Summary

An area of 22.5 hectares within the Lot at 1636 Muirillup Road, Northcliffe, is proposed for vegetation clearing. As assessed by distribution of habitat trees greater than 50cm diameter, the area comprised predominantly Karri *E. diversicolor* forest with native understory in mostly excellent to pristine condition. Marri *C. calophylla* occurred over approximately 6.7 hectares, with 5.5 hectares where Marri was recorded as the most frequent habitat tree species. Areas with Marri had native understory in excellent to pristine condition. A small defined zone in the north of the impacted area showed evidence of human disturbance and weed invasion in the understory, and was in degraded to good condition. The area proposed for vegetation removal slopes to the west down to a minor watercourse, which flows south into Shannon State Forest.

The presence of scattered notched tree stumps combined with consideration of the current size distribution of Karri *E. diversicolor*, Marri *C. calophylla* and Jarrah *E. marginata* present was consistent with pre-1960s low-intensity logging of larger tree diameter classes. There was no evidence of management or change in forest cover more recently, at least since 2000. Evidence of disturbance through recent harvesting and burning was absent, though human disturbance was evident in the understory on the northern edge adjacent pasture. Old-Growth forest in Western Australia is defined as ecologically mature forest where the effects of unnatural disturbance are negligible. Site assessment determined that the impacted area currently lacks many of largest senescent tree size classes, notably of Karri *E. diversicolor*, with these most likely to contain fauna nesting holes. On this basis the area scheduled for vegetation removal is not considered to fully meet the ecological definition of Old-Growth forest.

Habitat tree assessment for Black Cockatoos *Calyptorhynchus* sp. determined that 1123 trees over 22.5 hectares proposed for removal exceeded 50cm diameter at breast height, of which 35 trees exceeded 100cm diameter at breast height. The majority of habitat trees recorded were Karri *E. diversicolor*. No evidence of breeding activity by Black Cockatoos within the area surveyed was determined, and limited evidence of recent feeding activity on areas with Marri *C. calophylla* was found. White-tail Black Cockatoos (Carnaby's *C. latirostris* and/or more likely Baudin's *C. baudinii*) were observed from the impacted area, but were predominantly overlying. Potential nest hole presence was noted in 8 trees and 10 tree stumps within the impacted area, though nest holes were likely to have been underestimated due to height of the extant tree canopy. Should the vegetation be removed as proposed across the impacted area, 22.5 hectares of potential Black Cockatoo breeding habitat would be removed, and at least 5.5 hectares of potential Black Cockatoo high quality foraging habitat would be removed. The proposal was therefore deemed High Risk for potential impact on Black Cockatoos. Federal referral under the EPBC Act 1999 is recommended.

Phascogale *P. t. wambenger* was detected within the impacted at the Lot, using trail cameras. The single detection occurred in the south west corner of the impacted area, furthest from human influence, on one video/photograph set within 22 nights of cumulative trail camera recordings. Spotlighting, over cumulatively 8 hours, and search for faunal signs on tree trunks did not return additional evidence of Phascogale presence. It was not considered possible to definitively predict Phascogale *P. t. wambenger* habitat use in the impacted area from available data, though presence of suitable nesting hollows was considered likely.

1. Introduction

Smithson Environmental was contracted to assess the environmental impact of removal of existing forested vegetation, as delineated on Figure 3.1 below, located within 1636 Muirillup Road, Northcliffe (henceforward termed “The Lot”). The Lot totals 628577.97 m² / 62.9 hectares, and is currently utilised for agricultural purposes including stock and hay in the northern half, with a central main residence, and forested vegetation in the southern half (Figure 3.1). The landowner proposes to remove the delineated (Figure 3.1) area of forested vegetation to mitigate bushfire risk to the rear (south) of the main residence, and to increase the area available for agricultural purposes. The delineated area proposed for vegetation management (Figure 3.1) is henceforward termed “The Target Area”. The total area delineated in Figure 3.1 as the Target Area was mapped at 225288 m² / 22.53 hectares. The landowner has applied for a native vegetation clearing permit for the Target Area and was required to obtain environmental assessments specifically addressing the impacts upon Black Cockatoos (*Calyptorhynchus* sp.) and Brush-Tailed Phascogale (*Phascogale tapoatafa wambenger*). This reporting details the results of environmental impact assessment of removal of forested vegetation in the Target Area upon these two target faunal groups, with practical site assessments completed during November 2022.

2. Desktop Environmental Assessment

2.1. Introduction

The Lot is Zoned Priority Agriculture and lies approximately 298km south south east of Perth, 13km east of Northcliffe townsite, within the Shire of Manjimup. No Historic or Aboriginal Heritage areas are recorded at The Lot.

2.2. Physical Environment

Identification of Physical and Environmental Features Relevant to the Lot			
Feature Type	Location	Dataset or Data Source Used	Description
Topography	At The Lot	Landgate South West Contour Data (5m)	In the majority 145m a.s.l. Low-point is 125m a.s.l. in south-west corner, rising to 160m a.s.l. in south-east corner. Valley (125-135m a.s.l.) runs on a north-south axis into the south-west corner.
Topography	Adjacent The Lot	Landgate South West Contour Data (5m)	Rolling hills: hilltops to 165m a.s.l. at 355m south-east of Lot, with steep drop from there to Canterbury River valley.
Soil	At The Lot	ASRIS Soil Atlas	Across the Lot - Uc1: Steep hilly to hilly dissected lateritic plateau with steep valley side slopes: chief soils are hard, and also sandy, neutral, and also acidic, yellow and yellow mottled soils with conspicuous but relatively smaller areas of red earths. Associated are areas of block laterite, gravelly and bouldery soils on tops of rises and their colluvial slopes; some areas of leached sands, some soils on slopes; some soils on terraces of major streams
Soil	Adjacent The Lot	ASRIS Soil Atlas	30km south and west of Lot - Tc7: Knolls and hillocks-- "islands" of Granitic soils separated by swampy plains.
National Heritage and Aboriginal Heritage	At and Adjacent The Lot	AHIS, DOP-046	Not Indicated as Present
Acid Sulphate Soils	At and Adjacent The Lot	DER-ASS	Not Indicated as Present
Tuart Woodland	At and Adjacent The Lot	DCBA-048	Not Indicated as Present

2.2.1. Climate

Climate statistics are given for Pemberton weather station, 33km north-west of The Lot.

Identification of Climate Features Relevant to the Lot (Pemberton Weather Station, Bureau of Meteorology)													
Feature	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
Mean maximum temperature (°C)	26.3	26.6	24.6	21.3	18.3	16.0	15.2	15.6	16.9	18.9	21.5	24.1	20.4
Mean minimum temperature (°C)	13.2	13.6	12.8	11.0	9.3	8.2	7.2	7.1	7.6	8.7	10.3	11.9	10.1
Mean rainfall (mm)	22.4	19.5	36.8	74.2	149.6	187.2	210.0	171.6	129.7	89.5	60.1	34.7	1183.4
Mean 3pm windspeed (km/h)	13.7	13.6	12.5	10.8	11.5	12.2	13.0	13.5	14.0	14.6	14.7	14.3	13.2

2.3. Biotic Environment

2.3.1. Areas of Native Vegetation

Identification of Areas of Native Vegetation Relevant to the Lot			
Vegetation Type	Location	Dataset or Data Source Used	Description
Pre-European Native Vegetation Association Predicted	At The Lot	DPIRD-006: Pre-European Vegetation	Nornalup vegetation association: tall forest or woodland of mainly Karri <i>Eucalyptus diversicolor</i>
	Adjacent the Lot – 23.5km to north and west	DPIRD-006: Pre-European Vegetation	Bridgetown vegetation association: forests of Jarrah <i>E. marginata</i> and Marri <i>Corymbia calophylla</i>
	Adjacent the Lot – 13.7km to south and east	DPIRD-006: Pre-European Vegetation	Scott River vegetation association: sedgelands
Vegetation Complex Predicted	At the Lot	DBCA-047: South West Forest Regions of WA	In majority - Collis COd: Tall open forest of <i>E. marginata-C. calophylla-Banksia grandis</i> on saddles between hills in the perhumid zone.
			South-west corner: Granite Valleys Vh2: Tall open forest of <i>E. diversicolor-E. patens</i> on slopes with <i>Agonis flexuosa-Allocasuarina decussata - Callistachys lanceolata</i> on valley floors in hyperhumid and perhumid zones.
Forest Vegetation Present	At The Lot	Landgate Aerial Imagery	Forest vegetation identified as present
Native Vegetation Present	At The Lot	DPIRD-005: Native Vegetation Extent	Native vegetation indicated as present over majority of Target Area
Geomorphic Wetlands, and their 50m buffer	At and Adjacent the Lot	DCBA-013, 014, 016, 017, 019, 040, 043, 044,	Not Indicated as Present
Ramsar Sites	At and Adjacent the Lot	DCBA-010	Not Indicated as Present
South Coast Significant Wetlands	At and Adjacent the Lot	DCBA- 018	Not Indicated as Present
Streams and other Watercourses	At and Adjacent the Lot	DPIRD-069, 087, DWER-036	Not Indicated as Present; dam noted in valley on The Lot suggestive of stream

