown Clay Loam on Drainage Lines.	NJ38, NJ63, NJR17, NJR18, NJR20 and NJR22
Acacia Open Scrub (AOS2)	Open Scrub of <i>Acacia melleodora</i> , <i>Petalostylis labicheoides</i> and <i>A. ancistrocarpa</i> over Very Open Hummock Grassland of <i>Triodia wiseana</i> and <i>T. pungens</i> with Scattered Low Trees of <i>Corymbia hamersleyana</i> , <i>Eucalyptus gamophylla</i> (Mallee) and <i>E. xerothermica</i> on Red-Brown Loam on Minor Drainage Lines.	NJ45 and NJ55
Acacia Shrubland (AOS1)	Open Shrubland of <i>Acacia adsurgens</i> over Low Shrubland of <i>Gompholobium karijini</i> , <i>Halgania solanacea</i> aff. var. <i>hirsuta</i> and <i>Santalum lanceolatum</i> over Scattered Hummock Grasses of <i>Triodia</i> sp. Shovelanna Hill (S. van Leeuwen 3835) on Red-Brown Alluvial Sand on Drainage Lines.	NJR16
Acacia Shrubland (AS1)	Shrubland of <i>Acacia bivenosa</i> and <i>A. adsurgens</i> over Very Open Hummock Grassland of <i>Triodia wiseana</i> with Scattered Low Trees of <i>Eucalyptus leucophloia</i> subsp. <i>leucophloia</i> on Red-Brown Loam on Hill Slopes.	NJR59
Acacia Shrubland (AS2)	Shrubland of <i>Acacia sclerosperma</i> over Open Hummock Grassland of <i>Triodia pungens</i> and <i>T. longiceps</i> on Red-Brown Loam on Low Rises and Plains.	NJ14

Broad Floristic Formation	Vegetation Association	Sites and Relevés
<i>Acacia</i> Shrubland (AS3)	Open Scrub (to Open Shrubland) of <i>Acacia aneura</i> , <i>A. sclerosperma</i> and <i>A. bivenosa</i> over Hummock Grassland of <i>Triodia basedowii</i> , <i>T. pungens</i> and <i>T. sp.</i> Shovelanna Hill (S. van Leeuwen 3835) with Scattered Low Trees of <i>Eucalyptus xerothermica</i> and <i>E. gamophylla</i> (Mallee) on Red-Brown Sandy Loam on Plains.	NJ09, NJ20, NJ22, NJ23, NJ25, NJ26, NJ28, NJ30, NJ32 and NJ44
<i>Eucalyptus</i> Open Woodland (EOW1)	Open Woodland of <i>Eucalyptus camaldulensis</i> var. <i>obtusa</i> over Closed (to Open) Tussock Grassland of * <i>Cenchrus ciliaris</i> , * <i>Cynodon dactylon</i> and * <i>Echinochloa colona</i> over Very Open Herbs of * <i>Malvastrum americanum</i> on Red-Brown Clay Loam on Creeklines and Rivers.	NJR10, NJR51
<i>Eucalyptus</i> Woodland (EW1)	Woodland of <i>Eucalyptus victrix</i> over High Shrubland of <i>Acacia sclerosperma</i> and <i>A. citrinoviridis</i> over Open Tussock Grassland of * <i>Cenchrus ciliaris</i> , <i>Enteropogon ramosus</i> and <i>Chrysopogon fallax</i> on Red-Brown Loam on Creeklines and Rivers.	NJ16, NJ24 and NJR26
<i>Eucalyptus</i> Woodland (EW2)	Woodland of <i>Eucalyptus camaldulensis</i> var. <i>obtusa</i> over Scattered Shrubs of <i>Melaleuca lasiandra</i> and <i>Petalostylis labicheoides</i> over Very Open Sedges / Tussock Grassland of * <i>Echinochloa colona</i> , <i>Cyperus vaginatus</i> and <i>Typha domingensis</i> on Red-Brown Alluvial Loamy Clay on Creeklines and Rivers.	NJ12 and NJR08
<i>Triodia</i> Hummock Grassland (THG1)	Hummock Grassland of <i>Triodia</i> sp. Shovelanna Hill (S. van Leeuwen 3835) with Scattered Shrubs of <i>Acacia synchronicia</i> and <i>A. bivenosa</i> over on Red-Brown Loam on Hill Slopes.	NJ57 and NJ61
<i>Triodia</i> Hummock Grassland (THG2)	Hummock Grassland of <i>Triodia pungens</i> with High Open Shrubland of <i>Acacia aneura</i> , <i>A. dictyophleba</i> and <i>A. pruinocarpa</i> with Scattered Low Trees of <i>Corymbia hamersleyana</i> , <i>Eucalyptus gamophylla</i> (Mallee) and <i>E. xerothermica</i> on Red-Brown Loam on Plains and Floodplains.	NJ15, NJ42, NJ46, NJ67 and NJR53.

Broad Floristic Formation	Vegetation Association	Sites and Relevés
<i>Triodia</i> Hummock Grassland (THG3)	Hummock Grassland of <i>Triodia basedowii</i> and <i>Triodia pungens</i> with High Open Shrubland of <i>Acacia bivenosa</i> , <i>A. synchronicia</i> and <i>A. sclerosperma</i> with Scattered Low Trees of <i>Eucalyptus gamophylla</i> (Mallee) and <i>E. leucophloia</i> subsp. <i>leucophloia</i> on Skeletal Red-Brown Loam on Low Hill Slopes.	NJ18 and NJR12
<i>Triodia</i> Hummock Grassland (THG4)	Hummock Grassland of <i>Triodia</i> sp. Shovelanna Hill (S. van Leeuwen 3835) and <i>Triodia wiseana</i> with High Open Shrubland of <i>Acacia citrinoviridis</i> , <i>A. bivenosa</i> and <i>A. pruinocarpa</i> with Low Open Woodland (to Scattered Low Trees) of <i>Eucalyptus leucophloia</i> subsp. <i>leucophloia</i> , <i>Corymbia aspera</i> and <i>Hakea lorea</i> subsp. <i>lorea</i> over on Red-Brown Loam on Hill Slopes.	NJ11 and NJ13
<i>Triodia</i> Hummock Grassland (THG5)	Hummock Grassland of <i>Triodia pungens</i> with Low Open Woodland (to Scattered Trees) of <i>Eucalyptus xerothermica</i> , <i>E. gamophylla</i> (Mallee) and <i>E. socialis</i> subsp. <i>eucentrica</i> (Mallee) over Open Shrubland of <i>Acacia bivenosa</i> , <i>A. sclerosperma</i> and <i>A. ancistrocarpa</i> on Red-Brown Loam on Plains and Floodplains.	NJ10, NJ48, NJ49, NJ56, NJ58 and NJ69
<i>Triodia</i> Hummock Grassland (THG6)	Hummock Grassland of <i>Triodia</i> sp. Shovelanna Hill (S. van Leeuwen 3835) with Open Shrubland of <i>Acacia bivenosa</i> and <i>Grevillea wickhamii</i> subsp. <i>hispidula</i> with Scattered Low Trees of <i>Eucalyptus leucophloia</i> subsp. <i>leucophloia</i> on Red-Brown Skeletal Loam on Hill Slopes.	NJ31, NJ34, NJ40, NJ52 and NJR24
<i>Triodia</i> Open Hummock Grassland (TOHG1)	Open Hummock Grassland of <i>Triodia schinzii</i> with Open Shrubland of <i>Acacia pachyacra</i> , <i>A. aneura</i> var ? <i>pilbarana</i> and <i>A. catenulata</i> subsp. <i>occidentalis</i> with Scattered Mallees of <i>Eucalyptus gamophylla</i> on Red-Brown Clay Loam on Sand Plains.	NJ33 and NJ35
<i>Triodia</i> Open Hummock Grassland (TOHG2)	Open Hummock Grassland of <i>Triodia angusta</i> and <i>Triodia pungens</i> with Scattered Shrubs of <i>Acacia tetragonophylla</i> , <i>A. bivenosa</i> and <i>Senna glutinosa</i> subsp. <i>glutinosa</i> with Scattered Low Trees of <i>Eucalyptus leucophloia</i> subsp. <i>leucophloia</i> and <i>E. trivalva</i> (Mallee) on Red-Brown Sandy Loam on Hill Slopes.	NJ39, NJ41 and NJR43

