EXECUTIVE SUMMARY

Main Roads Western Australia (MRWA) is proposing to construct thirteen passing lanes on the Brand Highway between Gingin and Eneabba in Western Australia. Three flora and vegetation surveys of the study area have been previously been undertaken, however the EPBC Act listed “Banksia Woodlands of the Swan Coastal Plain” Threatened Ecological Community (TEC), which was listed as Endangered by the Department of Environment and Energy on 16 September 2016, was not considered to have been accurately delineated. Consequently, *ecologia* was commissioned by MRWA to undertake an additional vegetation survey to collect floristic data that would enable the TEC to be more accurately characterised and mapped.

A field survey was undertaken in November 2017, where thirty-one 10 x 10 metre floristic quadrats were assessed. A total of 113 quadrats have therefore now been assessed within the close vicinity of the Brand Highway study area over four surveys undertaken in 2016 and 2017. Of these, 40 quadrats from the Swan Coastal Plain were assessed as being representative of the Banksia Woodlands of the Swan Coastal Plain TEC, based on the key diagnostic criteria outlined in the *Approved Conservation Advice* (Threatened Species Scientific Committee 2016). The TEC within the study area also broadly corresponds to the P3 Priority Ecological Community (PEC) FCT23b. Ten patches of the TEC/FCT23b in ‘Good’ or better condition, ranging from 0.56 to 178 hectares in size, were mapped across the southern section of the study area on the Swan Coastal Plain, totalling 294.3 ha.

The Banksia Woodlands TEC within the study area is characterised by dominant *Banksia attenuata*, *B. menziesii* or *B. prionotes* in the upper canopy layer, together with a highly diverse understorey of shrubs and herbs. Emergent *Corymbia calophylla* and *Eucalyptus todtiana* are also present within many examples of the community. A total of 352 vascular plant taxa were recorded across all the Banksia woodland quadrats assessed within the study area, with a mean species richness of 41.7 taxa. The most frequently occurring understorey species included *Burchardia congesta*, *Mesomelaena pseudostygia*, *Eremaea pauciflora*, *Bossiaea eriocarpa*, *Stirlingia latifolia*, *Alexgeorgea nitens*, and *Lyginia barbata*, which are also typical for the community in a broader context. Only 16 species were recorded in 50% or more Banksia woodland quadrats. This low number of frequently occurring species is indicative of high species turnover across the study area.

Hierarchical cluster analysis indicated that quadrats identified as representing the Banksia Woodlands TEC belong to several distinct clusters and do not form a cohesive floristic group, highlighting the high degree of understorey variability present within the community. Banksia woodland quadrats from the Swan Coastal Plain and the Geraldton Sandplain are intermixed, indicating that these communities, as broadly defined here, cannot be distinguished based on overall species composition.

1 INTRODUCTION

1.1 PROJECT BACKGROUND

Main Roads Western Australia (MRWA) is proposing to construct thirteen passing lanes on the Brand Highway between Gingin and Eneabba in Western Australia (the study area, Figure 1.1). Previous flora and vegetation surveys of the study area have been undertaken by GHD (GHD 2016a, b) and Astron (Astron 2016). The extent of the EPBC Act listed Banksia Woodlands of the Swan Coastal Plain Threatened Ecological Community ('the TEC'), which was listed as Endangered by the Department of Environment and Energy on 16 September 2016, was not considered to have been accurately delineated during these surveys. Consequently, *ecologia* was commissioned by MRWA to undertake an additional vegetation survey to collect floristic data that would enable the TEC to be more accurately characterised and mapped.