2.3.2. Threatened and Protected Areas, Flora, Fauna and Communities

Identification of Protected and Threatened Areas Relevant to the Lot			
Area Type	Location	Dataset or Data Source Used	Description
Legislated Lands and Waters	At The Lot	DCBA-011	Not Indicated as Present
	Adjacent The Lot	DCBA-011	120m north – Jane National Park; 0m south – Shannon State Forest 1.2km south-west – Boorara-Gardner National Park 5km east – Shannon National Park
Bush Forever Areas	At and Adjacent The Lot	DPLH-019	Not Indicated as Present
Threatened Ecological Community	At and Adjacent The Lot	DCBA-046	Not Indicated as Present
Threatened and Priority Flora and 50m Continuous Buffer	At and Adjacent The Lot	DCBA-046	Not Indicated as Present
Known Black Cockatoo Night Roosting and Breeding Sites	At and Adjacent The Lot	DBCA-063, 064, Great Cocky Count Reporting, EPBC Act Guidelines Maps (Commonwealth of Australia 2012)	Night roost mapped 15km north-west of the Lot; area around Northcliffe mapped as within Baudin's Cockatoo <i>C. baudinii</i> breeding area and edge of Carnaby's Cockatoo <i>C. laticauda</i> breeding areas.
Forest Disease Risk Areas	At and Adjacent The Lot	DCBA-024	Indicated as Present 18km east of The Lot
Western Ringtail Possum Habitat Suitability	At and Adjacent The Lot	DCBA-049	Not Indicated as Present
Tuart Woodland	At and Adjacent The Lot	DCBA-048	Not Indicated as Present
Old Growth Forest within South West WA	At and Adjacent The Lot	www.dbca.wa.gov.au/sites/default/files/2021-11/Map Old-Growth Forests February 2020.pdf	The Lot is not indicated as Old Growth Forest. Multiple adjacent areas including Shannon State Forest on southern boundary are indicated as Old Growth Forest.

2.3.3. Locally Significant Natural Areas

Identification of Protected and Threatened Areas Relevant to the Lot			
Feature	Location	Dataset or Data Source Used	Description
Local Reserves	At and Adjacent The Lot	Shire of Manjimup	Not Indicated as Present
Species Vegetation Community identified as significant under Local Biodiversity Strategy	At and Adjacent The Lot	Shire of Manjimup	Not Indicated as Present
Habitat Trees Present	At and Adjacent The Lot	Shire of Manjimup	Not Indicated as Present

2.3.4. Lot History

Landgate Aerial photography is available from the present day along with 2014, 2007, 2004 and 2000. All aerial photographs show that forested vegetation cover was similar between 2000 and the present day, both at The Lot overall and within the Target Area on the Lot. No increases or decreases in forested areas at The Lot were visible. The only observable change was adjacent the Target Area, where trees in Shannon State Forest immediately to the south of Target Area were noted as harvested in aerial photographs from 2000.

2.4. Summary of Desktop Assessment Relevant to Impact Assessments

The Target Area for which vegetation management is proposed comprises extant forested vegetation expected to be native, most likely of Karri *E. diversicolor* or Jarrah *E. marginata* – Marri *C. calophylla* in the overstory. There is no evidence of management or change in forest cover of the Target Area since aerial photography in 2000, and no history of recent burns or disturbance. The Target Area is embedded within and contiguous with a network of linked National Parks and State Forests, and is not an isolated patch. No protected or threatened flora, fauna or communities are known to be present in the Target Area. The Target Area is not itself mapped as Old Growth Forest, but lies adjacent to mapped areas of Old Growth Forest.

3. Informal Flora Assessment

3.1. Methodology

The Target Area was walked intensively during the impact assessments carried out for Black Cockatoos and Phascogales described in sections 4 and 5 below. During assessment, features within the Target Area were noted, and flora species and tree stumps were noted with the aim to determine:

- Does the understory comprise native or introduced flora, and if native what is the condition?
- Does the forested vegetation within the Target Area comprise old-growth forest, lacking in previous human disturbance and/or timber harvest history?
- Are protected flora species or communities likely to be present?

It is noted that the assessment was informal, and was not regarded as sufficiently intensive to determine a full flora list for the Target Area (as would be required during a Level 1 flora survey). Condition was assessed against the Keighery Scale (Keighery 1994). Tree stumps were formally mapped only when these were noted to provide habitat for Black Cockatoos (section 4).

3.2. Results

Features recorded during assessment are mapped in Figure 3.1. A watercourse was noted as present to the west of and adjacent to the Target Area. An indicative 50m buffer was mapped around the watercourse. Firebreaks and main north-south access track were mapped (Figure 3.1).

Understory native flora noted during assessment are given in Table 3.1, these should be regarded as indicative. Condition across the majority of the Target Area was scored as excellent to pristine (Figure 3.1), with weeds noted only on access tracks and firebreaks and disturbance limited to occasional characteristically notched tree stumps. To the north and central part of the Target Area (delineated in Figure 3.1), a selected area was defined as in Degraded to Good condition, due to the presence of evidence of human disturbance in the form of wider access tracks, cleared patches, pits, presence of agricultural machinery, evidence of burrows of Fox *Vulpes vulpes*, and ingress of grassy weeds from the adjacent pasture. A typical view of the Target Area described in excellent to pristine condition is given in Figure 3.2.

Tree stumps were noted as rarely present scattered across the whole Target Area. These were noted as generally very large (tending 150cm diameter or more), predominantly Karri *E. diversicolor* with possibly one Jarrah *E. marginata*. Trunk notches were noted positioned below the sawed surface, which are characteristic of the use of cross-cut saw felling by hand (see Figure 3.2). This is indicative that selected very large Karri *E. diversicolor* were likely felled within the Target Area prior to the use of powered chainsaw felling, which was predominant through to the 1940s and 1950s (Heberle 1997). 10 tree stumps were recorded and mapped as providing habitat value for Black Cockatoos (section 4).

3.3. Summary and Implications for Black Cockatoo and Phascogale Surveys

- The forested understory comprises in the majority native vegetation in excellent to pristine condition. Introduced flora were restricted to a specific area on the northern edge and the centre north of the Target Area.
- Evidence of felling of very large (>1m diameter) Karri *E. diversicolor* and rarely Jarrah *E. marginata* was evident through tree stumps sparsely scattered through the Target Area. Stumps generally showed notches consistent with felling pre-1960s.
- No protected flora species or communities were identified during assessment. It is noted however that flora assessment was not intensive as expected for a full Level 1 survey

Table 3.1 Indicative understory (non-tree) species noted as present within the Target Area

Flora Species noted as present within the Target Area
<i>Caladenia latifolia</i>
<i>Chorilaena quercifolia</i>
<i>Chorizema cordatum</i>
<i>Clematis pubescens</i>
<i>Dampiera hederacea</i>
<i>Diplolaena dampieri</i>
<i>Hardenbergia comptoniana</i>
<i>Hibbertia cuneiformis</i>
<i>Hovea elliptica</i>
<i>Johnsonia lupulina</i>
<i>Kennedia coccinea</i>
<i>Persoonia longifolia</i>
<i>Pimelea longiflora</i>
<i>Pteridium esculentum</i>
<i>Thomasia triphylla</i>
<i>Trymalium odoratissimum</i>
<i>Xanthorrhoea preissii</i>