Broad Floristic Formation	Vegetation Association	Sites and Relevés
<i>Triodia</i> Open Hummock Grassland (TOHG3)	Open Hummock Grassland of <i>Triodia</i> sp. Shovelanna Hill (S. van Leeuwen 3835) and <i>T. wiseana</i> with Open Shrubland of <i>Acacia bivenosa</i> with Scattered Mallees of <i>Eucalyptus gamophylla</i> and <i>E. leucophloia</i> subsp. <i>leucophloia</i> (Trees) on Red-Brown Skeletal Loam on a Low Hill Slopes.	NJ36, NJ37 and NJ65
<i>Triodia</i> Open Hummock Grassland (TOHG4)	Open Hummock Grassland of <i>Triodia</i> sp. Shovelanna Hill (S. van Leeuwen 3835), <i>T. pungens</i> and <i>T. wiseana</i> with Scattered shrubs of <i>Acacia bivenosa</i> , <i>A. synchronicia</i> and <i>A. tetragonophylla</i> on Red-Brown Loam on Low Rocky Hill Slopes.	NJ19, NJ21, NJ27, NJR29 and NJR47

The vegetation associations recorded in the project area are not considered to be representative of TECs or PECs.

#### ***Newman Town Substation***

One vegetation community was described at the Newman Town Substation project area. The vegetation association is mapped in Figure 6h. No vegetation association analysis was undertaken as there was only one quadrat surveyed.

**Table 4b:** Classification of Quadrats into Vegetation Associations for Newman Town Substation

Broad Floristic Formation	Vegetation Association	Sites and Relevés
<i>Triodia</i> Open Hummock Grassland (TOHG5)	Open Hummock Grassland of <i>Triodia wiseana</i> and <i>T.</i> sp. Shovelanna Hill (S. van Leeuwen 3835) with Low Open Woodland of <i>Eucalyptus leucophloia</i> over High Shrubland of <i>Acacia bivenosa</i> , <i>A. kempeana</i> and <i>A. aneura</i> var. <i>aneura</i> over Very Open Tussock Grassland of <i>*Cenchrus ciliaris</i> on Red-Brown Sandy Loam on a Low Hill.	NJ07

The vegetation association recorded in the project area is not considered to be representative of TECs or PECs.

### 3.2.6 Vegetation Condition

#### ***Newman to Jimblebar***

The vegetation condition in the project area ranged from Completely Degraded to Pristine, with most of the sites rated as Excellent. Vegetation Condition is mapped in Figures 7A to H.

The majority of hilltops, hill slopes, sand plains, floodplains and minor drainage lines in the project area were rated as in Excellent to Pristine vegetation condition. Areas of lesser vegetation condition ratings were recorded in the vicinity of the Mount Whaleback mine site and the Fortescue River.

Disturbances to vegetation within the project area included the presence of introduced flora and fauna (e.g. *\*Cenchrus ciliaris* and cattle), clearing for infrastructure associated with past drill pads, vehicle tracks, flooding and fire.

Fire age was considered to range from Recent to Very Old, with the majority of sites having an Old fire age. See Appendix F for definitions of fire ages.

#### ***Newman Town Substation***

The condition of the vegetation in the Newman Town Substation project area ranged from Degraded to Completely Degraded (Figure 7h). There was a high level of disturbance within the project area from roads, adjacent infrastructure (i.e. existing Substation and powerlines) and introduced species (e.g. *\*Cenchrus ciliaris*).

The vegetation within the Newman Town Substation expansion area was considered to have a Very Old fire age. See Appendix F for definitions of fire ages.

## 4 DISCUSSION

### 4.1 FLORA OF CONSERVATION SIGNIFICANCE

No species listed under the *EPBC Act* or species of DRF were recorded in the project area. The survey was comprehensive and conducted in ideal conditions, following a period of above average summer rainfall with 235.6 mm (December – February) compared to an average of 171.8 mm. Therefore it is considered unlikely that any species with legislative protection occur in the project area.

The DRF species, *Lepidum catapycnon*, was previously recorded in the vicinity of the project area, approximately 7 km to the west of the project area, at Mount Whaleback mine site, where it was recorded on mud stone shale on rocky hills (ENV 2006b). However, *L. catapycnon* was not recorded in the project despite sufficient rainfall prior to the survey and considerable effort to locate the species, including walking transects along the proposed impact footprint, quadrating and targeted DRF searches. Its absence from the project area might be because no suitable habitat for *L. catapycnon* was recorded in the project area.

One Priority Flora species was recorded in the project area, *Goodenia nuda* (Priority 3) (Plate 1). *Goodenia nuda* is an erect to ascending herb to 0.5 m high with yellow flowers (WAH 2009). One individual was recorded in the project area, within a section of the Fortescue River floodplain. It has also been recorded in previous surveys in the vicinity of the project area, for example at West Jimblebar (ENV 2007b) where one individual was recorded. Habitat suitable for *G. nuda* did exist within the project area, this being floodplains and plains with red-brown loam soil. *Goodenia nuda* has been recorded at 37 locations across the Pilbara region (DEC 2009), therefore it is unlikely that this species is dependant on habitats in the project area.

Plate 1 *Goodenia nuda*

No other Priority flora species were recorded in the project area, despite 19 priority species being identified as potentially occurring in the vicinity of the project area. Habitat suitable for a number of the priority species identified in the desktop review were present in the project area, for example, riverine habitats commonly associated with *Gymnanthera cunninghamii* (Priority 1) and hill slopes commonly associated with *Eremophila magnifica* subsp. *magnifica* and *E. magnifica* subsp. *velutina* (Priority 1). These species were not located in the project area despite sufficient rainfall prior to the survey, considerable effort to locate the species, including walking transects along the proposed impact footprint, quadrating and targeted DRF searches.

## 4.2 FLORA OF INTEREST

Two taxa recorded in the project area are of conservation interest, although they have no legislative protection, these are *Muelleranthus trifoliolatus* and *Goodenia* sp. Sandy Creek (R.D. Royce 1653).