1.2 SURVEY OBJECTIVES

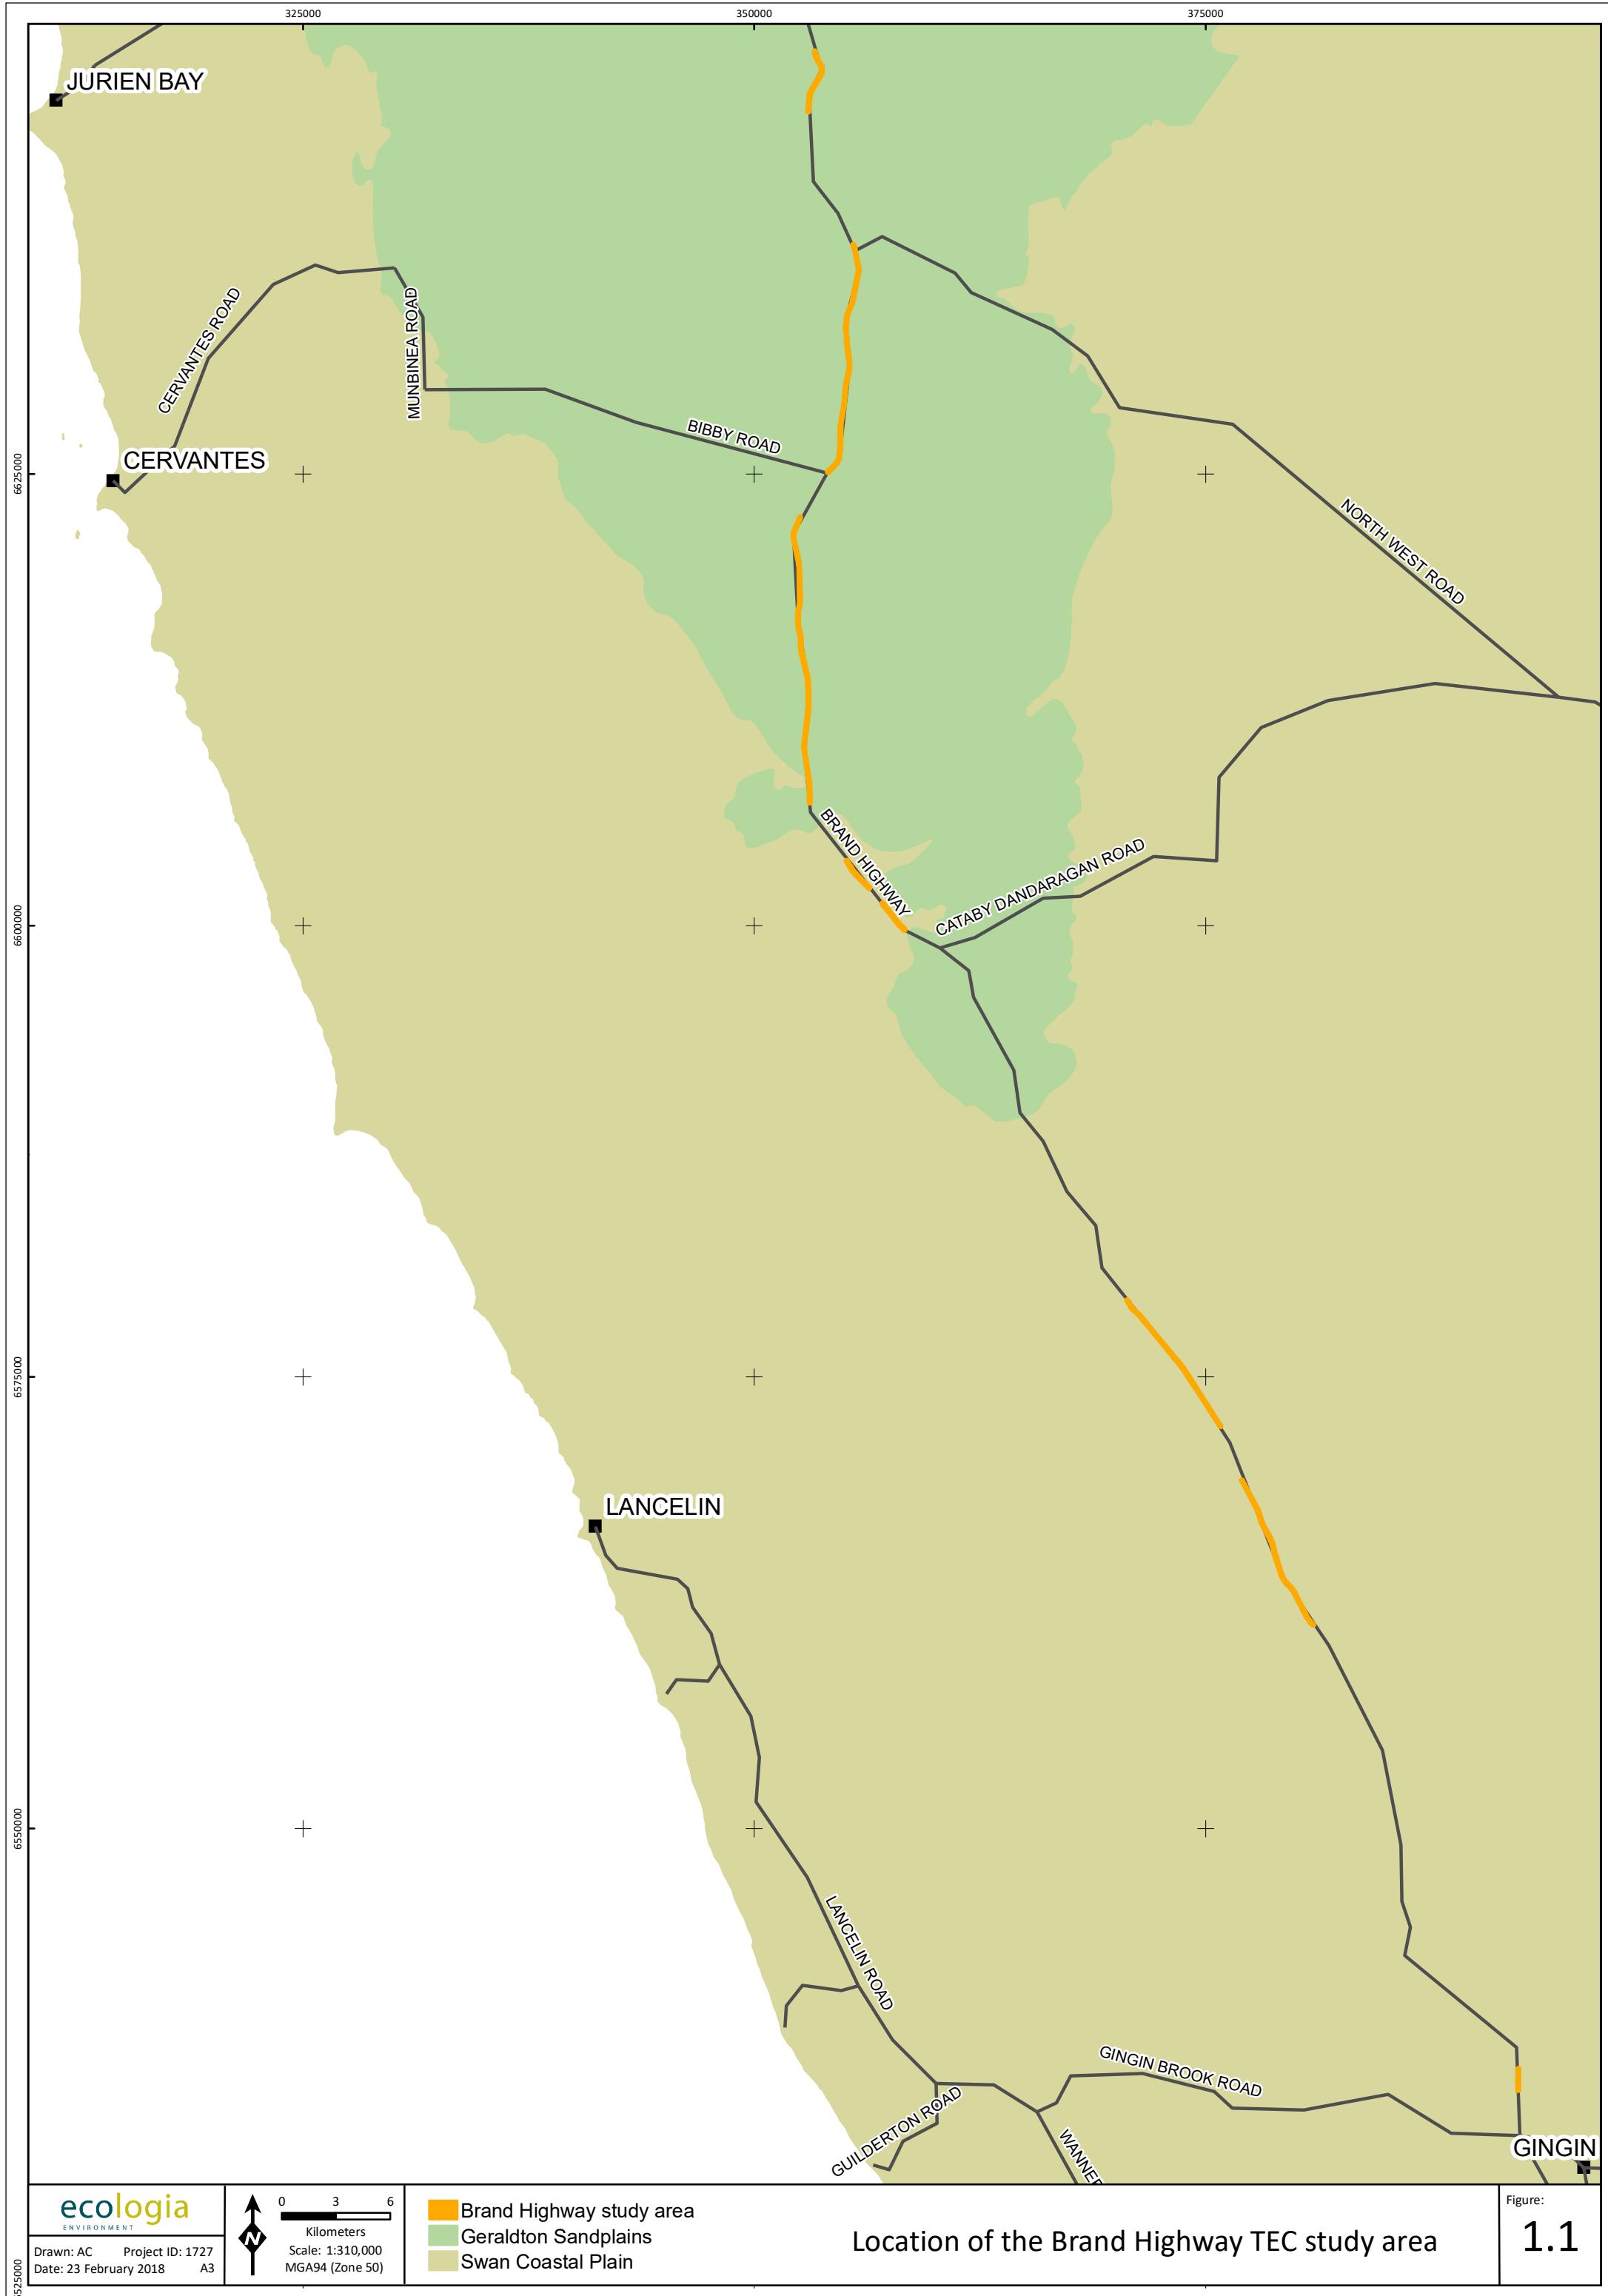

The objectives of the current survey were to:

- Survey additional 10 metre (m) x 10 m floristic quadrats within the study area in vegetation communities potentially representing the TEC, focussing on areas that had not been sufficiently assessed during previous surveys;
- Collate these quadrat data with those collected during previous surveys to identify and characterise the TEC within the study area;
- Use ground-truthed quadrat data to more accurately map the extent of the TEC within and immediately adjacent to the study area.

1.3 LEGISLATIVE FRAMEWORK

The survey was designed and undertaken to comply with the following guidance documents:

- Environmental Factor Guideline: Flora and Vegetation (EPA 2016a);
- Technical Guidance— Flora and Vegetation Surveys for Environmental Impact Assessment (EPA 2016b);
- Approved Conservation Advice (incorporating listing advice) for the Banksia Woodlands of the Swan Coastal Plain ecological community (Threatened Species Scientific Committee 2016).

2 METHODOLOGY

2.1 FIELD ASSESSMENT

The field survey was undertaken between 7 and 11 November 2017. Thirty-one 10 m x 10 m quadrats were assessed to determine the presence and extent of the Banksia Woodlands of the Swan Coastal Plain ecological community within the study area. These quadrats were in addition to eighty-two 10 m x 10 m quadrats that have previously been surveyed within the area (Astron 2016, GHD 2016a, b). Quadrats were established within vegetation patches that were considered to potentially represent the TEC (see section 2.3). Quadrat locations were selected to in-fill areas that were not sampled during the previous surveys. Although the TEC does not occur within the Geraldton Sandplain IBRA bioregion (Threatened Species Scientific Committee 2016), several additional quadrats were sampled within *Banksia* woodlands on the Geraldton Sandplain in the northern section of the study area, as these were considered, based on field observations, to broadly represent