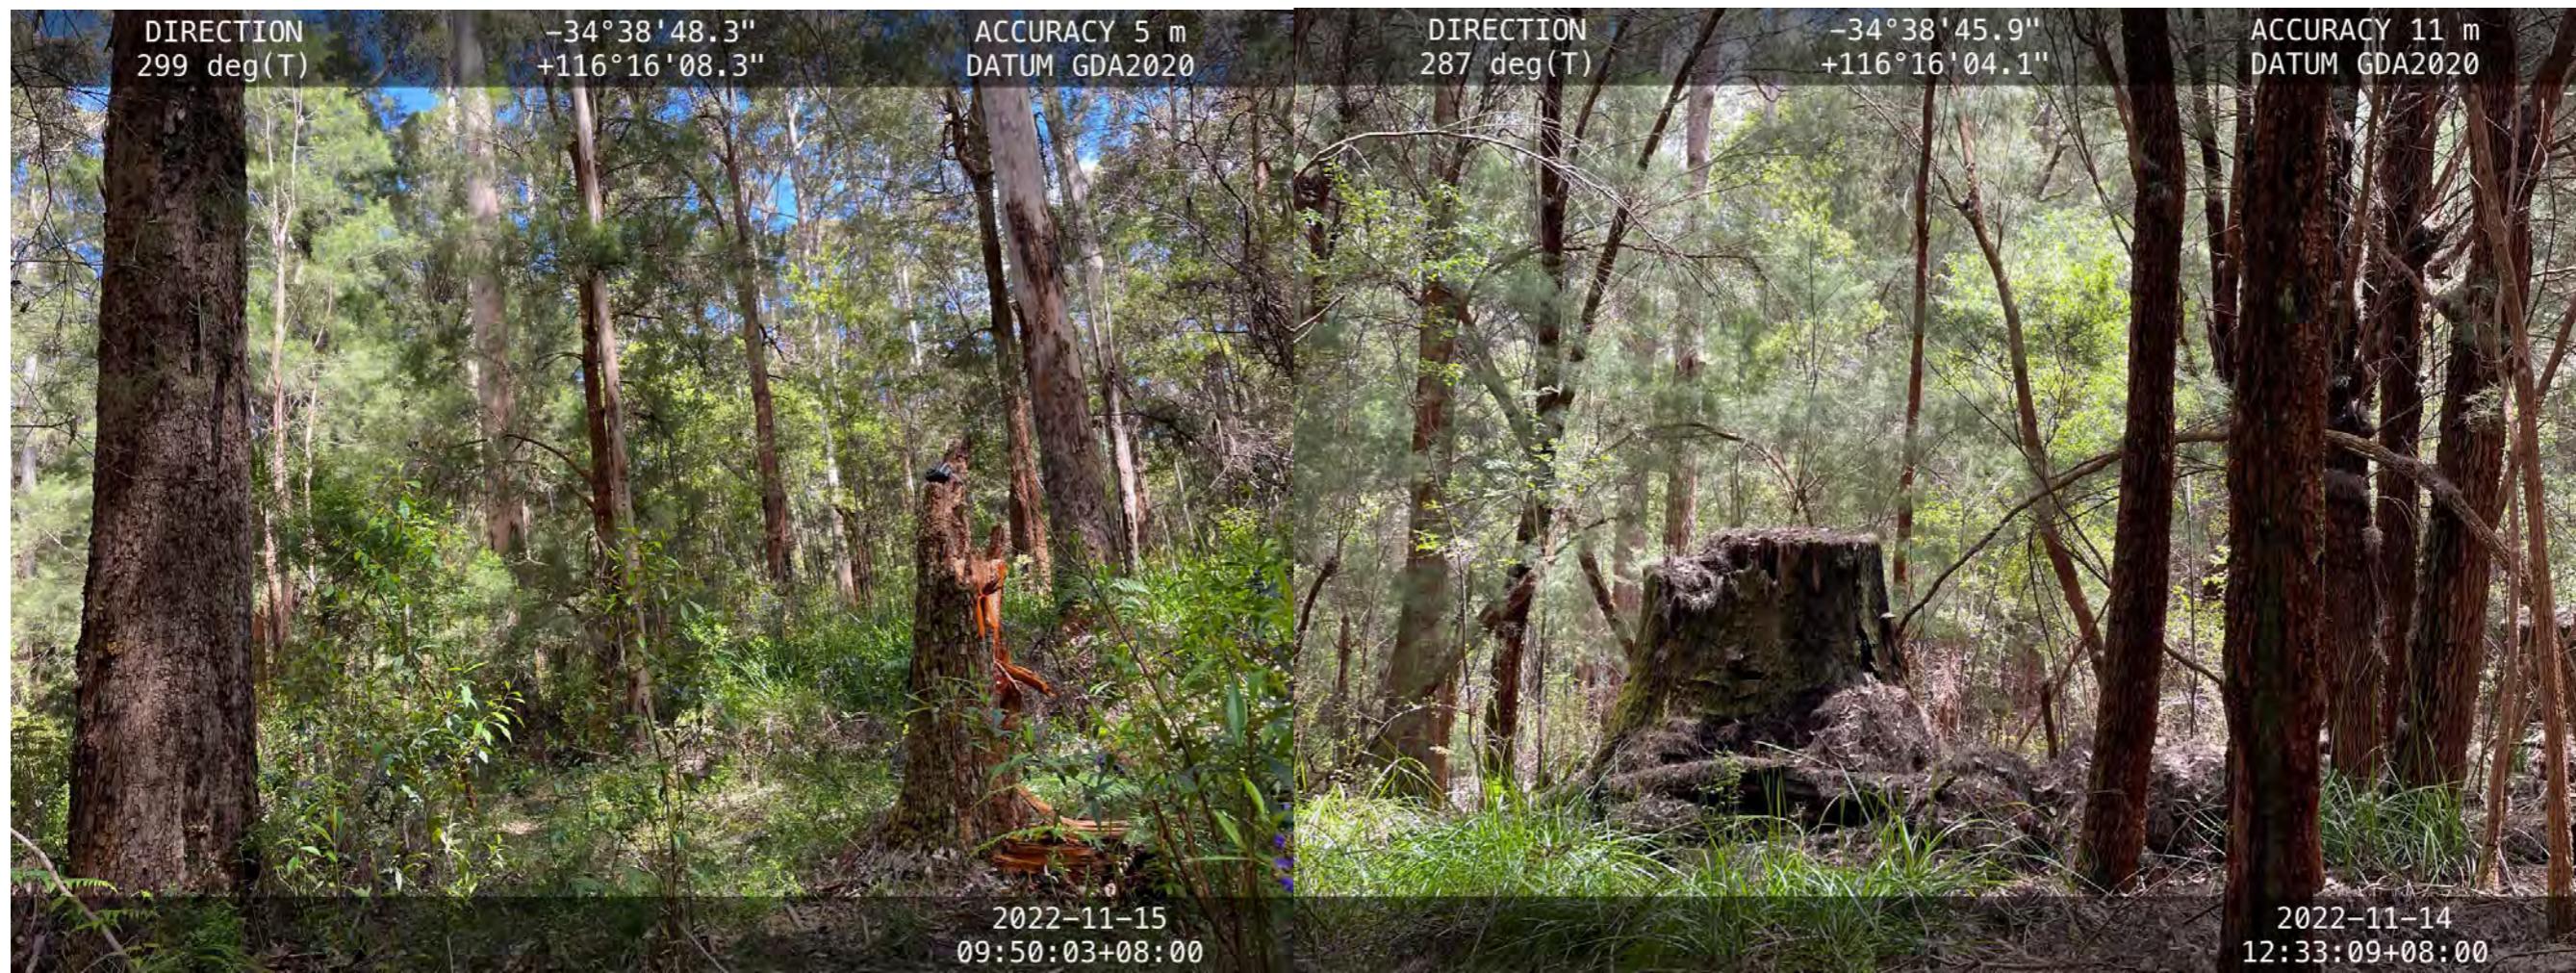

Figure 3.2 Typical views of the Target Area. Left - area in excellent to pristine condition, with trail camera NT2 installed. Right - stump showing evidence of cross-cut sawing

4. Black Cockatoo Impact Assessment

4.1. Rationale

The proposed removal of vegetation within the Target Area at The Lot will impact 22.5 hectares of vegetation. This vegetation, per desktop assessment as described in section 2, was considered likely to comprise native forests of Karri *E. diversicolor* or Jarrah *E. marginata* – Marri *C. calophylla*. The approval for removal of vegetation from the Target Area has been determined as dependent on lack of significant impact on Black Cockatoos.

Black Cockatoos within Western Australia comprise three species: two species of White-tailed cockatoos (Carnaby's cockatoo *Calyptorhynchus laticrostris*, and Baudin's cockatoo *C. baudinii*) and the Forest red-tailed Cockatoo (*Calyptorhynchus banksii naso*). Under both Western Australian State legislation and Federal EPBC Act, Black Cockatoos are protected, with Forest red-tailed considered Vulnerable and Carnaby's and Baudin's Endangered (Department of Biodiversity, Conservation and Attractions 2022). Therefore, the habitat of Black Cockatoos is protected, so any habitat removal or modification which is deemed to have significant impacts on Black Cockatoo habitats require Federal referral for approval as laid out in EPBC Act referral guidelines for Black Cockatoos (Commonwealth of Australia, 2012). The Target Area lies at the edge of the known breeding range for Carnaby's Cockatoo *C. laticrostris*, within the predicted mapped breeding range for Baudin's Cockatoo *C. baudinii*, and within the known range for Forest red-tailed Cockatoos *C. banksii naso*. Therefore, the purpose of this Black Cockatoo Impact Assessment is to determine whether removal of vegetation within the Target Area is deemed to have the potential for a significant impact on Black Cockatoo habitats, as defined by the EPBC Act referral guidelines for Black Cockatoos (Commonwealth of Australia, 2012).