One individual of *Muelleranthus trifoliolatus* was recorded in project area, in a drainage habitat. This taxa is widely distributed in the Gascoyne, Little Sandy Desert, Carnarvon and Murchison regions, which are south of the Pilbara region (WAH 2009); the nearest recorded location is 80 km south of the project area. This collection therefore represents a small range extension for this species.

One individual of *Goodenia* sp. Sandy Creek (R.D. Royce 1653) was recorded from a hill slope in the project area. *Goodenia* sp. Sandy Creek (R.D. Royce 1653) is a species which is superficially similar to the priority species *Goodenia hartiana* (Priority 2). *G. hartiana* has previously been recorded at 10 locations in the immediate vicinity (less than 5 km) of the project area (DEC 2009). It is doubtful that both these species occur within the local region and therefore previous records of the priority *G. hartiana* within the project area and its vicinity are likely to be misidentifications (pers. comm. Trudgen).

## 4.3 FLORA TAXA RICHNESS

### *Newman to Jimblebar*

The species richness in the Newman to Jimblebar project area (36.8 taxa per quadrat) was similar to that recorded in other nearby surveys. For example 44 taxa per quadrat were recorded in the West Jimblebar survey (ENV 2007b), 38 taxa per quadrat were recorded at the Mount Whaleback (ENV 2006b) and 37 taxa per quadrat recorded at the Orebody 24 survey (ENV 2006a). The taxa richness was higher in the project area than some other nearby surveys, for example 27 taxa per quadrat recorded at the Orebody 18 survey (ENV 2008a) and 14 taxa per quadrat recorded at the Jimblebar Access Road survey (ENV 2008b).

To summarise, whilst the species richness is higher than some adjacent surveys, it is comparable to most, and thus considered to be typical of a post-wet season survey conducted in the local region. The results also imply that the survey was adequate and conducted in good conditions.

### ***Newman Town Substation***

While the species richness of the Newman Town Substation is relatively high, when compared to a survey of Kurra Village (see section 3.1 for comparison), six of the taxa recorded were coloniser species while two were introduced species. These disturbance species, account for approximately 18% of the species recorded within the Substation project area.

## **4.4 INTRODUCED FLORA TAXA**

### ***Newman to Jimblebar***

Fifteen introduced flora species (4% of total taxa) were recorded in the project area, none of which are considered Declared Plants under the AARP Act 1976. The percentage of total taxa that were introduced species in the project area is slightly higher, but not dissimilar to that recorded at other nearby flora and vegetation surveys, for example: at OB24 2% of total taxa were introduced species (ENV 2006a); at OB18 and West Jimblebar less than 1% of total taxa were introduced species (ENV 2008a); at Mt Whaleback 2.3% of total taxa were introduced species (ENV 2006b); at West Wye Rail Junction 6.5% of total taxa were introduced species (ENV 2008b).

Introduced species were most abundant and had the greatest richness in the vicinity of the Mount Whaleback mine site and the Fortescue River. Both these areas are exposed to disturbances that are known to lead to increased introduced species invasion (Hussey *et al.* 1997), for example infrastructure developments, grazing of stock and flooding.

Of the introduced species recorded in the project area, a number have a High rating under the Environmental Weed Strategy for Western Australia (CALM 1999). These were *\*Acetosa vesicaria*, *\*Aerva javanica*, *\*Cenchrus ciliaris*, *\*C. setiger* and *\*Vachellia farnesiana*. Control of these introduced species may therefore be desirable.

Of those introduced species with High ratings under the Environmental Weed Strategy (CALM 1999), *\*Cenchrus ciliaris* was the most widespread in the project area. It was recorded at 38 sites (29 quadrats and nine relevés). The cover of *\*C. ciliaris* ranged from less than 1% to 70%, with an average cover of 8.6%. *\*C. ciliaris* is a perennial grass that occurs across much of northern Australia, and semi-arid areas (CRC Weed Management 2008). It is known to out-compete

native flora, exude allelopathic chemicals, adversely alter fire regimes and to be highly invasive (CRC Weed Management 2008). Management of this species is desirable.

A number of the introduced species recorded in the project area are rated as Moderate to Mild. These are *\*Cynodon dactylon*, *\*Malvastrum americanum*, *\*Sonchus oleraceus* and *\*Echinochloa colona*. Control of these introduced species may also be desirable to reduce impact on the conservation value of the vegetation in project area.

One introduced species that has a Low rating, is *\*Setaria verticillata* (Whorled Pigeon Grass). Control of this species is not a priority, as it is not likely to have much of an impact on the condition of the vegetation in the project area.

A number of the introduced species recorded in the project area are however not listed or not rated in the Environmental Weeds Strategy (CALM 1999). They include *\*Bidens bipinnata*, *\*Cucumis melo* subsp. *agrestis*, *\*Portulaca oleracea* and *\*Tribulus terrestris*. None of these are considered particularly invasive or environmentally harmful. Management of these is therefore not a priority.

It should also be noted that *\*Portulaca oleracea* is probably native in the Pilbara region, although is considered a weed by the WAH (2009), due in part to it being introduced to south-west Western Australia (Hussey *et al.* 1997). *\*Portulaca oleracea* was widespread in the project area, being recorded at 12 sites (11 quadrats and one relevé). Management of this taxon is not considered necessary; it is unlikely to have negligible impacts on native flora and is potentially native in the Pilbara.

### **Newman Town Substation**

Of the 44 taxa recorded within the Newman Town Substation project area, two were introduced flora species: *\*Aerva javanica* (Kapok bush) and *\*Cenchrus ciliaris* (Buffel Grass).

*\*Aerva javanica* and *\*Cenchrus ciliaris* were both recorded within the Degraded to Completely Degraded vegetation type TOHG5 and has a cover of less than one percent and 10% respectively.

No taxa recorded in the project area were Declared Plants under the ARRP Act 1976.

## 4.5 VEGETATION ASSOCIATIONS

### *Newman to Jimblebar*

Twenty one vegetation associations were characterised and categorised, and then mapped in the project area. None of these were considered to represent TECs or PECs. This was expected as only one TEC has been recorded in the vicinity of the project area, the Ethel Gorge TEC, which is a stygofauna based community.

Generally the vegetation associations mapped in the project area are considered to be typical of those in the region. The plains were dominated by mixed *Acacia* shrublands (e.g. *A. aneura*, *A. bivenosa*, *A. inaequilatera* and *A. synchronicia*) over tussock (e.g. *Eriachne* spp.) and hummock grasslands of *Triodia wiseana* and *T. pungens*. The mallee *Eucalyptus gamophylla* tended to occur on slightly elevated sections of the plains. The plains were juxtaposed by floodplains and disintegrating drainage lines, where *Eucalyptus xerothermica*, *Corymbia hamersleyana* and *C. aspera* were recorded. These floodplains tended to have higher diversity, typically with many herbs and tussock grasses, including the introduced species *\*Malvastrum americanum*, tussock grass *Chrysopogon fallax* and Asteraceae and *Ptilotus* herbs. The drainage line vegetation associations were observed to be frequently grazed and trampled by stock.