the same *Banksia* community as that on the Swan Coastal Plain in the south of the study area. In some cases, quadrats were positioned outside of the boundaries of the study area to avoid edge effects or if the vegetation within the study area boundary was not sufficiently wide to accommodate a quadrat. The following were recorded at each quadrat:

- Site number and location (GPS co-ordinate of the north-west corner);
- Photograph from the north-west corner;
- Size and shape of quadrat;
- A comprehensive species list (including weeds), and the dominant growth form, height, and estimated foliage cover of each species;
- Additional information including landform and soils; and
- Vegetation condition (Keighery 1994) and description of disturbance.

2.2 SPECIMEN IDENTIFICATION

Specimen identification was undertaken with reference to current taxonomic literature and herbarium reference specimens. Scientific names used in this report follow species concepts currently adopted by the Western Australian Herbarium. Specimens that were believed to differ somewhat from typical material were indicated with 'affinity' (aff.). Specimens that could not be adequately identified to genus or species level due to the absence of flower or fruit structures required for positive identification were indicated with a question mark, but were not considered to be otherwise anomalous.

2.3 IDENTIFYING THE BANKSIA WOODLANDS OF THE SWAN COASTAL PLAIN TEC

A number of key diagnostic characteristics are used to define the Banksia Woodlands of the Swan Coastal Plain ecological community, which are outlined in *Banksia Woodlands of the Swan Coastal Plain Approved Conservation Advice* (Threatened Species Scientific Committee 2016). These are summarised below, and were used to determine whether the vegetation community represented by a quadrat and associated floristic data corresponded with the TEC.

1. Key Diagnostic Characteristics

Location

- Swan Coastal Plain IBRA bioregion (SWA01, SWA02), and extending into the Jarrah Forest bioregion (JAF01, JAF02).