4.2. Methodology

Trees at site were assessed between 11th and 15th November 2022, to meet the methodological requirements described for tree habitat impact assessments within the EPBC Act referral guidelines for Black Cockatoos (Commonwealth of Australia, 2012). The entire Target Area was assessed, with the exception of low-lying areas adjacent the stream (section 3, see Figure 4.1) where exceptionally dense shrub-layer vegetation and steep slippery slopes made access challenging, and where canopy changed to that dominated by species such as *Taxandria juniperina*. Each tree was determined as whether exceeding 0.5m / 50cm diameter at breast height (henceforward “DBH”) at 1.4m above ground (as per AS4970-2007) using a fixed 50cm calliper. Trees meeting or exceeding 50cm DBH were measured using manual 50-80cm calipers (Haglof, Sweden). Diameters for trees above 80cm DBH were assessed using multiple caliper spans and are approximate. Each measured tree was marked onsite on the south side of the tree trunk using a single spray of Dulux fluorescent Spray Marker paint, and also geolocated using a Garmin GPSmap64 (adjacent the south side of the trunk). All trees were assessed for fauna and Black Cockatoo habitat potential via searching for potential nesting holes, fauna signs, and signs of feeding activity (the WA Museum 2022 nut mark guide was used to identify fruits with evidence of Black Cockatoo feeding activity). Trees meeting or exceeding 50cm DBH were considered to exceed the EPBC Act Black Cockatoo referral guidelines size limits for suitability for producing breeding holes (Commonwealth of Australia, 2012) and were defined as “Habitat Trees”. Any tree having suitable bird / large fauna nesting holes or hollows was also defined as a Habitat Tree, though these all occurred within the cohort of Habitat Trees based on size in this

assessment. In the Target Area a number of large Habitat trees defined as exceeding 80cm DBH, and very large Habitat trees defined as exceeding 100cm DBH, were recorded, and due to their significance in presenting potential Black Cockatoo nesting holes were categorised separately. Trees less than 50cm DBH as assessed by fixed caliper were not measured or otherwise recorded, due to the large numbers of trees present (note that no Wandoo *E. wandoo* or *E. accedens* were present at site, thus size limits of 30cm DBH do not apply in this assessment).

Throughout the assessment period incidental observations were made of Black Cockatoos present at the Lot. This included at dusk, where the Target Area was assessed for night roosts of Black Cockatoos by walking the major tracks for aural and visual evidence of Black Cockatoo presence.

4.2.1. Survey Limitations

The site survey occurred during November 2022, which is within the known breeding periods for all three Black Cockatoo species. The site survey occurred outside the autumn period selected for the Great Cocky Count (Birdlife Australia 2016), which targets the non-breeding period where communal night roosting behaviour is most likely observed, at least for Carnaby's and Baudin's Cockatoos, and thus accurate counting of individuals is permitted (Commonwealth of Australia, 2012; Birdlife Australia 2016). Thus the date of site assessment of this Target Area would be most likely to result in the detection of breeding Black Cockatoos at site, while potential night roosting behaviour at site by White-tail Black Cockatoos would be underestimated.

4.3. Results

4.3.1. Habitat Tree Assessment

Table 4.1 summarises tree data recorded, with results of assessment mapped in Figure 4.1. 1123 habitat trees were measured and mapped in the Target Area, of which the majority (871 habitat trees recorded, 78% of all trees recorded) were Karri *E. diversicolor*. Karri *E. diversicolor* occurred through the Target Area and was the dominant canopy tree over the majority of the area (Table 4.1, Figure 4.1). Marri *C. calophylla* was present over approximately 6.7 hectares (213 habitat trees recorded, 19% of all trees recorded), but increased to become the most frequent habitat tree species over two areas comprising 5.52 hectares of higher ground (see Figure 4.2). Patchy Karri Sheoak *Allocasuarina decussata* (23 habitat trees, 2% of all trees recorded) were recorded bordering areas dominated by Marri, while Jarrah *E. marginata* (12 habitat trees, 1% of all trees recorded) were restricted to the highest point within the Target Area (Figure 4.1). Warren River Cedar *Taxandria juniperina* (4 habitat trees, 0.4% of all trees recorded) were scattered to north west and north central areas with notably the highest soil moisture levels. It is noted that locations to north and west within the Target Area that are shown lacking in habitat trees contained dense vegetation at shrub and canopy levels but lacked trees of habitat size. In addition to 1123 habitat trees, 10 dead tree stumps were recorded as having habitat value to Black Cockatoos, by the provision of suitable diameter nesting holes. These are mapped in Figure 4.1. These tree stumps were predominantly >3m tall stumps of Karri *E. diversicolor*.

Of the habitat trees assessed, 852 (76%) were in the smaller size class (50-<80cm), with 271 (24%) exceeding 80cm DBH. Most large habitat trees (>80cm DBH) were Karri *E. diversicolor* (242 trees), with all bar one of the remainder Marri *C. calophylla*

(28 trees). 35 very large habitat trees were recorded (exceeding 100cm DBH): 28 were Karri *E. diversicolor* and 7 Marri *C. calophylla*. The very large habitat trees were predominantly located away from the highest hill in the Target Area (Figure 3.1). The largest tree sizes recorded were for Karri *E. diversicolor* 177cm, and for Marri *C. calophylla* 186cm. The projected age for the largest Karri *E. diversicolor* of 177cm is of the order of 250 years old (Bradshaw & Rayner 1997), while the average DBH for all habitat Karri *E. diversicolor* recorded was 71.5cm, projected to be of the order of 100 years old (Bradshaw & Rayner 1997). Habitat trees >200cm DBH were not present.

Despite the frequency of large and very large habitat trees recorded in the Target Area, relatively few positive indicators of fauna habitat features were noted within them. Six instances of hollow trunk bases were noted, one of which was from one of the 10 tree stumps separately mapped (see Appendix 1). Eight instances of potential nest holes within habitat trees were noted during assessment, two of which were from stumps (Appendix 1). It was observed that the majority of trees at site were exceptionally tall, with canopy at significant height, such that there was likely an underestimation of nest hole availability within living habitat trees when observed from the ground. 16 instances of multistem trees were noted, of which 13 were from Karri *E. diversicolor*: multistem trees are often indicative of tree management followed by regrowth. Only two positive observations of a Black Cockatoo-chewed Marri *C. calophylla* nut were recorded: these were both of Forest red-tailed Black Cockatoo chewed nuts at two separate Marri *C. calophylla* (Appendix 1). This was despite the abundant Marri *C. calophylla* nuts that were evident on the ground, and significant time spent searching for markings.

4.3.2. *Black Cockatoo Observations*

Table 4.2 lists observations of Black Cockatoos made at site. During the four days of assessment, 11 records of White-tail Black Cockatoos were noted, most were of White-tail Cockatoo overflights of the Target Area, predominantly heading eas. One record of White-tail Black Cockatoos within trees in the Target Area was noted (Table 4.2). No records of night roosting behaviour were noted on any of the evening assessments. Two brief dawn records of White-tail Cockatoos were noted, but these were also assessed as birds moving through the Target Area. The White-tail Cockatoo species was considered most likely based on call to be Baudin's *C. baudinii*.

Figure 4.1 Summary of habitat trees surveyed within the Target Area

Species	Scientific Name	DBH Class (cm)			Total
		50-<80	80-<100	>100	
Karri	<i>Eucalyptus diversicolor</i>	629	214	28	871
Marri	<i>Corymbia calophylla</i>	185	21	7	213
Karri Sheoak	<i>Allocasuarina decussata</i>	23	0	0	23
Jarrah	<i>Eucalyptus marginata</i>	12	0	0	12
Warren River Cedar	<i>Taxandria juniperina</i>	3	1	0	4
Total		852	236	35	1123

Figure 4.2 Observations of Black Cockatoos made in the Target Area

Date	Time	Black Cockatoo	Behaviour
11/11/22	05.30	White-Tailed	Calls from 2 birds
11/11/22	16.52	White-Tailed	Flying east over Target Area
12/11/22	13.36	White-Tailed	Overhead in Target Area
12/11/22	14.42	White-Tailed	Overhead in Target Area
14/11/22	05.10	White-Tailed	Call from 1 bird