The drainage line proper, creeklines and river were dominated by fringing woodlands of *Eucalyptus camaldulensis* var. *obtusa* and *E. victrix* over dense mixed shrublands of species such as *Acacia pyrifolia*, *A. citrinoviridis*, *Gossypium robinsonii* and *Petalostylis labicheoides*. Tussock grasses were common in these drainage communities including *Cymbopogon* sp. and *Themeda triandra*. In areas where permanent water occurred, *Cyperus vaginatus* and *Typha domingensis* grew beneath *Melaleuca lasiandra* shrubs; particularly along the Fortescue River bed. Introduced species were especially common in the drainage communities, possibly as a result of seeds being washed in from upstream and the moist conditions supporting germination. In addition, stock tends to congregate in drainage line areas whilst drinking water, which helps spread seeds into these vegetation associations.

The low hills in the project area tended to be characterised by open to low woodlands of *Eucalyptus leucophloia* subsp. *leucophloia*, over more open and low shrublands of species such as *Hakea chordophylla*, *Grevillia wickhamii*, *Calytrix carinata* and *Acacia adoxa* subsp. *adoxo*. Hummock grasslands dominated the understorey on the hill slope communities, including *Triodia* sp. Shovelanna Hill (S. van Leeuwen 3825) and *T. basedowii*. Mallee trees were also

frequently recorded on the hill slopes, including *Eucalyptus gamophylla*, *E. trivalvis* and *E. socialis* subsp. *eucentrica*.

Overall all the vegetation associations recorded in the project area are typical of the Eastern Pilbara region, and not considered to be of conservation value.

#### **Newman Town Substation**

No TECs or PECs were recorded in the Newman Town Substation project area and consistent with the DEC database search. One vegetation association was recorded and described during the survey: Open Hummock Grassland of *Triodia wiseana* and *T. sp.* Shovelanna Hill (S. van Leeuwen 3835) with Low Open Woodland of *Eucalyptus leucophloia* over High Shrubland of *Acacia bivenosa*, *A. kempeana* and *A. aneura* var. *aneura* over Very Open Tussock Grassland of *\*Cenchrus ciliaris* on Red-Brown Sandy Loam on a Low Hill.

The vegetation association recorded represents a mixture of a low hill community, indicated by the presence of the *Eucalyptus* and *Triodia* species, and a Mulga community, indicated by the presence of the *Acacia* shrubland.

## **4.6 VEGETATION CONDITION**

### **Newman to Jimblebar**

The majority of hilltops, hill slopes, sand plains, floodplains and minor drainage lines in the project area were rated as being in Excellent to Pristine vegetation condition. For much of the project area disturbances were limited to impacts from introduced species, the power line access track, and low intensity cattle grazing. See Appendix F for definitions of condition scale.

Areas of poorer vegetation condition were recorded in the vicinity of the Mount Whaleback mine site and the Fortescue River. In the vicinity of Mount Whaleback vegetation had been impacted by introduced species, particularly *\*Cenchrus ciliaris*, as well as infrastructure developments and cattle grazing. In the vicinity of the Fortescue River vegetation had been impacted by introduced species invasion, flooding, infrastructure development and grazing by stock.

### **Newman Town Substation**

The vegetation in the Newman Town Substation project area covered approximately 60% of the survey area. While small patches within the vegetation were of Good condition, the overall vegetation condition was Degraded to Completely Degraded. Disturbances included adjacent infrastructure (i.e. existing Substation and powerlines) and introduced species (e.g. *\*Cenchrus ciliaris*). The remainder of the project area (approximately 40%) was not considered to contain

native vegetation (Completely Disturbed; Figure 7h). See Appendix F for definitions of condition scale.

## 4.7 REGIONAL REPRESENTATION

### 4.7.1 Vegetation Types and Associations

Beard (1975) mapped two vegetation types in the proposed Newman to Jimblebar transmission line project area (Table 5). These can be correlated to mapping by Shepherd *et al.* (2002) who attempted to determine the current extent of these vegetation types. This said, for areas outside the Wheatbelt region, data accuracy is poor. In the absence of a more accurate dataset however this is currently the only means available to gauge regional representation.

ENV vegetation associations have been roughly correlated with the Beard (1975) broad vegetation types (Table 5). Differences exist with the terminology used in the descriptions as they are based on different methods of categorising and characterising vegetation types, and spatial scale of the analysis (i.e. region vs. local scale). Some ENV vegetation associations could not be roughly correlated with Beard (1975) vegetation types, because they are too discrete, including ENV vegetation associations EOW1, EW1 and EW2; all of which are drainage line, creekline or riverine vegetation associations.

**Table 5:** Regional Representation of Vegetation Types in the Proposed Newman to Jimblebar Transmission Line and Newman Town Substation Project Area

Beard (1975) Vegetation Type	Shepherd <i>et al</i> (2002) Vegetation Type	Pre-European Extent	Current Extent	**Extent in Reserves	ENV Vegetation Associations
e <sub>16</sub> Lr.t <sub>3</sub> Hi - Hummock grasslands, low tree steppe; Snappy Gum ( <i>Eucalyptus leucophloia</i> subsp. <i>leucophloia</i> ) over <i>Triodia wiseana</i>	82 - Hummock grasslands, low tree steppe; snappy gum over <i>Triodia wiseana</i>	2,920,910ha	2,920,910ha	265,802ha (9%)	THG1, THG2, THG3, THG5, THG6, TOHG1, TOHG2, TOHG3, TOHG4 and TOHG5
a <sub>1</sub> Li - Low woodland; Mulga ( <i>Acacia aneura</i> )	18 – Low woodland; mulga ( <i>Acacia aneura</i> )	24,675,970ha	24,659,110ha	567,159ha (2%)	AHS1, AHS2, AOS1, AOS2, AOS3, AS1, AS2 and AS3

\*\* Includes IUCN Class I-IV and Other Reserves.

Both of the vegetation types mapped by Beard (1975) as occurring in the project area have large distributions across the East Pilbara region, where the project area is located. Current EPA guidance recommends a standard level of native vegetation retention of at least 30% of each ecological community based on its pre-European extent in the State. Below this threshold level, species loss is known to accelerate exponentially at an ecosystem level (EPA 2000). These levels have been recognised in the *National Objectives and Targets for Biodiversity Conservation 2001-2005* (Commonwealth of Australia 2001), which recognises that the retention of 30% or more of the pre-clearing extent of each ecological community is generally necessary if Australia's biological diversity is to be protected. The two vegetation types are likely to have more than 30% of their pre-European extents remaining and therefore the vegetation in the project is considered to be regionally well represented.

#### 4.7.2 Land Systems

The proposed Newman to Jimblebar Transmission Line and the Newman Town Substation project area consists of eight land systems, as described by van Vreeswyk *et al.* (2004). These land systems are Newman, Boolgeeda, Divide, McKay, River, Washplain, Jamindie and Elimunna.

The Newman, Boolgeeda, Divide, McKay and River land systems cover relatively large portions of the Pilbara bioregion. Furthermore they are all geographically widespread. Therefore the regional representation value of these land systems is unlikely to be significantly impacted by disturbances associated with the project.