Soils and Landform

- Well drained, low nutrient soils on sandplains - Bassendean and Spearwood sands and occasionally on Quindalup sands; it is also common on sandy colluvium and aeolian sands of the Ridge Hill Shelf, Whicher Scarp and Dandaragan Plateau, and in other less common scenarios.

Structure

- The community is typically a woodland (although it may occur as a shrubland, open woodland or forest) with a distinctive upper sclerophyllous layer of low trees typically dominated or co-dominated one or more diagnostic *Banksia* species (below), with at least 2% canopy cover of those species;
- Emergent trees of medium or tall (>10 m) eucalypts (typically *Corymbia calophylla*, *Eucalyptus gomphocephala*, or *E. marginata*) or *Allocasuarina* may be present above the *Banksia* canopy;
- An often highly species-rich understorey of shrubs and herbs.

Composition

- The canopy is most commonly dominated by *Banksia attenuata*, *B. menziesii*, *B. prionotes*, or *B. ilicifolia*, and must include at least one of these species;
- If present, the emergent tree layer often includes *Corymbia calophylla*, *Eucalyptus marginata*, *E. gomphocephala*; lower trees often include *E. todtiana*, *Nuytsia floribunda*, *Allocasuarina fraseriana*, *Callitris arenaria*, *C. pyramidalis*, and *Xylomelum occidentale*.

2. Patch Condition

A patch must meet at least the 'Good' condition category (Keighery 1994), typically with at least 'low' native plant species diversity (relative to the expected range of diversity for that vegetation unit, where comparative data exists) and weeds at 5-50% cover. Patches that do not meet the minimum condition thresholds are excluded from national protection.

3. Minimum Patch Size Threshold

To be part of the TEC, minimum patch sizes apply based on vegetation condition (Keighery 1994): 'Pristine' (no minimum patch size); 'Excellent' (minimum of 0.5 ha); 'Very Good' (minimum of 1 ha); 'Good' (minimum of 2 ha).

4. Additional Considerations

- A patch is a discrete and mostly continuous area of the ecological community and may include small-scale (<30 m) variations, gaps and disturbances, such as tracks, paths or breaks;
- Variation in canopy cover, quality or condition of vegetation across a patch should not initially be considered evidence of multiple patches;
- The community is highly diverse and variable; the composition often changes across the patch, but structure and the presence of a significant *Banksia* component are unifying features;
- Restored (revegetated or replanted) sites are not excluded from the listed community.

2.4 SWAN COASTAL PLAIN BANKSIA ATTENUATA - BANKSIA MENZIESII WOODLANDS PEC

The Swan Coastal Plain *Banksia attenuata* - *Banksia menziesii* woodlands DBCA listed Priority 3 PEC (floristic community type (FCT) 23b of Gibson *et al.* 1994) is a component of the EPBC Act listed Endangered Banksia Woodlands of the Swan Coastal Plain ecological community. FCT23b occurs in the Bassendean system, from Melaleuca Park to Gingin, and is characterised by a set of frequently occurring species (Gibson *et al.* 1994), but is ultimately defined by overall floristic composition.

Assignment of a floristic community type is occasionally undertaken using multivariate cluster analysis, whereby floristic quadrat data are analysed together with that of the Gibson *et al.* (1994) dataset (the Swan Coastal Plain (SCP) dataset). The close overall floristic similarity of a quadrat to a SCP quadrat is considered indicative of it corresponding to the same FCT. However, the SCP dataset was not intended for this purpose, and the result of such analyses can be inconclusive and misleading. The SCP quadrats are confined to locations south of Seabird, approximately 25 kilometre (km) south of the current Brand Highway study area, so notable differences in overall floristic composition would be expected between quadrats due to high species turnover, even if they are considered to reflect the same broad vegetation community.

A more pragmatic approach was taken to identify the PEC here, whereby woodland communities within the study area (and occurring on the Swan Coastal Plain) where *B. attenuata* or *B. menziesii* are dominant in the upper canopy layer and with a diverse shrub and herb understorey, containing at least some species described as 'typical' for the community (i.e. they appear in at least 75% of FCT23b quadrats), were considered to at least broadly correspond to FCT23b (northern *Banksia attenuata* – *B. menziesii* woodlands).

Typical species with at least 75% frequent for FCT23b (Gibson *et al.* 1994) are: Trees: *Banksia attenuata* and *B. menziesii*; Shrubs: *Bossiaea eriocarpa*, *Calytrix flavescens*, *Eremaea pauciflora*, *Hibbertia subvaginata*, *Jacksonia floribunda*, *Petrophile linearis*, *Philoteca spicata*, and *Scholtzia involucrata*; and Herbs: *Alexgeorgea nitens*, *Anigozanthos humilis*, *Burchardia congesta*, *Lomandra hermaphrodita*, *Lyginia barbata*, *Patersonia occidentalis*, *Schoenus curvifolius*, *Stylidium repens*, and *Xanthosia huegelii*.

2.5 DATA ANALYSIS

Multivariate cluster analysis using floristic data provide an objective insight into the relationships between quadrats based on the degree of similarity in species composition. Analyses were conducted on floristic data collected from the 113 quadrats assessed as part of the current survey and three previous surveys of the Brand Highway study area (Astron 2016, GHD 2016a, b). All analyses were conducted using R statistical software (R Development Core Team 2016).

During two of the previous surveys (GHD 2016a, b) foliage cover was recorded in broad categories. For data analysis therefore, all records with ≤1% cover were treated as 1%, and when a cover range was recorded (e.g. 10-30%) the middle value was used (i.e. 20%). Taxa that could not be identified beyond genus level (e.g. *Lomandra* sp.) were excluded, although taxa with uncertainty (e.g. *Lyginia* ?*barbata*) were included together with the presumed species. Infraspecific taxa belonging to the same species were grouped if specimens could not be consistently identified to the same level. Annual species were retained.

Cluster analysis was conducted using the R package 'vegan' (Oksanen *et al.* 2017). The Bray-Curtis coefficient was used to calculate a site association matrix from transformed ($\log(x+1)$) species percent foliage cover data. Transformation is used in this case to downplay the relative influence of dominant species while increasing the relative influence of less abundant species. Unweighted arithmetic average clustering was then used to construct a dendrogram.