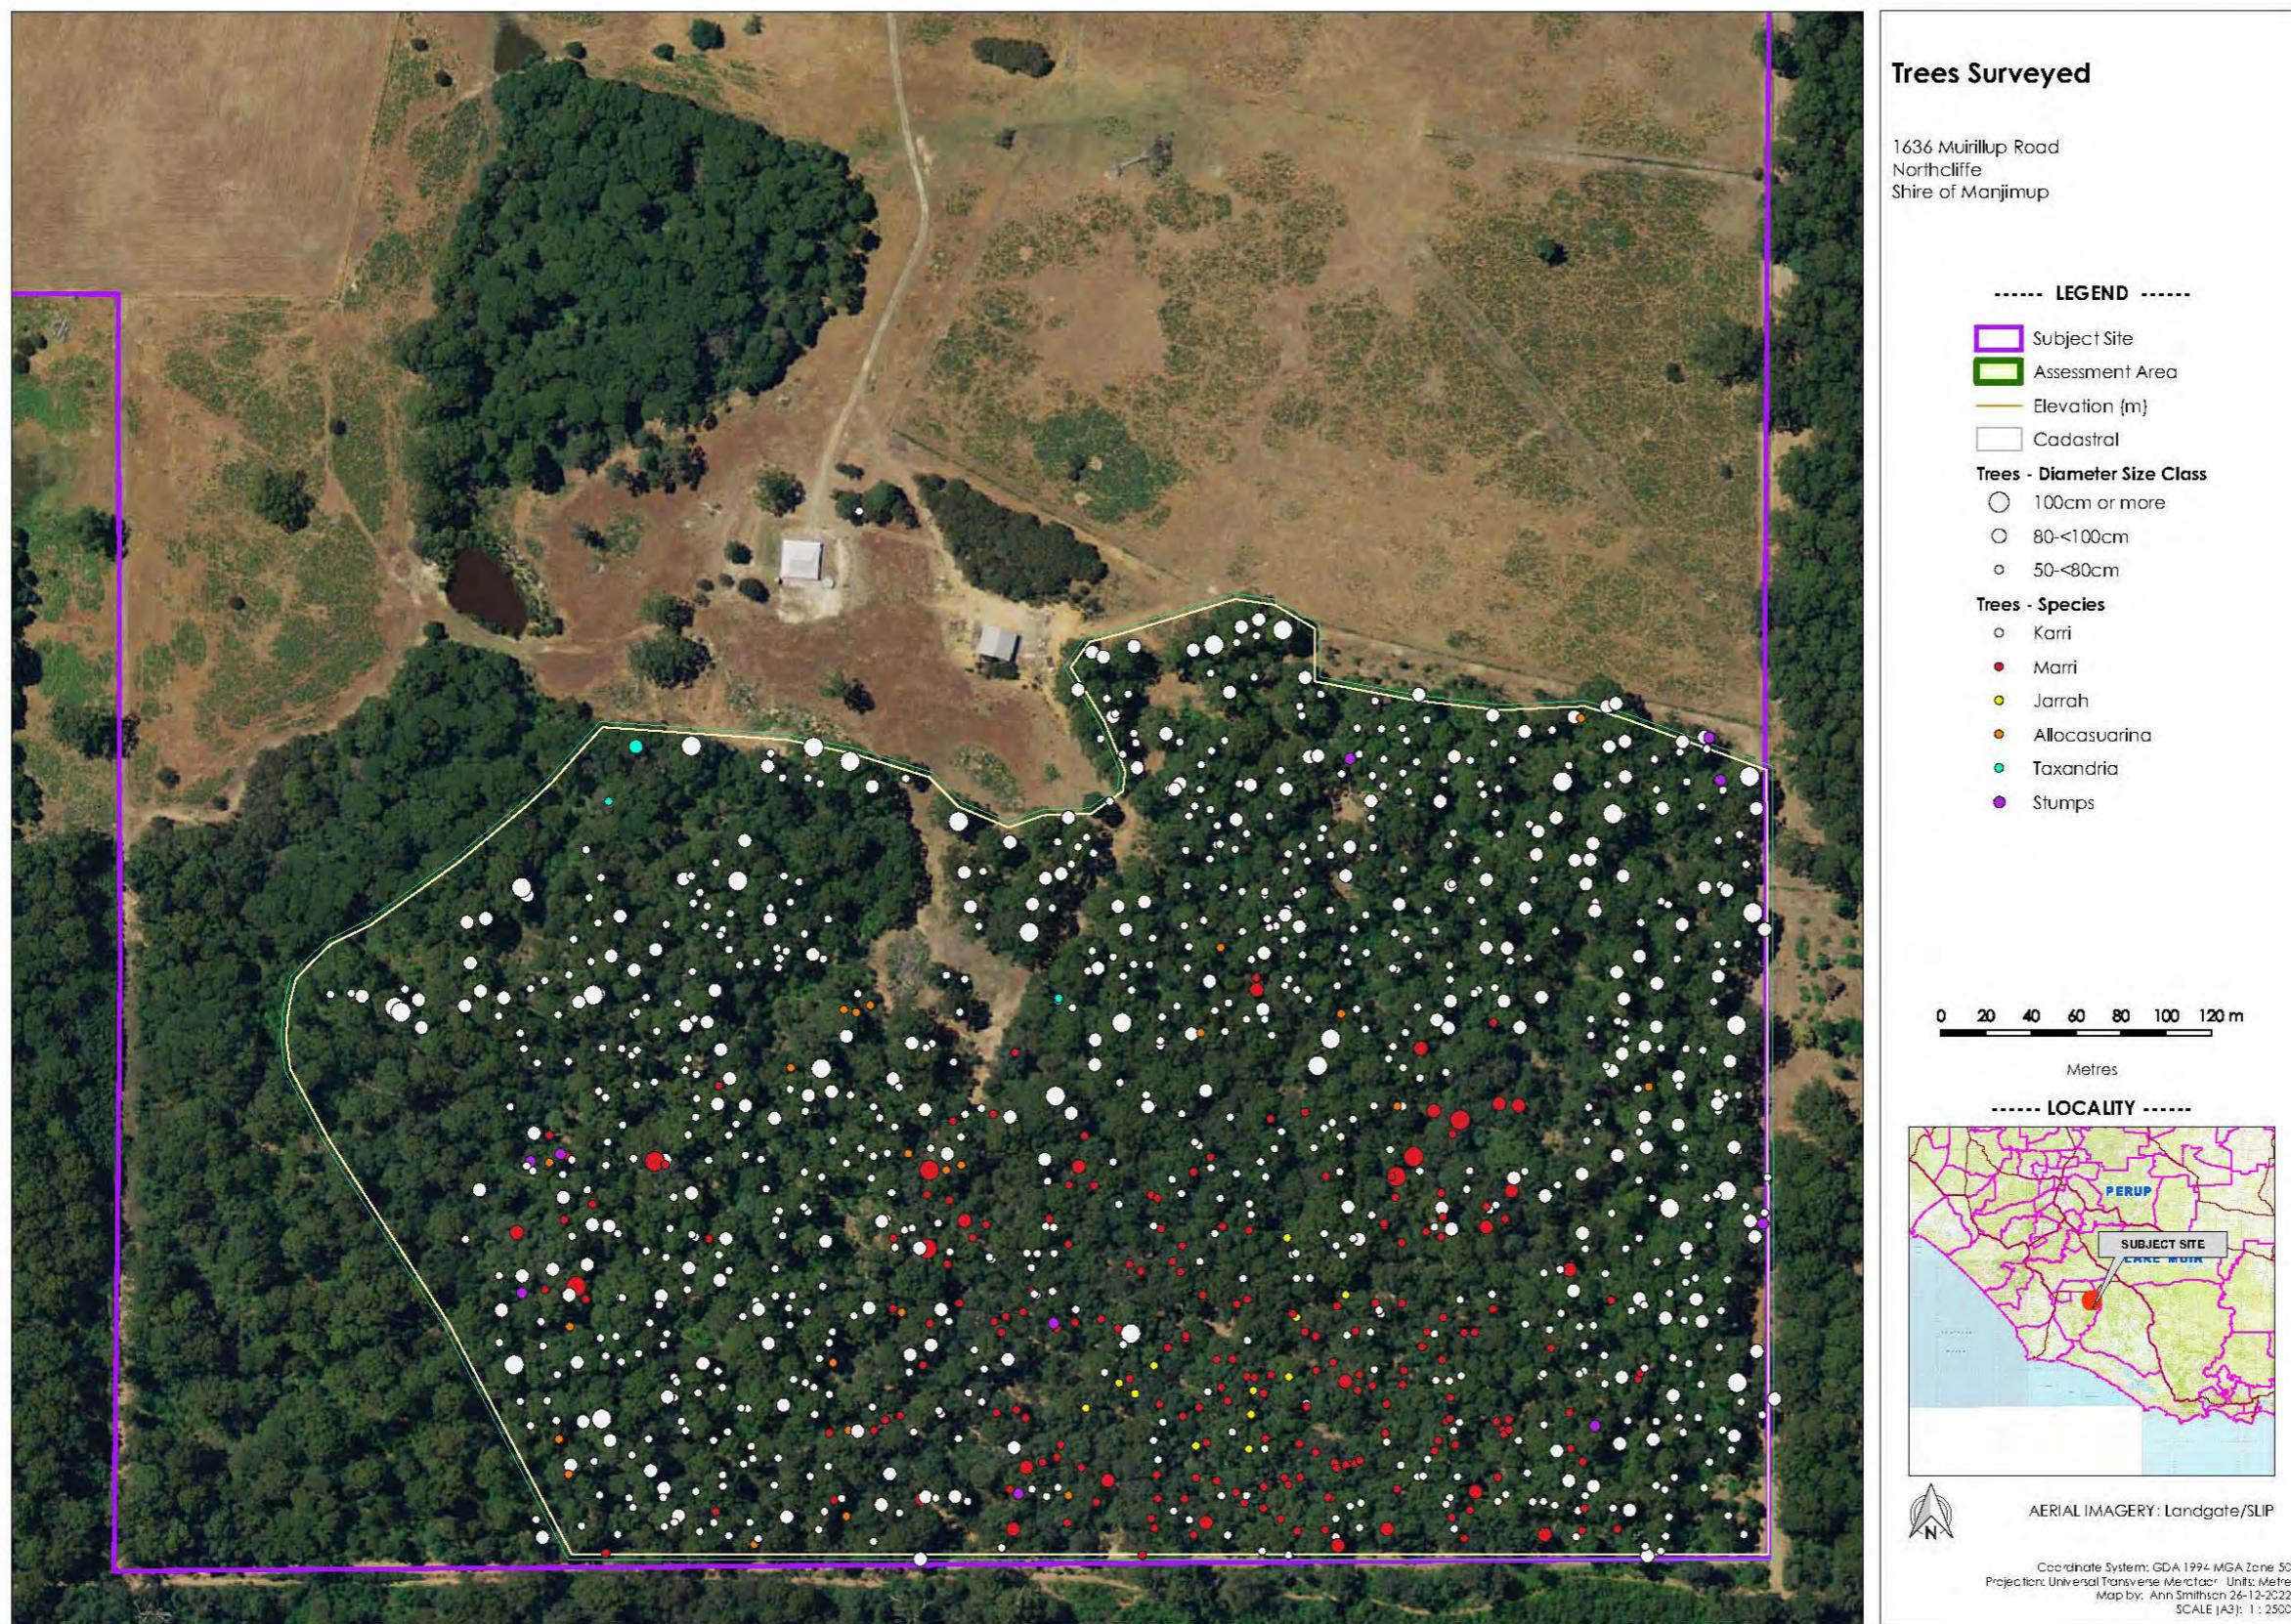

Figure 4.3 Results of habitat tree assessment within the Target Area, showing trees measured and mapped per section 4.2. Stumps shown are those with potential nest holes present only.

Figure 4.4 Area of 5.5 hectares containing Marri *C. calophylla* as the most frequent habitat tree.

4.4. Match to EPBC Act Black Cockatoo Referral Guidelines

Does the proposed Action fall within the scope of the EPBC Act referral guidelines for Black Cockatoos (Commonwealth of Australia 2012)?	
Does the impacts of the Action occur within the modelled distribution of Black Cockatoos?	Yes
Does the impact of the Action have the potential to affect any Black Cockatoo habitat or individuals?	Yes
Has Black Cockatoo habitat been surveyed using the recommended methods?	Yes
Does the Action propose to impact any of the following Black Cockatoo Habitats?	
Clearing of any known nesting tree	No
Comment: No evidence of breeding were positively identified in the Target Area during desktop assessment nor during site assessment.	
Clearing or degradation of any part of a vegetation community known to contain breeding habitat?	Possible
Comment: The Target Area contained 1123 trees exceeding 50cm DBH, including 28 Karri <i>E. diversicolor</i> and 7 Marri <i>C. calophylla</i> exceeding 100cm DBH, with an additional 10 stumps with potential nesting holes. These are indicative of high-quality potential breeding habitat for Black Cockatoos. The Target Area lies adjacent to or within the mapped range of White-tail Black Cockatoo breeding habitat (Baudin's <i>C. baudinii</i> , Carnaby's <i>C. latirostris</i>).	
Clearing of more than 1 hectares of quality foraging habitat?	Yes
Comment: The portion of the Target Area containing habitat Marri <i>C. calophylla</i> as the most frequent in the canopy, which is a preferred food source for Black Cockatoos, is approximately 5.5 hectares, with Marri <i>C. calophylla</i> found at site occupying 6.7 hectares. During the site assessment, however, limited evidence of ongoing use of the Target Area by foraging Black Cockatoos was obtained.	
Degradation (such as through altered hydrology or fire regimes) of more than 1 ha of foraging habitat?	Possible
Comment: The Target Area lies directly to the east of a watercourse which flows into Shannon State Forest, and is 22.5 hectares in size. A buffer around the water course of >50m is indicated in Figure 3.1. However, impacts of tree removal across the area on local water flows remains possible.	
Clearing or degradation (including pruning the top canopy) of a known night roosting site?	No
Comment: No night roosting sites are recorded or mapped within or adjacent the Target Area. However, the site assessment period would underestimate night roosting by White-tail Black Cockatoos, as this was conducted within the breeding period.	
Creating a gap of greater than 4 km between patches of Black Cockatoo habitat	No
Comment: The Target Area lies within an area that is predominantly forested, with large areas of State Forests and National Parks adjacent. No gaps would be created.	
Clearing or disturbance in areas surrounding Black Cockatoo breeding, foraging or night roosting habitat that has the potential to degrade habitat through introduction of invasive species, edge effects, hydrological changes, increased human visitation or fire.	Possible
Comment: The Target Area lies adjacent State Forest and National Parks mapped as Old-Growth Forest, and lies within mapped breeding areas for Baudin's Black Cockatoo <i>C. baudinii</i> . It is considered possible that modification of 22.7 hectares of forest to agricultural use will increase human visitation with potential negative impacts, and introduce invasive species.	
Actions that do not directly affect the listed species but that have the potential for indirect impacts such as increasing competitors for nest hollows.	No

Actions with the potential to introduce known plant diseases such as <i>Phytophthora</i> spp. to an area where the pathogen was not previously known	Possible