The Jamindie, Washplain and Elimunna land systems cover smaller portions of the Pilbara bioregion. This is however, not particularly small, when considering that of the 102 land systems documented and described by van Vreeswyk *et al.* (2004), 80 land systems each represent less than 1% of the total area surveyed. Furthermore both are quite widespread in the Pilbara region. Therefore, considering the small scale of the proposed disturbance (i.e. a single power line and association power poles), these land systems are not likely to be greatly impacted by the proposed transmission line. This is demonstrated by Table 6 below.

**Table 6:** Impact on Land Systems in Project Area

Land System	Total Area in Pilbara Bioregion	Area of Land System in Project Area	% impact of Project Area on Land System
Newman	14580 km <sup>2</sup>	0.1788 km <sup>2</sup>	0.001%
Boolgeeda	7748 km <sup>2</sup>	0.2466 km <sup>2</sup>	0.003%
Divide	5293 km <sup>2</sup>	0.009 km <sup>2</sup>	0.0001%
McKay	4202 km <sup>2</sup>	0.1639 km <sup>2</sup>	0.003%
River	4088 km <sup>2</sup>	0.0712 km <sup>2</sup>	0.0003%
Jamindie	2074 km <sup>2</sup>	0.0071 km <sup>2</sup>	0.0003%
Washplain	917 km <sup>2</sup>	0.0177 km <sup>2</sup>	0.001%
Elimunna	617 km <sup>2</sup>	0.0858 km <sup>2</sup>	0.01%

## 5 CONCLUSIONS

The survey of the proposed Newman to Jimblebar transmission line and Newman Town Substation is believed to have been adequate and comprehensive with 24 person days invested in the field survey. Overall a total of 365 and 44 taxa, respectively, were recorded in the project area, and a high to moderate level of species richness is displayed.

No Threatened species under the *EPBC Act*, or DRF species listed under the *WC Act* occur in the project area. Only one individual of *Goodenia nuda*, a Priority Three flora species, was recorded in the project area. This is despite considerable survey effort (i.e. transects across the entire project area) and ideal climate conditions at the time of survey (i.e. above average rainfall).

No taxa recorded in the project area are listed as Declared Plants under the *Agriculture and Related Resources Protection Act 1976* in the East Pilbara region.

The vegetation associations recorded in the project area are typical of the East Pilbara region and no vegetation associations occurring in the project area are listed as TECs or PECs.

# VEGETATION ASSOCIATIONS

- Acacia High Shrubland (AHS1)** High Shrubland of *Acacia citrinoviridis*, *A. bivenosa* and *Petalostylis labicheoides* over Hummock Grassland of *Triodia pungens* with Scattered Low Trees of *Eucalyptus xerothermica* on Red-Brown Alluvial on Drainage Lines and Floodplains.
- Acacia High Shrubland (AHS2)** High Shrubland of *Acacia ligulata*, *A. pruinocarpa* and *Petalostylis labicheoides* over Closed Hummock Grassland of *Triodia pungens* with Low Open Woodland of *Eucalyptus leucophloia* subsp. *leucophloia* on Red-Brown Loam on Hillslopes and Drainage Lines.
- Acacia Open Scrub (AOS1)** Open Scrub of *Acacia monticola*, *A. citrinoviridis* and *Petalostylis labicheoides* over Open Hummock Grassland of *Triodia pungens* and *T. basedowii* over Scattered Low Trees of *Eucalyptus leucophloia* subsp. *leucophloia* or *E. gamophylla* on Red-Brown Clay Loam on Drainage Lines.
- Acacia Open Scrub (AOS2)** Open Scrub of *Acacia melleodora*, *Petalostylis labicheoides* and *A. ancistrocarpa* over Very Open Hummock Grassland of *Triodia wiseana* and *T. pungens* with Scattered Low Trees of *Corymbia hamersleyana*, *Eucalyptus gamophylla* (Mallee) and *E. xerothermica* on Red-Brown Loam on Minor Drainage Lines.

- Acacia Shrubland (AS1)** Shrubland of *Acacia bivenosa* and *A. adsurgens* over Very Open Hummock Grassland of *Triodia wiseana* with Scattered Low Trees of *Eucalyptus leucophloia* subsp. *leucophloia* on Red-Brown Loam on Hillslopes.
- Triodia Hummock Grassland (THG1)** Hummock Grassland of *Triodia* sp. Shovelanna Hill (S. van Leeuwen 3835) with Scattered Shrubs of *Acacia synchronica* and *A. bivenosa* over on Red-Brown Loam on Hillslopes.
- Triodia Hummock Grassland (THG2)** Hummock Grassland of *Triodia pungens* with High Open Shrubland of *Acacia aneura*, *A. dictyophleba* and *A. pruinocarpa* with Scattered Low Trees of *Corymbia hamersleyana*, *Eucalyptus gamophylla* (Mallee) and *E. xerothermica* on Red-Brown Loam on Plains and Floodplains.
- Triodia Hummock Grassland (THG5)** Hummock Grassland of *Triodia pungens* with Low Open Woodland (to Scattered Trees) of *Eucalyptus xerothermica*, *E. gamophylla* (Mallee) and *E. socialis* subsp. *eucentrica* (Mallee) over Open Shrubland of *Acacia bivenosa*, *A. sclerosperma* and *A. ancistrocarpa* on Red-Brown Loam on Plains and Floodplains.
- Triodia Hummock Grassland (THG6)** Hummock Grassland of *Triodia* sp. Shovelanna Hill (S. van Leeuwen 3835) with Open Shrubland of *Acacia bivenosa* and *Grevillea wickhamii* subsp. *hispidula* with Scattered Low Trees of *Eucalyptus leucophloia* subsp. *leucophloia* on Red-Brown Skeletal Loam on Hillslopes.
- Triodia Open Hummock Grassland (TOHG3)** Open Hummock Grassland of *Triodia* sp. Shovelanna Hill (S. van Leeuwen 3835) and *T. wiseana* with Open Shrubland of *Acacia bivenosa* with Scattered Mallees of *Eucalyptus gamophylla* and *E. leucophloia* subsp. *leucophloia* (Trees) on Red-Brown Skeletal Loam on Low Hillslopes.