Indicator Species Analysis was conducted using the R package 'indicspecies' (De Caceres and Legendre 2009) to identify diagnostic species for the *Banksia* woodland quadrat group. Species with

high diagnostic value for a group are those that occur in all (or most) quadrats assigned to that group, but also occur in no (or few) quadrats outside of that group.

2.6 VEGETATION MAPPING

The Banksia woodlands of the Swan Coastal Plain TEC was mapped using ground-truthed site data and aerial imagery, with consideration given to condition thresholds, minimum patch size given vegetation condition, and small-scale gaps (< 30 m) between examples of the community. To remain consistent with the vegetation mapping of GHD (GHD 2016a, b) the community was mapped within a buffer zone of approximately 100 m extending from the centreline of the Brand Highway, and therefore mapping extends beyond the boundaries of the study area. The *Banksia* woodland community as defined here was also mapped within the Geraldton Sandplain IBRA bioregion in the north of the study area, as it corresponds to the same vegetation community.

2.7 STUDY TEAM AND LICENCES

This survey was coordinated, executed and reported by those summarised in Table 2.1.

Table 2.1 – Study team.

Project Staff			
Name	Qualifications	Role	Project role

The flora and vegetation assessment described in this report was conducted under the authorisation of the following DPaW licences:

Name	Licence Number	Licence
Brian Morgan	SL 011731	Licence to collect flora for scientific purposes

3 RESULTS AND DISCUSSION

3.1 KEY DIAGNOSTIC CHARACTERISTICS

Of the 113 quadrats assessed as part of this study, based on the biogeographic region, soils, landform, community structure and composition, and using the key diagnostic characters outlined in section 2.3, 40 quadrats corresponded with the Banksia Woodlands of the Swan Coastal Plain ecological community. An additional 20 quadrats from the Geraldton Sandplain bioregion in the north of the study area also floristically corresponded with the same vegetation community.

The broad community types present at *Banksia* woodland quadrats were typically *Banksia attenuata* or *B. menziesii* low open woodlands (56 quadrats), with four quadrats representing *B. prionotes* low open woodland (Table 3.1), although many examples of the community across the study area contain emergent *Corymbia calophylla* or *Eucalyptus todtiana*. Canopy cover of indicator *Banksia* species was at least 2% at all quadrats considered to be *Banksia* woodlands but was more typically between 10% and 40% (mean 23.1%). Overall floristic diversity was high, with 352 taxa (not including records that could not be fully identified) recorded across all *Banksia* woodland quadrats. Mean species richness per quadrat was 41.7, ranging from 21 to 65 species, including annual taxa and those that were recorded only in a single quadrat. Mean species richness here was slightly lower but comparable to that of the Northern *Banksia attenuata* – *Banksia menziesii* woodlands FCT23b (53.8 taxa) (Gibson *et al.* 1994).

Vegetation condition at all *Banksia* woodland quadrats was assessed as ‘Good’ or better according to the scale of Keighery (1994) with less than 50%, and usually much lower (mean 2.75%), introduced species cover (Table 3.1), therefore satisfying the minimum condition threshold for the TEC in all cases. Vegetation condition at most quadrats was considered ‘Excellent’ (58.3%), with fewer quadrats assessed as ‘Pristine’ (18.3%), ‘Very Good’ (18.3%), and ‘Good’ (5%). A total of 19 introduced species were recorded across all *Banksia* woodland quadrats, with mean weed species richness of 1.3 taxa.

Mapping of the TEC, including quadrat locations, is presented in Appendix A, and an overview of the TEC across the study area is shown in Figure 3.1. Twenty-six *Banksia* woodland patches were mapped across the study area, of which 10 occur on the Swan Coastal Plain and represent the Banksia Woodlands TEC. All SCP patches exceeded the patch size thresholds required for consideration as the TEC in relation to vegetation condition (Table 3.2). Only two SCP patches were less than 4 hectare (ha), and vegetation condition at both was assessed as ‘Excellent’ (Table 3.2). The Banksia Woodlands TEC is the dominant vegetation community occurring over most of the SCP section of the study area, comprising 294.3 ha of the total mapped area. *Banksia attenuata/menziesii* low open woodlands are present across approximately half of the GES section of the study area, comprising 237.9 ha (Figure 4.1).

3.2 SPECIES DIVERSITY AND INDICATOR SPECIES

A total of 352 vascular plant taxa, excluding those that could not be identified beyond genus level, were recorded from 60 *Banksia* woodland quadrats within the study area. The most diverse families (with 10 or more taxa) within the community were the Myrtaceae (46 taxa), Proteaceae (44 taxa), Fabaceae (32 taxa), Cyperaceae (22 taxa), Haemodoraceae (22 taxa), Asparagaceae (19 taxa), Ericaceae (18 taxa), Orchidaceae (16 taxa), Stylidiaceae (16 taxa), Droseraceae (15 taxa), Poaceae (15 taxa), Restionaceae (13 taxa), Dilleniaceae (12 taxa), Goodeniaceae (11 taxa) and Asteraceae (10 taxa). This floristic composition is also typical of the broader community (Threatened Species Scientific Committee 2016). A complete list of taxa recorded within *Banksia* woodland quadrats from all four surveys is included in Appendix B.

Key species for the *Banksia* woodland community within the study area are summarised in Table 3.3. The most frequently occurring understorey species included *Burchardia congesta*, *Mesomelaena*

pseudostygia, *Eremaea pauciflora*, *Bossiaea eriocarpa*, *Stirlingia latifolia*, *Alexgeorgea nitens*, and *Lyginia barbata*, which occur in over 65% of *Banksia* woodland quadrats. These species are also considered typical for the community in a broader context (Threatened Species Scientific Committee 2016). Only these 16 key species were present in 50% or more of the *Banksia* woodland quadrats, highlighting the high degree of variability in understorey species composition within the community, and there were no species recorded that occurred in all *Banksia* woodland quadrats. The low number of frequently occurring species within quadrats is indicative of high species turnover across the study area, which is a feature noted for the TEC generally (Threatened Species Scientific Committee 2016). Forty-six species had a significant association with the *Banksia* woodland group (Table 3.4), and are indicator species, to a greater or lesser degree, for the community within the study area. Of these, *Banksia attenuata*, *B. menziesii*, *Lyginia barbata*, *Stirlingia latifolia*, *Eremaea pauciflora*, *Bossiaea eriocarpa*, *Alexgeorgea nitens*, and *Adenanthes cygnorum* subsp. *cygnorum* showed the greatest level of association (> 0.65) within the *Banksia* woodland group.