Comment: Timber cutting and removal in the Target Area is likely to be carried out by machinery, which is likely to introduce plant diseases such as <i>Phytophthora</i> spp and invasive species such as plant weeds into the surrounding area. Mitigation via a Dieback and Weed Management Plan for timber operations is very highly recommended.	

4.5. Mitigation Actions Required

The Black Cockatoo habitat assessment for the Target Area has determined that the action has the potential to cause significant impacts on Black Cockatoos. The possibility for mitigation must therefore be considered under the EPBC Act (Commonwealth of Australia 2012).

4.5.1. Degradation of a community that contains breeding habitat

The potential for degradation of a community that contains potential breeding habitat could be mitigated by proposing the retention of all habitat trees >50cm DBH within the Target Area. This is not considered realistic, due to their large number. All 35 very large habitat trees (>100cm DBH) within the Target Area could be proposed for retention.

4.5.2. Removal and/or degradation of quality foraging habitat

Mitigation against the removal and/or degradation of quality foraging habitat could be achieved by removing only the northern half of the Target Area, and not removing the southern half of the Target Area dominated by Marri *C. calophylla*. This approach would however retain impacts on potential Black Cockatoo breeding habitats, as the northern half of the Target Area tends to harbour the majority of large and very large habitat trees for Karri *E. diversicolor*.

4.5.3. Introduction of invasive species, diseases and weeds.

4.5.3. Mitigation against breeding, foraging or night roosting habitat disturbance and degradation through introduction of invasive species, diseases and weeds could be achieved via a Management Plan for Dieback and Weeds. This should be developed and implemented during timber harvesting for the Target Area.

4.6. Summary of Requirement for Federal Referral Under EPBC Act Black Cockatoo Referral Guidelines (Commonwealth of Australia 2012)

Have the impact avoidance and impact mitigation options been reviewed as appropriate for the Action?	Yes
What is the residual risk that the Action will result in an impact on Black Cockatoos?	Determined as High Risk. 6.7 hectares (more than 1 hectare) of quality foraging habitat is proposed for removal. 1123 trees over 22.5 hectares that provide the potential for high quality Black Cockatoo breeding habitat are proposed for removal.
Is Referral under the EPBC Act for significant impact on Black Cockatoos determined to be required?	Yes
<p>Comment: Referral is recommended, due to the number and area of trees impacted and their provision or potential for provision of quality foraging and breeding habitat for Black Cockatoos. It is however noted that modest evidence of current use by Black Cockatoos during the period of survey was obtained.</p>	

5. Targeted Assessment – Phascogale (*Phascogale tapoatafa wambenger*)

5.1. Rationale

Within Western Australia, Phascogales (*Phascogale tapoatafa wambenger*) are considered specially protected species - species of special conservation interest as these are conservation dependent - under the WA Biodiversity Conservation Act 2016. The species is not listed as protected under the Federal EPBC Act (1999).

The proposed removal of vegetation within the Target Area at The Lot will impact 22.5 hectares of vegetation. This vegetation, per desktop assessment in section 2 and as described in sections 3 and 4, comprises native forests of Karri *E. diversicolor* with a component of Jarrah *E. marginata* – Marri *C. calophylla* at the highest point, with the majority in pristine condition. The approval for removal of vegetation from the Target Area has been determined as dependent on lack of significant impact on Phascogales (*P. t. wambenger*). The purpose of this assessment was therefore to determine whether Phascogales *P. t. wambenger* utilise the Target Area.