### APPENDIX A

#### RARE, PRIORITY AND THREATENED FLORA SPECIES

Appendix A1 – Definition of Rare and Priority Flora Species (DEC 2008c)

Conservation Code	Category
<b>R</b>	<p><b>Declared Rare Flora - Extant Taxa</b></p> <p>Taxa which have been adequately searched for and are deemed to be in the wild either rare, in danger of extinction, or otherwise in need of special protection, and have been gazetted as such.</p>
<b>X</b>	<p><b>Declared Rare Flora - Presumed Extinct Taxa</b></p> <p>Taxa which have not been collected, or otherwise verified, over the past 50 years despite thorough searching, or of which all known wild populations have been destroyed more recently, and have been gazetted as such.</p>
<b>P1</b>	<p><b>Priority One - Poorly Known Taxa</b></p> <p>Taxa which are known from one or a few (generally &lt;5) populations which are under threat, either due to small population size, or being on lands under immediate threat, e.g. road verges, urban areas, farmland, active mineral leases, etc., or the plants are under threat, e.g. from disease, grazing by feral animals, etc. May include taxa with threatened populations on protected lands. Such taxa are under consideration for declaration as 'rare flora', but are in urgent need of further survey.</p>
<b>P2</b>	<p><b>Priority Two - Poorly Known Taxa</b></p> <p>Taxa which are known from one or a few (generally &lt;5) populations, at least some of which are not believed to be under immediate threat (i.e. not currently endangered). Such taxa are under consideration for declaration as 'rare flora', but urgently need further survey.</p>
<b>P3</b>	<p><b>Priority Three - Poorly Known Taxa</b></p> <p>Taxa which are known from several populations, and the taxa are not believed to be under immediate threat (i.e. not currently endangered), either due to the number of known populations (generally &gt;5), or known populations being large, and either widespread or protected. Such taxa are under consideration for declaration as 'rare flora' but are in need of further survey.</p>
<b>P4</b>	<p><b>Priority Four - Rare Taxa</b></p> <p>Taxa which are considered to have been adequately surveyed and which, whilst being rare (in Australia), are not currently threatened by any identifiable factors. These taxa require monitoring every 5-10 years.</p>

Appendix A2 – Categories of Threatened Flora Species  
(DEC 2008c)

<b>Category Code</b>	<b>Category</b>
<b>Ex</b>	<p><b>Extinct</b></p> <p>Taxa which at a particular time if, at the time, there is no reasonable doubt that the last member of the species has died.</p>
<b>ExW</b>	<p><b>Extinct in the Wild</b></p> <p>Taxa which is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; or it has not been recorded in its known and/or expected habitat, at appropriate seasons, anywhere in its past range, despite exhaustive surveys over a time frame appropriate to its life cycle and form.</p>
<b>CE</b>	<p><b>Critically Endangered</b></p> <p>Taxa which at a particular time, it is facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with the prescribed criteria.</p>
<b>E</b>	<p><b>Endangered</b></p> <p>Taxa which is not critically endangered and it is facing a very high risk of extinction in the wild in the medium-term future, as determined in accordance with the prescribed criteria.</p>
<b>V</b>	<p><b>Vulnerable</b></p> <p>Taxa which is not critically endangered or endangered and is facing a high risk of extinction in the wild in the medium-term future, as determined in accordance with the prescribed criteria.</p>
<b>CD</b>	<p><b>Conservation Dependent</b></p> <p>Taxa which at a particular time if, at that time, the species is the focus of a specific conservation program, the cessation of which would result in the species becoming vulnerable, endangered or critically endangered within five years.</p>

## Appendix A3 – Threatened and Priority Flora Species Potentially Occurring in the Project Area

Species	Code	Description (WAH 2009)
<i>Lepidium catapycnon</i>	DRF & Vulnerable	Woody perennial herb or shrub to 0.3 m high. Found on skeletal soils on hillsides.
<i>Amaranthus</i> sp. Todd River (G. Chippendale 482)	P1	Herb.
<i>Aristida jerichoensis</i> var. <i>subspinulifera</i>	P1	Compactly tufted perennial, grass-like or herb, 0.3–0.8 m high, lemma groove muricate. Hardpan plains.
<i>Brachyscome</i> sp. Wanna Munna Flats (S. van Leeuwen 4662)	P1	Herb.
<i>Brunonia</i> sp. long hairs (D.E. Symon 2440)	P1	Erect herb, to 0.07 m high, with long spreading hairs on the leaves; spike to 0.3 m high. Along creeklines.
<i>Crotalaria smithiana</i>	P1	Annual, herb, to 0.4 m high. Fl. yellow, Jun. Regeneration site on floodplain
<i>Eremophila rigida</i>	P1	Bushy shrub, 0.3–4 m high. Fl. cream, Sep. Red sand alluvium. Hardpan plains, stony clay depressions.
<i>Goodenia lyrata</i>	P1	Prostrate herb, with lyrate leaves. Fl. yellow, Aug. Red sandy loam. Near claypan.
<i>Goodenia</i> sp. East Pilbara (AA Mitchell PRP 727)	P1	Open, erect annual or biennial herb to 0.2 m high. Found on clay soil, calcrete pebbles, low undulating plain, or swampy plains.
<i>Goodenia</i> sp. Pilbara calcrete (A.A. Mitchell PRP 1436)	P1	Herb.
<i>Isotropis parviflora</i>	P2	Shrub, 0.1 m high. Fl. white, pink, Mar. Valley slope of ironstone plateau.
<i>Goodenia hartiana</i>	P2	Erect to spreading, multistemmed perennial, herb or shrub (sub-shrub). Fl. blue, purple, Aug – Sep. Sand. Sand dune swales, sandhills.
<i>Acacia subtiliformis</i>	P3	Shrub to tree.
<i>Eremophila magnifica</i> subsp. <i>velutina</i>	P3	Shrub 0.5-1.5m high. Found on skeletal soils over ironstone on hill summits.
<i>Gymnanthera cunninghamii</i>	P3	Erect shrub, 1–2 m high. Fl. cream, yellow, green, Jan–Dec. Sandy soils.
<i>Nicotiana umbratica</i>	P3	Erect, short-lived annual or perennial, herb, 0.3–0.7 m high. Fl. white, Apr–Jun. Shallow soils. Rocky outcrops.
<i>Rhagodia</i> sp. Hamersley (M. Trudgen 17794)	P3	Shrub or herb.
<i>Tephrosia</i> sp. Cathedral Gorge (F.H. Mollemans 2420)	P3	Erect shrub 0.25 m. Found on clay-sand and pebbles.
<i>Themeda</i> sp. Hamersley Station (M. E. Trudgen 11431)	P3	Tussocky perennial, grass-like or herb, 0.9–1.8 m high. Fl. Aug. Red clay. Clay pan, grass plain.
<i>Eremophila magnifica</i> subsp. <i>magnifica</i>	P4	Shrub, 0.5–1.5 m high. Fl. blue, Aug–Nov. Skeletal soils over ironstone. Rocky screes.

# **APPENDIX B DEFINITION OF THREATENED AND PRIORITY ECOLOGICAL COMMUNITIES**

## NEWMAN TO JIMBLEBAR TRANSMISSION LINE AND NEWMAN TOWN SUBSTATION FLORA AND VEGETATION ASSESSMENT

### APPENDIX B

#### DEFINITIONS OF THREATENED AND PRIORITY ECOLOGICAL COMMUNITIES

##### B1: Definitions of Threatened Ecological Communities

###### Presumed Totally Destroyed (PD)

An ecological community will be listed as presumed totally destroyed if there are no recent records of the community being extant **and either** of the following applies (A or B);

- A) Records within the last 50 years have not been confirmed despite thorough searches or known or likely habitats **or**
- B) All occurrences recorded within the last 50 years have since been destroyed.