3.3 VARIATION IN FLORISTIC DIVERSITY AND STRUCTURE WITHIN THE COMMUNITY

Hierarchical cluster analysis was conducted using floristic data from 113 quadrats surveyed within the study area. The 60 quadrats representing *Banksia* woodlands belong to several distinct clusters and do not form a cohesive floristic group, highlighting the high degree of understorey variability present within the community (Figure 3.2). Furthermore, *Banksia* woodland quadrats from the Swan Coastal Plain and the Geraldton Sandplain are intermixed, indicating that these communities, as broadly defined here, cannot be distinguished based on overall species composition.

Variation in indicator *Banksia* canopy cover is highly variable within the community, varying from 2% to 71% across all quadrats (Table 3.1). Towards the Geraldton Sandplain bioregion in the north of the study area, vegetation is increasingly dominated by low mixed heath communities (GHD 2016a, b), and *Banksia attenuata* and *B. menziesii* woodlands tend to be lower and sparser, generally confined to lower slopes on deeper sands. *Banksia* tree canopy cover was very low (< 2%) at some quadrats in this area (e.g. GA19), and therefore these were not considered to represent the TEC. Some quadrats in the same area (e.g. ECO09 and ECO11), however, had higher *Banksia* tree canopy cover (5% and 15% respectively), and were considered to correspond to the TEC. As a consequence of the high variability in vegetation structure and the intergradation of low *Banksia* woodlands with heaths, in some cases it was difficult to accurately delineate the boundary of the TEC.

3.4 SIMILARITY TO THE P3 PEC FCT23B (NORTHERN B. ATTENUATA – B. MENZIESII WOODLANDS)

Thirteen key or indicator species listed above for the Banksia Woodlands TEC within the study area (Table 3.3; Table 3.4) are also listed as one of 19 ‘typical’ species for the P3 Priority Ecological Community (PEC) FCT23b (Gibson *et al.* 1994). The remaining six typical species were also present within the community. Fifteen of the 18 ‘common’ species listed for FCT23b were also present. Consequently, the Banksia Woodlands of the Swan Coastal Plain TEC described and mapped as part of this study broadly corresponds to FCT23b.

Table 3.1 – Summary of *Banksia* woodland quadrats.

<i>Banksia</i> community type	Number of quadrats
<i>Banksia attenuata</i> low open woodland	14
<i>Banksia menziesii</i> low open woodland	2
<i>Banksia attenuata</i> and <i>B. menziesii</i> low open woodland	40
<i>Banksia prionotes</i> low open woodland	4
Indicator <i>Banksia</i> canopy cover	Canopy cover (%)
Minimum canopy cover	2
Maximum canopy cover	71
Mean canopy cover	23.1
Species richness	Species richness
Total number of taxa recorded	352
Minimum quadrat species richness	21
Maximum quadrat species richness	65
Mean quadrat species richness	41.7
Total weeds recorded	19
Mean weed richness	1.3
Weed cover	Foliage cover (%)
Minimum quadrat weed cover	0
Maximum quadrat weed cover	41
Mean quadrat weed cover	2.75
Vegetation condition (TEC quadrats)	Percentage of quadrats
Pristine	18.3%
Excellent	58.3%
Very Good	18.3%
Good	5.0%

Table 3.2 – Size and vegetation condition of *Banksia* woodland patches mapped across the study area.

Patch ID	IBRA	Area (ha)	Vegetation condition	Quadrat
Patch 1	GES	2.44	Good	ECO1
Patch 2	GES	5.97	Very Good - Excellent	GM14, GM16
Patch 3	GES	3.05	Very Good	ECO2
Patch 4	GES	19.41	Pristine	ECO9

<i>Conostylis angustifolia</i>	0.289	0.044

Coloured branches indicate quadrats representing *Banksia attenuata*/B. menziesii/B. prionotes woodlands; green branches are quadrats from SCP, blue branches are quadrats from GSP.

Figure 3.2 – Dendrogram summarising floristic relationships among quadrats.

3.5 FLORA SURVEY LIMITATIONS AND CONSTRAINTS

An assessment of survey-specific issues and limitations (EPA 2016b) is detailed in Table 3.5.

Table 3.5 – Survey limitations.

Constraint	Impact	Comment
Availability of contextual information at a regional and local scale	Nil	Local scale vegetation mapping and floristic data were available for the study area. This information was sufficient to provide appropriate contextual information for the current survey.
Competency/experience of the team carrying out the survey, including experience in the bioregion surveyed	Nil	The botanists carrying out the survey have extensive experience undertaking flora and vegetation surveys on the Swan Coastal Plain and Geraldton Sandplain.
Proportion of flora recorded and/or collected, any identification issues	Nil	Several specimens could not be adequately identified to species level due to the absence of required flowering or fruiting material. This is unlikely to have had any notable impact on the analysis or assessment presented.
Was the appropriate area fully surveyed (effort and extent)	Nil	Thirty-one quadrats were assessed during this survey in addition to 82 quadrats assessed during previous surveys. This level of survey effort is considered sufficient.
Access restrictions within the survey area	Nil	All parts of the study area were accessible.
Survey timing, rainfall, season of survey	Nil	The survey was conducted during the optimal season for floristic surveys in the South-West.
Disturbance that may have affected the results of survey such as fire, flood or clearing	Nil	There were no disturbances that constrained the survey.