Phascogale (*P. t. wambenger*) is a small nocturnal and arboreal marsupial that has a limited distribution to the south west corner of Western Australia, and is predominantly insectivorous and carnivorous with a conspicuous brush tail (Department of Environment and Conservation 2012). Nesting occurs within dens in tree hollows above ground, and female home ranges are of the order of 20-70 hectares in size (Department of Environment and Conservation 2012). Breeding occurs in winter (May-July) (Department of Environment and Conservation 2012).

5.2. Methodology

The Target Area was assessed at the Lot for the presence of Phascogale *P. t. wambenger* via observation of faunal tracks and signs, via spotlight surveys and via trail cameras.

During site assessment for habitat trees per section 4, the Target Area was also assessed for fauna, including tracks, scat and signs such as scratch markings on trees. The routes taken during assessment were recorded via a Garmin GPSMap64. The total area walked during assessments is shown in Figure 5.1. Spotlight surveys were carried out on the evenings of 11th, 12th, 13th and 14th November 2022. All spotlight surveys commenced at the main residence at the Lot at approximately 8pm (1.5 hours after dark) and lasted approximately 2 hours. On 11th and 13th November 2022, spotlighting targeted the boundary firebreak to the north and east sides of the Target Area, returning from the south east corner of the Target area, with a total return distance of 1.6km. On 12th and 14th November 2022, spotlighting targeted the central track running north-south, and boundary firebreak along the south of the Target Area, with total return distance of 1.9km. Tracks for spotlight surveys can be seen in Figures 3.1 and 5.1. Due to the density of understory vegetation and leaf litter resulting in high likelihood of disturbance, spotlighting was not carried out away from firebreaks and main track. Particular attention was paid during spotlighting to larger trees with potential nest hollows. A high-power LED torch with beam length >100m was used for spotlight surveys.

Trail cameras were placed on the afternoon of 10th November 2022 into selected locations within the south side of the Target Area (see Figure 5.1). Each camera was attached at about 2m above ground, orientated in portrait format, and aimed up a focal tree trunk and into the canopy so as to maximise the area of tree trunk imaged

and thus detection of the target fauna. Each trail camera was no-glow, and set to video (10 second) + subsequent photo mode, with a 30 second subsequent trigger delay, and maximal sensitivity. Two camera brands were used: one Ltl Acorn 5610 and a further four Nextech QC8043. Trail cameras were retrieved on the morning of 15th November 2022, resulting in 5 nights of recording by 5 trail cameras. A typical trail camera installation can be seen in Figure 3.2. It was noted that lack of available trail cameras at the period of survey limited the number of trail cameras that could be installed on site.

5.3. Results

The fauna tracks, scats and markings assessment did not detect any evidence for the presence of Phascogale *P. t. wambenger*. Numerous faunal trackways through the Target Area were observed at ground level, but scat located along these indicated the presence either of Western Grey Kangaroo *Macropus fuliginosus* and Fox *Vulpes vulpes*, in particular at the northern and eastern firebreaks along the Target Area adjacent pastureland at the Lot (Figure 3.1). The spotlight survey of the canopy also did not detect any evidence for Phascogale *P. t. wambenger*, although there were numerous observations of Western Grey Kangaroo *Macropus fuliginosus*.

The trail camera assessment resulted in images from 4 of 5 cameras, with the Ltl Acorn noted to have ceased imaging during survey at halfway point due to shortened camera battery life (likely due to high recording levels of non-target species such as birds). No trail cameras other than NT3 showed images of interest (images are available on request).

Trail camera NT3 showed a single video and image of interest from 11th November 2022 at 19.28. The 10 second video (available on request) shows movement caused by a small arboreal animal hidden within branches adjacent a Karri *E. diversicolor* trunk, at approximately 3m above ground. The photo taken subsequently to the video (Figure 5.2) shows a small arboreal animal with small pointed face and blurred brush tail leaping towards the camera which was fixed at approximately 2m above ground level. The image was identified as Phascogale *P. t. wambenger*. No alternative fauna were considered feasible as alternatives that could have generated this image. The fauna record has been reported to DCBA.

5.4. Summary

Phascogale *P. t. wambenger* was detected in the Target Area by a single trail camera detection, at the location mapped for NT3 (Figure 5.1). It is thus inferred that Phascogale *P. t. wambenger* is present within at least part of the Target Area. It was noted that the detection was on the trail camera located in the south west of the Target Area both near to the stream and furthest from human influence, which is highest to north and east of the Target Area (Figure 3.1). The absence of other evidence of Phascogale *P. t. wambenger* in the Target Area may be due both to the known difficulty in detecting arboreal marsupials e.g. by spotlighting, the low density or absence of the target fauna across all or part of the Target Area, low density of trail cameras that were available for use in the survey period, and possible influence of Fox *Vulpes vulpes* which may deter native fauna activity away from tracks and firebreaks and/or result in faunal movement being focussed higher in the canopy where assessment is difficult. Detailed determination of the extent of habitat use by Phascogale *P. t. wambenger* within the Target Area would require extended trail camera surveys over multiple seasons, which proved beyond the scope of the current assessment. Given the size of the known home range of Phascogale *P. t.*

wambenger at >20 hectares, the possibility that the whole Target Area is within the home range of the detected individual cannot be disproven based on the current data. Site assessment indicated that suitable nesting holes and hollows were present within the Target Area.