###### Critically Endangered (CR)

An ecological community will be listed as **Critically Endangered** when it has been adequately surveyed and is found to be facing an extremely high risk of total destruction in the immediate future. This will be determined on the basis of the best available information, by it meeting **any one or more** of the following criteria (A, B or C):

- A) The estimated geographic range, and/or total area occupied, and/or number of discrete occurrences since European settlement have been reduced by at least 90% and **either or both** of the following apply (i or ii)
  - i) geographic range, and/or total area occupied and/or number of discrete occurrences are continuing to decline such that total destruction of the community is imminent (within approximately 5 years)
  - ii) modification throughout its range is continuing such that in the immediate future (within approximately 5 years) the community is unlikely to be capable of being substantially rehabilitated.
- B) Current distribution is limited, and **one or more** of the following apply (i, ii or iii):
  - i) geographic range and/or number of discrete occurrences, and/or area occupied is highly restricted and the community is currently subject to known threatening processes which are likely to result in total destruction throughout its range in the immediate future (within approximately 5 years)
  - ii) there are very few occurrences, each of which is small and/or isolated and extremely vulnerable to known threatening processes
  - iii) there may be many occurrences but total area is very small and each occurrence is small and/or isolated and extremely vulnerable to known threatening processes

- C) The ecological community exists only as highly modified occurrences which may be capable of being rehabilitated if such work begins in the immediate future (within approximately 5 years)

### **Endangered (EN)**

An ecological community will be listed as **Endangered** when it has been adequately surveyed and is not Critically Endangered but is facing a very high risk of total destruction in the near future. This will be determined on the basis of the best available information, by it meeting **any one or more** of the following criteria (A, B or C):

- A) The estimated geographic range, and/or total area occupied, and/or number of discrete occurrences since European settlement have been reduced by at least 70% and **either or both** of the following apply (i or ii)
- i) geographic range, and/or total area occupied and/or number of discrete occurrences are continuing to decline such that total destruction of the community is likely in the short term (within approximately 10 years)
  - ii) modification throughout its range is continuing such that in the short term future (within approximately 10 years) the community is unlikely to be capable of being substantially restored or rehabilitated.
- B) Current distribution is limited, and **one or more** of the following apply (i, ii or iii):
- i) geographic range and/or number of discrete occurrences, and/or area occupied is highly restricted and the community is currently subject to known threatening processes which are likely to result in total destruction throughout its range in the short term future (within approximately 10 years)
  - ii) there are very few occurrences, each of which is small and/or isolated and extremely vulnerable to known threatening processes
  - iii) there may be many occurrences but total area is very small and each occurrence is small and/or isolated and extremely vulnerable to known threatening processes
- C) The ecological community exists only as highly modified occurrences which may be capable of being rehabilitated if such work begins in the short term future (within approximately 10 years).

### **Vulnerable (VU)**

An ecological community will be listed as **Vulnerable** when it has been adequately surveyed and is not Critically Endangered or Endangered but is facing a high risk of total destruction in the medium to long term future. This will be determined on the basis of the best available information, by it meeting **any one or more** of the following criteria (A, B or C):

- A) The ecological community exists largely as modified occurrences which are likely to be capable of being substantially restored or rehabilitated.
- B) The ecological community can be modified or destroyed and would be vulnerable to threatening processes, is restricted in area and/or range and/or is only found at a few locations.
- C) The ecological community may still be widespread but is believed likely to move into a category of higher threat in the medium to long term future because of existing or impending threatening processes.

## **B2: Definitions of Priority Ecological Communities**

Possible threatened ecological communities that do not meet survey criteria or that are not adequately defined are added to the Priority Ecological Community Lists under Priorities 1, 2 and 3. These three categories are ranked in order of priority for survey and/or definition of the community, and evaluation of conservation status, so that consideration can be given to their declaration as threatened ecological communities. Ecological Communities that are adequately known, and are rare but not threatened or meet criteria for Near Threatened, or that have been recently removed from the threatened list, are placed in Priority 4. These ecological communities require regular monitoring. Conservation Dependent ecological communities are placed in Priority 5.

**Priority One:** Poorly known ecological communities Ecological communities with apparently few, small occurrences, all or most not actively managed for conservation (e.g. within agricultural or pastoral lands, urban areas, active mineral leases) and for which current threats exist. Communities may be included if they are comparatively well known from one or more localities but do not meet adequacy of survey requirements, and/or are not well defined, and appear to be under immediate threat from known threatening processes across their range.

**Priority Two:** Poorly known ecological communities. Communities that are known from few small occurrences, all or most of which are actively managed for conservation (e.g. within national parks, conservation parks, nature reserves, State forest, unallocated Crown land, water reserves, etc.) and not under imminent threat of destruction or degradation.

Communities may be included if they are comparatively well known from one or more localities but do not meet adequacy of survey requirements, and/or are not well defined, and appear to be under threat from known threatening processes.

**Priority Three:** Poorly known ecological communities

- (i) Communities that are known from several to many occurrences, a significant number or area of which are not under threat of habitat destruction or degradation or:
- (ii) Communities known from a few widespread occurrences, which are either large or within significant remaining areas of habitat in which other occurrences may occur, much of it not under imminent threat, or;
- (iii) Communities made up of large, and/or widespread occurrences, that may or not be represented in the reserve system, but are under threat of modification across much of their range from processes such as grazing by domestic and/or feral stock, and inappropriate fire regimes.

Communities may be included if they are comparatively well known from several localities but do not meet adequacy of survey requirements and/or are not well defined, and known threatening processes exist that could affect them.

**Priority Four:** Ecological communities that are adequately known, rare but not threatened or meet criteria for Near Threatened, or that have been recently removed from the threatened list. These communities require regular monitoring.

- (a) Rare. Ecological communities known from few occurrences that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and

that are considered not currently threatened or in need of special protection, but could be if present circumstances change. These communities are usually represented on conservation lands.

- (b) Near Threatened. Ecological communities that are considered to have been adequately surveyed and that do not qualify for Conservation Dependent, but that are close to qualifying for Vulnerable.
- (c) Ecological communities that have been removed from the list of threatened communities during the past five years.

**Priority Five:** Conservation Dependent ecological communities. Ecological communities that are not threatened but are subject to a specific conservation program, the cessation of which would result in the community becoming threatened within five years.

**APPENDIX C**  
**ENVIRONMENTAL WEEDS AND**  
**DECLARED PLANT CATEGORIES**  
**AND INTRODUCED FLORA**  
**SPECIES POTENTIALLY**  
**OCCURRING IN THE**  
**PROJECT AREA**

## NEWMAN TO JIMBLEBAR TRANSMISSION LINE AND NEWMAN TOWN SUBSTATION FLORA AND VEGETATION ASSESSMENT

### APPENDIX C

#### ENVIRONMENTAL WEEDS AND DECLARED PLANT CATEGORIES AND INTRODUCED FLORA SPECIES POTENTIALLY OCCURRING IN THE PROJECT AREA

##### C1: Criteria used for Ranking Environmental Weeds

The Environmental Weed Strategy for Western Australia (CALM 1999) contains criteria for the assessment and ranking of weeds in terms of their environmental impact on biodiversity. These criteria are as follows:

- **Invasiveness** – ability to invade bushland in good to excellent condition or ability to invade waterways. (Score as yes or no).
- **Distribution** – wide current or potential distribution including consideration of known history of wide spread distribution elsewhere in the world. (Score as yes or no).
- **Environmental Impacts** – ability to change the structure, composition and function of ecosystems. In particular an ability to form a monoculture in a vegetation community. (Score as yes or no).