APPENDIX B

**VASCULAR PLANT SPECIES RECORDED FROM
BANKSIA WOODLANDS**

FAMILY	NAME
ANARTHRIACEAE	<i>Anarthria laevis</i>
APIACEAE	<i>Apium prostratum</i> <i>Platysace</i> sp. <i>Xanthosia huegelii</i>
ARALIACEAE	<i>Hydrocotyle callicarpa</i> <i>Trachymene pilosa</i>
ASPARAGACEAE	? <i>Lomandra</i> sp. <i>Chamaescilla corymbosa</i> var. <i>corymbosa</i> <i>Laxmannia omnifertilis</i> <i>Laxmannia sessiliflora</i> <i>Lomandra</i> ? <i>caespitosa</i> <i>Lomandra caespitosa</i> <i>Lomandra hermaphrodita</i> <i>Lomandra preissii</i> <i>Lomandra sericea</i> <i>Lomandra</i> sp. <i>Sowerbaea laxiflora</i> <i>Thysanotus</i> ? <i>thyrsoides</i> <i>Thysanotus arbuscula</i> <i>Thysanotus dichotomus</i> <i>Thysanotus patersonii</i> <i>Thysanotus patersonii/manglesianus</i> <i>Thysanotus</i> sp. <i>Thysanotus sparteus</i> <i>Thysanotus spiniger</i> <i>Thysanotus thyrsoides</i> <i>Thysanotus triandrus</i>
ASTERACEAE	* <i>Arctotheca calendula</i> <i>Helichrysum luteoalbum</i> * <i>Hypochaeris glabra</i> * <i>Hypochaeris radicata</i> <i>Podotheca angustifolia</i> <i>Podotheca gnaphalioides</i> <i>Pterochaeta paniculata</i> * <i>Sonchus oleraceus</i> * <i>Ursinia anthemoides</i> subsp. <i>anthemoides</i> <i>Waitzia suaveolens</i> <i>Waitzia suaveolens</i> var. <i>suaveolens</i>
BRASSICACEAE	* <i>Sisymbrium</i> sp.
CAMPANULACEAE	* <i>Wahlenbergia capensis</i>
CASUARINACEAE	<i>Allocasuarina humilis</i>
CASUARINACEAE	<i>Allocasuarina preissii</i>
CELASTRACEAE	<i>Tripteroecoccus brunonis</i>

CENTROLEPIDACEAE	<i>Centrolepis drummondiana</i>
	<i>Centrolepis pilosa</i>
CHLOANTHACEAE	<i>Hemiphora bartlingii</i>
COLCHICACEAE	<i>Burchardia congesta</i>
CRASSULACEAE	<i>Crassula colorata</i>
	<i>Crassula colorata</i> var. <i>acuminata</i>
CUPRESSACEAE	<i>Callitris arenaria</i>
CUPRESSACEAE	<i>Callitris pyramidalis</i>
CYPERACEAE	<i>Baumea rubiginosa</i>
	<i>Caustis dioica</i>
	* <i>Isolepis marginata</i>
	<i>Lepidosperma apricola</i>
	<i>Lepidosperma calcicola</i>
	<i>Lepidosperma leptostachyum</i>
	<i>Lepidosperma pubisquamum</i>
	<i>Lepidosperma scabrum</i>
	<i>Mesomelaena pseudostygia</i>
	<i>Schoenus ?clandestinus</i>
	<i>Schoenus brevisetis</i>
	<i>Schoenus caespititius</i>
	<i>Schoenus clandestinus</i>
	<i>Schoenus curvifolius</i>
	<i>Schoenus grandiflorus</i>
	<i>Schoenus griffinianus</i>
	<i>Schoenus latitans</i>
	<i>Schoenus pedicellatus</i>
	<i>Schoenus pleiostemoneus</i>
	<i>Schoenus rigens</i>
	<i>Schoenus</i> sp.
	<i>Tetraria octandra</i>
	<i>Tricostularia neesii</i>
DASYPOGONACEAE	<i>Calectasia narragara</i>
	<i>Dasypogon bromeliifolius</i>
	<i>Dasypogon obliquifolius</i>
DILLENIACEAE	<i>Hibbertia acerosa</i>
	<i>Hibbertia aurea</i>
	<i>Hibbertia crassifolia</i>
	<i>Hibbertia desmophylla</i>
	<i>Hibbertia helianthemooides</i>
	<i>Hibbertia huegelii</i>
	<i>Hibbertia hypericoides</i>
	<i>Hibbertia ovata</i>
	<i>Hibbertia polystachya</i>
	<i>Hibbertia sericosepala</i>
	<i>Hibbertia spicata</i> subsp. <i>spicata</i>
	<i>Hibbertia subvaginata</i>

DROSERACEAE	<i>Drosera citrina</i> <i>Drosera ?macrantha</i> <i>Drosera ?pallida</i> <i>Drosera ?parvula</i> <i>Drosera bulbosa</i> subsp. <i>bulbosa</i> <i>Drosera citrina</i> <i>Drosera eneabba</i> <i>Drosera erythrorhiza</i> <i>Drosera erythrorhiza</i> ?subsp. <i>magna</i> <i>Drosera gigantea</i> <i>Drosera humilis</i> <i>Drosera macrantha</i> <i>Drosera marchantii</i> <i>Drosera menziesii</i> <i>Drosera menziesii</i> subsp. <i>penicillaris</i> <i>Drosera pallida</i> <i>Drosera parvula</i> <i>Drosera</i> sp. <i>Drosera spilos</i> <i>Drosera subhirtella</i>
ERICACEAE	? <i>Leucopogon</i> sp. <i>Andersonia heterophylla</i> <i>Andersonia lehmanniana</i> subsp. <i>lehmanniana</i> <i>Astroloba xerophyllum</i> <i>Conostephium ?pendulum</i> <i>Conostephium magnum</i> <i>Conostephium pendulum</i> <i>Conostephium preissii</i> <i>Leucopogon</i> aff. <i>conostephoides</i> <i>Leucopogon</i> ? <i>leptanthus</i> <i>Leucopogon conostephoides</i> <i>Leucopogon oldfieldii</i> <i>Leucopogon oliganthus</i> <i>Leucopogon racemulosus</i> <i>Leucopogon</i> sp. <i>Leucopogon</i> sp. Moore River (M. Hislop 1695) <i>Leucopogon</i> sp. Northern ciliate (R. Davis 3393) <i>Leucopogon sprengelioides</i> <i>Lysinema elegans</i> <i>Lysinema pentapetalum</i>
EUPHORBIACEAE	<i>Monotaxis grandiflora</i> var. <i>grandiflora</i>
FABACEAE	<i>Acacia barbinervis</i> subsp. <i>borealis</i> <i>Acacia blakelyi</i> <i>Acacia huegelii</i> <i>Acacia latipes</i> subsp. <i>latipes</i> <i>Acacia pulchella</i>