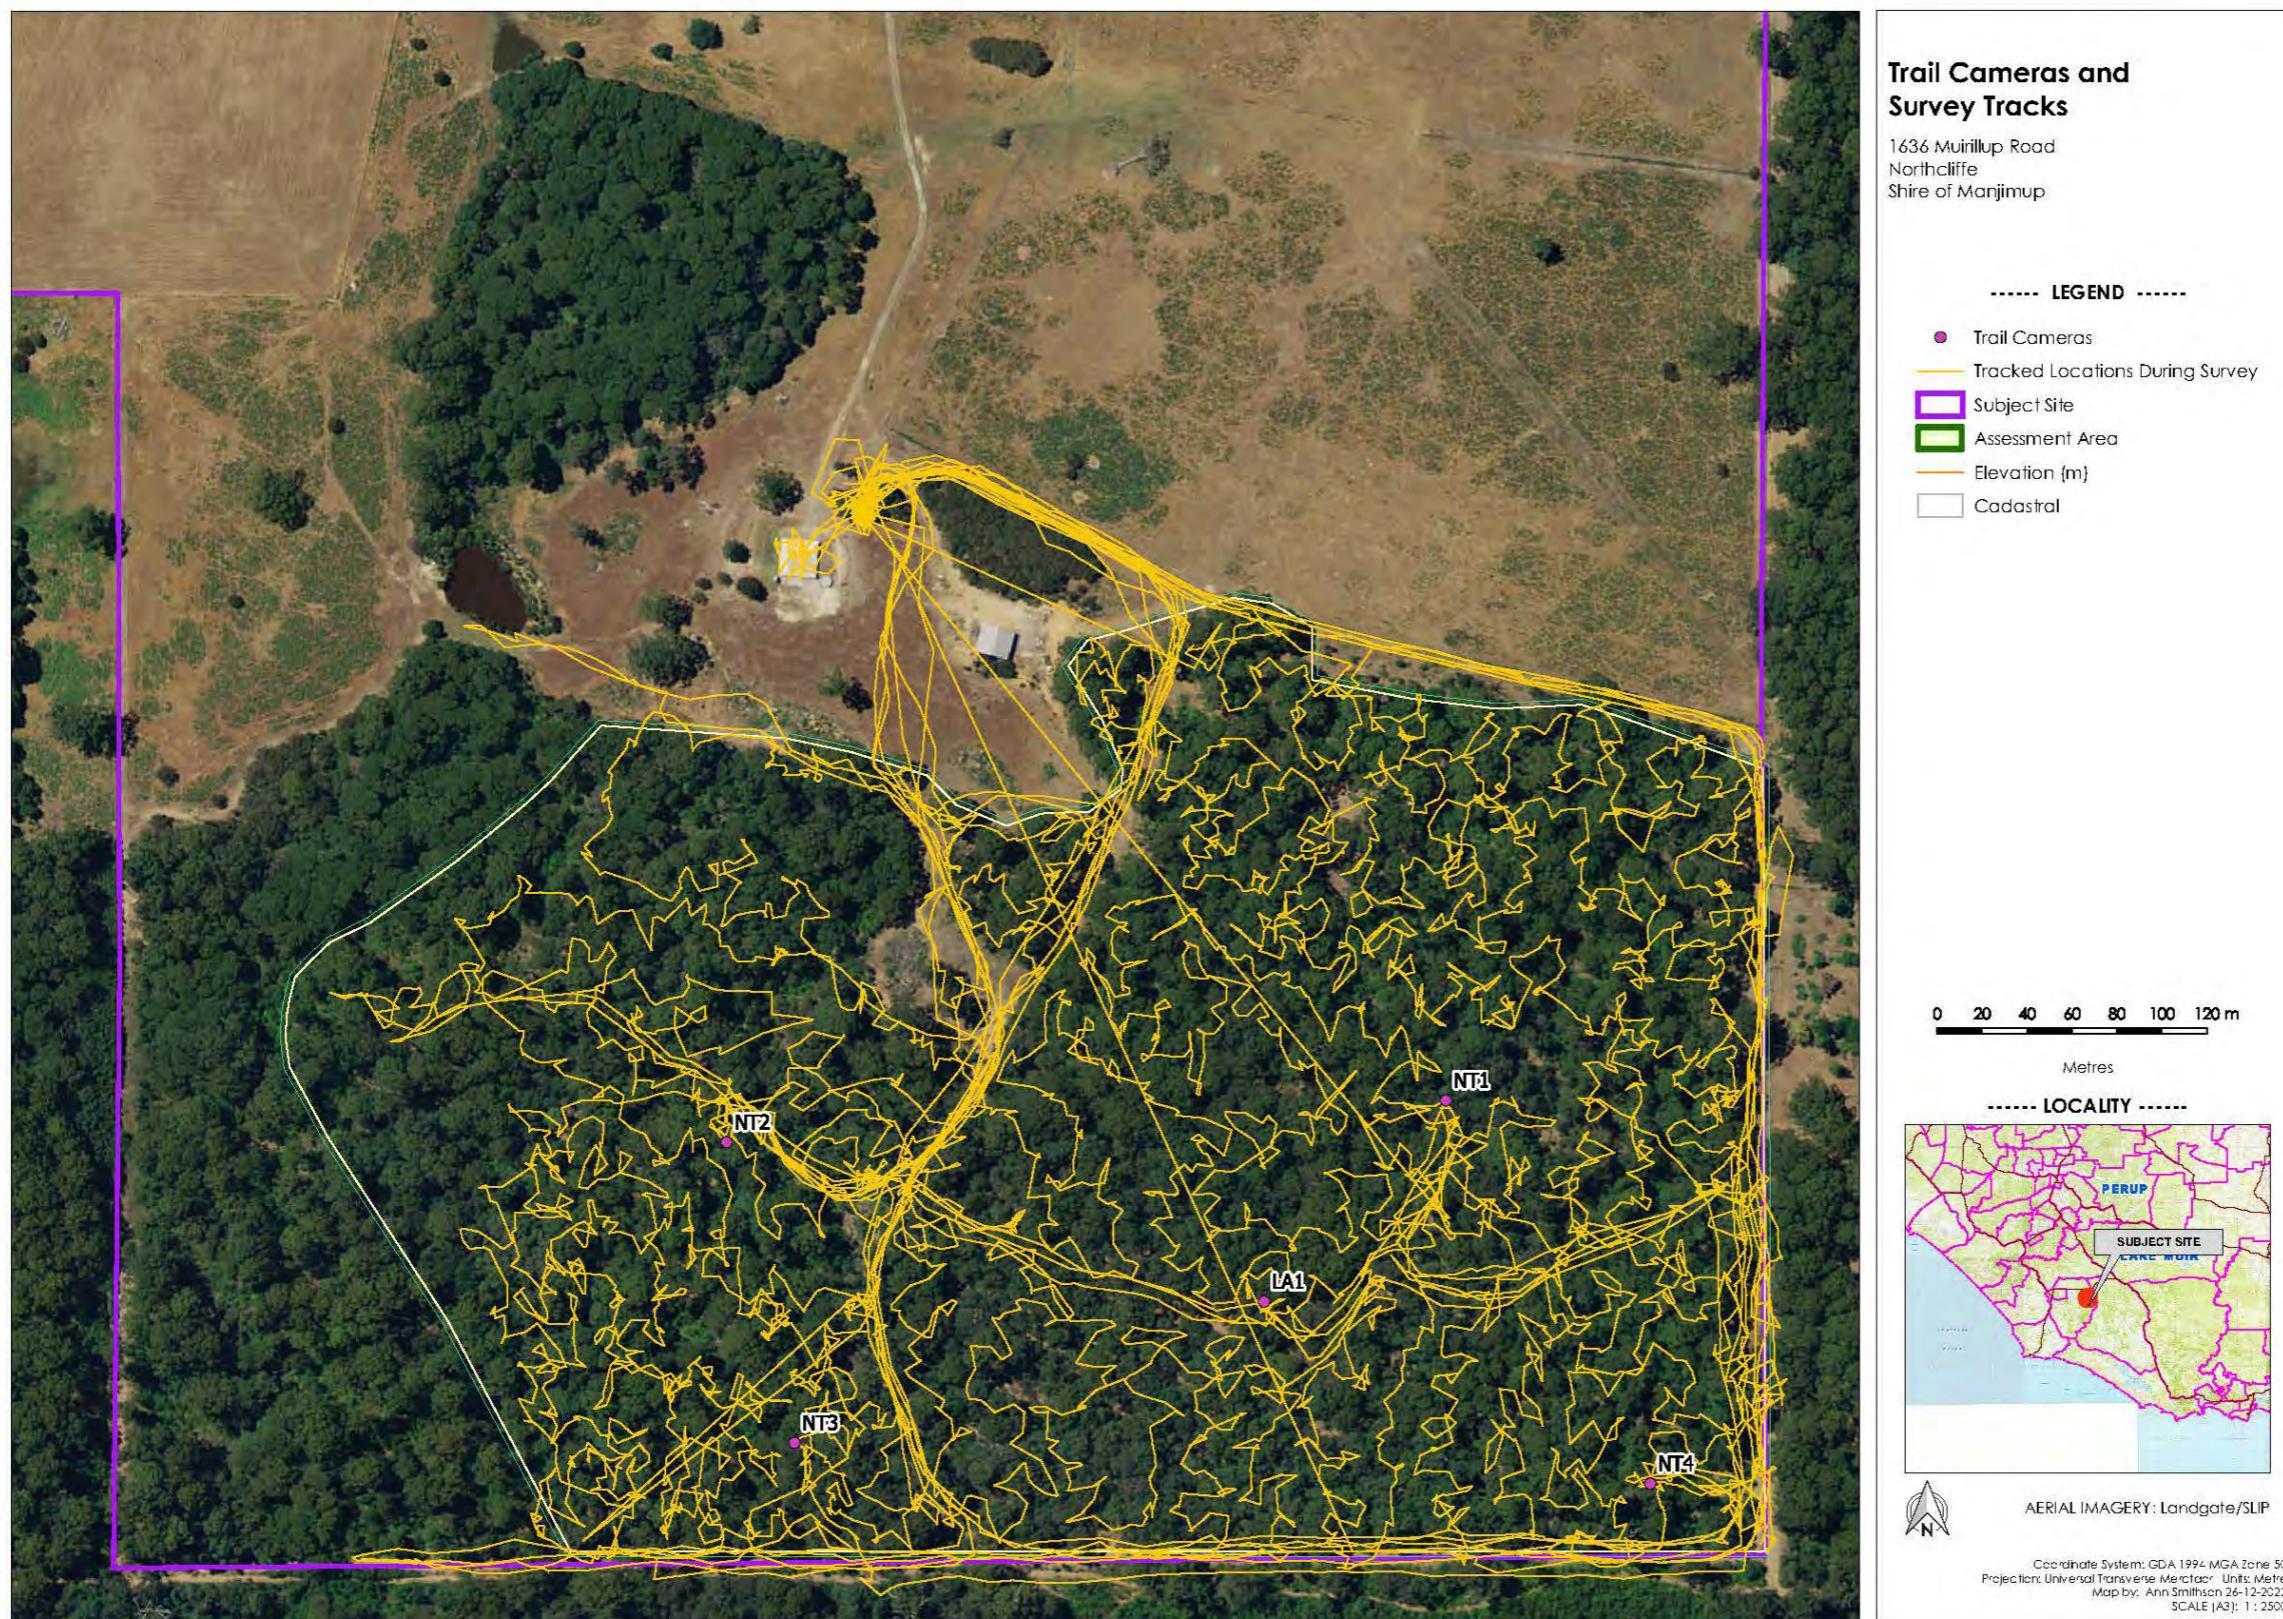

Figure 5.1 Location of trail cameras and routes taken during assessments for faunal tracks and signs

The tracked locations (yellow) show all routes walked from 11th to 15th November 2022. Routes used during spotlighting correspond to northern, eastern and southern firebreaks, and the main north-south track.

Figure 5.2 Image recorded by trail camera NT3 on 11/11/2022 identified as *Phascogale P. t. wambenger*