The rating of each weed is determined by the following scoring system:

- **High** - a weed species would have to score yes for all three criteria. Rating a weed species as high would indicate prioritising this weed for control and/or research i.e. prioritising funding to it.
- **Moderate** -a weed species would have to score yes for two of the above criteria. Rating a weed species as moderate would indicate that control or research effort should be directed to it if funds are available, however it should be monitored (possibly a reasonably high level of monitoring).
- **Mild** – a weed species scoring one of the criteria. A mild rating would indicate monitoring of the week and control where appropriate.
- **Low** – a weed species would score none of the criteria. A low ranking would mean that this species would require a low level of monitoring.

Source: Department of Conservation and Land Management (1999). *Environmental Weed Strategy for Western Australia*. Department of Conservation and Land Management, Perth, Western Australia.

## **C2: Standard Meanings of Declared Plant Categories**

### **P1**

Prohibits movement.

The movement of plants or their seeds is prohibited within the State.

This prohibits the movement of contaminated machinery and produce including livestock and fodder.

### **P2**

Aim is to eradicate infestation.

Treat all plants to destroy and prevent propagation each year until no plants remain. The infested area must be managed in such a way that prevents the spread of seed or plant parts on or in livestock, fodder, grain, vehicles and/or machinery.

### **P3**

Aims to control infestation by reducing area and/or density of infestation.

The infested area must be managed in such a way that prevents the spread of seed or plant parts within and from the property on or in livestock, fodder, grain, vehicles and/or machinery.

Treat to destroy and prevent seed set all plants:

- \* Within 50m inside of the boundaries of the infestation;
- \* within 50m of roads and high water mark on waterways;
- \* within 50m of sheds, stock yards and houses.

Treatment must be done prior to seed set each year.

Properties with less than 20ha of infestation must treat the entire infestation.

Additional areas may be ordered to be treated.

### **P4**

Aims to prevent infestation spreading beyond existing boundaries of infestation

The infested area must be managed in such a way that prevents the spread of seed or plant parts within and from the property on or in livestock, fodder, grain, vehicles and/or machinery.

Treat to destroy and prevent seed set all plants:

- \* within 50m inside of the boundaries of the infested property for one-leaf and 20m for two-leaf;
- \* within 50m of roads and high water mark on waterways;
- \* within 50m of sheds, stock yards and houses.

Treatment must be done prior to seed set each year. Properties with less than 20ha of infestation must treat the entire infestation.

Additional areas may be ordered to be treated.

Special considerations.

In the case of P4 infestations where they continue across property boundaries there is no requirement to treat the relevant part of the property boundaries as long as the boundaries of the infestation as a whole are treated. There must be agreement between neighbours in relation to the treatment of these areas.

## **P5**

Aims to control infestations on public lands.

Source: Department of Agriculture and Food (2008). *List of Declared Plants*. Department of Agriculture and Food, Western Australia. Online: <http://www.agric.wa.gov.au/>.

### C3: Introduced Flora Species Potentially Occurring in the Project Area

Species	Rating	Description (WAH 2009)
* <i>Acetosa vesicaria</i>	High	Ruby dock Common on roadsides and in disturbed areas in the arid zone.
* <i>Aerva javanica</i>	High	Kapok Bush Has become a widespread weed of roadsides, creeklines and disturbed areas.
* <i>Cenchrus ciliaris</i>	High	Buffel grass Widely planted as a pastoral grass. Has become a widespread weed of roadsides, creeklines and most vegetation types in the Pilbara.
* <i>Vachellia farnesiana</i>	High	Mimosa Bush Common in low-lying areas, river and creek banks and disturbed sites.
* <i>Cynodon dactylon</i>	Moderate	Couch grass Widely planted as a lawn grass.
* <i>Malvastrum americanum</i>	Moderate	Spiked Malvastrum Weed of river and creek margins, wastelands and arid zone habitats.
* <i>Solanum nigrum</i>	Moderate	Black Berry Nightshade Common amongst medium trees in sand, wet soil; occupying river banks, swamps and plains. Found in both disturbed and undisturbed natural vegetation.
* <i>Sonchus oleraceus</i>	Moderate	Common Sowthistle Common on roadsides and disturbed land.
* <i>Alternanthera pungens</i>	Low	Khaki Weed; Creeping chaffweed; Joyweed Found on flat plains, creek banks, drainage channels and roadsides.
* <i>Chloris virgata</i>	Low	Feathertop Rhodes Grass Commonly found on sand dunes.
* <i>Citrullus lanatus</i>	Low	Pie Melon Commonly found on disturbed areas, plains, river banks, and drainage areas.
* <i>Conyza bonariensis</i>	Low	Flaxleay Fleabane Found on a variety of soils. Often located in waste places and roadsides.

Species	Rating	Description (WAH 2009)
* <i>Setaria verticillata</i>	Low	Common and widespread weed of disturbed land, riverine edges and shrublands in the Pilbara.
* <i>Bidens bipinnata</i>	TBA	Bipinnate Beggartick Favours wetlands and is thought to be spread by cattle.
* <i>Portulaca oleracea</i>	N/A	Purslane Common on clay loam and sand and on disturbed land.
* <i>Cucumis melo</i> subsp. <i>agrestis</i>	N/A	Ulcardo Melon Common in the Kimberly and Pilbara bioregions.
* <i>Tribulus terrestris</i>	N/A	Often on sandy soils and found in waste places.

# **BUSH FOREVER CONDITION**

# **SCALE**

**NEWMAN TO JIMBLEBAR TRANSMISSION LINE AND NEWMAN TOWN  
SUBSTATION FLORA AND VEGETATION ASSESSMENT**

**APPENDIX F**

**F1: BUSH FOREVER CONDITION SCALE**

<b>Condition Scale Code</b>	<b>Condition Scale</b>
<b>P</b>	<b>Pristine (1)</b> Pristine or nearly so, no obvious signs of disturbance
<b>E</b>	<b>Excellent (2)</b> Vegetation structure intact, disturbance affecting individual species and weeds are non-aggressive species.
<b>VG</b>	<b>Very Good (3)</b> Vegetation structure altered, obvious signs of disturbance. For example, disturbance to vegetation structure caused by repeated fires, the presence of some more aggressive weeds, dieback, logging and grazing.
<b>G</b>	<b>Good (4)</b> Vegetation structure significantly altered by very obvious signs of multiple disturbance. Retains basic vegetation structure or ability to regenerate it. For example, disturbance to vegetation structure caused by very frequent fires, the presence of some very aggressive weeds at high density, partial clearing, dieback and grazing.
<b>D</b>	<b>Degraded (5)</b> Basic vegetation structure severely impacted by disturbance. Scope for regeneration but not to a state approaching good condition without intensive management. For example, disturbance to vegetation structure caused by very frequent fires, the presence of very aggressive weeds, partial clearing, dieback and grazing.
<b>CD</b>	<b>Completely Degraded (6)</b> The structure of the vegetation is no longer intact and the area is completely or almost completely without native species. These areas are often described as 'parkland cleared' with the flora comprising weed or crop species with isolated native trees or shrubs.