Acacia pulchella var. *glaberrima*
Acacia pulchella var. *pulchella*
Acacia stenoptera
Bossiaea eriocarpa
Daviesia angulata
Daviesia decurrens
Daviesia divaricata
Daviesia divaricata subsp. *divaricata*
Daviesia hakeoides subsp. *subnuda*
Daviesia incrassata
Daviesia incrassata subsp. *incrassata*
Daviesia incrassata subsp. *teres*
Daviesia nudiflora
Daviesia nudiflora subsp. *nudiflora*
Daviesia podophylla
Gastrolobium capitatum
Gastrolobium linearifolium
Gastrolobium oxylobioides
Gastrolobium plicatum
Gompholobium aristatum
Gompholobium knightianum
Gompholobium shuttleworthii
Gompholobium tomentosum

Hovea stricta
Isotropis cuneifolia
Isotropis cuneifolia subsp. *cuneifolia*
Jacksonia ?nutans
Jacksonia floribunda
Jacksonia hakeoides
Jacksonia horrida
Jacksonia nutans
Jacksonia sternbergiana
Sphaerolobium linophyllum
Sphaerolobium medium

GOODENIACEAE

?*Goodeniaceae* sp.
Dampiera linearis
Dampiera spicigera
Goodenia coerulea
Lechenaultia floribunda
Lechenaultia linarioides
Lechenaultia stenosepala
Scaevola canescens
Scaevola lanceolata
Scaevola repens
Scaevola repens var. *repens*

	<i>Verreauxia reinwardtii</i>
GYROSTEMONACEAE	<i>Gyrostemon racemiger</i>
	<i>Gyrostemon subnudus</i>
HAEMODORACEAE	<i>Anigozanthos humilis</i>
	<i>Anigozanthos humilis</i> subsp. <i>humilis</i>
	<i>Anigozanthos pulcherrimus</i>
	<i>Anigozanthos</i> sp.
	<i>Blancoa canescens</i>
	<i>Conostylis aculeata</i>
	<i>Conostylis aculeata</i> subsp. <i>aculeata</i>
	<i>Conostylis aculeata</i> subsp. <i>cygnorum</i>
	<i>Conostylis angustifolia</i>
	<i>Conostylis aurea</i>
	<i>Conostylis candidans</i> subsp. <i>candidans</i>
	<i>Conostylis crassinervia</i>
	<i>Conostylis crassinervia</i> subsp. <i>absens</i>
	<i>Conostylis hiemalis</i>
	<i>Conostylis juncea</i>
	<i>Conostylis setigera</i> subsp. <i>setigera</i>
	<i>Conostylis</i> sp.
	<i>Conostylis teretifolia</i>
	<i>Conostylis teretifolia</i> subsp. <i>teretifolia</i>
	<i>Haemodorum brevisepalum</i>
	<i>Haemodorum loratum</i>
	<i>Haemodorum paniculatum</i>
	<i>Haemodorum</i> sp.
	<i>Haemodorum spicatum</i>
	<i>Haemodorum venosum</i>
	<i>Phlebocarya ciliata</i>
	<i>Phlebocarya filifolia</i>
HALORAGACEAE	<i>Glischrocaryon aureum</i>
	<i>Gonocarpus pithyoides</i>
HEMEROCALLIDACEAE	<i>Arnocrinum preissii</i>
	<i>Corynotheca micrantha</i> var. <i>micrantha</i>
	<i>Hensmania turbinata</i>
	<i>Johnsonia pubescens</i> subsp. <i>pubescens</i>
	<i>Tricoryne elatior</i>
	<i>Tricoryne</i> sp. Eneabba (E.A. Griffin 1200)
IRIDACEAE	* <i>Gladiolus caryophyllaceus</i>
	<i>Patersonia occidentalis</i>
	<i>Patersonia occidentalis</i> subsp. <i>occidentalis</i>
	<i>Patersonia occidentalis</i> var. <i>occidentalis</i>
	* <i>Romulea rosea</i>
LAMIACEAE	<i>Hemiandra incana</i>
	<i>Hemiandra linearis</i>
	<i>Hemiandra pungens</i>

	<i>Hemiandra</i> sp.
	<i>Quoya verbascina</i>
LAURACEAE	<i>Cassytha aurea</i> var. <i>hirta</i>
	<i>Cassytha flava</i>
	<i>Cassytha glabella</i>
	<i>Cassytha glabella</i> forma <i>casuarinae</i>
	<i>Cassytha pomiformis</i>
	<i>Cassytha racemosa</i>
	<i>Cassytha</i> sp.
LOGANIACEAE	<i>Logania spermacocea</i>
	<i>Orianthera spermacocea</i>
	<i>Phyllangium divergens</i>
	<i>Phyllangium paradoxum</i>
LORANTHACEAE	<i>Nuytsia floribunda</i>
MALVACEAE	<i>Lasiopetalum lineare</i>
MOLLUGINACEAE	<i>Macarthuria australis</i>
MYRTACEAE	<i>Babingtonia grandiflora</i>
	<i>Beaufortia</i> ? <i>bicolor</i>
	<i>Beaufortia bicolor</i>
	<i>Beaufortia elegans</i>
	<i>Beaufortia</i> sp.
	<i>Calothamnus quadrifidus</i>
	<i>Calothamnus quadrifidus</i> subsp. <i>quadrifidus</i>
	<i>Calothamnus sanguineus</i>
	<i>Calytrix depressa</i>
	<i>Calytrix flavescens</i>
	<i>Calytrix fraseri</i>
	<i>Calytrix sapphirina</i>
	<i>Calytrix</i> sp.
	<i>Conothamnus trinervis</i>
	<i>Corymbia calophylla</i>
	<i>Darwinia sanguinea</i>
	<i>Eremaea asterocarpa</i>
	<i>Eremaea asterocarpa</i> subsp. <i>asterocarpa</i>
	<i>Eremaea fimbriata</i>
	<i>Eremaea pauciflora</i>
	<i>Eremaea pauciflora</i> var. <i>calyptra</i>
	<i>Eremaea pauciflora</i> var. <i>pauciflora</i>
	<i>Eucalyptus</i> ? <i>rudis</i> (<i>juvenile</i>)
	<i>Eucalyptus todtiana</i>
	<i>Hypocalymma angustifolium</i>
	<i>Hypocalymma xanthopetalum</i>
	<i>Kunzea glabrescens</i>
	<i>Kunzea micrantha</i>
	<i>Leptospermum erubescens</i>
	<i>Leptospermum spinescens</i>

- Melaleuca ?dichroma*
Melaleuca ?europoma
Melaleuca ?trichophylla
Melaleuca ciliosa
